Package ‘ggquiver’

December 6, 2021

Version 0.3.2
Title Quiver Plots for 'ggplot2'
Description An extension of 'ggplot2' to provide quiver plots to visualise vector fields.
This functionality is implemented using a geom to produce a new graphical layer, which allows aesthetic options. This layer can be overlaid on a map to improve visualisation of mapped data.
Depends R (>= 3.2.0)
Imports ggplot2
Suggests dplyr, ggmap, maps, pkgdown, testthat

geom_quiver

Quiver plots for ggplot2

Description
Displays the direction and length of vectors on a graph.

Usage
geom_quiver(
  mapping = NULL,
  data = NULL,
  stat = "quiver",
  position = "identity",
  center = FALSE,
  rescale = FALSE,
  vecsize = NULL,
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE,
  ...
)

GeomQuiver

stat_quiver(
  mapping = NULL,
  data = NULL,
  geom = "quiver",
  position = "identity",
  center = FALSE,
  rescale = FALSE,
  vecsize = NULL,
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE,
  ...
)

StatQuiver

Arguments
mapping  Set of aesthetic mappings created by aes() or aes_. If specified and inherit.aes = TRUE (the default), it is combined with the default mapping at the top level of the plot. You must supply mapping if there is no plot mapping.
**geom_quiver**

- **data**
  The data to be displayed in this layer. There are three options:
  - If **NULL**, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
  - A data frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.
  - A function will be called with a single argument, the plot data. The return value must be a data frame, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x, 10)`).

- **stat**
  The statistical transformation to use on the data for this layer, as a string.

- **position**
  Position adjustment, either as a string, or the result of a call to a position adjustment function.

- **center**
  If **FALSE** (the default), the vector lines will start at the specified x and y. If **TRUE**, the arrows will be centered about x and y.

- **rescale**
  If **FALSE** (the default), the vectors will not be rescaled. If **TRUE**, the vectors given by (u, v) will be rescaled using the scale function.

- **vecsize**
  By default **NULL**, vectors sizing is automatically determined. If a grid can be identified, they will be scaled to the grid, if not, the vectors will not be scaled.
  By specifying a numeric input here, the length of all arrows can be adjusted. Setting vecsize to zero will prevent scaling the arrows.

- **na.rm**
  If **FALSE** (the default), removes missing values with a warning. If **TRUE** silently removes missing values.

- **show.legend**
  Logical. Should this layer be included in the legends? **NA**, the default, includes if any aesthetics are mapped. **FALSE** never includes, and **TRUE** always includes. It can also be a named logical vector to finely select the aesthetics to display.

- **inherit.aes**
  If **FALSE**, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. `borders()`.

- **...**
  Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.

- **geom**
  The geometric object to use display the data

**Format**

An object of class `GeomQuiver` (inherits from `GeomSegment`, `Geom`, `ggproto`, `gg`) of length 2.
An object of class `StatQuiver` (inherits from `Stat`, `ggproto`, `gg`) of length 3.

**Computed variables**

- `x` centered x start position for velocity arrow
- `y` centered y start position for velocity arrow
- `xend` centered x end position for velocity arrow
- `yend` centered y end position for velocity arrow
Examples

```
library(ggplot2)
# Quiver plots of mathematical functions
field <- expand.grid(x=seq(0,pi,pi/12), y=seq(0,pi,pi/12))
ggplot(field, aes(x=x,y=y,u=cos(x),v=sin(y))) +
  geom_quiver()

# Removing automatic scaling
ggplot(seals, aes(x=long, y=lat, u=delta_long, v=delta_lat)) +
  geom_quiver(vecsize=NULL) +
  borders("state")

# Centering arrows is useful for plotting on maps.
library(dplyr)
library(ggmap)
wind_data <- wind %>% filter(between(lon, -96, -93) & between(lat, 28.7, 30))
qmplot(lon, lat, data=wind_data, extent="panel", geom = "blank", zoom=8, maptype = "toner-lite") +
  geom_quiver(aes(u=delta_lon, v=delta_lat, colour = spd), center=TRUE)
```
