Package ‘ggpol’

March 28, 2020

Title Visualizing Social Science Data with ‘ggplot2’
Version 0.0.6
Description A ‘ggplot2’ extension for implementing parliament charts and several other useful visualizations.
URL https://github.com/erocoar/ggpol
License MIT + file LICENSE
Encoding UTF-8
LazyData true
Depends ggplot2 (>= 3.3.0), R (>= 3.4.0)
Imports grid, gtable, grDevices, plyr, rlang, dplyr, tibble, glue
RoxygenNote 7.1.0
Suggests knitr, rmarkdown
 ‘stat-confmat.R’ ‘stat-parliament.R’
NeedsCompilation no

FacetShare  

**Description**

ggplot extensions

---

**facet_share**  

* A shared axis for two panels

**Description**

'facet_share' uses [facet_wrap()] to build two panels with a shared axis.

**Usage**

```r
facet_share(
  facets,
  scales = "fixed",
  reverse_num = FALSE,
  shrink = TRUE,
  labeller = "label_value",
  as.table = TRUE,
  switch = NULL,
  drop = TRUE,
  dir = "h",
  strip.position = "top"
)
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>facets</td>
<td>A set of variables or expressions quoted by <code>vars()</code> and defining faceting groups on the rows or columns dimension. The variables can be named (the names are passed to <code>labeller</code>). For compatibility with the classic interface, can also be a formula or character vector. Use either a one sided formula,:<code>~a+b</code>, or a character vector,<code>c(&quot;a&quot;,&quot;b&quot;)</code>.</td>
</tr>
<tr>
<td>scales</td>
<td>Should scales be fixed(&quot;fixed&quot;, the default), free(&quot;free&quot;), or free in one dimension(&quot;free_x&quot;,&quot;free_y&quot;)?</td>
</tr>
</tbody>
</table>
GeomConfmat

Reverse_num
Used when passing on flipped data (times -1) for the second (right/bottom) panel. If 'TRUE', this will multiply the axis labels for that panel by -1.

Shrink
If 'TRUE', will shrink scales to fit output of statistics, not raw data. If 'FALSE', will be range of raw data before statistical summary.

Labeller
A function that takes one data frame of labels and returns a list or data frame of character vectors. Each input column corresponds to one factor. Thus there will be more than one with vars(cyl,am). Each output column gets displayed as one separate line in the strip label. This function should inherit from the "labeller" S3 class for compatibility with labeller(). You can use different labeling functions for different kind of labels, for example use label_parsed() for formatting facet labels. label_value() is used by default, check it for more details and pointers to other options.

As.table
If 'TRUE', the default, the facets are laid out like a table with highest values at the bottom-right. If 'FALSE', the facets are laid out like a plot with the highest value at the top-right.

Switch
By default, the labels are displayed on the top and right of the plot. If "x", the top labels will be displayed to the bottom. If "y", the right-hand side labels will be displayed to the left. Can also be set to "both".

Drop
If 'TRUE', the default, all factor levels not used in the data will automatically be dropped. If 'FALSE', all factor levels will be shown, regardless of whether or not they appear in the data.

Dir
Direction: either "h" for horizontal, the default, or "v", for vertical.

Strip.position
By default, the labels are displayed on the top of the plot. Using strip.position it is possible to place the labels on either of the four sides by setting strip.position = c("top","bottom","left","right")

GeomConfmat

Confusion Matrix

Description
Plot a confusion matrix.

Usage
geom_confmat(
  mapping = NULL,
  data = NULL,
  stat = "confmat",
  position = "identity",
  width = NULL,
  height = NULL,
  annotate = TRUE,
  text.perc = FALSE,
  text.digits = 3,
)
text.alpha = NULL,
text.angle = NULL,
text.colour = NULL,
text.family = NULL,
text.fontface = NULL,
text.group = NULL,
text.hjust = NULL,
text.lineheight = NULL,
text.size = NULL,
text.vjust = NULL,
...
na.rm = FALSE,
show.legend = NA,
inherit.aes = TRUE
)

stat_conmat(
  mapping = NULL,
  data = NULL,
  geom = "tile",
  position = "identity",
  show.legend = NA,
  inherit.aes = TRUE,
  na.rm = FALSE,
  normalize = FALSE,
  ...
)

Arguments

mapping   Set of aesthetic mappings created by `aes()` or `aes_()`. If specified and `inherit.aes = TRUE` (the default), it is combined with the default mapping at the top level of the plot. You must supply `mapping` if there is no plot mapping.
data   The data to be displayed in this layer. There are three options:

  - If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
  - A data frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.
  - A function will be called with a single argument, the plot data. The return value must be a data frame, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x,10)`).

stat   The statistical transformation to use on the data for this layer, as a string.
position   Position adjustment, either as a string, or the result of a call to a position adjustment function.
width   The tile height.
height   The tile width.
annotate  Boolean indicator for whether to include values as text in each tile.
text.perc  Boolean indicator for whether to add ‘%’ to the end of each value.
text.digits  Numeric vector equal to length one, indicating the number of digits to display. ‘round(x, text.digits)’.
text.alpha  Alpha value for the text grobs.
text.angle  Angle value for the text grobs.
text.colour  Colour of the text grobs.
text.family  Font family of the text grobs.
text.fontface  Font face of the text grobs.
text.group  Groups of the text grobs.
text.hjust  Hjust of the text grobs.
text.lineheight  Lineheight of the text grobs.
text.size  Size of the text grobs.
text.vjust  Vjust of the text grobs.
  ...  Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.
na.rm  If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.
show.legend  logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
inherit.aes  If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders().
geom  The geometric object to use display the data
normalize  Boolean indicator for whether to scale the frequency values.

Examples

```r
x <- sample(LETTERS[seq(4)], 50, replace = TRUE)
y <- sample(LETTERS[seq(4)], 50, replace = TRUE)

ggplot() +
  geom_confmat(aes(x = x, y = y), normalize = TRUE, text.perc = TRUE)
```
Description

An arc bar diagram that allows for spacing between the individual arc components and spans 180 degrees.

Usage

```r
gem.arcbar(
  mapping = NULL,
  data = NULL,
  stat = "arcbar",
  position = "identity",
  n = 360,
  sep = 0.05,
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE,
  ...
)
```

```r
stat.arcbar(
  mapping = NULL,
  data = NULL,
  geom = "arcbar",
  position = "identity",
  n = 360,
  sep = 0.05,
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE,
  ...
)
```

Arguments

- **mapping**: Set of aesthetic mappings created by `aes()` or `aes()`. If specified and `inherit.aes = TRUE` (the default), it is combined with the default mapping at the top level of the plot. You must supply `mapping` if there is no plot mapping.

- **data**: The data to be displayed in this layer. There are three options:
  - If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
  - A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.
A function will be called with a single argument, the plot data. The return value must be a data.frame, and will be used as the layer data. A function can be created from a formula (e.g. \(\text{head}(x, 10)\)).

**stat**

The statistical transformation to use on the data for this layer, as a string.

**position**

Position adjustment, either as a string, or the result of a call to a position adjustment function.

**n**

The number of

**sep**

Separation between the different shares, as a total proportion of pi.

**na.rm**

If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.

**show.legend**

logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

**inherit.aes**

If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders().

**...**

Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

**geom**

The geometric object to use display the data

---

**Aesthetics**

geom_arcbar understands the following aesthetics (required aesthetics are in bold):

- **shares** - **r0** - inner radius - **r1** - outer radius - color - fill - linetype - alpha

**Examples**

```r

ggplot(bt) + geom_arcbar(aes(shares = seats, r0 = 5, r1 = 10, fill = parties)) + scale_fill_manual(values = bt$colors) + coord_fixed() + theme_void()
```
Repelling text for GeomBar.

Usage

```r
geom_bartext(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  parse = FALSE,
  nudge_x = 0,
  nudge_y = 0,
  spacing = 0.003,
  dir = "v",
  check_overlap = FALSE,
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE,
  ...)
```

Arguments

- **mapping**: Set of aesthetic mappings created by `aes()` or `aes_()`. If specified and `inherit.aes = TRUE` (the default), it is combined with the default mapping at the top level of the plot. You must supply `mapping` if there is no plot mapping.

- **data**: The data to be displayed in this layer. There are three options: If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`. A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a `data.frame`, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x, 10)`).

- **stat**: The statistical transformation to use on the data for this layer, as a string.

- **position**: Position adjustment, either as a string, or the result of a call to a position adjustment function.

- **parse**: If `TRUE`, the labels will be parsed into expressions and displayed as described in `?plotmath`.
**geom_boxjitter**

A hybrid boxplot.

**Description**

Half boxplot, half scatterplot with customizable jitter.

**Usage**

```r
geom_boxjitter(
  mapping = NULL,
  data = NULL,
  stat = "BoxJitter",
)```

geom_boxjitter

```r
position = "dodge",
...
outlier.colour = NULL,
outlier.color = NULL,
outlier.fill = NULL,
outlier.shape = 19,
outlier.size = 1.5,
outlier.stroke = 0.5,
outlier.alpha = NULL,
outlier.intersect = FALSE,
jitter.colour = NULL,
jitter.color = NULL,
jitter.fill = NULL,
jitter.shape = 19,
jitter.size = 1.5,
jitter.stroke = 0.5,
jitter.alpha = NULL,
jitter.position = ggplot2::PositionJitter,
jitter.params = list(width = NULL, height = NULL),
boxplot.expand = FALSE,
notch = FALSE,
notchwidth = 0.5,
varwidth = FALSE,
errorbar.draw = FALSE,
errorbar.length = 0.5,
na.rm = FALSE,
show.legend = NA,
inherit.aes = TRUE
```

**Arguments**

- **mapping**
  Set of aesthetic mappings created by `aes()` or `aes()`. If specified and `inherit.aes = TRUE` (the default), it is combined with the default mapping at the top level of the plot. You must supply `mapping` if there is no plot mapping.

- **data**
  The data to be displayed in this layer. There are three options:
  - If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
  - A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.
  - A function will be called with a single argument, the plot data. The return value must be a `data.frame`, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x,10)`).

- **stat**
  Use to override the default connection between `geom_boxplot` and `stat_boxplot`.

- **position**
  Position adjustment, either as a string, or the result of a call to a position adjustment function.
Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.

`outlier.colour` Default aesthetics for outliers. Set to `NULL` to inherit from the aesthetics used for the box.

In the unlikely event you specify both US and UK spellings of colour, the US spelling will take precedence.

Sometimes it can be useful to hide the outliers, for example when overlaying the raw data points on top of the boxplot. Hiding the outliers can be achieved by setting `outlier.shape = NA`. Importantly, this does not remove the outliers, it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.

`outlier.color` Default aesthetics for outliers. Set to `NULL` to inherit from the aesthetics used for the box.

In the unlikely event you specify both US and UK spellings of colour, the US spelling will take precedence.

Sometimes it can be useful to hide the outliers, for example when overlaying the raw data points on top of the boxplot. Hiding the outliers can be achieved by setting `outlier.shape = NA`. Importantly, this does not remove the outliers, it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.

`outlier.fill` Default aesthetics for outliers. Set to `NULL` to inherit from the aesthetics used for the box.

In the unlikely event you specify both US and UK spellings of colour, the US spelling will take precedence.

Sometimes it can be useful to hide the outliers, for example when overlaying the raw data points on top of the boxplot. Hiding the outliers can be achieved by setting `outlier.shape = NA`. Importantly, this does not remove the outliers, it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.

`outlier.shape` Default aesthetics for outliers. Set to `NULL` to inherit from the aesthetics used for the box.

In the unlikely event you specify both US and UK spellings of colour, the US spelling will take precedence.

Sometimes it can be useful to hide the outliers, for example when overlaying the raw data points on top of the boxplot. Hiding the outliers can be achieved by setting `outlier.shape = NA`. Importantly, this does not remove the outliers, it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.

`outlier.size` Default aesthetics for outliers. Set to `NULL` to inherit from the aesthetics used for the box.

In the unlikely event you specify both US and UK spellings of colour, the US spelling will take precedence.

Sometimes it can be useful to hide the outliers, for example when overlaying the raw data points on top of the boxplot. Hiding the outliers can be achieved by setting `outlier.shape = NA`. Importantly, this does not remove the outliers,
it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.

**outlier.stroke**  
Default aesthetics for outliers. Set to **NULL** to inherit from the aesthetics used for the box.  

In the unlikely event you specify both US and UK spellings of colour, the US spelling will take precedence.  

Sometimes it can be useful to hide the outliers, for example when overlaying the raw data points on top of the boxplot. Hiding the outliers can be achieved by setting `outlier.shape = NA`. Importantly, this does not remove the outliers, it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.

**outlier.alpha**  
Default aesthetics for outliers. Set to **NULL** to inherit from the aesthetics used for the box.  

In the unlikely event you specify both US and UK spellings of colour, the US spelling will take precedence.  

Sometimes it can be useful to hide the outliers, for example when overlaying the raw data points on top of the boxplot. Hiding the outliers can be achieved by setting `outlier.shape = NA`. Importantly, this does not remove the outliers, it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.

**outlier.intersect**  
Defaults to ‘FALSE’. If set to ‘TRUE’, outliers will be part of the jitter-plot (but keeping the given outlier graphical parameters) rather than plotted vertically above / below the whisker lines.

**jitter.colour, jitter.color, jitter.fill, jitter.shape, jitter.size, jitter.stroke, jitter.alpha**  
Default aesthetics for jitter, set to ‘NULL’ to inherit from the aesthetics used for the box.

**jitter.position**  
Position object used for calculating jitter (defaults to ‘ggplot2::PositionJitter’).

**jitter.params**  
Parameters passed to ‘jitter.position’ (for ‘ggplot2::PositionJitter’, this is ‘width’, ‘height’ and ‘seed’).

**boxplot.expand**  
Defaults to ‘FALSE’. If set to ‘TRUE’, the full boxplots will be plotted.

**notch**  
If FALSE (default) make a standard box plot. If TRUE, make a notched box plot. Notches are used to compare groups; if the notches of two boxes do not overlap, this suggests that the medians are significantly different.

**notchwidth**  
For a notched box plot, width of the notch relative to the body (defaults to `notchwidth = 0.5`).

**varwidth**  
If FALSE (default) make a standard box plot. If TRUE, boxes are drawn with widths proportional to the square-roots of the number of observations in the groups (possibly weighted, using the weight aesthetic).

**errorbar.draw**  
Draw horizontal whiskers at the top and bottom (the IQR). Defaults to ‘FALSE’.

**errorbar.length**  
Length of the horizontal whiskers (errorbar). Defaults to half the width of the half-boxplot, or half the width of the entire boxplot if `boxplot.expand` is set to ‘TRUE’.
geom_circle

na.rm If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.

show.legend logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

inherit.aes If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders().

Examples

set.seed(221)
df <- data.frame(score = rgamma(150, 4, 1),
                 gender = sample(c("M", "F"), 150, replace = TRUE),
                 genotype = factor(sample(1:3, 150, replace = TRUE)))

ggplot(df) + geom_boxjitter(aes(x = gender, y = score, fill = genotype),
                            jitter.shape = 21, jitter.color = NA,
                            outlier.color = NA, errorbar.draw = TRUE) +
          scale_fill_manual(values = c("#CF3721", "#31A9B8", "#258039")).

theme_minimal()

geom_circle Circles with pre-defined radii.

Description

Similar to ‘[geom_point()]’, but allows for full control of the size.

Usage

geom_circle(
            mapping = NULL,
            data = NULL,
            stat = "circle",
            position = "identity",
            n = 360,
            na.rm = FALSE,
            show.legend = NA,
            inherit.aes = TRUE,
            ...
          )

stat_circle(
            mapping = NULL,
            data = NULL,
            geom = "circle",
            ...)
position = "identity",
    n = 360,
    na.rm = FALSE,
    show.legend = NA,
    inherit.aes = TRUE,
    ...
  )

Arguments

mapping Set of aesthetic mappings created by aes() or aes_. If specified and inherit.aes = TRUE (the default), it is combined with the default mapping at the top level of the plot. You must supply mapping if there is no plot mapping.

data The data to be displayed in this layer. There are three options:
If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot().
A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created.
A function will be called with a single argument, the plot data. The return value must be a data.frame, and will be used as the layer data. A function can be created from a formula (e.g. ~ head(.x,10)).

stat The statistical transformation to use on the data for this layer, as a string.

position Position adjustment, either as a string, or the result of a call to a position adjustment function.

n The number of points calculated for the circle polygon, defaults to 360.

na.rm If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.

show.legend logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

inherit.aes If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders().

... Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

geom The geometric object to use display the data

Aesthetics

geom_circle understands the following aesthetics (required aesthetics are in bold):
- **x** - x-coordinate of center - **y** - y-coordinate of center - **r** - radius - color - fill - linetype - alpha
Examples

```r
set.seed(22189)
df <- data.frame(x = sample(1:10, 3), y = sample(1:10, 3),
r = sample(3:4, 3, replace = TRUE))

ggplot(df) + geom_circle(aes(x = x, y = y, r = r, fill = gl(3, 1))) +
    coord_fixed()
```

Description

Draws a parliament diagram based on parties’ member counts, where each point in the arc represents a single member of parliament. Parties are plotted right-to-left.

Usage

```r
geom_parliament(
    mapping = NULL,
    data = NULL,
    stat = "parliament",
    position = "identity",
    r0 = 1.5,
    r1 = 3,
    n = 360,
    na.rm = FALSE,
    show.legend = NA,
    inherit.aes = TRUE,
    ...
)
```

```r
stat_parliament(
    mapping = NULL,
    data = NULL,
    geom = "parliament",
    position = "identity",
    r0 = 1.5,
    r1 = 3,
    n = 360,
    na.rm = FALSE,
    show.legend = NA,
    inherit.aes = TRUE,
    ...
)
```
Arguments

mapping Set of aesthetic mappings created by `aes()` or `aes_()`. If specified and `inherit.aes = TRUE` (the default), it is combined with the default mapping at the top level of the plot. You must supply `mapping` if there is no plot mapping.

data The data to be displayed in this layer. There are three options:

If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.

A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.

A function will be called with a single argument, the plot data. The return value must be a `data.frame`, and will be used as the layer data. A function can be created from a `formula` (e.g. `~ head(.x,10)`).

stat The statistical transformation to use on the data for this layer, as a string.

position Position adjustment, either as a string, or the result of a call to a position adjustment function.

r0 Inner radius, defaults to 1.5.

r1 Outer radius, defaults to 3.

n Number of passed to ‘StatCircle’, defaults to 360.

na.rm If `FALSE`, the default, missing values are removed with a warning. If `TRUE`, missing values are silently removed.

show.legend logical. Should this layer be included in the legends? `NA`, the default, includes if any aesthetics are mapped. `FALSE` never includes, and `TRUE` always includes. It can also be a named logical vector to finely select the aesthetics to display.

inherit.aes If `FALSE`, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. `borders()`.

... Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = “red”` or `size = 3`. They may also be parameters to the paired geom/stat.

geom The geometric object to use display the data

Aesthetics

`geom_parliament` understands the following aesthetics (required aesthetics are in bold): **seats**
- number of seats of the parties - fill - color - linetype - alpha

Computed variables

x,y coordinates of individual MPs
Examples

```r
bt <- data.frame(
  parties = factor(c("CDU", "CSU", "AfD", "FDP", "SPD", 
    "Linke", "Gruene", "Fraktionslos"), 
    levels = c("CDU", "CSU", "AfD", "FDP", "SPD", 
    "Linke", "Gruene", "Fraktionslos")), 
  seats = c(200, 46, 92, 80, 153, 69, 67, 2), 
  colors = c("black", "blue", "lightblue", "yellow", 
    "red", "purple", "green", "grey"), 
  stringsAsFactors = FALSE)

ggplot(bt) + 
  geom_parliament(aes(seats = seats, fill = parties), color = "black") + 
  scale_fill_manual(values = bt$colors, labels = bt$parties) + 
  coord_fixed() + 
  theme_void()
```

Description

This is a version of `ggplot2::geom_rect()` that defaults to spanning the entirety of the y-axis.

Usage

```r
geom_tshighlight(
  mapping = NULL, 
  data = NULL, 
  stat = "identity", 
  position = "identity", 
  ..., 
  na.rm = FALSE, 
  show.legend = NA, 
  inherit.aes = TRUE
)
```

Arguments

- **mapping**
  Set of aesthetic mappings created by `aes()` or `aes()`. If specified and `inherit.aes` = `TRUE` (the default), it is combined with the default mapping at the top level of the plot. You must supply `mapping` if there is no plot mapping.

- **data**
  The data to be displayed in this layer. There are three options:
  - If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
  - A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.
A function will be called with a single argument, the plot data. The return value must be a data.frame, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x,10)`).

**stat**

The statistical transformation to use on the data for this layer, as a string.

**position**

Position adjustment, either as a string, or the result of a call to a position adjustment function.

... Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.

**na.rm**

If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.

**show.legend**

logical. Should this layer be included in the legends? `NA`, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

**inherit.aes**

If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. `borders()`.

**Aesthetics**

`geom_tshighlight` understands the following aesthetics (required aesthetics are in bold):

- **xmin**
- **xmax**
- fill
- color

**Examples**

```r
ggplot(economics, aes(x = date, y = unemploy)) + geom_line() + geom_tshighlight(aes(xmin = as.Date("01/01/1990", format = "%d/%m/%Y"), xmax = as.Date("01/01/2000", format = "%d/%m/%Y")), alpha = 0.01)
```
