Package ‘ggpp’

April 10, 2022

Type    Package
Title   Grammar Extensions to 'ggplot2'
Version 0.4.4
Date    2022-04-10
Maintainer Pedro J. Aphalo <pedro.aphalo@helsinki.fi>
Description Extensions to 'ggplot2' respecting the grammar of graphics paradigm. Geometries: geom_table(), geom_plot() and geom_grob() add insets to plots using native data coordinates, while geom_table_npc(), geom_plot_npc() and geom_grob_npc() do the same using "npc" coordinates through new aesthetics "npcx" and "npcy". Statistics: select observations based on 2D density. Positions: radial nudging away from a center point and nudging away from a line or curve; combined stacking and nudging; combined dodging and nudging.

ggpp-package

Description

Extensions to 'ggplot2' respecting the grammar of graphics paradigm. Geometries: geom_table(), geom_plot() and geom_grob() add insets to plots using native data coordinates, while geom_table_npc(), geom_plot_npc() and geom_grob_npc() do the same using "npc" coordinates through new aesthetics "npcx" and "npcy". Statistics: select observations based on 2D density. Positions: radial nudging away from a center point and nudging away from a line or curve; combined stacking and nudging; combined dodging and nudging.

Details

Package 'ggpp' provides functions that extend the grammar of graphics as implemented in 'ggplot2'. It attempts to stay true to the original grammar and to respect the naming conventions used in 'ggplot2'.

Extensions provided:

- Geoms adding support for plot, table and grob insets within the grammar. Geoms using a parallel pseudo-scale based on native plot coordinates (npc) to allow annotations consistent with the grammar and so supporting facets and grouping. Geoms for annotations on the edges of the plotting area. Geom for easily drawing lines separating the quadrants of a plot.
- Stats for filtering-out/filtering-in observations in regions of a panel or group where the density of observations is high. Statistics simultaneously computing summaries, optionally using different functions, along x and y. Stat computing quadrant counts.
- Position functions implementing multi-directional nudging based on the data.
- Scales. Pseudo-scales supporting npc coordinates for x and y.
- Specializations of the ggplot() generic accepting time series objects of classes ts and xts as data argument.

Acknowledgements

We thank Kamil Slowikowski not only for contributing ideas and code examples to this package but also for adding new features to his package 'ggrepel' that allow new use cases for stat_dens2d_labels(), position_nudge_center(), position_nudge_line() and position_nudge_to() from this package. This package includes code copied and/or modified from that in package 'ggplot2'.

---

**annotate**

*Annotations supporting NPC*

Description

A revised version of `annotate()` from package ‘ggplot2’ adding support for `npcx` and `npcy` position aesthetics, allowing use of the geometries defined in the current package such as `geom_text_npc()`. It also has a parameter `label` that directly accepts data frames, `ggplots` and `grobs` as arguments in addition to objects of atomic classes like character. When package ‘ggpmisc’ is loaded this definition of `annotate()` overrides that in package ‘ggplot2’.

Usage

```r
annotate(
  geom,
  x = NULL,
  y = NULL,
  xmin = NULL,
  xmax = NULL,
  ymin = NULL,
  ymax = NULL,
  xend = NULL,
  yend = NULL,
 npcx = NULL,
 npcy = NULL,
  label = NULL,
  ...,
  na.rm = FALSE
)
```
Arguments

- **geom** character Name of geom to use for annotation.
- **x, y, xmin, ymin, xmax, ymax, xend, yend, npcx, npcy** numeric Positioning aesthetics - you must specify at least one of these.
- **label** character, data.frame, ggplot or grob.
- **...** Other named arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `color = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.
- **na.rm** logical If `FALSE`, the default, missing values are removed with a warning. If `TRUE`, missing values are silently removed.

Details

Note that all position aesthetics are scaled (i.e., they will expand the limits of the plot so they are visible), but all other aesthetics are set. This means that layers created with this function will never affect the legend.

Value

A plot layer instance.

Note

To use the original definition of `annotate()` after loading package `ggpmisc`, use `ggplot2::annotate()`.

Examples

```r
p <- ggplot(mtcars, aes(x = wt, y = mpg)) + geom_point()
# Works as ggplot2::annotate()
p + annotate("text", x = 5, y = 32, label = "Some text")
p + annotate("label", x = c(2, 5), y = c(15, 32),
              label = c("A", "B"))
p + annotate("table", x = 5, y = 30,
              label = data.frame(A = 1:2, B = letters[1:2]))
p + annotate("plot", x = 5.5, y = 34,
              label = p + theme_bw(9))
p + annotate("rect", xmin = 3, xmax = 4.2, ymin = 12, ymax = 21, alpha = .2)
p + annotate("segment", x = 2.5, xend = 4, y = 15, yend = 25, colour = "blue")
p + annotate("pointrange", x = 3.5, y = 20, ymin = 12, ymax = 28,
              colour = "red", size = 1.5)
# But ggpmisc::annotate() also works with npcx and npcy pseudo-aesthetics
p + annotate("label_npc", npcx = c(0.1, 0.9), npcy = c(0.1, 0.9),
              label = c("A", "B"))
p + annotate("label_npc", npcx = 0.9, npcy = c(0.1, 0.9),
              label = c("A", "B"))
p + annotate("text_npc", npcx = 0.9, npcy = 0.9, label = "Some text")
```
p + annotate("text_npc", npcx = "right", npcy = "top", label = "Some text")

p + annotate("table_npc", npcx = 0.9, npcy = 0.9,
             label = data.frame(A = 1:2, B = letters[1:2]))

p + annotate("plot_npc", npcx = 1, npcy = 1,
             label = p + theme_bw(9))

p + annotate("plot_npc", npcx = c(0, 1), npcy = c(0, 1),
             label = list(p + theme_bw(9), p + theme_grey(9)),
             vp.width = 0.3, vp.height = 0.4)

desc

**geom_grob**

*Inset graphical objects*

**Description**

*geom_grob* and *geom_grob_npc* add Grobs as insets to the ggplot using syntax similar to that of *geom_text* and *geom_text_s*. In most respects they behave as any other ggplot geometry: they add a layer containing one or more grobs and faceting works as usual.

**Usage**

```r
geom_grob(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...
)
```

```r
geom_grob_npc(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...
)
```
geom_grob

Arguments

mapping The aesthetic mapping, usually constructed with \texttt{aes} or \texttt{aes_}. Only needs to be set at the layer level if you are overriding the plot defaults.
data A layer specific dataset - only needed if you want to override the plot defaults.
stat The statistical transformation to use on the data for this layer, as a string.
position Position adjustment, either as a string, or the result of a call to a position adjustment function.
... other arguments passed on to \texttt{layer}. This can include aesthetics whose values you want to set, not map. See \texttt{layer} for more details.
nudge_x, nudge_y Horizontal and vertical adjustments to nudge the starting position of each text label. The units for nudge_x and nudge_y are the same as for the data units on the x-axis and y-axis.
add.segments logical. Display connecting segments or arrows between original positions and displaced ones if both are available.
arrow specification for arrow heads, as created by \texttt{arrow}
na.rm If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
show.legend logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
inherit.aes If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. \texttt{borders}.

details

You can modify the alignment of inset grobs with the \texttt{vjust} and \texttt{hjust} aesthetics. These can either be a number between 0 (right/bottom) and 1 (top/left) or a character ("left", "middle", "right", "bottom", "center", "top").

You can modify the size of inset grobs with the \texttt{vp.width} and \texttt{vp.height} aesthetics. These can take a number between 0 (smallest possible inset) and 1 (whole plotting area width or height). The default value for for both of these aesthetics is 1/5. Thus, in contrast to \texttt{geom_text} and \texttt{geom_text_s} the size of the insets remains the same relative to the size of the plotting area irrespective of how the plot is rendered. The aspect ratio of insets is preserved and size is adjusted until the whole inset fits within the viewport.

You can modify inset grob alignment with the \texttt{vjust} and \texttt{hjust} aesthetics. These can either be a number between 0 (right/bottom) and 1 (top/left) or a character ("left", "middle", "right", "bottom", "center", "top"). There several two special alignments: "inward" and "outward". Inward always aligns text towards the center of the plotting area, and outward aligns it away from the center of the plotting area. It tagged with '_mean' or '_median' the mean or median of the data in the panel along the corresponding axis is used as center.

By default this geom uses \texttt{position_nudge_center} which is backwards compatible with \texttt{position_nudge} but provides additional control on the direction of the nudging. In contrast to \texttt{position_nudge}, \texttt{position_nudge_center} and all other position functions defined in packages ‘ggpp’ and ‘ggrepel’ keep the original coordinates thus allowing the plotting of connecting segments and arrows.
This geom works only with tibbles as data, as its expects a list of graphics objects ("grob") to be mapped to the label aesthetic.

The x and y aesthetics determine the position of the whole inset grob, similarly to that of a text label, justification is interpreted as indicating the position of the grob with respect to its $x$ and $y$ coordinates in the data, and angle is used to rotate the grob as a whole.

In the case of geom_grob_npc(), npcx and npcy aesthetics determine the position of the inset grob. As for text labels, justification is interpreted as indicating the position of the grob with respect to the x and y coordinates in "npc" units, and angle is used to rotate the plot as a whole.

annotate cannot be used with geom = "grob". Use annotate (automatic unless 'ggpp' is not attached) as redefined in 'ggpp' when adding inset grobs as annotations (automatic unless 'ggpp' is not attached).

Value

A plot layer instance.

References

The idea of implementing a geom_custom() for grobs has been discussed as an issue at https://github.com/tidyverse/ggplot2/issues/1399.

See Also

gem_plot, geom_table, annotate, position_nudge_keep, position_nudge_to, position_jitternudge, position_dodgenudge and position_stacknudge.

Other geometries adding layers with insets: geom_plot(), geom_table()

Examples

library(tibble)
df <- tibble(x = 2, y = 15, grob = list(grid::circleGrob(r = 0.2)))

# without nudging no segments are drawn
ggplot(data = mtcars, aes(wt, mpg)) +
  geom_point(aes(colour = factor(cyl))) +
  geom_grob(data = df, aes(x, y, label = grob))

# with nudging segments are drawn
ggplot(data = mtcars, aes(wt, mpg)) +
  geom_point(aes(colour = factor(cyl))) +
  geom_grob(data = df, aes(x, y, label = grob),
            nudge_x = 0.5,
            segment.colour = "red")

# with nudging plotting of segments can be disabled
ggplot(data = mtcars, aes(wt, mpg)) +
  geom_point(aes(colour = factor(cyl))) +
  geom_grob(data = df, aes(x, y, label = grob),
            add.segments = FALSE,
            nudge_x = 0.5)
Description

‘geom_text_npc()’ adds text directly to the plot. ‘geom_label_npc()’ draws a rectangle behind the text, making it easier to read. The difference is that x and y mappings are expected to be given in ‘npc’ graphic units. They are intended to be used for positioning text relative to the physical dimensions of a plot. This can be achieved with ‘annotate()’ except when faceting is used.

Usage

```r
geom_label_npc(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ..., 
  parse = FALSE,
  nudge_x = 0,
  nudge_y = 0,
  label.padding = grid::unit(0.25, "lines"),
  label.r = grid::unit(0.15, "lines"),
  label.size = 0.25,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = FALSE
)
```

```r
geom_text_npc(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ..., 
  parse = FALSE,
  nudge_x = 0,
  nudge_y = 0,
  check_overlap = FALSE,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = FALSE
)
```
Arguments

mapping
The aesthetic mapping, usually constructed with `aes` or `aes_`. Only needs to be set at the layer level if you are overriding the plot defaults.

data
A layer specific data set - only needed if you want to override the plot defaults.

stat
The statistical transformation to use on the data for this layer, as a string.

position
Position adjustment, either as a string, or the result of a call to a position adjustment function.

... other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

parse
If TRUE, the labels will be parsed into expressions and displayed as described in `?plotmath`.

nudge_x, nudge_y
Horizontal and vertical adjustment to nudge labels by. Useful for offsetting text from points, particularly on discrete scales.

label.padding
Amount of padding around label. Defaults to 0.25 lines.

label.r
Radius of rounded corners. Defaults to 0.15 lines.

label.size
Size of label border, in mm.

na.rm
If `FALSE` (the default), removes missing values with a warning. If `TRUE` silently removes missing values.

show.legend
logical. Should this layer be included in the legends? `NA`, the default, includes if any aesthetics are mapped. `FALSE` never includes, and `TRUE` always includes.

inherit.aes
If `FALSE`, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. `borders`.

check_overlap
If ‘TRUE’, text that overlaps previous text in the same layer will not be plotted.

Details

Note that the "width" and "height" of a text element are 0, so stacking and dodging text will not work by default, and axis limits are not automatically expanded to include all text. Obviously, labels do have height and width, but they are physical units, not data units. The amount of space they occupy on the plot is not constant in data units: when you resize a plot, labels stay the same size, but the size of the axes changes.

‘geom_text_npc()’ and ‘geom_label_npc()’ add labels for each row in the data, even if coordinates x, y are set to single values in the call to ‘geom_label_npc()’ or ‘geom_text_npc()’. To add labels at specified points use [annotate()] with ‘annotate(geom = "text_npc", ...)’ or ‘annotate(geom = "label_npc", ...)’.

Value

A plot layer instance.

‘geom_label_npc()’

Currently ‘geom_label_npc()’ does not support the ‘angle’ aesthetic and is considerably slower than ‘geom_text_npc()’. The ‘fill’ aesthetic controls the background colour of the label.
Alignment

You can modify text alignment with the ‘vjust’ and ‘hjust’ aesthetics. These can either be a number between 0 (right/bottom) and 1 (top/left) or a character ("left", "middle", "right", "bottom", "center", "top"). There are two special alignments: "inward" and "outward". Inward always aligns text towards the center, and outward aligns it away from the center. When using textual positions a shift is added based on grouping, however unused levels are not dropped. In plots with faceting so that not all groups appear in each panel, gaps will appear in between labels. To solve this pass numeric values for the npc coordinates of each label instead of character strings.

Note

This geom is identical to 'ggplot2' geom_text() except that it interprets x and y positions in npc units. It translates x and y coordinates from npc units to native data units and calls functions from 'ggplot2'’s GeomText().

geom_text

Examples

df <- data.frame(
  x = c(0, 0, 1, 1, 0.5),
  x.chr = c("left", "left", "right", "right", "center"),
  y = c(0, 1, 0, 1, 0.5),
  y.chr = c("bottom", "top", "bottom", "top", "middle"),
  text = c("bottom-left", "top-left", "bottom-right", "top-right", "center-middle")
)

ggplot(df) +
  geom_text_npc(aes(npcx = x, npcy = y, label = text))

ggplot(df) +
  geom_text_npc(aes(npcx = x.chr, npcy = y.chr, label = text))

ggplot(data = mtcars, mapping = aes(wt, mpg)) +
  geom_point() +
  geom_text_npc(data = df, aes(npcx = x, npcy = y, label = text))

ggplot(data = mtcars, mapping = aes(wt, mpg)) +
  geom_point() +
  geom_text_npc(data = df, aes(npcx = x, npcy = y, label = text)) +
  expand_limits(y = 40, x = 6)

ggplot(data = mtcars) +
  geom_point(mapping = aes(wt, mpg)) +
  geom_label_npc(data = df, aes(npcx = x, npcy = y, label = text))
Description

Text geoms are most useful for labelling plots. `geom_text_s()` adds text to the plot and for nudged positions links the original location to the nudged text with a segment.

Usage

```r
gem_label_s(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ..., 
  parse = FALSE,
  nudge_x = 0,
  nudge_y = 0,
  label.padding = grid::unit(0.25, "lines"),
  label.r = grid::unit(0.15, "lines"),
  label.size = 0.25,
  add.segments = TRUE,
  arrow = NULL,
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE
)
```

```r
gem_text_s(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ..., 
  parse = FALSE,
  nudge_x = 0,
  nudge_y = 0,
  add.segments = TRUE,
  arrow = NULL,
  check_overlap = FALSE,
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE
)
```
geom_label_s

Arguments

mapping
Set of aesthetic mappings created by [ggplot2::aes]. If specified and inherit.aes = TRUE (the default), is combined with the default mapping at the top level of the plot. You only need to supply mapping if there isn’t a mapping defined for the plot.

data
A data frame. If specified, overrides the default data frame defined at the top level of the plot.

stat
The statistical transformation to use on the data for this layer, as a string.

position
Position adjustment, either as a string, or the result of a call to a position adjustment function.

... other arguments passed on to layer. There are three types of arguments you can use here:

• Aesthetics: to set an aesthetic to a fixed value, like colour = "red" or size = 3.
• Other arguments to the layer, for example you override the default stat associated with the layer.
• Other arguments passed on to the stat.

parse
If TRUE, the labels will be parsed into expressions and displayed as described in ?plotmath.

nudge_x, nudge_y
Horizontal and vertical adjustments to nudge the starting position of each text label. The units for nudge_x and nudge_y are the same as for the data units on the x-axis and y-axis.

label.padding
Amount of padding around label. Defaults to 0.25 lines.

label.r
Radius of rounded corners. Defaults to 0.15 lines.

label.size
Size of label border, in mm.

add.segments
logical Display connecting segments or arrows between original positions and displaced ones if both are available.

arrow
specification for arrow heads, as created by arrow

na.rm
If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.

show.legend
logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.

inherit.aes
If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders.

check_overlap
If TRUE, text that overlaps previous text in the same layer will not be plotted. check_overlap takes place at draw time and in the order of the data, thus its action depends of the size at which the plot is drawn.
Details

Note that when you change the scale limits for x and/or y of a plot, text labels stay the same size, as determined by the size aesthetic. The actual size as seen in the plotted output is decided during the rendering of the plot to a graphics device. Limits are expanded only to include the anchor point of the labels because the "width" and "height" of a text element are 0 (as seen by ggplot2). For the same reason, stacking and dodging text will not work as they take place within 'ggplot2' before the rendered size of text is known. Text labels do have height and width, but in grid units, not data units.

By default this geom uses position_nudge_center which is backwards compatible with position_nudge but provides additional control on the direction of the nudging. In contrast to position_nudge, position_nudge_center and all other position functions defined in packages 'ggpp' and 'ggrepel' keep the original coordinates thus allowing the plotting of connecting segments and arrows.

Value

A plot layer instance.

Under development

This is preliminary version of the geom. I plan to add features like padding around text and points. I aim to make use of the new features of 'grid' in R >= 4.1.0 to keep the implementation as fast and simple as possible. Currently this geom does all drawing using at most two vectorized calls to 'grid' functions. As a temporary replacement of padding around text one can use 'slightly out-of-range' numeric values for justification as shown in the examples. Aesthetics 'segment.colour' and 'segment.alpha' are implemented, but 'segment.linetype' not yet.

Alignment

You can modify text alignment with the 'vjust' and 'hjust' aesthetics. These can either be a number between 0 (right/bottom) and 1 (top/left) or a character ("left", "middle", "right", "bottom", "center", "top"). There several two special alignments: "inward" and "outward". Inward always aligns text towards the center of the plotting area, and outward aligns it away from the center of the plotting area. It tagged with "_mean" or "_median" the mean or median of the data in the panel along the corresponding axis is used as center.

Note

You can alternatively use geom_label_repel, possibly setting 'max.iter = 0' to disable repulsion when needed.

Examples

```r
my.cars <- mtcars[c(TRUE, FALSE, FALSE, FALSE), ]
my.cars$name <- rownames(my.cars)

## geom_plot

**Inset plots**

**Description**

`geom_plot` and `geom_plot_npc` add ggplot objects as insets to the base ggplot, using syntax similar to that of `geom_label` and `geom_text_s`. In most respects they behave as any other ggplot geometry: a layer can contain multiple tables and faceting works as usual.

**Usage**

```r
geom_plot(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  nudge_x = 0,
  nudge_y = 0,
  add.segments = TRUE,
  arrow = NULL,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = FALSE
)

geom_plot_npc(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...
)```
Arguments

mapping The aesthetic mapping, usually constructed with `aes` or `aes_`. Only needs to be set at the layer level if you are overriding the plot defaults.
data A layer specific data set - only needed if you want to override the plot defaults.
stat The statistical transformation to use on the data for this layer, as a string.
position Position adjustment, either as a string, or the result of a call to a position adjustment function.
... other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.
nudge_x, nudge_y Horizontal and vertical adjustments to nudge the starting position of each text label. The units for nudge_x and nudge_y are the same as for the data units on the x-axis and y-axis.
add.segments logical Display connecting segments or arrows between original positions and displaced ones if both are available.
arrow specification for arrow heads, as created by `arrow`
na.rm If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
show.legend logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
inherit.aes If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. `borders`.

Details

You can modify the alignment of inset plots with the `vjust` and `hjust` aesthetics. These can either be a number between 0 (right/bottom) and 1 (top/left) or a character ("left", "middle", "right", "bottom", "center", "top").

You can modify the size of inset plots with the `vp.width` and `vp.height` aesthetics. These can take a number between 0 (smallest possible inset) and 1 (whole plotting area width or height). The default value for for both of these aesthetics is 1/5. Thus, in contrast to `geom_text` and `geom_text_s` the size of the insets remains the same relative to the size of the plotting area irrespective of how the plot is rendered. The aspect ratio of insets is preserved and size is adjusted until the whole inset fits within the viewport.

You can modify inset plot alignment with the ‘vjust’ and ‘hjust’ aesthetics. These can either be a number between 0 (right/bottom) and 1 (top/left) or a character ("left", "middle", "right", "bottom", "center", "top"). There several two special alignments: "inward" and "outward". Inward always aligns text towards the center of the plotting area, and outward aligns it away from
the center of the plotting area. It tagged with '_mean' or '_median' the mean or median of the data in the panel along the corresponding axis is used as center.

By default this geom uses `position_nudge_center` which is backwards compatible with `position_nudge` but provides additional control on the direction of the nudging. In contrast to `position_nudge`, `position_nudge_center` and all other position functions defined in packages 'ggpp' and 'ggrepel' keep the original coordinates thus allowing the plotting of connecting segments and arrows.

This geom works only with tibbles as data, as its expects a list of ggplot objects ("gg" class) to be mapped to the label aesthetic.

The x and y aesthetics determine the position of the whole inset plot, similarly to that of a text label, justification is interpreted as indicating the position of the plot with respect to its x and y coordinates in the data, and angle is used to rotate the plot as a whole.

In the case of `geom_plot_npc()`, npcx and npcy aesthetics determine the position of the inset plot. As for text labels, justification is interpreted as indicating the position of the inset plot with respect to its npcx and npcy coordinates, and angle is used to rotate the plot as a whole.

`annotate()` cannot be used with `geom = "plot"`. Use `annotate` (automatic unless 'ggpp' is not attached) as redefined in 'ggpp' when adding inset plots as annotations (automatic unless 'ggpp' is not attached).

The "width" and "height" of an inset as for a text element are 0, so stacking and dodging inset plots will not work by default, and axis limits are not automatically expanded to include all inset plots. Obviously, insets do have height and width, but they are physical units, not data units. The amount of space they occupy on the main plot is not constant in data units of the base plot: when you modify scale limits, inset plots stay the same size relative to the physical size of the base plot.

**Value**

A plot layer instance.

**Known problem!**

In some cases when explicit coordinates are added to the inner plot, it may be also necessary to add explicitly coordinates to the outer plots.

**Note**

These geoms work only with tibbles as data, as they expects a list of ggplots ("gg" objects) to be mapped to the label aesthetic. Aesthetics mappings in the inset plot are independent of those in the base plot.

In the case of `geom_plot NPC()`, x and y aesthetics determine the position of the whole inset plot, similarly to that of a text label, justification is interpreted as indicating the position of the plot with respect to the $x$ and $y$ coordinates in the data, and angle is used to rotate the plot as a whole.

In the case of `geom_plot_npc()`, npcx and npcy aesthetics determine the position of the whole inset plot, similarly to that of a text label, justification is interpreted as indicating the position of the plot with respect to the $x$ and $y$ coordinates in "npc" units, and angle is used to rotate the plot as a whole.

`annotate()` cannot be used with `geom = "plot"`. Use `annotation_custom` directly when adding inset plots as annotations.
References

The idea of implementing a `geom_custom()` for grobs has been discussed as an issue at https://github.com/tidyverse/ggplot2/issues/1399.

Other geometries adding layers with insets: `geom_grob()`, `geom_table()`

Examples

```r
# inset plot with enlarged detail from a region of the main plot
library(tibble)
p <-
ggplot(data = mtcars, mapping = aes(x = wt, y = mpg)) + geom_point()

df <- tibble(x = 0.01, y = 0.01,
plot = list(p +
  coord_cartesian(xlim = c(3, 4), ylim = c(13, 16)) +
  labs(x = NULL, y = NULL) +
  theme_bw(10)))
p + expand_limits(x = 0, y = 0) + geom_plot_npc(data = df, aes(x = x, y = y, label = plot))

p + expand_limits(x = 0, y = 0) + geom_plot_npc(data = df,
  aes(x = x, y = y, label = plot),
  vp.width = 1/2, vp.height = 1/4)

p + expand_limits(x = 0, y = 0) + geom_plot_npc(data = df,
  aes(x = x, y = y, label = plot),
  vp.width = 1/4, vp.height = 1/4)

p + geom_plot(data = df,
  aes(x = x + 3, y = y + 20, label = plot),
  nudge.x = -1, nudge.y = -7,
  hjust = 0.5, vjust = 0.5,
  arrow = arrow(length = unit(0.5, "lines"),
    segment.colour = "red"),
  vp.width = 1/5, vp.height = 1/5)
```
**Description**

The "point_s" geom provides a superset of the capabilities of geom "point" from package 'ggplot2' by allowing plotting of segments joining the original position of displaced observations to their current position rendered as points or graphic symbols. Displacements by position functions from packages 'ggpp' and 'ggrepel' are supported.

**Usage**

```r
geom_point_s(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ..., 
  nudge_x = 0,
  nudge_y = 0,
  arrow = NULL,
  add.segments = TRUE,
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE
)
```

**Arguments**

- **mapping**: Set of aesthetic mappings created by `aes`. If specified and `inherit.aes = TRUE` (the default), is combined with the default mapping at the top level of the plot. You only need to supply `mapping` if there isn’t a mapping defined for the plot.
- **data**: A data frame. If specified, overrides the default data frame defined at the top level of the plot.
- **stat**: The statistical transformation to use on the data for this layer, as a string.
- **position**: Position adjustment, either as a string, or the result of a call to a position adjustment function.
- **...**: other arguments passed on to `layer`. There are three types of arguments you can use here:
  - Aesthetics: to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`.
  - Other arguments to the layer, for example you override the default `stat` associated with the layer.
  - Other arguments passed on to the stat.
geom_point_s

nudge_x, nudge_y
Horizontal and vertical adjustments to nudge the starting position of each text label. The units for nudge_x and nudge_y are the same as for the data units on the x-axis and y-axis.

arrow
specification for arrow heads, as created by arrow

add.segments
logical Display connecting segments or arrows between original positions and displaced ones if both are available.

na.rm
If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.

show.legend
logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.

inherit.aes
If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders.

Details
The plotting of segments is similar in idea at that available in geom_text_repel and relies on position functions that rename instead of removing the original original x and y coordinates from the data object.

By default this geom uses position_nudge_center which is backwards compatible with position_nudge but provides additional control on the direction of the nudging. In contrast to position_nudge, position_nudge_center and all other position functions defined in packaged ‘ggpp’ and ‘ggrepel’ keep the original coordinates thus allowing the plotting of connecting segments and arrows.

Value
A plot layer instance.

Examples

# Same output as with geom_point()
ggplot(mpg[1:20, ],
      aes(cyl, hwy)) +
    geom_point_s()

ggplot(mpg[1:20, ],
      aes(cyl, hwy, label = drv)) +
    geom_point_s(position = position_nudge_keep(x = 0.2),
                 color = "red",
                 segment.colour = "brown") +
    geom_point_s()
ggplot(mpg[1:20,],
  aes(cyl, hwy, label = drv)) +
  geom_point_s(position = position_nudge_keep(x = 0.2),
    color = "red",
    segment.colour = "brown") +
  geom_point_s()

ggplot(mpg[1:50,],
  aes(cyl, hwy, label = drv)) +
  geom_point_s(position = position_jitternudge(width = 0.66, height = 2,
    seed = 456,
    nudge.from = "jittered",
    kept.origin = "original"),
    color = "red",
    arrow = grid::arrow(length = grid::unit(0.4, "lines"))) +
  geom_point_s()

---

**geom_quadrant_lines**

Reference lines: horizontal plus vertical, and quadrants

**Description**

`geom_vhlines()` adds in a single layer both vertical and horizontal guide lines. Can be thought of as a convenience function that helps with producing consistent vertical and horizontal guide lines. It behaves like `geom_vline()` and `geom_hline()`. `geom_quadrant_lines()` displays the boundaries of four quadrants with an arbitrary origin. The quadrants are specified in the same way as in `stat_quadrant_counts()` and is intended to be used to add guide lines consistent with the counts by quadrant computed by this stat.

**Usage**

```r
geom_quadrant_lines(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  pool.along = "none",
  xintercept = 0,
  yintercept = 0,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = FALSE,
  ...
)
```

```r
geom_vhlines(
  mapping = NULL,
```
Arguments

mapping  The aesthetic mapping, usually constructed with `aes` or `aes_`. Only needs to be set at the layer level if you are overriding the plot defaults.
data  A layer specific data set - only needed if you want to override the plot defaults.
stat  The statistic object to use display the data
position  The position adjustment to use for overlapping points on this layer
pool.along  character, one of "none", "x" or "y", indicating which quadrants to pool to calculate counts by pair of quadrants.
xintercept,yintercept  numeric vectors the coordinates of the origin of the quadrants.
na.rm  a logical indicating whether NA values should be stripped before the computation proceeds.
show.legend  logical. Should this layer be included in the legends? `NA`, the default, includes if any aesthetics are mapped. `FALSE` never includes, and `TRUE` always includes.
inherit.aes  If `FALSE`, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and should not inherit behaviour from the default plot specification, e.g. `borders`.
...  other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

Details

While `geom_vhlines()` does not provide defaults for the intercepts and accept vectors of length > 1, `geom_quadrant_lines()` sets by default the intercepts to zero producing the natural quadrants and only accepts vectors of length one per panel. That is `geom_vhlines()` can be used to plot a grid while `geom_quadrant_lines()` plots at most one vertical and one horizontal line. In the case of `geom_quadrant_lines()` the pooling along axes can be specified in the same way as in `stat_quadrant_counts()`.

Value

A plot layer instance.

**geom_table**

Inset tables

Description

geom_table and geom_table_npc add data frames as table insets to the base ggplot, using syntax similar to that of geom_text and geom_text_s. In most respects they behave as any other ggplot geometry: a layer can contain multiple tables and faceting works as usual.

Usage

```r
geom_table(mapping = NULL,
          data = NULL,
          ...)```

geom_table

stat = "identity",
position = "identity",
..., 
nudge_x = 0,
nudge_y = 0,
add.segments = TRUE,
arrow = NULL,
table.theme = NULL,
table.rownames = FALSE,
table.colnames = TRUE,
table.hjust = 0.5,
parse = FALSE,
na.rm = FALSE,
show.legend = FALSE,
inherit.aes = FALSE
)

geom_table_npc(
  mapping = NULL,
data = NULL,
stat = "identity",
position = "identity",
..., 
table.theme = NULL,
table.rownames = FALSE,
table.colnames = TRUE,
table.hjust = 0.5,
parse = FALSE,
na.rm = FALSE,
show.legend = FALSE,
inherit.aes = FALSE
)

Arguments

mapping The aesthetic mapping, usually constructed with aes or aes_. Only needs to be set at the layer level if you are overriding the plot defaults.
data A layer specific data set - only needed if you want to override the plot defaults.
stat The statistical transformation to use on the data for this layer, as a string.
position Position adjustment, either as a string, or the result of a... other arguments passed on to layer. This can include aesthetics whose values you want to set, not map. See layer for more details.
nudge_x, nudge_y Horizontal and vertical adjustments to nudge the starting position of each text label. The units for nudge_x and nudge_y are the same as for the data units on the x-axis and y-axis.
add.segments logical Display connecting segments or arrows between original positions and displaced ones if both are available.
arrow specification for arrow heads, as created by `arrow`

table.theme NULL, list or function A gridExtra theme definition, or a constructor for a theme or NULL for default.

table.rownames, table.colnames logical flag to enable or disable printing of row names and column names.

table.hjust numeric Horizontal justification for the core and column headings of the table.

parse If TRUE, the labels will be parsed into expressions and displayed as described in `?plotmath`.

na.rm If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.

show.legend logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.

inherit.aes If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. `borders`.

Details

You can modify the alignment of inset tables with the `vjust` and `hjust` aesthetics. These can either be a number between 0 (right/bottom) and 1 (top/left) or a character ("left", "middle", "right", "bottom", "center", "top").

You can modify the size of inset tables with the `vp.width` and `vp.height` aesthetics. These can take a number between 0 (smallest possible inset) and 1 (whole plotting area width or height). The default value for both of these aesthetics is 1/5. Thus, in contrast to `geom_text` and `geom_text_s` the size of the insets remains the same relative to the size of the plotting area irrespective of how the plot is rendered. The aspect ratio of insets is preserved and size is adjusted until the whole inset fits within the viewport.

You can modify inset table alignment with the `vjust` and `hjust` aesthetics. These can either be a number between 0 (right/bottom) and 1 (top/left) or a character ("left", "middle", "right", "bottom", "center", "top"). There are several two special alignments: "inward" and "outward". Inward always aligns text towards the center of the plotting area, and outward aligns it away from the center of the plotting area. It tagged with '._mean' or '._median' the mean or median of the data in the panel along the corresponding axis is used as center.

By default this geom uses `position_nudge_center` which is backwards compatible with `position_nudge` but provides additional control on the direction of the nudging. In contrast to `position_nudge`, `position_nudge_center` and all other position functions defined in packages `ggpp` and `ggrepel` keep the original coordinates thus allowing the plotting of connecting segments and arrows.

This geom works only with tibbles as data, as its expects a list of data frames (or tibbles) to be mapped to the label aesthetic. A table is built with function `gridExtra::gtable()` for each data frame in the list, and formatted according to a table theme or ttheme. The character strings in the data frame can be parsed into R expressions so the inset tables can include maths.

If the argument passed to `table.theme` is a constructor function (passing its name without parenthesis), the values mapped to size, colour, fill, alpha, and family aesthetics will the passed to this theme constructor for each individual table. In contrast, if a ready constructed ttheme stored as a list object is passed as argument (e.g., by calling the constructor, using constructor name followed
by parenthesis), it will be used as is, i.e., mappings to aesthetics such as colour are ignored if present. By default the constructor ttheme_gtdefault is used and colour and fill, are mapped to NA. Mapping these aesthetics to NA triggers the use of the default base_colour of the ttheme. As the table is built with function gridExtra::gtable(), for formatting details, please, consult tableGrob.

The x and y aesthetics determine the position of the whole inset table, similarly to that of a text label, justification is interpreted as indicating the position of the inset table with respect to its x and y coordinates in the data, and angle is used to rotate the inset table as a whole.

In the case of geom_table_npc(), npcx andnpcy aesthetics determine the position of the inset table. As for text labels, justification is interpreted as indicating the position of the inset plot with respect to itsnpcx andnpcy coordinates, and angle is used to rotate the plot as a whole.

annotate cannot be used with geom = "table". Use annotate (automatic override unless 'ggpp' is not attached) as redefined in 'ggpp' when adding inset plots as annotations (automatic unless 'ggpp' is not attached).

Value
A plot layer instance.

Note
Complex tables with annotations or different colouring of rows or cells can be constructed with functions in package 'gridExtra' or in any other way as long as they can be saved as grid graphical objects and then added to a ggplot as a new layer with geom_grob.

References
This geometry is inspired on answers to two questions in Stackoverlow. In contrast to these earlier examples, the current geom obeys the grammar of graphics, and attempts to be consistent with the behaviour of 'ggplot2' geometries. [https://stackoverflow.com/questions/12318120/adding-table-within-the-plotting-region-of-a-ggplot-in-r](https://stackoverflow.com/questions/12318120/adding-table-within-the-plotting-region-of-a-ggplot-in-r) [https://stackoverflow.com/questions/25554548/adding-sub-tables-on-each-panel-of-a-facet-ggplot-in-r?](https://stackoverflow.com/questions/25554548/adding-sub-tables-on-each-panel-of-a-facet-ggplot-in-r)

  geom_point() +
  geom_table_npc(data = dfnpc, aes(npcx = x, npcy = y, label = tb))

---

geometric_x_margin_arrow  Reference arrows on the margins

Description

Small arrows on plot margins can supplement a 2d display with annotations. Arrows can be used to highlight specific values along a margin. The geometries geometric_x_margin_arrow() and geometric_y_margin_arrow() behave similarly geometric_vline() and geometric_hline() and share their "double personality" as both annotations and geometries.

Usage

geometric_x_margin_arrow(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  xintercept,
  sides = "b",
  arrow.length = 0.03,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = FALSE
)

geometric_y_margin_arrow(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  yintercept,
  sides = "l",
  arrow.length = 0.03,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = FALSE
)
Arguments

- **mapping**: The aesthetic mapping, usually constructed with `aes` or `aes_`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**: A layer specific dataset - only needed if you want to override the plot defaults.
- **stat**: The statistical transformation to use on the data for this layer, as a string.
- **position**: Position adjustment, either as a string, or the result of a call to a position adjustment function.
- **xintercept, yintercept**: numeric Parameters that control the position of the marginal points. If these are set, data, mapping and show.legend are overridden.
- **sides**: A string that controls which sides of the plot the rugs appear on. It can be set to a string containing any of ‘“trbl”’, for top, right, bottom, and left.
- **arrow.length**: numeric value expressed in npc units for the length of the arrows inwards from the edge of the plotting area.
- **na.rm**: If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
- **show.legend**: logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
- **inherit.aes**: If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders.

Value

A plot layer instance.

See Also

Other Geometries for marginal annotations in ggplots: `geom_x_margin_grob()`, `geom_x_margin_point()`

Examples

```r
p <- ggplot(mtcars, aes(wt, mpg)) +
     geom_point()
p + geom_x_margin_arrow(xintercept = 3.5)
p + geom_y_margin_arrow(yintercept = c(18, 28, 15))
p + geom_x_margin_arrow(data = data.frame(x = c(2.5, 4.5)),
                        mapping = aes(xintercept = x))
p + geom_x_margin_arrow(data = data.frame(x = c(2.5, 4.5)),
                        mapping = aes(xintercept = x),
                        sides="tb")
```
**Add Grobs on the margins**

**Description**

Marging points can supplement a 2d display with annotations. Marging points can highlight individual cases or values along a margin. The geometries `geom_x_margin_grob()` and `geom_y_margin_grob()` behave similarly to `geom_vline()` and `geom_hline()` and share their "double personality" as both annotations and geometries.

**Usage**

```r
geom_x_margin_grob(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  xintercept,
  sides = "b",
  grob.shift = 0,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = FALSE
)
```

```r
geom_y_margin_grob(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  yintercept,
  sides = "l",
  grob.shift = 0,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = FALSE
)
```

**Arguments**

- **mapping**: The aesthetic mapping, usually constructed with `aes` or `aes_`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**: A layer specific dataset - only needed if you want to override the plot defaults.
- **stat**: The statistical transformation to use on the data for this layer, as a string.
geom_x_margin_point

position  Position adjustment, either as a string, or the result of a call to a position adjustment function.

...  other arguments passed on to layer. This can include aesthetics whose values you want to set, not map. See layer for more details.

xintercept, yintercept  numeric Parameters that control the position of the marginal points. If these are set, data, mapping and show.legend are overridden.

sides  A character string of length one that controls on which side of the plot the grob annotations appear on. It can be set to a string containing one of "t", "r", "b" or "l", for top, right, bottom, and left.

grob.shift  numeric value expressed in npc units for the shift of the marginal grob inwards from the edge of the plotting area.

na.rm  If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.

show.legend  logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.

inherit.aes  If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders.

Value  A plot layer instance.

See Also  Other Geometries for marginal annotations in ggplots: geom_x_margin_arrow(), geom_x_margin_point()

Examples  

# We can add icons to the margin of a plot to signal events

---

**Description**

Marging points can supplement a 2d display with annotations. Marging points can highlight individual cases or values along a margin. The geometries geom_x_margin_point() and geom_y_margin_point() behave similarly geom_vline() and geom_hline() and share their "double personality" as both annotations and geometries.
Usage

geom_x_margin_point(
    mapping = NULL,
    data = NULL,
    stat = "identity",
    position = "identity",
    ...
    ,
    xintercept,
    sides = "b",
    point.shift = 0.017,
    na.rm = FALSE,
    show.legend = FALSE,
    inherit.aes = FALSE
)

geom_y_margin_point(
    mapping = NULL,
    data = NULL,
    stat = "identity",
    position = "identity",
    ...
    ,
    yintercept,
    sides = "l",
    point.shift = 0.017,
    na.rm = FALSE,
    show.legend = FALSE,
    inherit.aes = FALSE
)

Arguments

mapping The aesthetic mapping, usually constructed with `aes` or `aes_`. Only needs to be set at the layer level if you are overriding the plot defaults.

data A layer specific dataset - only needed if you want to override the plot defaults.

stat The statistical transformation to use on the data for this layer, as a string.

position Position adjustment, either as a string, or the result of a call to a position adjustment function.

... other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

xintercept, yintercept numeric Parameters that control the position of the marginal points. If these are set, data, mapping and show.legend are overridden.

sides A string that controls which sides of the plot the rugs appear on. It can be set to a string containing any of ‘"trbl"’, for top, right, bottom, and left.

point.shift numeric value expressed in npc units for the shift of the rug points inwards from the edge of the plotting area.
na.rm  If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.

show.legend  logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.

inherit.aes  If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders.

Value
A plot layer instance.

Other Geometries for marginal annotations in ggplots: geom_x_margin_arrow(), geom_x_margin_grob()

Examples
p <- ggplot(mtcars, aes(wt, mpg)) + geom_point()
p + geom_x_margin_point(xintercept = 3.5)
p + geom_y_margin_point(yintercept = c(18, 28, 15))
p + geom_x_margin_point(data = data.frame(x = c(2.5, 4.5)),
                        mapping = aes(xintercept = x))
p + geom_x_margin_point(data = data.frame(x = c(2.5, 4.5)),
                        mapping = aes(xintercept = x),
                        sides="tb")

Description
ggplot() initializes a ggplot object. It can be used to declare the input spectral object for a graphic and to optionally specify the set of plot aesthetics intended to be common throughout all subsequent layers unless specifically overridden.

Usage
## S3 method for class 'ts'
ggplot(
data, 
mapping = NULL, 
..., 
time.resolution = "day", 
as.numeric = TRUE,
## S3 method for class 'xts'
ggplot(data, mapping = NULL, ..., time.resolution = "day", as.numeric = TRUE, environment = parent.frame() )

### Arguments

- **data**: Default spectrum dataset to use for plot. If not a spectrum, the methods used will be those defined in package ggplot2. See `ggplot`. If not specified, must be supplied in each layer added to the plot.

- **mapping**: Default list of aesthetic mappings to use for plot. If not specified, in the case of spectral objects, a default mapping will be used.

- **...**: Other arguments passed on to methods. Not currently used.

- **time.resolution**: character The time unit to which the returned time values will be rounded.

- **as.numeric**: logical If TRUE convert time to numeric, expressed as fractional calendar years.

- **environment**: If an variable defined in the aesthetic mapping is not found in the data, ggplot will look for it in this environment. It defaults to using the environment in which `ggplot()` is called.

### Details

`ggplot()` is typically used to construct a plot incrementally, using the + operator to add layers to the existing ggplot object. This is advantageous in that the code is explicit about which layers are added and the order in which they are added. For complex graphics with multiple layers, initialization with `ggplot` is recommended.

There are three common ways to invoke `ggplot`:

- `ggplot(ts,aes(x,y,<other aesthetics>))`
- `ggplot(ts)`

The first method is recommended if all layers use the same data and the same set of aesthetics, although this method can also be used to add a layer using data from another data frame. See the first example below. The second method specifies the default spectrum object to use for the plot, and the units to be used for y in the plot, but no aesthetics are defined up front. This is useful when one data frame is used predominantly as layers are added, but the aesthetics may vary from one layer to another. The third method specifies the default spectrum object to use for the plot, but no aesthetics are defined up front. This is useful when one spectrum is used predominantly as layers are added, but the aesthetics may vary from one layer to another.
Value
A "ggplot" object.

Note
Current implementation does not merge default mapping with user supplied mapping. If user supplies a mapping, it is used as is. To add to the default mapping, aes() can be used by itself to compose the ggplot.

Examples
library(ggplot2)
ggplot(lynx) + geom_line()

Description
`position_dodgenudge()` combines into one function the action of `ggplot2::position_dodge` and `ggplot2::position_nudge` and `position_dodge2nudge()` combines into one function the action of `ggplot2::position_dodge2` and `ggplot2::position_nudge`. They are useful when labelling plots such as grouped bars, columns, etc. and when adding dodged to text labels linked to observations plotted without dodge. It can replace other position functions as it is backwards compatible. Like all other position functions in `ggpp` and `ggrepel` it preserves the initial position to allow drawing of segments or arrow linking the original position to the displaced one.

Usage
```r
position_dodgenudge(
  width = 1,
  preserve = c("total", "single"),
  x = 0,
  y = 0,
  direction = "none",
  kept.origin = "dodged"
)
```
```r
position_dodge_keep(width = 1, preserve = c("total", "single"))
```
```r
position_dodge2_keep(width = 1, preserve = c("total", "single"))
```
```r
position_dodge2nudge(
  width = 1,
  preserve = c("total", "single"),
  padding = 0.1,
)```
```r
default
  reverse = FALSE,
  x = 0,
  y = 0,
  direction = "none",
  kept.origin = "dodged"
)

Arguments

- `width`: Dodging width, when different to the width of the individual elements. This is useful when you want to align narrow geoms with wider geoms. See the examples.
- `preserve`: Should dodging preserve the total width of all elements at a position, or the width of a single element?.
- `x, y`: Amount of vertical and horizontal distance to move. A numeric vector of length 1, or of the same length as rows there are in 'data',
- `direction`: One of "none", "split", "split.x" or "split.y". A value of "none" replicates the behavior of [ggplot2::position_nudge]. At the moment "split" changes the sign of the nudge at zero, which is suitable for column plots with negative slices.
- `kept.origin`: One of "original", "dodged" or "none".
- `padding`: Padding between elements at the same position. Elements are shrunk by this proportion to allow space between them. Defaults to 0.1.
- `reverse`: If TRUE, will reverse the default stacking order. This is useful if you're rotating both the plot and legend.

Details

The applied dodge is identical to that by [ggplot2::position_dodge] while nudging is similar to that by [ggplot2::position_nudge].

There are two possible uses for these functions. First they can be used to label dodged bars or boxplots. In this case, it is mandatory to use the same argument to 'width' when passing 'position_dodge()' to 'geom_col()' and 'position_dodgenudge()' to 'geom_text()' or 'geom_label()' or their repulsive equivalents. Otherwise the arrows or segments will fail to connect to the labels. In other words jittering is computed twice. Jitter should be identical with the same arguments as 'position_dodgenudge()' as this last function simply call the same code from package 'ggplot2'.

The second use is to dodge labels to be connected to elements that have not been jittered. The return of original positions instead of the dodged ones is achieved by passing 'origin = "original"' instead of the default of 'origin = "dodged"'.

Value

A "Position" object.

Examples

df <- data.frame(x1 = c(1, 2, 1, 3, -1),
    x2 = c("a", "a", "b", "b", "b"),
    grp = c("some long name", "other name", "some name",
            "another name", "some long name"))

# Add labels to a horizontal column plot (stacked by default)
ggplot(data = df, aes(x1, x2, group = grp)) +
    geom_col(aes(fill = grp), width = 1,
             position = position_dodge()) +
    geom_vline(xintercept = 0) +
    geom_text(aes(label = grp),
              position = position_dodgenudge(x = 0.09, direction = "split"),
              angle = 90) +
    theme(legend.position = "none")

ggplot(data = df, aes(x2, x1, group = grp)) +
    geom_col(aes(fill = grp), width = 0.75,
             position = position_dodge(width = 0.75)) +
    geom_vline(xintercept = 0) +
    geom_text(aes(label = grp),
              position = position_dodgenudge(y = 0.1,
                                              direction = "split",
                                              width = 0.75)) +
    theme(legend.position = "none")

position_jitternudge

Combined positions jitter and nudge

Description

'position_jitternudge()' combines into one function the action of [ggplot2::position_jitter] and [ggplot2::position_nudge]. It is useful when labels to jittered plots and when adding jitter to text labels linked to points plotted without jitter. It can replace other position functions as it is backwards compatible. Like all other position functions in 'ggpp' and 'ggrepel' it preserves the initial position to allow drawing of segments or arrow linking the original position to the displaced one.
position_jitternudge

Usage

position_jitternudge(
  width = NULL,
  height = NULL,
  seed = NA,
  x = 0,
  y = 0,
  direction = "as.is",
  nudge.from = "original",
  kept.origin = "jittered"
)

position_jitter_keep(width = NULL, height = NULL, seed = NA)

Arguments

width, height  Amount of vertical and horizontal jitter. The jitter is added in both positive and negative directions, so the total spread is twice the value specified here. If omitted, defaults to 40 resolution of the data: this means the jitter values will occupy 80 implied bins. Categorical data is aligned on the integers, so a width or height of 0.5 will spread the data so it's not possible to see the distinction between the categories.

seed  A random seed to make the jitter reproducible. Useful if you need to apply the same jitter twice, e.g., for a point and a corresponding label. The random seed is reset after jittering. If NA (the default value), the seed is initialised with a random value; this makes sure that two subsequent calls start with a different seed. Use NULL to use the current random seed and also avoid resetting (the behaviour of ggplot 2.2.1 and earlier).

x, y  Amount of vertical and horizontal distance to move. A numeric vector of length 1, or of the same length as rows there are in ‘data’.

direction  One of "as.is", "alternate", "split", "split.x" or "split.y". A value of "none" replicates the behavior of [ggplot2::position_nudge]. At the moment "split" changes the sign of the nudge depending on the direction of the random jitter applied to each individual observation, which is suitable for nudging labels outward of the jittered data.

nudge.from  One of "original", "jittered", "original.y" (or "jittered.x"), "original.x" (or "jittered.y"). A value of "original" applies the nudge before jittering the observations, while "jittered" applies the nudging after jittering.

kept.origin  One of "original", "jittered" or "none".

Details

Jitter is identical to that by [ggplot2::position_jitter] while nudging is enhanced compared to [ggplot2::position_nudge] by taking into use cases specific to the combination of jitter and nudge.

There are two possible uses for this function. First it can be used to label jittered point in a plot. In this case, it is mandatory to use the same arguments to ‘width’, ‘height’ and ‘seed’ when passing ‘position_jitter()’ to ‘geom_point()’ and ‘position_jitternudge()’ to ‘geom_text()’ or ‘geom_label()’.
or their repulsive equivalents. Otherwise the arrows or segments will fail to connect to the labels. In other words jittering is computed twice. Jitter should be identical with the same arguments as `position_jitternudge()` as this last function simply call the same code from package `ggplot2`.

The second use is to jitter labels to be connected to points that have not been jittered. The return of original positions instead of the jittered ones is achieved by passing `origin = "original"` instead of the default of `origin = "jittered"`.

**Value**

A "Position" object. The layer function within it returns a data frame, with the jittered + nudged values in columns `x` and `y` and by default the jittered values with no nudging as `x_orig` and `y_orig`. When passing `nudge.from = "original` the original values with no jitter or nudge applied are returned instead as `x_orig` and `y_orig`.

**Note**

When `direction = "split"` is used together with no jitter, the split to left and right, or up and down is done at random.

`[ggplot2::position_jitter()], [ggplot2::position_nudge()], [ggrepel::position_nudge_repel()]`. Other position adjustments: `position_dodgenudge()`, `position_nudge_center()`, `position_nudge_line()`, `position_nudge_to()`, `position_stacknudge()`

**Examples**

```r
jitter <- position_jitter(width = 0.3, height = 2, seed = 123)

jitter_nudge <- position_jitternudge(width = 0.3, height = 2,
  seed = 123, x = 0.4,
  direction = "as.is",
  nudge.from = "original.x")

ggplot(mpg[1:20, ],
  aes(cyl, hwy, label = drv)) +
  geom_point(position = jitter) +
  geom_text_s(position = jitter_nudge)

jitter_nudge <- position_jitternudge(width = 0.3, height = 2,
  seed = 123, x = -0.4,
  direction = "as.is",
```
position_nudge_center

Nudge labels away from a central point

Description

‘position_nudge_center()’ is generally useful for adjusting the position of labels or text, both on a discrete or continuous scale. In contrast to [ggplot2::position_nudge], ‘position_nudge_center()’ returns in ‘data’ both the original coordinates and the nudged coordinates.

Usage

position_nudge_center(
  x = 0,
position_nudge_center

y = 0,
center_x = NULL,
center_y = NULL,
direction = NULL,
obey_grouping = NULL,
kept.origin = "original"
)

position_nudge_centre(
  x = 0,
y = 0,
  center_x = NULL,
  center_y = NULL,
  direction = NULL,
  obey_grouping = NULL,
  kept.origin = "original"
)

position_nudge_keep(x = 0, y = 0)

Arguments

x, y  
Amount of vertical and horizontal distance to move. A numeric vector of length 1, or of the same length as rows there are in 'data',

center_x, center_y  
The coordinates of the virtual origin out from which nudging radiates or splits in opposite directions. A numeric vector of length 1 or of the same length as rows there are in 'data', or a function returning either of these vectors computed from the variables in data mapped to 'x' or 'y', respectively.

direction  
One of "none", "radial", or "split". A value of "none" replicates the behavior of [ggplot2::position_nudge]. Which of these three values is the default depends on the values passed to the other parameters.

obey_grouping  
A logical flag indicating whether to obey or not groupings of the observations. By default, grouping is obeyed when both of the variables mapped to _x_ and _y_ are continuous numeric and ignored otherwise.

kept.origin  
One of "original" or "none".

Details

This position function is backwards compatible with [ggplot2::position_nudge] but extends it by adding support for nudging that varies across the plotting region, either in opposite directions or radially from a virtual _center point_.

The wrapper `position_nudge_keep()` with exactly the same signature and behaviour as [ggplot2::position_nudge] provides an easier to remember name when the desire is only to have access to both the original and nudged coordinates.

Positive values as arguments to 'x' and 'y' are added to the original position along either axis. If no arguments are passed to 'center_x', 'center_y' or 'direction', the nudging is applied as is, as is the
case if `direction = "none"`. If non-'NULL' arguments are passed to both `center_x` and `center_y`, `direction = "radial"` is assumed. In this case, if 'x' and/or 'y' positive nudging is applied radially outwards from the center, while if negative, inwards towards the center. When a non-'NULL' argument is passed only to one of 'center_x' or 'center_y', `direction = "split"` is assumed. In this case when the initial location of the point is to the left of 'center_x', '-x' is used instead of 'x' for nudging, and when the initial location of the point is to the below of 'center_y', '-y' is used instead of 'y' for nudging. If non-'NULL' arguments are passed to both 'center_x' and 'center_y', and 'direction' is passed "split" as argument, then the split as described above is applied to both _x_ and _y_ coordinates.

**Value**

A "Position" object.

**Note**

Some situations are handled as special cases. When `direction = "split"` or `direction = "radial"`, observations at exactly the _center_ are nudged using 'x' and 'y' unchanged. When `direction = "split"`, and both 'center_x' and 'center_y' have been supplied, segments are drawn at eight different possible angles. When segments are exactly horizontal or vertical they would be shorter than when drawn at the other four angles, in which case ‘x’ or ‘y’ are extended to ensure these segments are of the same lengths as those at other angles.

This position is most useful when labeling points forming a cloud or along vertical or horizontal lines or "divides".

[ggplot2::position_nudge()], [ggrepel::position_nudge_repel()].

Other position adjustments: position_dodgenudge(), position_jitternudge(), position_nudge_line(), position_nudge_to(), position_stacknudge()

**Examples**

df <- data.frame(
x = c(1,3,2,5,4,2.5),
y = c("abc","cd","d","c","bcd","a")
)

# Plain nudging, same as with ggplot2::position_nudge()

```r
ggplot(df, aes(x, y, label = y)) +
  geom_point() +
  geom_text(hjust = 0, vjust = 0,
            position = position_nudge(x = 0.05, y = 0.07)
  )
```

```r
ggplot(df, aes(x, y, label = y)) +
  geom_point() +
  geom_text(hjust = 0, vjust = 0,
            position = position_nudge_center(x = 0.05, y = 0.07)
  )
```
# "split" nudging

ggplot(df, aes(x, y)) +
  geom_point() +
  geom_text(aes(label = y),
            hjust = "outward", vjust = "outward",
            position = position_nudge_center(x = 0.05,

```
position_nudge_line

Nudge labels away from a line

Description

`position_nudge_line` is generally useful for adjusting the starting position of labels or text to be repelled while preserving the original position as the start of the segments. The difference compared to `[position_nudge_center()]` is that the nudging is away from from a line or curve fitted to the data points or supplied as coefficients. While `[position_nudge_center()]` is most useful for "round-shaped", vertically- or horizontally elongated clouds of points, `[position_nudge_line()]` is most suitable when observations follow a linear or curvilinear relationship between _x_ and _y_ values. In contrast to `[ggplot2::position_nudge]`, `position_nudge_line()` returns in `data` both the original coordinates and the nudged coordinates.

Usage

`position_nudge_line()`
position_nudge_line

x = NA_real_,
y = NA_real_,
xy_relative = c(0.03, 0.03),
abline = NULL,
method = NULL,
formula = y ~ x,
direction = NULL,
line_nudge = 1,
kept.origin = "original"
)

Arguments

x, y  
Amount of vertical and horizontal distance to move. A numeric vector of length 1, or of the same length as rows there are in ‘data’.

xy_relative  
Nudge relative to _x_ and _y_ data expanse, ignored unless ‘x’ and ‘y’ are both ‘NA’s.

abline  
a vector of length two giving the intercept and slope.

method  
one of “spline”, “lm” or “auto”.

formula  
a model formula for [lm()] when ‘method = "lm"’. Ignored otherwise.

direction  
one of "none", or "split".

line_nudge  
a positive multiplier >= 1, increasing nudging away from the curve or line compared to nudging from points.

kept.origin  
one of "original" or "none".

Details

The default amount of nudging is 3 _x_ and _y_ axes, which in most cases is good. In most cases it is best to apply nudging along a direction perpendicular to the line or curve, if this is the aim, passing an argument to only one of ‘x’, ‘y’ or ‘xy_relative’ will be enough. When ‘direction = "split"’ nudging is away from an implicit line or curve on either side with positive nudging. The line of curve can be smooth spline or linear regression fitted on-the-fly to the data points, or a straight line defined by its coefficients passed to ‘abline’. The fitting is well defined only if the observations fall roughly on a curve or straight line that is monotonic in ‘y’. By means of ‘line_nudge’ one can increment nudging away from the line or curve compared to away from the points, which is useful for example to keep labels outside of a confidence band. Direction defaults to “"split"” when ‘line_nudge > 1’, and otherwise to “"none"”.

Value

A "Position" object.

Note

For ‘method = "lm"’ only model formulas corresponding to polynomials with no missing terms are supported. If using [poly()], ‘raw = TRUE’ is required.

In practice, ‘x’ and ‘y’ should have the same sign for nudging to work correctly.
This position is most useful when labeling points conforming a cloud along an arbitrary curve or line.

position_nudge_to

Nudge labels to new positions

Description

'position_nudge_to()' is generally useful for adjusting the position of labels or text, both on a discrete or continuous scale. This version from package 'ggpmisc' differs from [ggplot2::position_nudge] in that the coordinates of the new position are given directly, rather than as a displacement from the original location. As other position functions in this package, it preserves the original position to allow the text to be linked back to its original position with a segment or arrow.

Usage

position_nudge_to(x = NULL, y = NULL, kept.origin = "original")

Arguments

x, y Coordinates of the destination position. A numeric vector of length 1, or of the same length as rows there are in 'data'. The default, 'NULL', leaves the original coordinates unchanged.

kept.origin One of "original" or "none".

Details

The new 'x' or 'y' replace the original ones, while the original coordinates are returned in 'x_orig' and 'y_orig'.

Value

A "Position" object.
See Also

[ggplot::position_nudge()], [ggrepel::position_nudge_repel()].

Other position adjustments: position_dodgenudge(), position_jitternudge(), position_nudge_center(), position_nudge_line(), position_stacknudge()

Examples

df <- data.frame(
  x = c(1,3,2,5,4,2.5),
  y = c(2, 1, 2.5, 1.8, 2.8, 1.5),
  label = c("abc","cd","d","c","bcd","a")
)

ggplot(df, aes(x, y, label = label)) +
  geom_point() +
  geom_text(position = position_nudge_to(y = 3))

ggplot(df, aes(x, y, label = label)) +
  geom_point() +
  geom_text_s(position = position_nudge_to(y = 3),
              vjust = -0.2)

position_stacknudge  Combined positions stack and nudge

Description

‘position_stacknudge()’ is useful when labelling plots such as stacked bars, stacked columns, stacked lines, etc. In contrast to [ggplot2::position_nudge], ‘position_stacknudge()’ returns in ‘data’ both the original coordinates and the nudged coordinates.

Usage

position_stacknudge(
  vjust = 1,
  reverse = FALSE,
  x = 0,
  y = 0,
  direction = "none",
  kept.origin = "stacked"
)

position_fillnudge(
  vjust = 1,
  reverse = FALSE,
  x = 0,
)
position_stacknudge

y = 0,
direction = "none",
kept.origin = "stacked"
)

position_stack_keep(vjust = 1, reverse = FALSE)

position_fill_keep(vjust = 1, reverse = FALSE)

Arguments

vjust Vertical adjustment for geoms that have a position (like points or lines), not a
dimension (like bars or areas). Set to 0 to align with the bottom, 0.5 for the
middle, and 1 (the default) for the top.
reverse If TRUE, will reverse the default stacking order. This is useful if you’re rotating
both the plot and legend.
x, y Amount of vertical and horizontal distance to move. A numeric vector of length
1, or of the same length as rows there are in ‘data’,
direction One of "none", "split", "split.x" or "split.y". A value of "none" replicates the
behavior of [ggplot2::position_nudge]. At the moment "split" changes the sign
of the nudge at zero, which is suitable for column plots with negative slices.
kept.origin One of "original", "stacked" or "none".

Details

This position function is backwards compatible with [ggplot2::position_nudge] but extends it by
adding support for stacking and for the repulsive geometries from package ’ggrepel’.
The wrapper ‘position_nudge_keep()’ with exactly the same signature and behaviour as [ggplot2::position_nudge]
provides an easier to remember name when the desire is only to have access to both the original and
nudged coordinates.

Value

A “Position” object.

scale_continuous_npc

position = position_stacknudge(vjust = 0.5, y = 0.4),
vjust = "bottom") +
theme(legend.position = "none")

---

**scale_continuous_npc**  
Position scales for continuous data (npcx & npcy)

---

**Description**

'scale_npcx_continuous()' and 'scale_npcy_continuous()' are scales for continuous npcx and npcy aesthetics expressed in "npc" units. There are no variants. Obviously limits are always the full range of "npc" units and transformations meaningless. These scales are used by the newly defined aesthetics npcx and npcy.

**Usage**

```r
scale_npcx_continuous(...)  
scale_npcy_continuous(...)  
```

**Arguments**

```r
...
```

Other arguments passed on to `continuous_scale()`

**Value**

A "Scale" object.

---

**stat_apply_group**  
Apply a function to x or y values

---

**Description**

`stat_summary_xy()` and `stat_centroid()` are similar to `ggplot2::stat_summary()` but summarize both x and y values in the same plot layer. Differently to `stat_summary()` no grouping based on data values is done; the grouping respected is that already present based on mappings to aesthetics. This makes it possible to highlight the actual location of the centroid with `geom_point()`, `geom_text()`, and similar geometries. Instead, if we use `geom_rug()` they are only a convenience avoiding the need to add two separate layers and flipping one of them using `orientation = "y"`. 
Usage

```r
stat_apply_group(
  mapping = NULL,
  data = NULL,
  geom = "line",
  .fun.x = NULL,
  .fun.x.args = list(),
  .fun.y = NULL,
  .fun.y.args = list(),
  position = "identity",
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = TRUE,
  ...
)
```

```r
stat_summary_xy(
  mapping = NULL,
  data = NULL,
  geom = "point",
  .fun.x = NULL,
  .fun.x.args = list(),
  .fun.y = NULL,
  .fun.y.args = list(),
  position = "identity",
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = TRUE,
  ...
)
```

```r
stat_centroid(
  mapping = NULL,
  data = NULL,
  geom = "point",
  .fun = NULL,
  .fun.args = list(),
  position = "identity",
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = TRUE,
  ...
)
```

Arguments

- `mapping` The aesthetic mapping, usually constructed with `aes`. Only needs to be set at the layer level if you are overriding the plot defaults.
data A layer specific dataset - only needed if you want to override the plot defaults.

geom The geometric object to use display the data

.fun.x, .fun.y, .fun function to be applied or the name of the function to be applied as a character string.

.fun.x.args, .fun.y.args, .fun.args additional arguments to be passed to the function as a named list.

position The position adjustment to use for overlapping points on this layer

na.rm a logical value indicating whether NA values should be stripped before the computation proceeds.

show.legend logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.

inherit.aes If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. borders.

... other arguments passed on to layer. This can include aesthetics whose values you want to set, not map. See layer for more details.

Details

stat_apply_group applies functions to data. When possible it is preferable to use transformations through scales or summary functions such as ggplot2::stat_summary(), stat_summary_xy() or stat_centroid(). There are some computations that are not scale transformations but are not usual summaries either, as the number of data values does not decrease all the way to one row per group. A typical case for a summary is the computation of quantiles. For transformations are cumulative ones, e.g., using cumsum(), runmed() and similar functions. Obviously, it is always possible to apply such functions to the data before plotting and passing them to a single layer function. However, it can be useful to apply such functions on-the-fly to ensure that grouping is consistent between computations and aesthetics. One particularity of these statistics is that they can apply simultaneously different functions to x values and to y values when needed. In contrast to these statistics, geom_smooth applies a function that takes both x and y values as arguments.

These four statistics are similar. They differ on whether they return a single or multiple rows of data per group.

Value

A data frame with the same variables as the data input, with either a single or multiple rows, with the values of x and y variables replaced by the values returned by the applied functions, or possibly filled with NA if no function was supplied or available by default. If the applied function returns a named vector, the names are copied into columns x.names and/or y.names. If the summary function applied returns a one row data frame, it will be column bound keeping the column names, but overwriting columns x and/or y with y from the summary data frame. In the names returned by .fun.x the letter "y" is replaced by "x". These allows the use of the same functions as in ggplot2::stat_summary().

x x-value as returned by .fun.x, with names removed
y  y-value as returned by \texttt{.fun.y}, with names removed
\texttt{x.names}  if the x-value returned by \texttt{.fun.x} is named, these names
\texttt{y.names}  if the y-value returned by \texttt{.fun.y} is named, these names
\texttt{xmin, xmax}  values returned by \texttt{.fun.x} under these names, if present
\texttt{ymin, ymax}  values returned by \texttt{.fun.y} under these names, if present
\texttt{<other>}  additional values as returned by \texttt{.fun.y} under other names

\textbf{Note}

The applied function(s) must accept as first argument a vector that matches the variables mapped to \texttt{x} or \texttt{y} aesthetics. For \texttt{stat_summary_xy()} and \texttt{stat_centroid()} the function(s) to be applied is(are) expected to return a vector of length 1 or a data frame with only one row, as \texttt{mean_se()}, \texttt{mean_cl_normal()}, \texttt{mean_cl_boot()}, \texttt{mean_sdl()} and \texttt{median_hilow()} from 'ggplot2' do.

For \texttt{stat_apply_group} the vectors returned by the the functions applied to \texttt{x} and \texttt{y} must be of exactly the same length. When only one of \texttt{.fun.x} or \texttt{.fun.y} are passed a function as argument, the other variable in the returned data is filled with \texttt{NA_real_}. If other values are desired, they can be set by means of a user-defined function.

\textbf{Examples}

```r
set.seed(123456)
my.df <- data.frame(X = rep(1:20,2),
                   Y = runif(40),
                   category = rep(c("A","B"), each = 20))

# make sure rows are ordered for X as we will use functions that rely on this
my.df <- my.df[order(my.df["X"]), ]

# Centroid
ggplot(my.df, aes(x = X, y = Y, colour = category)) +
  stat_centroid(shape = "cross", size = 6) +
  geom_point()

ggplot(my.df, aes(x = X, y = Y, colour = category)) +
  stat_centroid(geom = "rug", size = 1.5, .fun = median) +
  geom_point()

ggplot(my.df, aes(x = X, y = Y, colour = category)) +
  stat_centroid(geom = "text", aes(label = category)) +
  geom_point()

# quantiles
ggplot(my.df, aes(x = X, y = Y, colour = category)) +
  geom_point() +
```

\texttt{mean_se()}, \texttt{mean_cl_normal()}, \texttt{mean_cl_boot()}, \texttt{mean_sdl()} and \texttt{median_hilow()} from 'ggplot2' do.

For \texttt{stat_apply_group} the vectors returned by the the functions applied to \texttt{x} and \texttt{y} must be of exactly the same length. When only one of \texttt{.fun.x} or \texttt{.fun.y} are passed a function as argument, the other variable in the returned data is filled with \texttt{NA_real_}. If other values are desired, they can be set by means of a user-defined function.

stat_dens1d_filter

Filter observations by local 1D density

Description

stat_dens1d_filter Filters-out/filters-in observations in regions of a plot panel with high density of observations, based on the values mapped to one of x and y aesthetics. stat_dens1d_filter_g does the same filtering by group instead of by panel. This second stat is useful for highlighting observations, while the first one tends to be most useful when the aim is to prevent clashes among text labels.

Usage

stat_dens1d_filter(
mapping = NULL,
data = NULL,
geom = "point",
position = "identity",
...,
keep.fraction = 0.1,
keep.number = Inf,
keep.sparse = TRUE,
invert.selection = FALSE,
bw = "SJ",
kernel = "gaussian",
adjust = 1,
n = 512,
orientation = "x",
na.rm = TRUE,
show.legend = FALSE,
inherit.aes = TRUE
)

stat_dens1d_filter_g(

```r
# Example usage

library(ggplot2)

# Data
my.df <- data.frame(x = rnorm(1000), y = rnorm(1000), category = sample(1:5, 1000, replace = TRUE))

# Plot
p1 <- ggplot(my.df, aes(x = X, y = Y, colour = category)) +
  stat_dens1d_filter(geom = "point") +
  geom_point() +
  stat_apply_group(geom = "debug",
                   .fun.x = quantile,
                   .fun.x.args = list(probs = my.probs),
                   .fun.y = quantile,
                   .fun.y.args = list(probs = my.probs))

p1
```

```r
# Example usage

# Data
my.df <- data.frame(x = rnorm(1000), y = rnorm(1000), category = sample(1:5, 1000, replace = TRUE))

# Grouped plot
p2 <- ggplot(my.df, aes(x = X, y = Y, colour = category)) +
  stat_dens1d_filter_g(geom = "point") +
  geom_point() +
  stat_apply_group(.fun.y = cumsum, geom = "debug")

p2
```
mapping = NULL,
data = NULL,
geom = "point",
position = "identity",
keep.fraction = 0.1,
keep.number = Inf,
keep.sparse = TRUE,
invert.selection = FALSE,
na.rm = TRUE,
show.legend = FALSE,
inherit.aes = TRUE,
bw = "SJ",
adjust = 1,
kernel = "gaussian",
n = 512,
orientation = "x",
...
)

Arguments

mapping The aesthetic mapping, usually constructed with aes or aes_. Only needs to be set at the layer level if you are overriding the plot defaults.
data A layer specific dataset - only needed if you want to override the plot defaults.
geom The geometric object to use display the data.
position The position adjustment to use for overlapping points on this layer...
other arguments passed on to layer. This can include aesthetics whose values you want to set, not map. See layer for more details.
keep.fraction numeric [0..1]. The fraction of the observations (or rows) in data to be retained.
keep.number integer Set the maximum number of observations to retain, effective only if obeying keep.fraction would result in a larger number.
keep.sparse logical If TRUE, the default, observations from the more sparse regions are retained, if FALSE those from the densest regions.
invert.selection logical If TRUE, the complement of the selected rows are returned.
bw numeric or character The smoothing bandwidth to be used. If numeric, the standard deviation of the smoothing kernel. If character, a rule to choose the bandwidth, as listed in bw.nrd.
kernel character See density for details.
adjust numeric A multiplicative bandwidth adjustment. This makes it possible to adjust the bandwidth while still using the a bandwidth estimator through an argument passed to bw. The larger the value passed to adjust the stronger the smoothing, hence decreasing sensitivity to local changes in density.
n numeric Number of equally spaced points at which the density is to be estimated for applying the cut point. See density for details.
orientation  character The aesthetic along which density is computed. Given explicitly by setting orientation to either "x" or "y".

na.rm  a logical value indicating whether NA values should be stripped before the computation proceeds.

show.legend  logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.

inherit.aes  If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders.

Value

A plot layer instance. Using as output data a subset of the rows in input data retained based on a 1D filtering criterion.

See Also

density used internally.

Other statistics returning a subset of data: stat_dens1d_labels(), stat_dens2d_filter(), stat_dens2d_labels()

# label observations
ggplot(data = d, aes(x, y, label = lab, colour = group)) +
stat_dens1d_labels

Replace labels in data based on 1D density

Description

stat_dens1d_labels() Sets values mapped to the label aesthetic to "" or a user provided character string based on the local density in regions of a plot panel. Its main use is together with repulsive geoms from package ggrepel. If there is no mapping to label in data, the mapping is set to rownames(data), with a message.

Usage

stat_dens1d_labels(
  mapping = NULL,
  data = NULL,
  geom = "text",
  position = "identity",
  ...,
  keep.fraction = 0.1,
  keep.number = Inf,
  keep.sparse = TRUE,
  invert.selection = FALSE,
  bw = "SJ",
  kernel = "gaussian",
  adjust = 1,
  n = 512,
  orientation = "x",
  label.fill = "",
  na.rm = TRUE,
  show.legend = FALSE,
  inherit.aes = TRUE
)
Arguments

- **mapping**: The aesthetic mapping, usually constructed with `aes` or `aes_`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**: A layer specific dataset - only needed if you want to override the plot defaults.
- **geom**: The geometric object to use display the data.
- **position**: The position adjustment to use for overlapping points on this layer.
- **...**: other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.
- **keep.fraction**: numeric [0..1]. The fraction of the observations (or rows) in `data` to be retained.
- **keep.number**: integer Set the maximum number of observations to retain, effective only if obeying `keep.fraction` would result in a larger number.
- **keep.sparse**: logical If TRUE, the default, observations from the more sparse regions are retained, if FALSE those from the densest regions.
- **invert.selection**: logical If TRUE, the complement of the selected rows are returned.
- **bw**: numeric or character The smoothing bandwidth to be used. If numeric, the standard deviation of the smoothing kernel. If character, a rule to choose the bandwidth, as listed in `bw.nrd`.
- **kernel**: character See `density` for details.
- **adjust**: numeric A multiplicative bandwidth adjustment. This makes it possible to adjust the bandwidth while still using the a bandwidth estimator through an argument passed to `bw`. The larger the value passed to `adjust` the stronger the smoothing, hence decreasing sensitivity to local changes in density.
- **n**: numeric Number of equally spaced points at which the density is to be estimated for applying the cut point. See `density` for details.
- **orientation**: character The aesthetic along which density is computed. Given explicitly by setting orientation to either "x" or "y".
- **label.fill**: character vector of length 1 or a function.
- **na.rm**: a logical value indicating whether NA values should be stripped before the computation proceeds.
- **show.legend**: logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
- **inherit.aes**: If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. `borders`.

Details

`stat_dens1d_labels()` is designed to work together with statistics from package 'ggrepel'. To avoid text labels being plotted over unlabelled points the corresponding rows in `data` need to be retained but labels replaced with the empty character string, "". This makes `stat_dens1d_filter` unsuitable for the task. Non-the-less `stat_dens1d_labels()` could be useful in some other cases, as the substitution character string can be set by the user.
Value

A plot layer instance. Using as output data the input data after value substitution based on a 1D the filtering criterion.

See Also

density used internally.

stat_dens2d_filter
stat_dens2d_labels

Replace labels in data based on 2D density

Description

stat_dens2d_labels() Sets values mapped to the label aesthetic to "" or a user provided character string based on the local density in regions of a plot panel. Its main use is together with repulsive geoms from package ggrepel. If there is no mapping to label in data, the mapping is set to rownames(data), with a message.

Usage

stat_dens2d_labels(
  mapping = NULL,
  data = NULL,
  geom = "text",
  position = "identity",
  ...

  keep.fraction = 0.1,
  keep.number = Inf,
  keep.sparse = TRUE,
  invert.selection = FALSE,
  h = NULL,
  n = NULL,
  label.fill = "",
  na.rm = TRUE,
  show.legend = FALSE,
  inherit.aes = TRUE
)

Arguments

mapping  The aesthetic mapping, usually constructed with aes or aes_. Only needs to be set at the layer level if you are overriding the plot defaults.
data  A layer specific dataset - only needed if you want to override the plot defaults.
geom  The geometric object to use display the data.
position  The position adjustment to use for overlapping points on this layer
...  other arguments passed on to layer. This can include aesthetics whose values you want to set, not map. See layer for more details.
keep.fraction  numeric [0..1]. The fraction of the observations (or rows) in data to be retained.
keep.number  integer Set the maximum number of observations to retain, effective only if obeying keep.fraction would result in a larger number.
keep.sparse  logical If TRUE, the default, observations from the more sparse regions are retained, if FALSE those from the densest regions.
stat_dens2d_labels

invert.selection

logical If TRUE, the complement of the selected rows are returned.

h

vector of bandwidths for x and y directions. Defaults to normal reference bandwidth (see bandwidth.nrd). A scalar value will be taken to apply to both directions.

n

Number of grid points in each direction. Can be scalar or a length-2 integer vector

label.fill

character vector of length 1 or a function.

na.rm

a logical value indicating whether NA values should be stripped before the computation proceeds.

show.legend

logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.

inherit.aes

If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders.

Details

stat_dens2d_labels() is designed to work together with statistics from package 'ggrepel'. To avoid text labels being plotted over unlabelled points the corresponding rows in data need to be retained but labels replaced with the empty character string, "". This makes stat_dens2d_filter unsuitable for the task. Non-the-less stat_dens2d_labels() could be useful in some other cases, as the substitution character string can be set by the user.

Value

A plot layer instance. Using as output data the input data after value substitution based on a 2D the filtering criterion.

See Also

kde2d used internally.

Other statistics returning a subset of data: stat_dens1d_filter(), stat_dens1d_labels(), stat_dens2d_filter()

Examples

random_string <-
  function(len = 6) {
    paste(sample(letters, len, replace = TRUE), collapse = "")
  }

# Make random data.
set.seed(1001)
d <- tibble::tibble(
  x = rnorm(100),
  y = rnorm(100),
  group = rep(c("A", "B"), c(50, 50)),
)
lab = replicate(100, { random_string() })

# using defaults
ggplot(data = d, aes(x, y, label = lab)) +
  geom_point() +
  stat_dens2d_labels()

# using defaults
ggplot(data = d, aes(x, y, label = lab)) +
  geom_point() +
  stat_dens2d_labels(geom = "text_s",
                    position = position_nudge_center(x = 0.1, y = 0.1,
                                                      center_x = mean,
                                                      center_y = mean),
                    vjust = "outward_mean", hjust = "outward_mean") +
  expand_limits(x = c(-4, 4.5))

ggrepel.installed <- requireNamespace("ggrepel", quietly = TRUE)
if (ggrepel.installed) {
  library(ggrepel)

  ggplot(data = d, aes(x, y, label = lab, colour = group)) +
  geom_point() +
  stat_dens2d_labels(geom = "text_repel")

  ggplot(data = d, aes(x, y, label = lab, colour = group)) +
  geom_point() +
  stat_dens2d_labels(geom = "text_repel", label.fill = NA)

  # we keep labels starting with "a" across the whole plot, but all in sparse
  # regions. To achieve this we pass as argument to label.fill a function
  # instead of a character string.
  label.fun <- function(x) {ifelse(grepl("^a", x), x, "")}
  ggplot(data = d, aes(x, y, label = lab, colour = group)) +
  geom_point() +
  stat_dens2d_labels(geom = "text_repel", label.fill = label.fun)
}

# Using geom_debug() we can see that all 100 rows in \code{d} are
# returned. But only those labelled in the previous example still contain
# the original labels.

gginnards.installed <- requireNamespace("gginnards", quietly = TRUE)
if (gginnards.installed) {
  library(gginnards)

  ggplot(data = d, aes(x, y, label = lab)) +
  geom_point() +
  stat_dens2d_labels(geom = "debug")
}
Description

`stat_fmt_tb` selects, reorders and/or renames columns and or rows of a tibble nested in data. This stat is intended to be used to pre-process tibble objects mapped to the label aesthetic before adding them to a plot with `geom_table`.

Usage

```r
stat_fmt_tb(
  mapping = NULL,
  data = NULL,
  geom = "table",
  tb.vars = NULL,
  tb.rows = NULL,
  digits = 3,
  position = "identity",
  table.theme = NULL,
  table.rownames = FALSE,
  table.colnames = TRUE,
  table.hjust = 0.5,
  parse = FALSE,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = TRUE,
  ...
)
```

Arguments

- `mapping`: The aesthetic mapping, usually constructed with `aes` or `aes_`. Only needs to be set at the layer level if you are overriding the plot defaults.
- `data`: A layer specific dataset - only needed if you want to override the plot defaults.
- `geom`: The geometric object to use display the data
- `tb.vars, tb.rows`: character or numeric vectors, optionally named, used to select and/or rename the columns or rows in the table returned.
- `digits`: integer indicating the number of significant digits to be retained in data.
- `position`: The position adjustment to use for overlapping points on this layer
- `table.theme`: NULL, list or function A gridExtra theme definition, or a constructor for a theme or NULL for default.
- `table.rownames, table.colnames`: logical flag to enable or disabling printing of row names and column names.
stat_fmt_tb

Table Horizontal justification for the core and column headings of the table.

parse
If TRUE, the labels will be parsed into expressions and displayed as described in ?plotmath.

na.rm
A logical indicating whether NA values should be stripped before the computation proceeds.

show.legend
Logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.

inherit.aes
If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders.

... other arguments passed on to layer. This can include aesthetics whose values you want to set, not map. See layer for more details.

Value
A plot layer instance. Using as output data a copy of the input data in which the data frames mapped to label have been modified.

Computed variables
The output of sequentially applying slice with tb.rows as argument and select with tb.vars to a list variable list mapped to label and containing a single tibble per row in data.

See Also
See geom_table for details on how tables respond to mapped aesthetics and table themes. For details on predefined table themes see ttheme_gtdefault.

Examples
my.df <-
tibble::tibble(
  x = c(1, 2),
  y = c(0, 4),
  group = c("A", "B"),
  a = tibble::tibble(Xa = 1:6, Y = rep(c("x", "y"), 3)),
  b = tibble::tibble(Xb = 1:3, Y = "x")
)

ggplot(my.df, aes(x, y, label = tbs)) +
  stat_fmt_tb() +
  expand_limits(x = c(0,3), y = c(-2, 6))

# Hide column names, display row names

ggplot(my.df, aes(x, y, label = tbs)) +
  stat_fmt_tb(table.colnames = FALSE,
              table.rownames = TRUE) +
  expand_limits(x = c(0,3), y = c(-2, 6))

# Use a theme for the table
stat_quadrant_counts

Number of observations in quadrants

description

stat_quadrant_counts() counts the number of observations in each quadrant of a plot panel. By default it adds a text label to the far corner of each quadrant. It can also be used to obtain the total number of observations in each of two pairs of quadrants or in the whole panel. Grouping is ignored, so in every case a single count is computed for each quadrant in a plot panel.

usage

stat_quadrant_counts(
  mapping = NULL,
  data = NULL,
  geom = "text_npc",
  position = "identity",
  quadrants = NULL,
  pool.along = "none",
  xintercept = 0,
  yintercept = 0,
  label.x = NULL,
  label.y = NULL,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = TRUE,
Arguments

- **mapping**: The aesthetic mapping, usually constructed with `aes` or `aes_*`. Only needs to be set at the layer level if you are overriding the plot defaults.
- **data**: A layer specific dataset - only needed if you want to override the plot defaults.
- **geom**: The geometric object to use display the data
- **position**: The position adjustment to use for overlapping points on this layer
- **quadrants**: integer vector indicating which quadrants are of interest, with a 0L indicating the whole plot.
- **pool.along**: character, one of "none", "x" or "y", indicating which quadrants to pool to calculate counts by pair of quadrants.
- **xintercept, yintercept**: numeric the coordinates of the origin of the quadrants.
- **label.x, label.y**: numeric Coordinates (in npc units) to be used for absolute positioning of the labels.
- **na.rm**: a logical indicating whether NA values should be stripped before the computation proceeds.
- **show.legend**: logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
- **inherit.aes**: If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and should not inherit behaviour from the default plot specification, e.g. `borders`.
- **...**: other arguments passed on to `layer`. This can include aesthetics whose values you want to set, not map. See `layer` for more details.

Details

This statistic can be used to automatically count observations in each of the four quadrants of a plot, and by default add these counts as text labels. Values exactly equal to `xintercept` or `yintercept` are counted together with those larger than the intercepts. An argument value of zero, passed to formal parameter `quadrants` is interpreted as a request for the count of all observations in each plot panel.

The default origin of quadrants is at `xintercept = 0, yintercept = 0`. Also by default, counts are computed for all quadrants within the $x$ and $y$ scale limits, but ignoring any marginal scale expansion. The default positions of the labels is in the farthest corner or edge of each quadrant using npc coordinates. Consequently, when using facets even with free limits for $x$ and $y$ axes, the location of the labels is consistent across panels. This is achieved by use of `geom = "text_npc"` or `geom = "label_npc"`. To pass the positions in native data units, pass `geom = "text"` explicitly as argument.

Value

A plot layer instance. Using as output data the counts of observations per plot quadrant.
Computed variables

Data frame with one to four rows, one for each quadrant for which counts are counted in data.

- **quadrant** integer, one of 0:4
- **x** x value of label position in data units
- **y** y value of label position in data units
- **npcx** x value of label position in npc units
- **npcy** y value of label position in npc units
- **count** number of observations

As shown in one example below `geom_debug` can be used to print the computed values returned by any statistic. The output shown includes also values mapped to aesthetics, like `label` in the example.

    pool.along = "x", yintercept = 10) +
  stat_quadrant_counts(colour = "blue", label.x = "right",
    pool.along = "x", yintercept = 10) +
  geom_point() +
  expand_limits(y = c(7, 13))

ggplot(my.data, aes(x, y)) +
  geom_point() +
  stat_quadrant_counts(quadrants = 0, label.x = "left", label.y = "bottom")

ggplot(my.data, aes(x, y)) +
  geom_point() +
  stat_quadrant_counts(geom = "text") # use "tex" instead
```

try_data_frame  
**Convert an R object into a tibble**

**Description**

This function tries to convert any R object into a data.frame object. If `x` is already a data.frame, it is returned as is. If it is a list or a vector it is converted by means of `as.data.frame()`. If of any other type, a conversion into an object of class `xts` is attempted by means of `try.xts()` and if successful the `xts` object is converted into a data frame with a variable time containing times as POSIXct and the remaining data columns with the time series data. In this conversion row names are stripped.

**Usage**

```r
try_data_frame(
  x,
  time.resolution = "month",
  as.numeric = FALSE,
  col.names = NULL
)
```

```r
try_tibble(x, time.resolution = "month", as.numeric = FALSE, col.names = NULL)
```

**Arguments**

- **x**  
  An R object
- **time.resolution**  
  character The time unit to which the returned time values will be rounded.
as.numeric logical If TRUE convert time to numeric, expressed as fractional calendar years.
col.names character vector

Value

A tibble::tibble object, derived from data.frame.

Warning!

The time zone was set to "UTC" by try.xts() in the test cases I used. Setting TZ to "UTC" can cause some trouble as several frequently used functions have as default the local or system TZ and will apply a conversion before printing or plotting time data, which in addition is affected by summer/winter time transitions. This should be taken into account as even for yearly data when conversion is to POSIXct a day (1st of January) will be set, but then shifted some hours if printed on a TZ different from "UTC". I recommend reading the documentation of package lubridate-package where the irregularities of time data and the difficulties they cause are very well described. In many cases when working with time series with yearly observations it is best to work with numeric values for years.

Note

This function can be used to easily convert time series data into a format that can be easily plotted with package ggplot2. try_tibble is another name for try_data_frame which tracks the separation and re-naming of data_frame into tibble::tibble in the imported packages.

Examples

```r
class(lynx)
try_tibble(lynx)
try_tibble(lynx, as.numeric = TRUE)
try_tibble(lynx, "year")
class(austres)
try_tibble(austres)
try_tibble(austres, as.numeric = TRUE)
try_tibble(austres, "quarter")
class(cars)
try_tibble(cars)
```

ttheme_gtdefault Table themes

Description

Additional theme constructors for use with geom_table.
**Usage**

```r
ttheme_gtdefault(
    base_size = 10,
    base_colour = "black",
    base_family = "",
    parse = FALSE,
    padding = unit(c(0.8, 0.6), "char"),
    ...
)

ttheme_gtminimal(
    base_size = 10,
    base_colour = "black",
    base_family = "",
    parse = FALSE,
    padding = unit(c(0.5, 0.4), "char"),
    ...
)

ttheme_gtbw(
    base_size = 10,
    base_colour = "black",
    base_family = "",
    parse = FALSE,
    padding = unit(c(1, 0.6), "char"),
    ...
)

ttheme_gtplain(
    base_size = 10,
    base_colour = "black",
    base_family = "",
    parse = FALSE,
    padding = unit(c(0.8, 0.6), "char"),
    ...
)

ttheme_gtdark(
    base_size = 10,
    base_colour = "grey90",
    base_family = "",
    parse = FALSE,
    padding = unit(c(0.8, 0.6), "char"),
    ...
)

ttheme_gtlight(
    base_size = 10,
```
Arguments

base_size numeric, default font size.
base_colour default font colour.
base_family default font family.
parse logical, default behaviour for parsing text as plotmath.
padding length-2 unit vector specifying the horizontal and vertical padding of text within each cell.
...

Details

Depending on the theme, the base_colour, which is mapped to the colour aesthetic if present, is applied to only the text elements, or to the text elements and rules. The difference is exemplified below.

Value

A list object that can be used as ttheme in the construction of tables with functions from package 'gridExtra'.
Note

These theme constructors are wrappers on `gridExtra::ttheme_default()` and `gridExtra::ttheme_minimal()`. They can also be used with `grid.table` if desired.

Examples

```r
library(dplyr)
library(tibble)

mtcars %>%
  group_by(cyl) %>%
  summarize(wt = mean(wt), mpg = mean(mpg)) %>%
  ungroup() %>%
  mutate(wt = sprintf("%.2f", wt),
         mpg = sprintf("%.1f", mpg)) -> tb

df <- tibble(x = 5.45, y = 34, tb = list(tb))

# Same as the default theme constructor
ggplot(mtcars, aes(wt, mpg, colour = factor(cyl))) +
  geom_point() +
  geom_table(data = df, aes(x = x, y = y, label = tb),
             table.theme = ttheme_gtdefault) +
  theme_classic()

# Minimal theme constructor
ggplot(mtcars, aes(wt, mpg, colour = factor(cyl))) +
  geom_point() +
  geom_table(data = df, aes(x = x, y = y, label = tb),
             table.theme = ttheme_gtminimal) +
  theme_classic()

# A theme with white background
ggplot(mtcars, aes(wt, mpg, colour = factor(cyl))) +
  geom_point() +
  geom_table(data = df, aes(x = x, y = y, label = tb),
             table.theme = ttheme_gtbw) +
  theme_bw()

# Default colour of theme superceded by aesthetic constant
ggplot(mtcars, aes(wt, mpg, colour = factor(cyl))) +
  geom_point() +
  geom_table(data = df, aes(x = x, y = y, label = tb),
             table.theme = ttheme_gtbw, colour = "darkblue") +
  theme_bw()

# A theme with dark background
ggplot(mtcars, aes(wt, mpg, colour = factor(cyl))) +
  geom_point() +
  geom_table(data = df, aes(x = x, y = y, label = tb),
             table.theme = ttheme_gtdark) +
  theme_dark()
```
ttheme_set

Set default table theme

Description

Set R option to the theme to use as current default. This function is implemented differently but is used in the same way as ggplot2::theme_set() but affects the default table-theme instead of the plot theme.

Usage

ttheme_set(table.theme = NULL)

Arguments

  table.theme  NULL, list or function A gridExtra ttheme definition, or a constructor for a theme or NULL for default.
theme_set

Value
A named list with the previous value of the option.

Note
The theme is set when a plot object is constructed, and consequently the option setting does not affect rendering of ready built plot objects.

Examples
library(dplyr)
library(tibble)

mtcars %>%
group_by(cyl) %>%
summarize(wt = mean(wt), mpg = mean(mpg)) %>%
ungroup() %>%
mutate(wt = sprintf("%.2f", wt),
       mpg = sprintf("%.1f", mpg)) -> tb

df <- tibble(x = 5.45, y = 34, tb = list(tb))

# Same as the default theme constructor
ggplot(mtcars, aes(wt, mpg, colour = factor(cyl))) +
geom_point() +
geom_table(data = df, aes(x = x, y = y, label = tb))

# set a new default
old_theme <- theme_set(theme_gstripes)

ggplot(mtcars, aes(wt, mpg, colour = factor(cyl))) +
geom_point() +
geom_table(data = df, aes(x = x, y = y, label = tb))

# restore previous setting
theme_set(old_theme)
