**fortify.igraph**

*Fortify method for networks of class* igraph

**Description**

Fortify method for networks of class `igraph`

**Usage**

```r
## S3 method for class 'igraph'
fortify(
  model,
  data = NULL,
  layout = igraph::nicely(),
  arrow.gap = ifelse(igraph::is.directed(model), 0.025, 0),
  by = NULL,
  scale = TRUE,
  stringsAsFactors = getOption("stringsAsFactors"),
  ...
)
```

**Arguments**

- `model` an object of class `igraph`.
- `data` not used by this method.
- `layout` a function call to an `igraph` layout function, such as `layout_nicely` (the default), or a 2 column matrix giving the x and y coordinates for the vertices. See `layout_` for details.
arrow.gap

a parameter that will shorten the network edges in order to avoid overplotting
dependent arrows and nodes; defaults to 0 when the network is undirected (no edge
shortening), or to 0.025 when the network is directed. Small values near 0.025
will generally achieve good results when the size of the nodes is reasonably
small.

by

a character vector that matches an edge attribute, which will be used to generate
a data frame that can be plotted with facet_wrap or facet_grid. The nodes of
the network will appear in all facets, at the same coordinates. Defaults to NULL
(no faceting).

scale

whether to (re)scale the layout coordinates. Defaults to TRUE, but should be set
to FALSE if layout contains meaningful spatial coordinates, such as latitude and
longitude.

stringsAsFactors

whether vertex and edge attributes should be converted to factors if they are of
class character. Defaults to the value ofgetOption("stringsAsFactors"),
which is TRUE by default: see data.frame.

... additional parameters for the layout_ function

Value

a data.frame object.

fortify.network  Fortify method for networks of class network

Description

See the vignette at https://briatte.github.io/ggnetwork/ for a description of both this func-
tion and the rest of the ggnetwork package.

Usage

## S3 method for class 'network'
fortify(
  model,
  data = NULL,
  layout = "fruchtermanreingold",
  weights = NULL,
  arrow.gap = ifelse(network::is.directed(model), 0.025, 0),
  by = NULL,
  scale = TRUE,
  stringsAsFactors = getOption("stringsAsFactors"),
  ...
)

)
Arguments

model        an object of class network.
data         not used by this method.
layout       a network layout supplied by gplot.layout, such as "fruchtermanreingold" (the default), or a two-column matrix with as many rows as there are nodes in the network, in which case the matrix is used as nodes coordinates.
weights      the name of an edge attribute to use as edge weights when computing the network layout, if the layout supports such weights (see 'Details'). Defaults to NULL (no edge weights).
arrow.gap    a parameter that will shorten the network edges in order to avoid overplotting edge arrows and nodes; defaults to 0 when the network is undirected (no edge shortening), or to 0.025 when the network is directed. Small values near 0.025 will generally achieve good results when the size of the nodes is reasonably small.
by           a character vector that matches an edge attribute, which will be used to generate a data frame that can be plotted with facet_wrap or facet_grid. The nodes of the network will appear in all facets, at the same coordinates. Defaults to NULL (no faceting).
scale        whether to (re)scale the layout coordinates. Defaults to TRUE, but should be set to FALSE if layout contains meaningful spatial coordinates, such as latitude and longitude.
stringsAsFactors whether vertex and edge attributes should be converted to factors if they are of class character. Defaults to the value ofgetOption("stringsAsFactors"), which is TRUE by default: see data.frame.

Details

dotify.network will return a warning if it finds duplicated edges after converting the network to an edge list. Duplicated edges should be eliminated in favour of single weighted edges before using a network layout that supports edge weights, such as the Kamada-Kawai force-directed placement algorithm.

Value

a data.frame object.

Examples

if (require(ggplot2) & require(network)) {

  # source: ?network::flo
data(flo)

  # data example
ggnetwork(flo)

# plot example
ggplot(ggnetwork(flo), aes(x, y, xend = xend, yend = yend)) +
  geom_edges(alpha = 0.5) +
  geom_nodes(size = 12, color = "white") +
  geom_nodetext(aes(label = vertex.names), fontface = "bold") +
  theme_blank()

# source: ?network::emon
data(emon)

data example
ggnetwork(emon[[1]], layout = "target", niter = 100)

# data example with edge weights
ggnetwork(emon[[1]], layout = "kamadakawai", weights = "Frequency")

# plot example with straight edges
ggplot(
  ggnetwork(emon[[1]], layout = "kamadakawai", arrow.gap = 0.025),
  aes(x, y, xend = xend, yend = yend)
) +
  geom_edges(aes(color = Frequency),
    arrow = arrow(length = unit(10, "pt"), type = "closed")
  ) +
  geom_nodes(aes(size = Formalization)) +
  scale_color_gradient(low = "grey50", high = "tomato") +
  scale_size_area(breaks = 1:3) +
  theme_blank()

# plot example with curved edges
ggplot(
  ggnetwork(emon[[1]], layout = "kamadakawai", arrow.gap = 0.025),
  aes(x, y, xend = xend, yend = yend)
) +
  geom_edges(aes(color = Frequency),
    curvature = 0.1,
    arrow = arrow(length = unit(10, "pt"), type = "open")
  ) +
  geom_nodes(aes(size = Formalization)) +
  scale_color_gradient(low = "grey50", high = "tomato") +
  scale_size_area(breaks = 1:3) +
  theme_blank()

# facet by edge attribute
ggplot(
  ggnetwork(emon[[1]], arrow.gap = 0.02, by = "Frequency"),
  aes(x, y, xend = xend, yend = yend)
) +
  geom_edges(arrow = arrow(length = unit(5, "pt"), type = "closed")) +
  geom_nodes() +
  theme_blank() +
facet_grid(. ~ Frequency, labeller = label_both)

# user-provided layout
ggplot(
    ggnetwork(emon[[1]], layout = matrix(runif(28), ncol = 2)),
    aes(x, y, xend = xend, yend = yend)
) +
  geom_edges(arrow = arrow(length = unit(5, "pt"), type = "closed")) +
  geom_nodes() +
  theme_blank()
}

---

**geom_edges**

*Draw the edges of a network.*

**Description**

All arguments to this geom are identical to those of `geom_segment`, including `arrow`, which is useful to plot directed networks in conjunction with the `arrow.gap` argument of `fortify.network`. The `curvature`, `angle` and `ncp` arguments of `geom_curve` are also available: if curvature is set to any value above 0 (the default), the edges produced by `geom_edges` will be curved.

**Usage**

```r
geom_edges(
  mapping = NULL,
  data = NULL,
  position = "identity",
  arrow = NULL,
  curvature = 0,
  angle = 90,
  ncp = 5,
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE,
  ...
)
```

**Arguments**

- **mapping**
  - Set of aesthetic mappings created by `aes()` or `aes()`. If specified and `inherit.aes = TRUE` (the default), it is combined with the default mapping at the top level of the plot. You must supply `mapping` if there is no plot mapping.

- **data**
  - The data to be displayed in this layer. There are three options:
    - If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
geom_edges

A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.

A function will be called with a single argument, the plot data. The return value must be a data.frame, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x, 10)`).

position
Position adjustment, either as a string, or the result of a call to a position adjustment function.

arrow
specification for arrow heads, as created by arrow().

curvature
A numeric value giving the amount of curvature. Negative values produce left-hand curves, positive values produce right-hand curves, and zero produces a straight line.

angle
A numeric value between 0 and 180, giving an amount to skew the control points of the curve. Values less than 90 skew the curve towards the start point and values greater than 90 skew the curve towards the end point.

ncp
The number of control points used to draw the curve. More control points creates a smoother curve.

na.rm
If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.

show.legend
logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

inherit.aes
If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders().

...
Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

Examples

```r
if (require(network) && require(sna)) {

  # rerun if the example does not produce reciprocated ties
  n <- network(random_graph(10, tprob = 0.2), directed = TRUE)

  # just edges
  ggplot(n, aes(x, y, xend = xend, yend = yend)) +
  geom_edges(size = 1, colour = "steelblue") +
  theme_blank()

  # with nodes
  ggplot(n, aes(x, y, xend = xend, yend = yend)) +
  geom_edges(size = 1, colour = "steelblue") +
  geom_nodes(size = 3, colour = "steelblue") +
  theme_blank()

```
# with arrows
```r
ggplot(n, aes(x, y, xend = xend, yend = yend)) + geom_edges(
  size = 1, colour = "steelblue",
  arrow = arrow(length = unit(0.5, "lines"), type = "closed")
) + geom_nodes(size = 3, colour = "steelblue") + theme_blank()
```

# with curvature
```r
ggplot(n, aes(x, y, xend = xend, yend = yend)) + geom_edges(
  size = 1, colour = "steelblue", curvature = 0.15,
  arrow = arrow(length = unit(0.5, "lines"), type = "closed")
) + geom_nodes(size = 3, colour = "steelblue") + theme_blank()
```

# arbitrary categorical edge attribute
```r
e <- sample(letters[1:2], network.edgecount(n), replace = TRUE)
set.edge.attribute(n, "type", e)
ggplot(n, aes(x, y, xend = xend, yend = yend)) + geom_edges(aes(linetype = type),
  size = 1, curvature = 0.15,
  arrow = arrow(length = unit(0.5, "lines"), type = "closed")
) + geom_nodes(size = 3, colour = "steelblue") + theme_blank()
```

# arbitrary numeric edge attribute (signed network)
```r
e <- sample(-2:2, network.edgecount(n), replace = TRUE)
set.edge.attribute(n, "weight", e)
ggplot(n, aes(x, y, xend = xend, yend = yend)) + geom_edges(aes(colour = weight),
  curvature = 0.15,
  arrow = arrow(length = unit(0.5, "lines"), type = "closed")
) + geom_nodes(size = 3, colour = "grey50") + scale_colour_gradient(low = "steelblue", high = "tomato") + theme_blank()
```

# draw only a subset of all edges
```r
positive_weight <- function(x) {
  x[ x$weight >= 0, ]
}
ggplot(n, aes(x, y, xend = xend, yend = yend)) + geom_edges(aes(colour = weight), data = positive_weight) + geom_nodes(size = 4, colour = "grey50") + scale_colour_gradient(low = "gold", high = "tomato") + theme_blank()
```
geom_edgetext

Label the edges of a network.

Description

All arguments to both geom_edgetext and geom_edgelabel are identical to those of geom_label, with the only difference that the label.size argument defaults to 0 in order to avoid drawing a border around the edge labels. The labels will be drawn at mid-edges. geom_text and geom_label produce strictly identical results.

Usage

geom_edgetext(
  mapping = NULL,
  data = NULL,
  position = "identity",
  parse = FALSE,
  ...
)

geom_edgelabel(
  mapping = NULL,
  data = NULL,
  position = "identity",
  parse = FALSE,
  ...
)

Arguments

mapping Set of aesthetic mappings created by aes() or aes(). If specified and inherit.aes = TRUE (the default), it is combined with the default mapping at the top level of
the plot. You must supply mapping if there is no plot mapping.

**data**
The data to be displayed in this layer. There are three options:

- If NULL, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
- A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.
- A function will be called with a single argument, the plot data. The return value must be a data.frame, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x, 10)`).

**position**
Position adjustment, either as a string, or the result of a call to a position adjustment function. Cannot be jointly specified with `nudge_x` or `nudge_y`.

**parse**
If TRUE, the labels will be parsed into expressions and displayed as described in ?plotmath.

**...**
Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.

**nudge_x**
Horizontal and vertical adjustment to nudge labels by. Useful for offsetting text from points, particularly on discrete scales. Cannot be jointly specified with `position`.

**nudge_y**
Horizontal and vertical adjustment to nudge labels by. Useful for offsetting text from points, particularly on discrete scales. Cannot be jointly specified with `position`.

**label.padding**
Amount of padding around label. Defaults to 0.25 lines.

**label.r**
Radius of rounded corners. Defaults to 0.15 lines.

**label.size**
Size of label border, in mm.

**na.rm**
If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.

**show.legend**
logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

**inherit.aes**
If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. `borders()`.

### Examples

```r
if (require(network) && require(sna)) {
  data(flo, package = "network")
  n <- network(flo, directed = FALSE)

  # arbitrary categorical edge attribute
  e <- sample(letters[1:4], network.edgecount(n), replace = TRUE)
  set.edge.attribute(n, "type", e)
}
```
# with labelled edges
ggplot(n, aes(x, y, xend = xend, yend = yend)) +
  geom_edges(aes(colour = type)) +
  geom_edgetext(aes(label = type, colour = type)) +
  geom_nodes(size = 4, colour = "grey50") +
  theme_blank()

# label only a subset of all edges with arbitrary symbol
edge_type <- function(x) {
  x[x$type == "a", ]
}

ggplot(n, aes(x, y, xend = xend, yend = yend)) +
  geom_edges() +
  geom_edgetext(label = "=", data = edge_type) +
  geom_nodes(size = 4, colour = "grey50") +
  theme_blank()

---

**geom_edgetext_repel**  
*Draw repulsive edge labels.*

**Description**

All arguments to both `geom_edgetext_repel` and `geom_edgelabel_repel` are identical to those of `geom_label_repel`. `geom_text_repel` and `geom_label_repel` produce strictly identical results.

**Usage**

```r
geom_edgetext_repel(
  mapping = NULL,
  data = NULL,
  parse = FALSE,
  ...
  box.padding = unit(0.25, "lines"),
  label.padding = unit(0.25, "lines"),
  point.padding = unit(1e-06, "lines"),
  label.r = unit(0.15, "lines"),
  label.size = 0.25,
  arrow = NULL,
  force = 1,
  max.iter = 10000,
  nudge_x = 0,
  nudge_y = 0,
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE
)
```
geom_edgelabel_repel(
  mapping = NULL,
  data = NULL,
  parse = FALSE,
  ...
  box.padding = unit(0.25, "lines"),
  label.padding = unit(0.25, "lines"),
  point.padding = unit(1e-06, "lines"),
  label.r = unit(0.15, "lines"),
  label.size = 0.25,
  arrow = NULL,
  force = 1,
  max.iter = 10000,
  nudge_x = 0,
  nudge_y = 0,
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE
)

Arguments

mapping Set of aesthetic mappings created by \texttt{aes} or \texttt{aes_}. If specified and \texttt{inherit.aes} = \texttt{TRUE} (the default), is combined with the default mapping at the top level of the plot. You only need to supply \texttt{mapping} if there isn’t a mapping defined for the plot.

data A data frame. If specified, overrides the default data frame defined at the top level of the plot.

parse If \texttt{TRUE}, the labels will be parsed into expressions and displayed as described in ?plotmath

... other arguments passed on to \texttt{layer}. There are three types of arguments you can use here:

  • Aesthetics: to set an aesthetic to a fixed value, like \texttt{colour = "red"} or \texttt{size = 3}.

  • Other arguments to the layer, for example you override the default \texttt{stat} associated with the layer.

  • Other arguments passed on to the \texttt{stat}.

box.padding Amount of padding around bounding box, as unit or number. Defaults to 0.25. (Default unit is lines, but other units can be specified by passing \texttt{unit(x, "units")}).

label.padding Amount of padding around label, as unit or number. Defaults to 0.25. (Default unit is lines, but other units can be specified by passing \texttt{unit(x, "units")}).

point.padding Amount of padding around labeled point, as unit or number. Defaults to 0. (Default unit is lines, but other units can be specified by passing \texttt{unit(x, "units")}).

label.r Radius of rounded corners, as unit or number. Defaults to 0.15. (Default unit is lines, but other units can be specified by passing \texttt{unit(x, "units")}).
geom_edgetext_repel

label.size  Size of label border, in mm.
arrow  specification for arrow heads, as created by arrow
force  Force of repulsion between overlapping text labels. Defaults to 1.
max.iter  Maximum number of iterations to try to resolve overlaps. Defaults to 10000.
nudge_x  Horizontal and vertical adjustments to nudge the starting position of each text label. The units for nudge_x and nudge_y are the same as for the data units on the x-axis and y-axis.
nudge_y  Horizontal and vertical adjustments to nudge the starting position of each text label. The units for nudge_x and nudge_y are the same as for the data units on the x-axis and y-axis.
na.rm  If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
show.legend  logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
inherit.aes  If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders.

Examples

if (require(network) && require(sna)) {
  data(flo, package = "network")
  n <- network(flo, directed = FALSE)

  # arbitrary categorical edge attribute
  e <- sample(1:4, network.edgecount(n), replace = TRUE)
  set.edge.attribute(n, "day", e)

  # with repulsive edge labels
  ggplot(n, aes(x, y, xend = xend, yend = yend)) +
  geom_edges() +
  geom_edgetext_repel(aes(label = day), box.padding = unit(0.5, "lines")) +
  geom_nodes(size = 4, colour = "grey50") +
  theme_blank()

  # repulsive edge labels for only a subset of all edges
  edge_day <- function(x) {
    x[ x$day > 2, ]
  }
  ggplot(n, aes(x, y, xend = xend, yend = yend)) +
  geom_edges(aes(colour = cut(day, (4:0)[ -3 ]))) +
  geom_edgetext_repel(aes(
    label = paste("day", day),
    colour = cut(day, (4:0)[ -3 ])
  ), data = edge_day) +
  geom_nodes(size = 4, colour = "grey50") +
  scale_colour_manual("day",
    labels = c("old ties", "day 3", "day 4"),
    values = c("grey50", "gold", "tomato")
)
geom_nodes

Draw the nodes of a network.

Description

All arguments to this geom are identical to those of `geom_point`.

Usage

```r
geom_nodes(
  mapping = NULL,
  data = NULL,
  position = "identity",
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE,
  ...
)
```

Arguments

- **mapping**: Set of aesthetic mappings created by `aes()` or `aes()`. If specified and `inherit.aes = TRUE` (the default), it is combined with the default mapping at the top level of the plot. You must supply `mapping` if there is no plot mapping.
- **data**: The data to be displayed in this layer. There are three options:
  - If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
  - A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.
  - A function will be called with a single argument, the plot data. The return value must be a `data.frame`, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x, 10)`).
- **position**: Position adjustment, either as a string, or the result of a call to a position adjustment function.
- **na.rm**: If `FALSE`, the default, missing values are removed with a warning. If `TRUE`, missing values are silently removed.
- **show.legend**: Logical. Should this layer be included in the legends? `NA`, the default, includes if any aesthetics are mapped. `FALSE` never includes, and `TRUE` always includes. It can also be a named logical vector to finely select the aesthetics to display.
geom_nodetext

If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders().

... Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

Examples

if (require(network) && require(sna)) {
  data(flo, package = "network")
  n <- network(flo, directed = FALSE)

  # just nodes
  ggplot(n, aes(x, y)) +
  geom_nodes(size = 3, shape = 21, colour = "steelblue") +
  theme_blank()

  # with edges
  ggplot(n, aes(x, y, xend = xend, yend = yend)) +
  geom_edges(colour = "steelblue") +
  geom_nodes(size = 3, shape = 21, colour = "steelblue", fill = "white") +
  theme_blank()

  # with nodes sized according to degree centrality
  ggplot(n, aes(x, y, xend = xend, yend = yend)) +
  geom_edges(colour = "steelblue") +
  geom_nodes(size = degree(n), shape = 21, colour = "steelblue", fill = "white") +
  theme_blank()

  # with nodes colored according to betweenness centrality
  n %>% "betweenness" <- betweenness(flo)
  ggplot(n, aes(x, y, xend = xend, yend = yend)) +
  geom_edges(colour = "grey50") +
  geom_nodes(aes(colour = betweenness), size = 3) +
  scale_colour_gradient(low = "gold", high = "tomato") +
  theme_blank() +
  theme(legend.position = "bottom")
}

geom_nodetext  Label the nodes of a network.

Description

All arguments to these geoms are identical to those of geom_text and geom_label.
Usage

```r
geom_nodetext(
    mapping = NULL,
    data = NULL,
    position = "identity",
    ..., 
    parse = FALSE,
    nudge_x = 0,
    nudge_y = 0,
    check_overlap = FALSE,
    na.rm = FALSE,
    show.legend = NA,
    inherit.aes = TRUE
)
```

```r
geom_nodelabel(
    mapping = NULL,
    data = NULL,
    position = "identity",
    ..., 
    parse = FALSE,
    nudge_x = 0,
    nudge_y = 0,
    label.padding = unit(0.25, "lines"),
    label.r = unit(0.15, "lines"),
    label.size = 0.25,
    na.rm = FALSE,
    show.legend = NA,
    inherit.aes = TRUE
)
```

Arguments

- **mapping**
  Set of aesthetic mappings created by `aes()` or `aes()`. If specified and `inherit.aes` = TRUE (the default), it is combined with the default mapping at the top level of the plot. You must supply mapping if there is no plot mapping.

- **data**
  The data to be displayed in this layer. There are three options:
  - If NULL, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
  - A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.
  - A function will be called with a single argument, the plot data. The return value must be a data.frame, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x, 10)`).

- **position**
  Position adjustment, either as a string, or the result of a call to a position adjustment function. Cannot be jointly specified with `nudge_x` or `nudge_y`.
geom_nodetext

... Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

parse

If TRUE, the labels will be parsed into expressions and displayed as described in ?plotmath.

nudge_x

Horizontal and vertical adjustment to nudge labels by. Useful for offsetting text from points, particularly on discrete scales. Cannot be jointly specified with position.

nudge_y

Horizontal and vertical adjustment to nudge labels by. Useful for offsetting text from points, particularly on discrete scales. Cannot be jointly specified with position.

check_overlap

If TRUE, text that overlaps previous text in the same layer will not be plotted. check_overlap happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling geom_text(). Note that this argument is not supported by geom_label().

na.rm

If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.

show.legend

logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

inherit.aes

If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders().

label.padding

Amount of padding around label. Defaults to 0.25 lines.

label.r

Radius of rounded corners. Defaults to 0.15 lines.

label.size

Size of label border, in mm.

Examples

```r
## geom_nodetext examples

if (require(network) && require(sna)) {
  n <- network(rgraph(10, tprob = 0.2), directed = FALSE)
  
  # just node labels
  ggplot(n, aes(x, y)) +
  geom_nodetext(aes(label = vertex.names)) +
  theme_blank()

  # with nodes underneath
  ggplot(n, aes(x, y)) +
  geom_nodes(colour = "gold", size = 9) +
  geom_nodetext(aes(label = vertex.names)) +
  theme_blank()

  # with nodes and edges
  ggplot(n, aes(x, y, xend = xend, yend = yend)) +
```

geom_edges(colour = "gold") +
geom_nodes(colour = "gold", size = 9) +
geom_nodetext(aes(label = vertex.names)) +
theme_blank()
}

## geom_nodelabel examples

if (require(network) && require(sna)) {
  data(flo, package = "network")
  n <- network(flo, directed = FALSE)

  # with text labels
  ggplot(n, aes(x, y, xend = xend, yend = yend)) +
  geom_edges(colour = "grey50") +
  geom_nodelabel(aes(label = vertex.names)) +
  theme_blank()

  # with text labels coloured according to degree centrality
  n %v% "degree" <- degree(n)
  ggplot(n, aes(x, y, xend = xend, yend = yend)) +
  geom_edges(colour = "grey50") +
  geom_nodelabel(aes(label = vertex.names, fill = degree)) +
  scale_fill_gradient(low = "gold", high = "tomato") +
  theme_blank()

  # label only a subset of all nodes
  high_degree <- function(x) {
    x[x$degree > median(x$degree), ]
  }
  ggplot(n, aes(x, y, xend = xend, yend = yend)) +
  geom_edges(colour = "steelblue") +
  geom_nodes(aes(size = degree), colour = "steelblue") +
  geom_nodelabel(aes(label = vertex.names),
                data = high_degree,
                colour = "white", fill = "tomato"
  ) +
  theme_blank()
}

---

**geom_nodetext_repel**  
*Draw repulsive node labels*

**Description**

All arguments to these geoms are identical to those of geom_text_repel and geom_label_repel.
### Usage

```r
geom_nodetext_repel(
  mapping = NULL,
  data = NULL,
  parse = FALSE,
  ...
)
```

```r
geom_nodelabel_repel(
  mapping = NULL,
  data = NULL,
  parse = FALSE,
  ...
)
```

### Arguments

- **mapping**: Set of aesthetic mappings created by `aes` or `aes_`. If specified and `inherit.aes` = TRUE (the default), is combined with the default mapping at the top level of the plot. You only need to supply `mapping` if there isn’t a mapping defined for the plot.

- **data**: A data frame. If specified, overrides the default data frame defined at the top level of the plot.

- **parse**: If TRUE, the labels will be parsed into expressions and displayed as described in ?plotmath.
other arguments passed on to layer. There are three types of arguments you can use here:

- Aesthetics: to set an aesthetic to a fixed value, like colour = "red" or size = 3.
- Other arguments to the layer, for example you override the default stat associated with the layer.
- Other arguments passed on to the stat.

box.padding Amount of padding around bounding box, as unit or number. Defaults to 0.25. (Default unit is lines, but other units can be specified by passing unit(x, "units").)

point.padding Amount of padding around labeled point, as unit or number. Defaults to 0. (Default unit is lines, but other units can be specified by passing unit(x, "units").)

arrow specification for arrow heads, as created by arrow

force Force of repulsion between overlapping text labels. Defaults to 1.

max.iter Maximum number of iterations to try to resolve overlaps. Defaults to 10000.

nudge_x Horizontal and vertical adjustments to nudge the starting position of each text label. The units for nudge_x and nudge_y are the same as for the data units on the x-axis and y-axis.

nudge_y Horizontal and vertical adjustments to nudge the starting position of each text label. The units for nudge_x and nudge_y are the same as for the data units on the x-axis and y-axis.

na.rm If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.

show.legend logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.

inherit.aes If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders.

label.padding Amount of padding around label, as unit or number. Defaults to 0.25. (Default unit is lines, but other units can be specified by passing unit(x, "units").)

label.r Radius of rounded corners, as unit or number. Defaults to 0.15. (Default unit is lines, but other units can be specified by passing unit(x, "units").)

label.size Size of label border, in mm.

Examples

## geom_nodetext_repel example

```r
if (require(network) && require(sna)) {
  n <- network(rgraph(10, tprob = 0.2), directed = FALSE)
  ggplot(n, aes(x, y, xend = xend, yend = yend)) +
    geom_edges(colour = "steelblue") +
    geom_nodetext_repel(aes(label = paste("node", vertex.names)),
      box.padding = unit(1, "lines")) +
    geom_nodes(colour = "steelblue", size = 3) +
```
if (require(network) && require(sna)) {
  data(flo, package = "network")
  n <- network(flo, directed = FALSE)
  ggplot(n, aes(x, y, xend = xend, yend = yend)) +
  geom_edges(colour = "steelblue") +
  geom_nodelabel_repel(aes(label = vertex.names),
      box.padding = unit(1, "lines")
  ) +
  geom_nodes(colour = "steelblue", size = 3) +
  theme_blank()
}

# label only a subset of all nodes
n %v% "degree" <- degree(n)
low_degree <- function(x) {
  x[ x$degree < median(x$degree), ]
}
  ggplot(n, aes(x, y, xend = xend, yend = yend)) +
  geom_edges(colour = "steelblue") +
  geom_nodelabel_repel(aes(label = vertex.names),
      box.padding = unit(1.5, "lines"),
      data = low_degree,
      segment.colour = "tomato",
      colour = "white", fill = "tomato"
  ) +
  geom_nodes(aes(size = degree), colour = "steelblue") +
  theme_blank()
}

---

**ggnetwork**

*Fortify network objects.*

**Description**

A wrapper for the `fortify.network` and `fortify.igraph` functions that will also try to coerce matrices and data frames to network objects.

**Usage**

```r
  ggnetwork(x, ...)
```
Arguments

- `x`: an object of class `network` or `igraph`, or any object that can be coerced to that class, such as an adjacency or incidence matrix, or an edge list: see `edgeset.constructors` and `network` for details.
- `...`: arguments passed to the `fortify.network` or `fortify.igraph` functions.

scale_safely  Rescale x to (0, 1), except if x is constant

Description

Discussed in PR #32: [https://github.com/briatte/ggnetwork/pull/32](https://github.com/briatte/ggnetwork/pull/32)

Usage

```r
scale_safely(x, scale = diff(range(x)))
```

Arguments

- `x`: a vector to rescale
- `scale`: the scale on which to rescale the vector

Value

The rescaled vector, coerced to a vector if necessary. If the original vector was constant, all of its values are replaced by 0.5.

Author(s)

Kipp Johnson

theme_blank  Blank ggplot2 theme, suited for plotting networks.

Description

A `ggplot2` theme without lines, borders, axis text or titles, suited for plotting networks.

Usage

```r
theme_blank(base_size = 12, base_family = "", ...)
```

Arguments

- `base_size`: base font size
- `base_family`: base font family
- `...`: other `theme` arguments
theme_facet

Blank ggplot2 theme with a panel border.

Description
A variation of theme_blank that adds a panel border to the plot, which is often suitable for plotting faceted networks.

Usage
theme_facet(base_size = 12, base_family = "", ...)

Arguments
- base_size: base font size
- base_family: base font family
- ...: other theme arguments
