Package ‘ggpointless’

October 13, 2022

Title A Small Collection of Geometries, and Stats for 'ggplot2'
Version 0.0.3
Description A collection of geometries and stats for 'ggplot2'. Currently it supports geom_pointless() which adds minimal emphasis to your plots. Or just some visual sugar. geom_lexis() draws a 45° lifeline of an event that mimics lexis diagrams. geom_chaikin() applies Chaikin's corner cutting algorithm to a path.

co2_ml

Monthly CO2 records taken at Mauna Loa, since March 1958

Description

Usage

co2_ml

Format

A data frame with 766 rows and 5 variables

- date  date of measurement
- year  year of measurement
- month month of measurement
- co2_ppm  CO2 concentration, in parts per million
- decade decade of the measurement

Source

Dr. Pieter Tans, NOAA/GML (gml.noaa.gov/ccgg/trends/) and Dr. Ralph Keeling, Scripps Institution of Oceanography (scrippsc02.ucsd.edu/).

https://gml.noaa.gov/ccgg/trends/data.html
**covid_vac**

*Rates of COVID-19 Cases and Deaths by Vaccination Status*

**Description**

Data on overall weekly rates of COVID-19 cases and deaths among fully vaccinated and unvaccinated people aged 12 years and older, according to COVID-19 positive specimen collection date. Data covers the periods from April 4, to December 25, 2021.

**Usage**

`covid_vac`

**Format**

A data frame with 146 rows and 4 variables

- **date**  Week of data collection
- **incidence**  COVID-19 cases and deaths, standardized by age
- **status**  Vaccination status
- **outcome**  COVID-19 cases and deaths

**Source**

Centers for Disease Control and Prevention, Rates of COVID-19 Cases and Deaths by Vaccination Status

---

**female_leaders**

*Female leaders of independent states.*

**Description**

Data from Wikipedia on women who have been elected or appointed head of state or government of their respective countries since the interwar period (1918–1939).

**Usage**

`female_leaders`
Format

A data frame with 131 rows and 5 variables

- **name**  Person
- **startdate**  Start of tenure
- **enddate**  End of tenure
- **country**  Country
- **power**  Executive or non-executive

Details

This list includes women who were appointed by a governing committee or parliament where heads of state or government are not directly elected by citizens. The list does not include women chosen by a hereditary monarch.

**geom_chaikin**

Apply Chaikin’s corner cutting algorithm to smooth a path

---

Description

Chaikin’s corner-cutting algorithm can be used to smooth sharp corners of a path.

Usage

```r
geom_chaikin(
  mapping = NULL,
  data = NULL,
  stat = "chaikin",
  position = "identity",
  ...,
  iterations = 5,
  ratio = 0.25,
  closed = FALSE,
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE
)

stat_chaikin(
  mapping = NULL,
```
`geom_chaikin`

```r
data = NULL,
geom = "path",
position = "identity",
...
iterations = 5,
ratio = 0.25,
closed = FALSE,
na.rm = FALSE,
show.legend = NA,
inherit.aes = TRUE
```

**Arguments**

- **mapping**
  
  Set of aesthetic mappings created by `aes()` or `aes(...)`. If specified and `inherit.aes = TRUE` (the default), it is combined with the default mapping at the top level of the plot. You must supply `mapping` if there is no plot mapping.

- **data**
  
  The data to be displayed in this layer. There are three options:
  
  If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
  
  A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.
  
  A function will be called with a single argument, the plot data. The return value must be a `data.frame`, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x, 10)`).

- **position**
  
  Position adjustment, either as a string, or the result of a call to a position adjustment function.

- **...**
  
  Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.

- **iterations**
  
  Integer. Number of iterations to apply. Must be between 0 and 10.

- **ratio**
  
  Numeric. Cutting ratio must be between 0 and 1.

- **closed**
  
  Logical. Specify if result is an open or closed shape.

- **na.rm**
  
  If `FALSE`, the default, missing values are removed with a warning. If `TRUE`, missing values are silently removed.

- **show.legend**
  
  Logical. Should this layer be included in the legends? `NA`, the default, includes if any aesthetics are mapped. `FALSE` never includes, and `TRUE` always includes. It can also be a named logical vector to finely select the aesthetics to display.

- **inherit.aes**
  
  If `FALSE`, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. `borders()`.

- **geom, stat**
  
  Use to override the default connection between `geom_chaikin` and `stat_chaikin`. 
Details

Chaikin’s corner cutting algorithm iteratively turns a jagged path into a smooth path.

The recursion formula starts from two vertices A and B, which represent a single corner of your path. From this, the algorithm derives two new points: one at the specified ratio when going from point A to point B, and one when going from B to A in the opposite direction. By default, a ratio of 0.25 results in two points: the first at 25% of point A and the other at 75% of point A (or 25% of point B). Those new points form a smoother path. Then the algorithm applies the same rule to each pair of new points. The rule is applied iterations times. The maximum number of iterations is 10, default is 5.

The ratio parameter must be a number between 0 and 1. If ratio > 0.5, then it will be flipped to 1 - ratio, and a message is shown.

Aesthetics

geom_chaikin() understands the following aesthetics (required aesthetics are in bold):

- x
- y
- alpha
- color
- group
- linetype
- size

References

Examples

```r
set.seed(42)
dat <- data.frame(
  x = seq.int(10),
  y = sample(15:30, 10)
)
p1 <- ggplot(dat, aes(x, y)) +
  geom_line(linetype = "12")
p1 +
  geom_chaikin()
p1 +
  geom_chaikin(iterations = 1)

triangle <- data.frame(x = c(0, 0, 1), y = c(0, 1, 1))
p2 <- ggplot(triangle, aes(x, y)) +
```
geom_lexis

```r
geom_path(linetype = "12") +
coord_equal()

# ratio let's you control
p2 + geom_chaikin(ratio = .1)
p2 + geom_chaikin(ratio = .5)

# closed parameter to generate a closed shape - or not
p2 + geom_chaikin(iterations = 5, ratio = 0.25, closed = FALSE) # default
p2 + geom_chaikin(closed = TRUE)
```

display events of different cohorts in form of a lexis charts

Description

This geom can be used to plot 45° lifelines for a cohort. Lexis diagrams are named after Wilhelm Lexis and used by demographers for more than a century.

Usage

```r
geom_lexis(
  mapping = NULL,
  data = NULL,
  ..., point_show = TRUE,
  point_colour = NULL,
  point_size = NULL,
  gap_filler = TRUE,
  lineend = "round",
  linejoin = "round",
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE
)
```

```r
stat_lexis(
  mapping = NULL,
  data = NULL,
  ..., na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE
)
```
Arguments

mapping  
Set of aesthetic mappings created by `aes()` or `aes()`. If specified and `inherit.aes = TRUE` (the default), it is combined with the default mapping at the top level of the plot. You must supply `mapping` if there is no plot mapping.

data  
The data to be displayed in this layer. There are three options:
If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.
A function will be called with a single argument, the plot data. The return value must be a `data.frame`, and will be used as the layer data. A function can be created from a `formula` (e.g. `~ head(.x, 10)`).
...
Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.

point_show  
logical. Should a point be shown at the end of each segment? TRUE by default

point_colour  
color of a point

point_size  
the size of a point

gap_filler  
logical. Should gaps be filled? TRUE by default

lineend  
line end style (round, butt, square)

linejoin  
line join style (round, mitre, bevel)

na.rm  
If `FALSE`, the default, missing values are removed with a warning. If `TRUE`, missing values are silently removed.

show.legend  
logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

inherit.aes  
If `FALSE`, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. `borders()`.

Details

This geom draws 45° lines from the start to the end of a 'lifetime'. It is a combination of a segment, and a point. Besides `y` and `yend` coordinates this geom creates one additional variable called `type` in the layer data. You might want to map to an aesthetic with `ggplot2::after_stat()`, see Examples section and vignette("ggspointless") for more details.

Rows in your data with either missing `x` or `xend` values will be removed (your segments must start and end somewhere).

Aesthetics

text: geom.lexis() understands the following aesthetics (required aesthetics are in bold):

- x
• `xend`
• `alpha`
• `color`
• `fill`
• `group`
• `shape`
• `size`
• `linetype`
• `stroke`

Examples

def1 <- data.frame(
    key = c("A", "B", "C", "D", "E"),
    start = c(0, 1, 6, 5, 6, 9),
    end = c(5, 4, 10, 9, 8, 11)
)
p <- ggplot(df1, aes(x = start, xend = end, color = key))
p +
    geom_lexis()
p +
    geom_lexis(gap_filler = FALSE)
p +
    geom_lexis(aes(linetype = after_stat(type)),
               point_show = FALSE)

# change point appearance
p + geom_lexis(
    point_colour = "black",
    point_size = 3,
    shape = 21,
    fill = "white",
    stroke = 1
)

# missing values will be removed
df2 <- data.frame(
    key = c("A", "B", "C", "D"),
    start = c(0, 1, 7, 5, 6),
    end = c(5, 4, 13, 9, NA)
)ggplot(df2, aes(x = start, xend = end, color = key)) +
geom_lexis()

# Ideally, 'x' values should be increasing, unlike
# in the next example
df3 <- data.frame(x = Sys.Date() - 0:2, xend = Sys.Date() + 1:3)
ggplot(df3, aes(x = x, xend = xend)) +
geom_pointless()

# If `x` is of class Date, `xend` can't be of class `POSIXt` or # `POSIXct`. The error is thrown by the `scales::date_trans` function.
## Not run:
```r
ggplot(
data.frame(x = Sys.Date(), xend = Sys.time()),
aes(x = x, xend = xend))
  +
  geom_pointless()
## End(Not run)
```

---

**geom_pointless**

Emphasize some observations with points

**Description**

This is a wrapper around `geom_point()` with the one additional argument: location. It allows to emphasize some observations, namely the first, the last, the minima and/or maxima, see examples. This geom is not particularly useful on its own, hence its name, but hopefully in conjunction with `geom_line()` and friends.

**Usage**

```r
geom_pointless(
  mapping = NULL,
  data = NULL,
  stat = "pointless",
  position = "identity",
  ..., 
  location = "last",
  na.rm = FALSE,
  orientation = NA,
  show.legend = NA,
  inherit.aes = TRUE
)
```

```r
stat_pointless(
  mapping = NULL,
  data = NULL,
  geom = "point",
  position = "identity",
  ..., 
  location = "last",
  na.rm = FALSE,
  orientation = NA,
```
geom_pointless

show.legend = NA,
inherit.aes = TRUE
)

## Arguments

mapping Set of aesthetic mappings created by aes() or aes_. If specified and inherit.aes = TRUE (the default), it is combined with the default mapping at the top level of the plot. You must supply mapping if there is no plot mapping.

data The data to be displayed in this layer. There are three options:
If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot().
A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created.
A function will be called with a single argument, the plot data. The return value must be a data.frame, and will be used as the layer data. A function can be created from a formula (e.g. ~ head(.x, 10)).

position Position adjustment, either as a string, or the result of a call to a position adjustment function.

... Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

location A character vector specifying which observations to highlight, default is "last".

na.rm If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.

orientation The orientation of the layer. The default (NA) automatically determines the orientation from the aesthetic mapping. In the rare event that this fails it can be given explicitly by setting orientation to either "x" or "y". See the Orientation section for more detail.

show.legend logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

inherit.aes If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders().

geom, stat Overwrite the default connection between geom_pointless() and stat_pointless().

## Details

The location argument allows you to specify which observations should be highlighted. If location is "last", the default, a single point will be plotted at the last non-missing observation. The locations are determined in the order in which they appear in the data – like geom_path() does compared to geom_line(). See the vignette("ggpointless") for more details.
Overplotting

Points may be plotted on top of one another. If location is set to "all", then the order in which points are plotted from top to bottom is: "first" > "last" > "minimum" > "maximum". Otherwise, the order is determined as specified in the location argument, which also then applies to the order legend key labels, see examples.

Orientation

This geom treats each axis differently and, can thus have two orientations. Often the orientation is easy to deduce from a combination of the given mappings and the types of positional scales in use. Thus, ggplot2 will by default try to guess which orientation the layer should have. Under rare circumstances, the orientation is ambiguous and guessing may fail. In that case the orientation can be specified directly using the orientation parameter, which can be either "x" or "y". The value gives the axis that the geom should run along, "x" being the default orientation you would expect for the geom.

Aesthetics

gem_pointless() understands the following aesthetics (required aesthetics are in bold):

• x
• y
• alpha
• color
• fill
• group
• shape
• size
• stroke

Computed variables

location  locations, returned as factor

Examples

x <- seq(-pi, pi, length.out = 100)
y <- outer(x, 1:5, FUN = function(x, y) sin(x * y))

df1 <- data.frame(
  var1 = x,
  var2 = rowSums(y)
)

# not terribly useful on its own ...
p <- ggplot(df1, aes(x = var1, y = var2))
p + geom_pointless()
p + geom_pointless(location = "all")
# ... but in conjunction with `geom_line()`, hopefully
p <- p + geom_line()
p + geom_pointless()
p + geom_pointless(location = c("first", "last"))
p + geom_pointless(location = c("minimum", "maximum"))
p + geom_pointless(location = c("all"))

# The layer computes one additional variable, `location`, # that you can map e.g. to the color aesthetic
p + geom_pointless(
  aes(color = after_stat(location)),
  location = c("all"),
  size = 3
)

# Example with missing first and last observations
set.seed(42)
df1 <- data.frame(x = 1:10, y = c(NA, sample(1:8), NA))
ggplot(df1, aes(x, y)) +
  geom_line() +
  geom_pointless(location = c("first", "last"))

# Change the order in which points are drawn when they overlap
df1 <- data.frame(var1 = 1:2, var2 = 1:2)
cols <- c(
  "first" = "#f8766d",
  "last" = "#7cae00",
  "minimum" = "#00bfc4",
  "maximum" = "#c77cff"
)
p <- ggplot(df1, aes(x = var1, y = var2)) +
  geom_path() +
  coord_equal() +
  # makes comparison easier
  scale_color_manual(values = cols)

# same as location = 'all'
p + geom_pointless(aes(color = after_stat(location)),
  location = c("first", "last", "minimum", "maximum")
) +
  labs(subtitle = "same as location = 'all'")

# reversed custom order
p + geom_pointless(aes(color = after_stat(location)),
  location = c("maximum", "minimum", "last", "first")
) +
  labs(subtitle = "custom order")

# same as location = 'all' again
p + geom_pointless(aes(color = after_stat(location)),
  location = c("maximum", "minimum", "last", "first", "all"))
geom_pointless

```r
) +
  labs(subtitle = "same as location = 'all' again")

# Use stat_pointless() with a geom other than "point"
set.seed(42)
df1 <- data.frame(x = 1:10, y = sample(1:10))
ggplot(df1, aes(x, y)) +
  geom_line() +
  stat_pointless(
    aes(yintercept = y, color = after_stat(location)),
    location = c("maximum", "minimum"),
    geom = "hline"
  )

# Example using facets
# https://stackoverflow.com/q/29375169
p <- ggplot(economics_long, aes(x = date, y = value)) +
  geom_line() +
  facet_wrap(~variable, ncol = 1, scales = "free_y")

p +
  geom_pointless(
    aes(color = after_stat(location)),
    location = c("minimum", "maximum"),
    size = 2
  )
```
