

Package ‘ggraph’

March 17, 2020

Type Package

Title An Implementation of Grammar of Graphics for Graphs and Networks

Version 2.0.2

Maintainer Thomas Lin Pedersen <thomasp85@gmail.com>

Description The grammar of graphics as implemented in ggplot2 is a poor fit for graph and network visualizations due to its reliance on tabular data input. ggraph is an extension of the ggplot2 API tailored to graph visualizations and provides the same flexible approach to building up plots layer by layer.

ggraph-package	<i>ggraph: An Implementation of Grammar of Graphics for Graphs and Networks</i>
----------------	---

Description

The grammar of graphics as implemented in ggplot2 is a poor fit for graph and network visualizations due to its reliance on tabular data input. ggraph is an extension of the ggplot2 API tailored to graph visualizations and provides the same flexible approach to building up plots layer by layer.

autograph

Quickplot wrapper for networks

Description

This function is intended to quickly show an overview of your network data. While it returns a `ggraph` object that layers etc can be added to it is limited in use and should not be used as a foundation for more complicated plots. It allows colour, labeling and sizing of nodes and edges, and the exact combination of layout and layers will depend on these as well as the features of the network. The output of this function may be fine-tuned at any release and should not be considered stable. If a plot should be reproducible it should be created manually.

Usage

```
autograph(graph, ...)

## Default S3 method:
autograph(
  graph,
  ...,
  node_colour = NULL,
  edge_colour = NULL,
  node_size = NULL,
  edge_width = NULL,
  node_label = NULL,
  edge_label = NULL
)
```

Arguments

```
graph          An object coercible to a tbl_graph
...            arguments passed on to methods
node_colour, edge_colour
               Colour mapping for nodes and edges
node_size, edge_width
               Size/width mapping for nodes and edges
node_label, edge_label
               Label mapping for nodes and edges
```

Examples

```
library(tidygraph)
gr <- create_notable('herschel') %>%
  mutate(class = sample(letters[1:3], n(), TRUE)) %E>%
  mutate(weight = runif(n()))

# Standard graph
```

```

autograph(gr)

# Adding node labels will cap edges
autograph(gr, node_label = class)

# Use tidygraph calls for mapping
autograph(gr, node_size = centrality_pagerank())

# Trees are plotted as dendrograms
iris_tree <- hclust(dist(iris[1:4]), method = 'euclidean'), method = 'ward.D2')
autograph(iris_tree)

```

facet_edges

Create small multiples based on edge attributes

Description

This function is equivalent to `ggplot2::facet_wrap()` but only facets edges. Nodes are repeated in every panel.

Usage

```

facet_edges(
  facets,
  nrow = NULL,
  ncol = NULL,
  scales = "fixed",
  shrink = TRUE,
  labeller = "label_value",
  as.table = TRUE,
  switch = NULL,
  drop = TRUE,
  dir = "h",
  strip.position = "top"
)

```

Arguments

facets	A set of variables or expressions quoted by <code>vars()</code> and defining faceting groups on the rows or columns dimension. The variables can be named (the names are passed to <code>labeller</code>). For compatibility with the classic interface, can also be a formula or character vector. Use either a one sided formula, <code>~a + b</code> , or a character vector, <code>c("a", "b")</code> .
nrow	Number of rows and columns.
ncol	Number of rows and columns.

scales	Should scales be fixed ("fixed", the default), free ("free"), or free in one dimension ("free_x", "free_y")?
shrink	If TRUE, will shrink scales to fit output of statistics, not raw data. If FALSE, will be range of raw data before statistical summary.
labeller	A function that takes one data frame of labels and returns a list or data frame of character vectors. Each input column corresponds to one factor. Thus there will be more than one with <code>vars(cyl, am)</code> . Each output column gets displayed as one separate line in the strip label. This function should inherit from the "labeller" S3 class for compatibility with <code>labeller()</code> . You can use different labeling functions for different kind of labels, for example use <code>label_parsed()</code> for formatting facet labels. <code>label_value()</code> is used by default, check it for more details and pointers to other options.
as.table	If TRUE, the default, the facets are laid out like a table with highest values at the bottom-right. If FALSE, the facets are laid out like a plot with the highest value at the top-right.
switch	By default, the labels are displayed on the top and right of the plot. If "x", the top labels will be displayed to the bottom. If "y", the right-hand side labels will be displayed to the left. Can also be set to "both".
drop	If TRUE, the default, all factor levels not used in the data will automatically be dropped. If FALSE, all factor levels will be shown, regardless of whether or not they appear in the data.
dir	Direction: either "h" for horizontal, the default, or "v", for vertical.
strip.position	By default, the labels are displayed on the top of the plot. Using <code>strip.position</code> it is possible to place the labels on either of the four sides by setting <code>strip.position = c("top", "bottom", "left", "right")</code>

See Also

Other ggraph-facets: [facet_graph\(\)](#), [facet_nodes\(\)](#)

Examples

```
gr <- tidygraph::as_tbl_graph(highschool)

ggraph(gr) +
  geom_edge_link() +
  geom_node_point() +
  facet_edges(~year)
```

Description

This function is equivalent to `ggplot2::facet_grid()` in that it allows for building a grid of small multiples where rows and columns correspond to a specific data value. While `ggplot2::facet_grid()` could be used it would lead to unexpected results as it is not possible to specify whether you are referring to a node or an edge attribute. Furthermore `ggplot2::facet_grid()` will draw edges in panels even though the panel does not contain both terminal nodes. `facet_graph` takes care of all of these issues, allowing you to define which data type the rows and columns are referencing as well as filtering the edges based on the nodes in each panel (even when nodes are not drawn).

Usage

```
facet_graph(
  facets,
  row_type = "edge",
  col_type = "node",
  margins = FALSE,
  scales = "fixed",
  space = "fixed",
  shrink = TRUE,
  labeller = "label_value",
  as.table = TRUE,
  switch = NULL,
  drop = TRUE
)
```

Arguments

<code>facets</code>	This argument is soft-deprecated, please use <code>rows</code> and <code>cols</code> instead.
<code>row_type</code> , <code>col_type</code>	Either 'node' or 'edge'. Which data type is being faceted in the rows and columns. Default is to facet on nodes column wise and on edges row wise.
<code>margins</code>	Either a logical value or a character vector. Margins are additional facets which contain all the data for each of the possible values of the faceting variables. If FALSE, no additional facets are included (the default). If TRUE, margins are included for all faceting variables. If specified as a character vector, it is the names of variables for which margins are to be created.
<code>scales</code>	Are scales shared across all facets (the default, "fixed"), or do they vary across rows ("free_x"), columns ("free_y"), or both rows and columns ("free")?
<code>space</code>	If "fixed", the default, all panels have the same size. If "free_y" their height will be proportional to the length of the y scale; if "free_x" their width will be proportional to the length of the x scale; or if "free" both height and width will vary. This setting has no effect unless the appropriate scales also vary.
<code>shrink</code>	If TRUE, will shrink scales to fit output of statistics, not raw data. If FALSE, will be range of raw data before statistical summary.
<code>labeller</code>	A function that takes one data frame of labels and returns a list or data frame of character vectors. Each input column corresponds to one factor. Thus there will be more than one with <code>vars(cyl, am)</code> . Each output column gets displayed

as one separate line in the strip label. This function should inherit from the "labeller" S3 class for compatibility with `labeller()`. You can use different labeling functions for different kind of labels, for example use `label_parsed()` for formatting facet labels. `label_value()` is used by default, check it for more details and pointers to other options.

<code>as.table</code>	If TRUE, the default, the facets are laid out like a table with highest values at the bottom-right. If FALSE, the facets are laid out like a plot with the highest value at the top-right.
<code>switch</code>	By default, the labels are displayed on the top and right of the plot. If "x", the top labels will be displayed to the bottom. If "y", the right-hand side labels will be displayed to the left. Can also be set to "both".
<code>drop</code>	If TRUE, the default, all factor levels not used in the data will automatically be dropped. If FALSE, all factor levels will be shown, regardless of whether or not they appear in the data.

See Also

Other ggraph-facets: `facet_edges()`, `facet_nodes()`

Examples

```
library(tidygraph)
gr <- as_tbl_graph(highschool) %>%
  mutate(popularity = as.character(cut(centrality_degree(mode = 'in'),
    breaks = 3,
    labels = c('low', 'medium', 'high')
  )))
ggraph(gr) +
  geom_edge_link() +
  geom_node_point() +
  facet_graph(year ~ popularity)
```

facet_nodes

Create small multiples based on node attributes

Description

This function is equivalent to `ggplot2::facet_wrap()` but only facets nodes. Edges are drawn if their terminal nodes are both present in a panel.

Usage

```
facet_nodes(
  facets,
  nrow = NULL,
  ncol = NULL,
  scales = "fixed",
```

```

shrink = TRUE,
labeller = "label_value",
as.table = TRUE,
switch = NULL,
drop = TRUE,
dir = "h",
strip.position = "top"
)

```

Arguments

facets	<p>A set of variables or expressions quoted by <code>vars()</code> and defining faceting groups on the rows or columns dimension. The variables can be named (the names are passed to <code>labeller</code>).</p> <p>For compatibility with the classic interface, can also be a formula or character vector. Use either a one sided formula, $\sim a + b$, or a character vector, <code>c("a", "b")</code>.</p>
nrow	Number of rows and columns.
ncol	Number of rows and columns.
scales	Should scales be fixed ("fixed", the default), free ("free"), or free in one dimension ("free_x", "free_y")?
shrink	If TRUE, will shrink scales to fit output of statistics, not raw data. If FALSE, will be range of raw data before statistical summary.
labeller	<p>A function that takes one data frame of labels and returns a list or data frame of character vectors. Each input column corresponds to one factor. Thus there will be more than one with <code>vars(cyl, am)</code>. Each output column gets displayed as one separate line in the strip label. This function should inherit from the "labeller" S3 class for compatibility with <code>labeller()</code>. You can use different labeling functions for different kind of labels, for example use <code>label_parsed()</code> for formatting facet labels. <code>label_value()</code> is used by default, check it for more details and pointers to other options.</p>
as.table	If TRUE, the default, the facets are laid out like a table with highest values at the bottom-right. If FALSE, the facets are laid out like a plot with the highest value at the top-right.
switch	By default, the labels are displayed on the top and right of the plot. If "x", the top labels will be displayed to the bottom. If "y", the right-hand side labels will be displayed to the left. Can also be set to "both".
drop	If TRUE, the default, all factor levels not used in the data will automatically be dropped. If FALSE, all factor levels will be shown, regardless of whether or not they appear in the data.
dir	Direction: either "h" for horizontal, the default, or "v", for vertical.
strip.position	By default, the labels are displayed on the top of the plot. Using <code>strip.position</code> it is possible to place the labels on either of the four sides by setting <code>strip.position = c("top", "bottom", "left", "right")</code>

  facet_nodes(~popularity)
```

flare

The class hierarchy of the flare visualization library

Description

This dataset contains the graph that describes the class hierarchy for the **Flare** ActionScript visualization library. It contains both the class hierarchy as well as the import connections between classes. This dataset has been used extensively in the D3.js documentation and examples and are included here to make it easy to redo the examples in ggraph.

Usage

flare

Format

A list of three data.frames describing the software structure of flare:

edges This data.frame maps the hierarchical structure of the class hierarchy as an edgelist, with the class in from being the superclass of the class in to.

vertices This data.frame gives additional information on the classes. It contains the full name, size and short name of each class.

imports This data.frame contains the class imports for each class implementation. The from column gives the importing class and the to column gives the import.

Source

The data have been adapted from the JSON downloaded from <https://gist.github.com/mbostock/1044242#file-readme-flare-imports-json> courtesy of Mike Bostock. The Flare framework is the work of the [UC Berkeley Visualization Lab](#).

Description

This set of functions makes it easy to define shapes at the terminal points of edges that are used to shorten the edges. The shapes themselves are not drawn, but the edges will end at the boundary of the shape rather than at the node position. This is especially relevant when drawing arrows at the edges as the arrows will be partly obscured by the node unless the edge is shortened. Edge shortening is dynamic and will update as the plot is resized, making sure that the capping remains at an absolute distance to the end point.

Usage

```

geometry(
  type = "circle",
  width = 1,
  height = width,
  width_unit = "cm",
  height_unit = width_unit
)

circle(radius = 1, unit = "cm")

square(length = 1, unit = "cm")

ellipsis(a = 1, b = 1, a_unit = "cm", b_unit = a_unit)

rectangle(width = 1, height = 1, width_unit = "cm", height_unit = width_unit)

label_rect(label, padding = margin(1, 1, 1.5, 1, "mm"), ...)

is.geometry(x)

```

Arguments

type	The type of geometry to use. Currently 'circle' and 'rect' is supported.
width, height, length, radius, a, b	The dimensions of the shape.
unit, width_unit, height_unit, a_unit, b_unit	The unit for the numbers given.
label	The text to be enclosed
padding	extra size to be added around the text using the <code>ggplot2::margin()</code> function
...	Passed on to <code>grid::gpar()</code>
x	An object to test for geometry inheritance

Details

geometry is the base constructor, while the rest are helpers to save typing. circle creates circles with a given radius, square creates squares at a given side length, ellipsis creates ellipses with given a and b values (width and height radii), and rectangle makes rectangles of a given width and height. label_rect is a helper that, given a list of strings and potentially formatting options creates a rectangle that encloses the string.

Value

A geometry object encoding the specified shape.

Examples

```
geometry(c('circle', 'rect', 'rect'), 1:3, 3:1)

circle(1:4, 'mm')

label_rect(c('some', 'different', 'words'), fontsize = 18)
```

geom_axis_hive

Draw rectangular bars and labels on hive axes

Description

This function lets you annotate the axes in a hive plot with labels and color coded bars.

Usage

```
geom_axis_hive(
  mapping = NULL,
  data = NULL,
  position = "identity",
  label = TRUE,
  axis = TRUE,
  show.legend = NA,
  ...
)
```

Arguments

mapping	Set of aesthetic mappings created by <code>aes()</code> or <code>aes_()</code> . If specified and <code>inherit.aes = TRUE</code> (the default), it is combined with the default mapping at the top level of the plot. You must supply mapping if there is no plot mapping.
data	The data to be displayed in this layer. There are three options: If <code>NULL</code> , the default, the data is inherited from the plot data as specified in the call to <code>ggplot()</code> .

A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.

A function will be called with a single argument, the plot data. The return value must be a `data.frame`, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x, 10)`).

<code>position</code>	Position adjustment, either as a string, or the result of a call to a position adjustment function.
<code>label</code>	Should the axes be labelled. Defaults to TRUE
<code>axis</code>	Should a rectangle be drawn along the axis. Defaults to TRUE
<code>show.legend</code>	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
<code>...</code>	Other arguments passed on to <code>layer()</code> . These are often aesthetics, used to set an aesthetic to a fixed value, like <code>colour = "red"</code> or <code>size = 3</code> . They may also be parameters to the paired geom/stat.

Aesthetics

`geom_axis_hive` understand the following aesthetics.

- `alpha`
- `colour`
- `fill`
- `size`
- `linetype`
- `label_size`
- `family`
- `fontface`
- `lineheight`

Author(s)

Thomas Lin Pedersen

Examples

```
# Plot the flare import graph as a hive plot
library(tidygraph)
flareGr <- as_tbl_graph(flare$imports) %>%
  mutate(
    type = dplyr::case_when(
      centrality_degree(mode = 'in') == 0 ~ 'Source',
      centrality_degree(mode = 'out') == 0 ~ 'Sink',
      TRUE ~ 'Both'
    )
  )
```

```

) %>%
activate(edges) %>%
mutate(
  type = dplyr::case_when(
    grepl('flare.analytics', paste(.N())$name[from], .N())$name[to])) ~ 'Analytics',
    TRUE ~ 'Other'
  )
)
ggraph(flareGr, 'hive', axis = type) +
  geom_edge_hive(aes(colour = type), edge_alpha = 0.1) +
  geom_axis_hive(aes(colour = type)) +
  coord_fixed()

```

geom_conn_bundle

Create hierarchical edge bundles between node connections

Description

Hierarchical edge bundling is a technique to introduce some order into the hairball structure that can appear when there's a lot of overplotting and edge crossing in a network plot. The concept requires that the network has an intrinsic hierarchical structure that defines the layout but is not shown. Connections between points (that is, not edges) are then drawn so that they loosely follows the underlying hierarchical structure. This results in a flow-like structure where lines that partly move in the same direction will be bundled together.

Usage

```

geom_conn_bundle(
  mapping = NULL,
  data = get_con(),
  position = "identity",
  arrow = NULL,
  lineend = "butt",
  show.legend = NA,
  n = 100,
  tension = 0.8,
  ...
)

```

```

geom_conn_bundle2(
  mapping = NULL,
  data = get_con(),
  position = "identity",
  arrow = NULL,
  lineend = "butt",
  show.legend = NA,
  n = 100,
  tension = 0.8,
)

```

```

    ...
  )

geom_conn_bundle0(
  mapping = NULL,
  data = get_con(),
  position = "identity",
  arrow = NULL,
  lineend = "butt",
  show.legend = NA,
  tension = 0.8,
  ...
)

```

Arguments

mapping	Set of aesthetic mappings created by <code>ggplot2::aes()</code> or <code>ggplot2::aes_()</code> . By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.
data	The result of a call to <code>get_con()</code>
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
arrow	Arrow specification, as created by <code>grid::arrow()</code> .
lineend	Line end style (round, butt, square).
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
n	The number of points to create along the path.
tension	How "loose" should the bundles be. 1 will give very tight bundles, while 0 will turn of bundling completely and give straight lines. Defaults to 0.8
...	Other arguments passed on to <code>layer()</code> . These are often aesthetics, used to set an aesthetic to a fixed value, like <code>colour = "red"</code> or <code>size = 3</code> . They may also be parameters to the paired geom/stat.

Aesthetics

`geom_conn_bundle*` understands the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x**
- **y**
- **group**
- **circular**
- edge_colour
- edge_width

- edge_linetype
- edge_alpha
- filter

Computed variables

index The position along the path (not computed for the *0 version)

Note

In order to avoid excessive typing edge aesthetic names are automatically expanded. Because of this it is not necessary to write edge_colour within the aes() call as colour will automatically be renamed appropriately.

Examples

```
# Create a graph of the flare class system
library(tidygraph)
flareGraph <- tbl_graph(flare$vertices, flare$edges) %>%
  mutate(
    class = map_bfs_chr(node_is_root(), .f = function(node, dist, path, ...) {
      if (dist <= 1) {
        return(shortName[node])
      }
      path$result[[nrow(path)]]
    })
  )
importFrom <- match(flare$imports$from, flare$vertices$name)
importTo <- match(flare$imports$to, flare$vertices$name)

# Use class inheritance for layout but plot class imports as bundles
ggraph(flareGraph, 'dendrogram', circular = TRUE) +
  geom_conn_bundle(aes(colour = stat(index)),
    data = get_con(importFrom, importTo),
    edge_alpha = 0.25
  ) +
  geom_node_point(aes(filter = leaf, colour = class)) +
  scale_edge_colour_distiller('', direction = 1, guide = 'edge_direction') +
  coord_fixed() +
  ggforce::theme_no_axes()
```

`geom_edge_arc`*Draw edges as Arcs*

Description

This geom is mainly intended for arc linear and circular diagrams (i.e. used together with `layout_tbl_graph_linear()`), though it can be used elsewhere. It draws edges as arcs with a height proportional to the distance between the nodes. Arcs are calculated as beziers. For linear layout the placement of control points are related to the curvature argument and the distance between the two nodes. For circular layout the control points are placed on the same angle as the start and end node at a distance related to the distance between the nodes.

Usage

```
geom_edge_arc(  
  mapping = NULL,  
  data = get_edges(),  
  position = "identity",  
  arrow = NULL,  
  strength = 1,  
  n = 100,  
  fold = FALSE,  
  lineend = "butt",  
  linejoin = "round",  
  linemitre = 1,  
  label_colour = "black",  
  label_alpha = 1,  
  label_parse = FALSE,  
  check_overlap = FALSE,  
  angle_calc = "rot",  
  force_flip = TRUE,  
  label_dodge = NULL,  
  label_push = NULL,  
  show.legend = NA,  
  ...,  
  curvature  
)  
  
geom_edge_arc2(  
  mapping = NULL,  
  data = get_edges("long"),  
  position = "identity",  
  arrow = NULL,  
  strength = 1,  
  n = 100,  
  fold = FALSE,  
  lineend = "butt",
```

```

    linejoin = "round",
    linemitre = 1,
    label_colour = "black",
    label_alpha = 1,
    label_parse = FALSE,
    check_overlap = FALSE,
    angle_calc = "rot",
    force_flip = TRUE,
    label_dodge = NULL,
    label_push = NULL,
    show.legend = NA,
    ...,
    curvature
)

geom_edge_arc0(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  strength = 1,
  lineend = "butt",
  show.legend = NA,
  fold = fold,
  ...,
  curvature
)

```

Arguments

mapping	Set of aesthetic mappings created by <code>ggplot2::aes()</code> or <code>ggplot2::aes_()</code> . By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.
data	The return of a call to <code>get_edges()</code> or a data.frame giving edges in correct format (see details for for guidance on the format). See <code>get_edges()</code> for more details on edge extraction.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
arrow	Arrow specification, as created by <code>grid::arrow()</code> .
strength	The bend of the curve. 1 approximates a halfcircle while 0 will give a straight line. Negative number will change the direction of the curve. Only used if <code>circular = FALSE</code> .
n	The number of points to create along the path.
fold	Logical. Should arcs appear on the same side of the nodes despite different directions. Default to FALSE.
lineend	Line end style (round, butt, square).

linejoin	Line join style (round, mitre, bevel).
linemitre	Line mitre limit (number greater than 1).
label_colour	The colour of the edge label. If NA it will use the colour of the edge.
label_alpha	The opacity of the edge label. If NA it will use the opacity of the edge.
label_parse	If TRUE, the labels will be parsed into expressions and displayed as described in grDevices::plotmath() .
check_overlap	If TRUE, text that overlaps previous text in the same layer will not be plotted. <code>check_overlap</code> happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling <code>geom_label()</code> or <code>geom_text()</code> .
angle_calc	Either 'none', 'along', or 'across'. If 'none' the label will use the angle aesthetic of the geom. If 'along' The label will be written along the edge direction. If 'across' the label will be written across the edge direction.
force_flip	Logical. If <code>angle_calc</code> is either 'along' or 'across' should the label be flipped if it is on it's head. Default to TRUE.
label_dodge	A grid::unit() giving a fixed vertical shift to add to the label in case of <code>angle_calc</code> is either 'along' or 'across'
label_push	A grid::unit() giving a fixed horizontal shift to add to the label in case of <code>angle_calc</code> is either 'along' or 'across'
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
...	Other arguments passed on to layer() . These are often aesthetics, used to set an aesthetic to a fixed value, like <code>colour = "red"</code> or <code>size = 3</code> . They may also be parameters to the paired geom/stat.
curvature	Deprecated. Use <code>strength</code> instead.

Aesthetics

`geom_edge_arc` and `geom_edge_arc0` understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x**
- **y**
- **xend**
- **yend**
- **circular**
- edge_colour
- edge_width
- edge_linetype
- edge_alpha
- filter

geom_edge_arc2 understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x**
- **y**
- **group**
- **circular**
- edge_colour
- edge_width
- edge_linetype
- edge_alpha
- filter

geom_edge_arc and geom_edge_arc2 furthermore takes the following aesthetics.

- start_cap
- end_cap
- label
- label_pos
- label_size
- angle
- hjust
- vjust
- family
- fontface
- lineheight

Computed variables

index The position along the path (not computed for the *0 version)

Edge variants

Many geom_edge_* layers comes in 3 flavors depending on the level of control needed over the drawing. The default (no numeric postfix) generate a number of points (n) along the edge and draws it as a path. Each point along the line has a numeric value associated with it giving the position along the path, and it is therefore possible to show the direction of the edge by mapping to this e.g. colour = stat(index). The version postfixed with a "2" uses the "long" edge format (see [get_edges\(\)](#)) and makes it possible to interpolate node parameter between the start and end node along the edge. It is considerable less performant so should only be used if this is needed. The version postfixed with a "0" draws the edge in the most performant way, often directly using an appropriate grob from the grid package, but does not allow for gradients along the edge.

Often it is beneficial to stop the drawing of the edge before it reaches the node, for instance in cases where an arrow should be drawn and the arrowhead shouldn't lay on top or below the node point.

geom_edge_* and geom_edge_*2 supports this through the start_cap and end_cap aesthetics that takes a `geometry()` specification and dynamically caps the termini of the edges based on the given specifications. This means that if `end_cap = circle(1, 'cm')` the edges will end at a distance of 1cm even during resizing of the plot window.

All geom_edge_* and geom_edge_*2 have the ability to draw a label along the edge. The reason this is not a separate geom is that in order for the label to know the location of the edge it needs to know the edge type etc. Labels are drawn by providing a label aesthetic. The label_pos can be used to specify where along the edge it should be drawn by supplying a number between 0 and 1. The label_size aesthetic can be used to control the size of the label. Often it is needed to have the label written along the direction of the edge, but since the actual angle is dependent on the plot dimensions this cannot be calculated beforehand. Using the angle_calc argument allows you to specify whether to use the supplied angle aesthetic or whether to draw the label along or across the edge.

Edge aesthetic name expansion

In order to avoid excessive typing edge aesthetic names are automatically expanded. Because of this it is not necessary to write `edge_colour` within the `aes()` call as `colour` will automatically be renamed appropriately.

  angle_calc = "rot",
  force_flip = TRUE,
  label_dodge = NULL,
  label_push = NULL,
  show.legend = NA,
  ...
)

geom_edge_bend2(
  mapping = NULL,
  data = get_edges("long"),
  position = "identity",
  arrow = NULL,
  strength = 1,
  flipped = FALSE,
  n = 100,
  lineend = "butt",
  linejoin = "round",
  linemitre = 1,
```

```

    label_colour = "black",
    label_alpha = 1,
    label_parse = FALSE,
    check_overlap = FALSE,
    angle_calc = "rot",
    force_flip = TRUE,
    label_dodge = NULL,
    label_push = NULL,
    show.legend = NA,
    ...
)

geom_edge_bend0(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  strength = 1,
  flipped = FALSE,
  lineend = "butt",
  show.legend = NA,
  ...
)

```

Arguments

mapping	Set of aesthetic mappings created by <code>ggplot2::aes()</code> or <code>ggplot2::aes_()</code> . By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.
data	The return of a call to <code>get_edges()</code> or a data.frame giving edges in correct format (see details for for guidance on the format). See <code>get_edges()</code> for more details on edge extraction.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
arrow	Arrow specification, as created by <code>grid::arrow()</code> .
strength	The strength of the curvature of the bend. 0 will result in a straight line while 1 will give a strong arc.
flipped	Logical, Has the layout been flipped by reassigning the mapping of x, y etc?
n	The number of points to create along the path.
lineend	Line end style (round, butt, square).
linejoin	Line join style (round, mitre, bevel).
linemitre	Line mitre limit (number greater than 1).
label_colour	The colour of the edge label. If NA it will use the colour of the edge.
label_alpha	The opacity of the edge label. If NA it will use the opacity of the edge.
label_parse	If TRUE, the labels will be parsed into expressions and displayed as described in <code>grDevices::plotmath()</code> .

check_overlap	If TRUE, text that overlaps previous text in the same layer will not be plotted. check_overlap happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling geom_label() or geom_text().
angle_calc	Either 'none', 'along', or 'across'. If 'none' the label will use the angle aesthetic of the geom. If 'along' The label will be written along the edge direction. If 'across' the label will be written across the edge direction.
force_flip	Logical. If angle_calc is either 'along' or 'across' should the label be flipped if it is on it's head. Default to TRUE.
label_dodge	A <code>grid::unit()</code> giving a fixed vertical shift to add to the label in case of angle_calc is either 'along' or 'across'
label_push	A <code>grid::unit()</code> giving a fixed horizontal shift to add to the label in case of angle_calc is either 'along' or 'across'
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
...	Other arguments passed on to <code>layer()</code> . These are often aesthetics, used to set an aesthetic to a fixed value, like <code>colour = "red"</code> or <code>size = 3</code> . They may also be parameters to the paired geom/stat.

```

`geom_edge_density` *Show edges as a density map*

Description

This geom makes it possible to add a layer showing edge presence as a density map. Each edge is converted to `n` points along the line and a jitter is applied. Based on this dataset a two-dimensional kernel density estimation is applied and plotted as a raster image. The density is mapped to the `alpha` level, making it possible to map a variable to the fill.

Usage

```
geom_edge_density(
  mapping = NULL,
  data = get_edges("short"),
  position = "identity",
  show.legend = NA,
  n = 100,
  ...
)
```

Arguments

mapping	Set of aesthetic mappings created by <code>ggplot2::aes()</code> or <code>ggplot2::aes_()</code> . By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.
data	The return of a call to <code>get_edges()</code> or a data.frame giving edges in correct format (see details for for guidance on the format). See <code>get_edges()</code> for more details on edge extraction.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
n	The number of points to estimate in the x and y direction, i.e. the resolution of the raster.
...	Other arguments passed on to <code>layer()</code> . These are often aesthetics, used to set an aesthetic to a fixed value, like <code>colour = "red"</code> or <code>size = 3</code> . They may also be parameters to the paired geom/stat.

Aesthetics

`geom_edge_density` understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

x y xend yend `edge_fill` filter

Computed variables

x, y The coordinates for each pixel in the raster

density The density associated with the pixel

Edge aesthetic name expansion

In order to avoid excessive typing edge aesthetic names are automatically expanded. Because of this it is not necessary to write `edge_colour` within the `aes()` call as `colour` will automatically be renamed appropriately.

Examples

```
require(tidygraph)
gr <- create_notable('bull') %>%
  activate(edges) %>%
  mutate(class = sample(letters[1:3], n(), replace = TRUE))

ggraph(gr, 'stress') +
  geom_edge_density(aes(fill = class)) +
  geom_edge_link() + geom_node_point()
```

geom_edge_diagonal *Draw edges as diagonals*

Description

This geom draws edges as diagonal bezier curves. The name comes from D3.js where this shape was called diagonals until it was renamed to **links**. A diagonal in this context is a quadratic bezier with the control points positioned halfway between the start and end points but on the same axis. This produces a pleasing fan-in, fan-out line that is mostly relevant for hierarchical layouts as it implies an overall directionality in the plot.

Usage

```
geom_edge_diagonal(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  strength = 1,
  flipped = FALSE,
  n = 100,
  lineend = "butt",
  linejoin = "round",
  linemitre = 1,
  label_colour = "black",
  label_alpha = 1,
  label_parse = FALSE,
```

```
    check_overlap = FALSE,
    angle_calc = "rot",
    force_flip = TRUE,
    label_dodge = NULL,
    label_push = NULL,
    show.legend = NA,
    ...
)

geom_edge_diagonal2(
  mapping = NULL,
  data = get_edges("long"),
  position = "identity",
  arrow = NULL,
  strength = 1,
  flipped = FALSE,
  n = 100,
  lineend = "butt",
  linejoin = "round",
  linemitre = 1,
  label_colour = "black",
  label_alpha = 1,
  label_parse = FALSE,
  check_overlap = FALSE,
  angle_calc = "rot",
  force_flip = TRUE,
  label_dodge = NULL,
  label_push = NULL,
  show.legend = NA,
  ...
)

geom_edge_diagonal0(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  strength = 1,
  flipped = FALSE,
  lineend = "butt",
  show.legend = NA,
  ...
)
```

Arguments

mapping Set of aesthetic mappings created by `ggplot2::aes()` or `ggplot2::aes_()`. By default `x`, `y`, `xend`, `yend`, `group` and `circular` are mapped to `x`, `y`, `xend`, `yend`, `edge.id` and `circular` in the edge data.

data	The return of a call to <code>get_edges()</code> or a <code>data.frame</code> giving edges in correct format (see details for for guidance on the format). See <code>get_edges()</code> for more details on edge extraction.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
arrow	Arrow specification, as created by <code>grid::arrow()</code> .
strength	The strength of the curvature of the diagonal. 0 will result in a straight line while 1 will give the familiar S-shape.
flipped	Logical, Has the layout been flipped by reassigning the mapping of x, y etc?
n	The number of points to create along the path.
lineend	Line end style (round, butt, square).
linejoin	Line join style (round, mitre, bevel).
linemitre	Line mitre limit (number greater than 1).
label_colour	The colour of the edge label. If NA it will use the colour of the edge.
label_alpha	The opacity of the edge label. If NA it will use the opacity of the edge.
label_parse	If TRUE, the labels will be parsed into expressions and displayed as described in <code>grDevices::plotmath()</code> .
check_overlap	If TRUE, text that overlaps previous text in the same layer will not be plotted. <code>check_overlap</code> happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling <code>geom_label()</code> or <code>geom_text()</code> .
angle_calc	Either 'none', 'along', or 'across'. If 'none' the label will use the angle aesthetic of the geom. If 'along' The label will be written along the edge direction. If 'across' the label will be written across the edge direction.
force_flip	Logical. If <code>angle_calc</code> is either 'along' or 'across' should the label be flipped if it is on it's head. Default to TRUE.
label_dodge	A <code>grid::unit()</code> giving a fixed vertical shift to add to the label in case of <code>angle_calc</code> is either 'along' or 'across'
label_push	A <code>grid::unit()</code> giving a fixed horizontal shift to add to the label in case of <code>angle_calc</code> is either 'along' or 'across'
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
...	Other arguments passed on to <code>layer()</code> . These are often aesthetics, used to set an aesthetic to a fixed value, like <code>colour = "red"</code> or <code>size = 3</code> . They may also be parameters to the paired geom/stat.

Aesthetics

`geom_edge_diagonal` and `geom_edge_diagonal0` understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x**

- **y**
- **xend**
- **yend**
- **circular**
- edge_colour
- edge_width
- edge_linetype
- edge_alpha
- filter

geom_edge_diagonal2 understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x**
- **y**
- **group**
- **circular**
- edge_colour
- edge_width
- edge_linetype
- edge_alpha
- filter

geom_edge_diagonal and *geom_edge_diagonal2* furthermore takes the following aesthetics.

- start_cap
- end_cap
- label
- label_pos
- label_size
- angle

```

geom_edge_elbow *Draw edges as elbows*

Description

This geom draws edges as an angle in the same manner as known from classic dendrogram plots of hierarchical clustering results. In case a circular transformation has been applied the first line segment will be drawn as an arc as expected. This geom is only applicable to layouts that return a direction for the edges (currently `layout_tbl_graph_dendrogram()`, `layout_tbl_graph_partition()` and `layout_tbl_graph_igraph()` with the "tree" algorithm).

Usage

```

geom_edge_elbow(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  strength = 1,
  flipped = FALSE,
  n = 100,
  lineend = "butt",
  linejoin = "round",
  linemitre = 1,
  label_colour = "black",
  label_alpha = 1,
  label_parse = FALSE,
  check_overlap = FALSE,
  angle_calc = "rot",
  force_flip = TRUE,
  label_dodge = NULL,
  label_push = NULL,
  show.legend = NA,
  ...
)

geom_edge_elbow2(
  mapping = NULL,

```

```

data = get_edges("long"),
position = "identity",
arrow = NULL,
strength = 1,
flipped = FALSE,
n = 100,
lineend = "butt",
linejoin = "round",
linemitre = 1,
label_colour = "black",
label_alpha = 1,
label_parse = FALSE,
check_overlap = FALSE,
angle_calc = "rot",
force_flip = TRUE,
label_dodge = NULL,
label_push = NULL,
show.legend = NA,
...
)

geom_edge_elbow(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  flipped = FALSE,
  lineend = "butt",
  show.legend = NA,
  ...
)

```

Arguments

mapping	Set of aesthetic mappings created by <code>ggplot2::aes()</code> or <code>ggplot2::aes_()</code> . By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.
data	The return of a call to <code>get_edges()</code> or a data.frame giving edges in correct format (see details for for guidance on the format). See <code>get_edges()</code> for more details on edge extraction.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
arrow	Arrow specification, as created by <code>grid::arrow()</code> .
strength	How bend the elbow should be. 1 will give a right angle, while 0 will give a straight line. Ignored for circular layouts
flipped	Logical, Has the layout been flipped by reassigning the mapping of x, y etc?
n	The number of points to create along the path.

lineend	Line end style (round, butt, square).
linejoin	Line join style (round, mitre, bevel).
linemitre	Line mitre limit (number greater than 1).
label_colour	The colour of the edge label. If NA it will use the colour of the edge.
label_alpha	The opacity of the edge label. If NA it will use the opacity of the edge.
label_parse	If TRUE, the labels will be parsed into expressions and displayed as described in <code>grDevices::plotmath()</code> .
check_overlap	If TRUE, text that overlaps previous text in the same layer will not be plotted. <code>check_overlap</code> happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling <code>geom_label()</code> or <code>geom_text()</code> .
angle_calc	Either 'none', 'along', or 'across'. If 'none' the label will use the angle aesthetic of the geom. If 'along' The label will be written along the edge direction. If 'across' the label will be written across the edge direction.
force_flip	Logical. If <code>angle_calc</code> is either 'along' or 'across' should the label be flipped if it is on it's head. Default to TRUE.
label_dodge	A <code>grid::unit()</code> giving a fixed vertical shift to add to the label in case of <code>angle_calc</code> is either 'along' or 'across'
label_push	A <code>grid::unit()</code> giving a fixed horizontal shift to add to the label in case of <code>angle_calc</code> is either 'along' or 'across'
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
...	Other arguments passed on to <code>layer()</code> . These are often aesthetics, used to set an aesthetic to a fixed value, like <code>colour = "red"</code> or <code>size = 3</code> . They may also be parameters to the paired geom/stat.

Aesthetics

`geom_edge_elbow` and `geom_edge_elbow0` understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x**
- **y**
- **xend**
- **yend**
- **circular**
- **direction**
- edge_colour
- edge_width
- edge_linetype
- edge_alpha

- filter

geom_edge_elbow2 understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x**
- **y**
- **group**
- **circular**
- **direction**
- edge_colour
- edge_width
- edge_linetype
- edge_alpha
- filter

geom_edge_elbow and geom_edge_elbow2 furthermore takes the following aesthetics.

- start_cap
- end_cap
- label
- label_pos
- label_size
- angle
- hjust
- vjust
- family
- fontface
- lineheight

Computed variables

index The position along the path (not computed for the *0 version)

Edge variants

Many geom_edge_* layers comes in 3 flavors depending on the level of control needed over the drawing. The default (no numeric postfix) generate a number of points (n) along the edge and draws it as a path. Each point along the line has a numeric value associated with it giving the position along the path, and it is therefore possible to show the direction of the edge by mapping to this e.g. colour = stat(index). The version postfix with a "2" uses the "long" edge format (see [get_edges\(\)](#)) and makes it possible to interpolate node parameter between the start and end node along the edge. It is considerable less performant so should only be used if this is needed. The version postfix with a "0" draws the edge in the most performant way, often directly using an appropriate grob from the grid package, but does not allow for gradients along the edge.

Often it is beneficial to stop the drawing of the edge before it reaches the node, for instance in cases where an arrow should be drawn and the arrowhead shouldn't lay on top or below the node point. `geom_edge_*` and `geom_edge_*2` supports this through the `start_cap` and `end_cap` aesthetics that takes a `geometry()` specification and dynamically caps the termini of the edges based on the given specifications. This means that if `end_cap = circle(1, 'cm')` the edges will end at a distance of 1cm even during resizing of the plot window.

All `geom_edge_*` and `geom_edge_*2` have the ability to draw a label along the edge. The reason this is not a separate geom is that in order for the label to know the location of the edge it needs to know the edge type etc. Labels are drawn by providing a label aesthetic. The `label_pos` can be used to specify where along the edge it should be drawn by supplying a number between 0 and 1. The `label_size` aesthetic can be used to control the size of the label. Often it is needed to have the label written along the direction of the edge, but since the actual angle is dependent on the plot dimensions this cannot be calculated beforehand. Using the `angle_calc` argument allows you to specify whether to use the supplied angle aesthetic or whether to draw the label along or across the edge.

Edge aesthetic name expansion

In order to avoid excessive typing edge aesthetic names are automatically expanded. Because of this it is not necessary to write `edge_colour` within the `aes()` call as `colour` will automatically be renamed appropriately.

ggraph(irisDen, 'dendrogram', height = height) +
  geom_edge_elbow0(aes(colour = class))
```

`geom_edge_fan`*Draw edges as curves of different curvature*

Description

This geom draws edges as cubic beziers with the control point positioned half-way between the nodes and at an angle dependent on the presence of parallel edges. This results in parallel edges being drawn in a non-overlapping fashion resembling the standard approach used in `igraph::plot.igraph()`. Before calculating the curvature the edges are sorted by direction so that edges going the same way will be adjacent. This geom is currently the only choice for non-simple graphs if edges should not be overplotted.

Usage

```
geom_edge_fan(  
  mapping = NULL,  
  data = get_edges(),  
  position = "identity",  
  arrow = NULL,  
  strength = 1,  
  n = 100,  
  lineend = "butt",  
  linejoin = "round",  
  linemitre = 1,  
  label_colour = "black",  
  label_alpha = 1,  
  label_parse = FALSE,  
  check_overlap = FALSE,  
  angle_calc = "rot",  
  force_flip = TRUE,  
  label_dodge = NULL,  
  label_push = NULL,  
  show.legend = NA,  
  ...,  
  spread  
)  
  
geom_edge_fan2(  
  mapping = NULL,  
  data = get_edges("long"),  
  position = "identity",  
  arrow = NULL,  
  strength = 1,  
  n = 100,  
  lineend = "butt",  
  linejoin = "round",  
  linemitre = 1,
```

```

    label_colour = "black",
    label_alpha = 1,
    label_parse = FALSE,
    check_overlap = FALSE,
    angle_calc = "rot",
    force_flip = TRUE,
    label_dodge = NULL,
    label_push = NULL,
    show.legend = NA,
    ...,
    spread
)

geom_edge_fan0(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  strength = 1,
  lineend = "butt",
  show.legend = NA,
  ...,
  spread
)

```

Arguments

mapping	Set of aesthetic mappings created by <code>ggplot2::aes()</code> or <code>ggplot2::aes_()</code> . By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.
data	The return of a call to <code>get_edges()</code> or a data.frame giving edges in correct format (see details for for guidance on the format). See <code>get_edges()</code> for more details on edge extraction.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
arrow	Arrow specification, as created by <code>grid::arrow()</code> .
strength	Modify the width of the fans <code>strength > 1</code> will create wider fans while the reverse will make them more narrow.
n	The number of points to create along the path.
lineend	Line end style (round, butt, square).
linejoin	Line join style (round, mitre, bevel).
linemitre	Line mitre limit (number greater than 1).
label_colour	The colour of the edge label. If NA it will use the colour of the edge.
label_alpha	The opacity of the edge label. If NA it will use the opacity of the edge.
label_parse	If TRUE, the labels will be parsed into expressions and displayed as described in <code>grDevices::plotmath()</code> .

check_overlap	If TRUE, text that overlaps previous text in the same layer will not be plotted. check_overlap happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling geom_label() or geom_text().
angle_calc	Either 'none', 'along', or 'across'. If 'none' the label will use the angle aesthetic of the geom. If 'along' The label will be written along the edge direction. If 'across' the label will be written across the edge direction.
force_flip	Logical. If angle_calc is either 'along' or 'across' should the label be flipped if it is on it's head. Default to TRUE.
label_dodge	A <code>grid::unit()</code> giving a fixed vertical shift to add to the label in case of angle_calc is either 'along' or 'across'
label_push	A <code>grid::unit()</code> giving a fixed horizontal shift to add to the label in case of angle_calc is either 'along' or 'across'
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
...	Other arguments passed on to <code>layer()</code> . These are often aesthetics, used to set an aesthetic to a fixed value, like <code>colour = "red"</code> or <code>size = 3</code> . They may also be parameters to the paired geom/stat.
spread	Deprecated. Use strength instead.

Aesthetics

geom_edge_fan and geom_edge_fan0 understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x**
- **y**
- **xend**
- **yend**
- **from**
- **to**
- edge_colour
- edge_width
- edge_linetype

geom_edge_hive	<i>Draw edges in hive plots</i>
----------------	---------------------------------

Description

This geom is only intended for use together with the hive layout. It draws edges between nodes as bezier curves, with the control points positioned at the same radii as the start or end point, and at a distance defined by the curvature argument.

Usage

```
geom_edge_hive(  
  mapping = NULL,  
  data = get_edges(),  
  position = "identity",  
  arrow = NULL,  
  strength = 1,  
  n = 100,  
  lineend = "butt",  
  linejoin = "round",  
  linemitre = 1,  
  label_colour = "black",  
  label_alpha = 1,  
  label_parse = FALSE,  
  check_overlap = FALSE,  
  angle_calc = "rot",  
  force_flip = TRUE,  
  label_dodge = NULL,  
  label_push = NULL,  
  show.legend = NA,  
  ...,  
  curvature  
)  
  
geom_edge_hive2(  
  mapping = NULL,  
  data = get_edges("long"),  
  position = "identity",  
  arrow = NULL,  
  strength = 1,  
  n = 100,  
  lineend = "butt",  
  linejoin = "round",  
  linemitre = 1,  
  label_colour = "black",  
  label_alpha = 1,  
  label_parse = FALSE,
```

```

    check_overlap = FALSE,
    angle_calc = "rot",
    force_flip = TRUE,
    label_dodge = NULL,
    label_push = NULL,
    show.legend = NA,
    ...,
    curvature
  )

geom_edge_hive0(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  strength = 1,
  lineend = "butt",
  show.legend = NA,
  ...,
  curvature
)

```

Arguments

mapping	Set of aesthetic mappings created by <code>ggplot2::aes()</code> or <code>ggplot2::aes_()</code> . By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.
data	The return of a call to <code>get_edges()</code> or a data.frame giving edges in correct format (see details for for guidance on the format). See <code>get_edges()</code> for more details on edge extraction.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
arrow	Arrow specification, as created by <code>grid::arrow()</code> .
strength	The curvature of the bezier. Defines the distance from the control points to the midpoint between the start and end node. 1 means the control points are positioned halfway between the nodes and the middle of the two axes, while 0 means it coincide with the nodes (resulting in straight lines)
n	The number of points to create along the path.
lineend	Line end style (round, butt, square).
linejoin	Line join style (round, mitre, bevel).
linemitre	Line mitre limit (number greater than 1).
label_colour	The colour of the edge label. If NA it will use the colour of the edge.
label_alpha	The opacity of the edge label. If NA it will use the opacity of the edge.
label_parse	If TRUE, the labels will be parsed into expressions and displayed as described in <code>grDevices::plotmath()</code> .

check_overlap	If TRUE, text that overlaps previous text in the same layer will not be plotted. check_overlap happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling geom_label() or geom_text().
angle_calc	Either 'none', 'along', or 'across'. If 'none' the label will use the angle aesthetic of the geom. If 'along' The label will be written along the edge direction. If 'across' the label will be written across the edge direction.
force_flip	Logical. If angle_calc is either 'along' or 'across' should the label be flipped if it is on it's head. Default to TRUE.
label_dodge	A <code>grid::unit()</code> giving a fixed vertical shift to add to the label in case of angle_calc is either 'along' or 'across'
label_push	A <code>grid::unit()</code> giving a fixed horizontal shift to add to the label in case of angle_calc is either 'along' or 'across'
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
...	Other arguments passed on to <code>layer()</code> . These are often aesthetics, used to set an aesthetic to a fixed value, like <code>colour = "red"</code> or <code>size = 3</code> . They may also be parameters to the paired geom/stat.
curvature	Deprecated. Use strength instead.

Aesthetics

geom_edge_hive and geom_edge_hive0 understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x**
- **y**
- **xend**
- **yend**

Examples

```
# Plot the flare import graph as a hive plot
library(tidygraph)
flareGr <- as_tbl_graph(flare$imports) %>%
  mutate(
    type = dplyr::case_when(
      centrality_degree(mode = 'in') == 0 ~ 'Source',
      centrality_degree(mode = 'out') == 0 ~ 'Sink',
      TRUE ~ 'Both'
    )
  ) %>%
  activate(edges) %>%
  mutate(
    type = dplyr::case_when(
      grepl('flare.analytics', paste(.N())$name[from], .N())$name[to]) ~ 'Analytics',
      TRUE ~ 'Other'
    )
  )

ggraph(flareGr, 'hive', axis = type) +
  geom_edge_hive(aes(colour = type), edge_alpha = 0.1) +
  coord_fixed()
```

Description

This geom draws edges in the simplest way - as straight lines between the start and end nodes. Not much more to say about that...

Usage

```
geom_edge_link(  
  mapping = NULL,  
  data = get_edges("short"),  
  position = "identity",  
  arrow = NULL,  
  n = 100,  
  lineend = "butt",  
  linejoin = "round",  
  linemitre = 1,  
  label_colour = "black",  
  label_alpha = 1,  
  label_parse = FALSE,  
  check_overlap = FALSE,  
  angle_calc = "rot",  
  force_flip = TRUE,  
  label_dodge = NULL,  
  label_push = NULL,  
  show.legend = NA,  
  ...  
)  
  
geom_edge_link2(  
  mapping = NULL,  
  data = get_edges("long"),  
  position = "identity",  
  arrow = NULL,  
  n = 100,  
  lineend = "butt",  
  linejoin = "round",  
  linemitre = 1,  
  label_colour = "black",  
  label_alpha = 1,  
  label_parse = FALSE,  
  check_overlap = FALSE,  
  angle_calc = "rot",  
  force_flip = TRUE,  
  label_dodge = NULL,  
  label_push = NULL,  
  show.legend = NA,  
  ...  
)
```

```
geom_edge_link0(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  lineend = "butt",
  show.legend = NA,
  ...
)
```

Arguments

mapping	Set of aesthetic mappings created by <code>ggplot2::aes()</code> or <code>ggplot2::aes_()</code> . By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.
data	The return of a call to <code>get_edges()</code> or a data.frame giving edges in correct format (see details for for guidance on the format). See <code>get_edges()</code> for more details on edge extraction.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
arrow	Arrow specification, as created by <code>grid::arrow()</code> .
n	The number of points to create along the path.
lineend	Line end style (round, butt, square).
linejoin	Line join style (round, mitre, bevel).
linemitre	Line mitre limit (number greater than 1).
label_colour	The colour of the edge label. If NA it will use the colour of the edge.
label_alpha	The opacity of the edge label. If NA it will use the opacity of the edge.
label_parse	If TRUE, the labels will be parsed into expressions and displayed as described in <code>grDevices::plotmath()</code> .
check_overlap	If TRUE, text that overlaps previous text in the same layer will not be plotted. <code>check_overlap</code> happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling <code>geom_label()</code> or <code>geom_text()</code> .
angle_calc	Either 'none', 'along', or 'across'. If 'none' the label will use the angle aesthetic of the geom. If 'along' The label will be written along the edge direction. If 'across' the label will be written across the edge direction.
force_flip	Logical. If <code>angle_calc</code> is either 'along' or 'across' should the label be flipped if it is on it's head. Default to TRUE.
label_dodge	A <code>grid::unit()</code> giving a fixed vertical shift to add to the label in case of <code>angle_calc</code> is either 'along' or 'across'
label_push	A <code>grid::unit()</code> giving a fixed horizontal shift to add to the label in case of <code>angle_calc</code> is either 'along' or 'across'
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

... Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.

Edge variants

Many `geom_edge_*` layers comes in 3 flavors depending on the level of control needed over the drawing. The default (no numeric postfix) generate a number of points (`n`) along the edge and draws it as a path. Each point along the line has a numeric value associated with it giving the position along the path, and it is therefore possible to show the direction of the edge by mapping to this e.g. `colour = stat(index)`. The version postfix with a "2" uses the "long" edge format (see `get_edges()`) and makes it possible to interpolate node parameter between the start and end node along the edge. It is considerable less performant so should only be used if this is needed. The version postfix with a "0" draws the edge in the most performant way, often directly using an appropriate grob from the grid package, but does not allow for gradients along the edge.

Often it is beneficial to stop the drawing of the edge before it reaches the node, for instance in cases where an arrow should be drawn and the arrowhead shouldn't lay on top or below the node point. `geom_edge_*` and `geom_edge_*2` supports this through the `start_cap` and `end_cap` aesthetics that takes a `geometry()` specification and dynamically caps the termini of the edges based on the given specifications. This means that if `end_cap = circle(1, 'cm')` the edges will end at a distance of 1cm even during resizing of the plot window.

All `geom_edge_*` and `geom_edge_*2` have the ability to draw a label along the edge. The reason this is not a separate geom is that in order for the label to know the location of the edge it needs to know the edge type etc. Labels are drawn by providing a label aesthetic. The `label_pos` can be used to specify where along the edge it should be drawn by supplying a number between 0 and 1. The `label_size` aesthetic can be used to control the size of the label. Often it is needed to have the label written along the direction of the edge, but since the actual angle is dependent on the plot dimensions this cannot be calculated beforehand. Using the `angle_calc` argument allows you to specify whether to use the supplied angle aesthetic or whether to draw the label along or across the edge.

Edge aesthetic name expansion

In order to avoid excessive typing edge aesthetic names are automatically expanded. Because of this it is not necessary to write `edge_colour` within the `aes()` call as `colour` will automatically be renamed appropriately.

Aesthetics

`geom_edge_link` and `geom_edge_link0` understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x**
- **y**
- **xend**
- **yend**
- `edge_colour`

- edge_width
- edge_linetype
- edge_alpha
- filter

geom_edge_link2 understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x**
- **y**
- **group**
- edge_colour
- edge_width
- edge_linetype
- edge_alpha
- filter

geom_edge_link and geom_edge_link2 furthermore takes the following aesthetics.

- start_cap
- end_cap
- label
- label_pos
- label_size
- angle
- hjust
- vjust
- family
- fontface
- lineheight

Computed variables

index The position along the path (not computed for the *0 version)

ggraph(gr, 'stress') +
  geom_edge_link0(aes(colour = class))

```

geom_edge_loop

Draw edges as diagonals

Description

This geom draws edge loops (edges starting and ending at the same node). Loops are drawn as bezier curves starting and ending at the position of the node and with control points protruding at an angle and in a direction specified in the call. As the start and end node is always the same `*2` method is provided. Loops can severely clutter up your visualization which is why they are decoupled from the other edge drawings. Only plot them if they are of importance. If the graph doesn't contain any loops the geom adds nothing silently.

Usage

```

geom_edge_loop(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  n = 100,
  lineend = "butt",
  linejoin = "round",
  linemitre = 1,
  label_colour = "black",
  label_alpha = 1,
  label_parse = FALSE,
  check_overlap = FALSE,
  angle_calc = "rot",
  force_flip = TRUE,
  label_dodge = NULL,
  label_push = NULL,
  show.legend = NA,

```

```

    ...
  )

geom_edge_loop0(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  arrow = NULL,
  lineend = "butt",
  show.legend = NA,
  ...
)

```

Arguments

mapping	Set of aesthetic mappings created by <code>ggplot2::aes()</code> or <code>ggplot2::aes_()</code> . By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.
data	The return of a call to <code>get_edges()</code> or a data.frame giving edges in correct format (see details for for guidance on the format). See <code>get_edges()</code> for more details on edge extraction.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
arrow	Arrow specification, as created by <code>grid::arrow()</code> .
n	The number of points to create along the path.
lineend	Line end style (round, butt, square).
linejoin	Line join style (round, mitre, bevel).
linemitre	Line mitre limit (number greater than 1).
label_colour	The colour of the edge label. If NA it will use the colour of the edge.
label_alpha	The opacity of the edge label. If NA it will use the opacity of the edge.
label_parse	If TRUE, the labels will be parsed into expressions and displayed as described in <code>grDevices::plotmath()</code> .
check_overlap	If TRUE, text that overlaps previous text in the same layer will not be plotted. <code>check_overlap</code> happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling <code>geom_label()</code> or <code>geom_text()</code> .
angle_calc	Either 'none', 'along', or 'across'. If 'none' the label will use the angle aesthetic of the geom. If 'along' The label will be written along the edge direction. If 'across' the label will be written across the edge direction.
force_flip	Logical. If <code>angle_calc</code> is either 'along' or 'across' should the label be flipped if it is on it's head. Default to TRUE.
label_dodge	A <code>grid::unit()</code> giving a fixed vertical shift to add to the label in case of <code>angle_calc</code> is either 'along' or 'across'
label_push	A <code>grid::unit()</code> giving a fixed horizontal shift to add to the label in case of <code>angle_calc</code> is either 'along' or 'across'

show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
...	Other arguments passed on to <code>layer()</code> . These are often aesthetics, used to set an aesthetic to a fixed value, like <code>colour = "red"</code> or <code>size = 3</code> . They may also be parameters to the paired geom/stat.

Aesthetics

`geom_edge_loop` and `geom_edge_loop0` understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x**
- **y**
- **from**
- **to**
- **span** *90*
- **direction** *45*
- **strength** *1*
- edge_colour
- edge_width
- edge_linetype
- edge_alpha
- filter

`geom_edge_loop` furthermore takes the following aesthetics.

- start_cap
- end_cap
- label
- label_pos
- label_size
- angle
- hjust
- vjust
- family
- fontface
- lineheight

Computed variables

index The position along the path (not computed for the *0 version)

Edge variants

Many `geom_edge_*` layers comes in 3 flavors depending on the level of control needed over the drawing. The default (no numeric postfix) generate a number of points (n) along the edge and draws it as a path. Each point along the line has a numeric value associated with it giving the position along the path, and it is therefore possible to show the direction of the edge by mapping to this e.g. `colour = stat(index)`. The version postfixed with a "2" uses the "long" edge format (see `get_edges()`) and makes it possible to interpolate node parameter between the start and end node along the edge. It is considerable less performant so should only be used if this is needed. The version postfixed with a "0" draws the edge in the most performant way, often directly using an appropriate grob from the grid package, but does not allow for gradients along the edge.

Often it is beneficial to stop the drawing of the edge before it reaches the node, for instance in cases where an arrow should be drawn and the arrowhead shouldn't lay on top or below the node point. `geom_edge_*` and `geom_edge_*2` supports this through the `start_cap` and `end_cap` aesthetics that takes a `geometry()` specification and dynamically caps the termini of the edges based on the given specifications. This means that if `end_cap = circle(1, 'cm')` the edges will end at a distance of 1cm even during resizing of the plot window.

All `geom_edge_*` and `geom_edge_*2` have the ability to draw a label along the edge. The reason this is not a separate geom is that in order for the label to know the location of the edge it needs to know the edge type etc. Labels are drawn by providing a label aesthetic. The `label_pos` can be used to specify where along the edge it should be drawn by supplying a number between 0 and 1. The `label_size` aesthetic can be used to control the size of the label. Often it is needed to have the label written along the direction of the edge, but since the actual angle is dependent on the plot dimensions this cannot be calculated beforehand. Using the `angle_calc` argument allows you to specify whether to use the supplied angle aesthetic or whether to draw the label along or across the edge.

Edge aesthetic name expansion

  position = "identity",
  arrow = NULL,
  sep = unit(2, "mm"),
  lineend = "butt",
  show.legend = NA,
  ...
)

```

Arguments

mapping	Set of aesthetic mappings created by <code>ggplot2::aes()</code> or <code>ggplot2::aes_()</code> . By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.
data	The return of a call to <code>get_edges()</code> or a data.frame giving edges in correct format (see details for for guidance on the format). See <code>get_edges()</code> for more details on edge extraction.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
arrow	Arrow specification, as created by <code>grid::arrow()</code> .
sep	The separation between parallel edges, given as a <code>grid::unit()</code>
n	The number of points to create along the path.
lineend	Line end style (round, butt, square).
linejoin	Line join style (round, mitre, bevel).
linemitre	Line mitre limit (number greater than 1).
label_colour	The colour of the edge label. If NA it will use the colour of the edge.
label_alpha	The opacity of the edge label. If NA it will use the opacity of the edge.
label_parse	If TRUE, the labels will be parsed into expressions and displayed as described in <code>grDevices::plotmath()</code> .

<code>check_overlap</code>	If TRUE, text that overlaps previous text in the same layer will not be plotted. <code>check_overlap</code> happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling <code>geom_label()</code> or <code>geom_text()</code> .
<code>angle_calc</code>	Either 'none', 'along', or 'across'. If 'none' the label will use the angle aesthetic of the geom. If 'along' The label will be written along the edge direction. If 'across' the label will be written across the edge direction.
<code>force_flip</code>	Logical. If <code>angle_calc</code> is either 'along' or 'across' should the label be flipped if it is on it's head. Default to TRUE.
<code>label_dodge</code>	A <code>grid::unit()</code> giving a fixed vertical shift to add to the label in case of <code>angle_calc</code> is either 'along' or 'across'
<code>label_push</code>	A <code>grid::unit()</code> giving a fixed horizontal shift to add to the label in case of <code>angle_calc</code> is either 'along' or 'across'
<code>show.legend</code>	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
<code>...</code>	Other arguments passed on to <code>layer()</code> . These are often aesthetics, used to set an aesthetic to a fixed value, like <code>colour = "red"</code> or <code>size = 3</code> . They may also be parameters to the paired geom/stat.

Aesthetics

`geom_edge_parallel` and `geom_edge_parallel0` understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x**
- **y**
- **xend**
- **yend**
- **from**
- **to**
- `edge_colour`
- `edge_width`
- `edge_linetype`
- `edge_alpha`
- `filter`

`geom_edge_parallel2` understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x**
- **y**
- **group**
- **from**

- **to**
- edge_colour
- edge_width
- edge_linetype
- edge_alpha
- filter

geom_edge_parallel and geom_edge_parallel2 furthermore takes the following aesthetics.

- start_cap
- end_cap
- label
- label_pos
- label_size
- angle
- hjust
- vjust
- family
- fontface
- lineheight

Computed variables

index The position along the path (not computed for the *0 version)

Edge variants

Many geom_edge_* layers comes in 3 flavors depending on the level of control needed over the drawing. The default (no numeric postfix) generate a number of points (n) along the edge and draws it as a path. Each point along the line has a numeric value associated with it giving the position along the path, and it is therefore possible to show the direction of the edge by mapping to this e.g. colour = stat(index). The version postfixed with a "2" uses the "long" edge format (see [get_edges\(\)](#)) and makes it possible to interpolate node parameter between the start and end node along the edge. It is considerable less performant so should only be used if this is needed. The version postfixed with a "0" draws the edge in the most performant way, often directly using an appropriate grob from the grid package, but does not allow for gradients along the edge.

Often it is beneficial to stop the drawing of the edge before it reaches the node, for instance in cases where an arrow should be drawn and the arrowhead shouldn't lay on top or below the node point. geom_edge_* and geom_edge_*2 supports this through the start_cap and end_cap aesthetics that takes a [geometry\(\)](#) specification and dynamically caps the termini of the edges based on the given specifications. This means that if end_cap = circle(1, 'cm') the edges will end at a distance of 1cm even during resizing of the plot window.

All geom_edge_* and geom_edge_*2 have the ability to draw a label along the edge. The reason this is not a separate geom is that in order for the label to know the location of the edge it needs

to know the edge type etc. Labels are drawn by providing a label aesthetic. The `label_pos` can be used to specify where along the edge it should be drawn by supplying a number between 0 and 1. The `label_size` aesthetic can be used to control the size of the label. Often it is needed to have the label written along the direction of the edge, but since the actual angle is dependent on the plot dimensions this cannot be calculated beforehand. Using the `angle_calc` argument allows you to specify whether to use the supplied angle aesthetic or whether to draw the label along or across the edge.

Edge aesthetic name expansion

In order to avoid excessive typing edge aesthetic names are automatically expanded. Because of this it is not necessary to write `edge_colour` within the `aes()` call as `colour` will automatically be renamed appropriately.

geom_edge_point	<i>Draw edges as glyphs</i>
-----------------	-----------------------------

Description

This geom draws edges as glyphs with their x-position defined by the x-position of the start node, and the y-position defined by the y-position of the end node. As such it will result in a matrix layout when used in conjunction with [layout_tbl_graph_matrix\(\)](#)

Usage

```
geom_edge_point(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  mirror = FALSE,
  show.legend = NA,
  ...
)
```

Arguments

mapping	Set of aesthetic mappings created by ggplot2::aes() or ggplot2::aes_() . By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.
data	The return of a call to get_edges() or a data.frame giving edges in correct format (see details for for guidance on the format). See get_edges() for more details on edge extraction.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
mirror	Logical. Should edge points be duplicated on both sides of the diagonal. Intended for undirected graphs. Default to FALSE
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
...	Other arguments passed on to layer() . These are often aesthetics, used to set an aesthetic to a fixed value, like <code>colour = "red"</code> or <code>size = 3</code> . They may also be parameters to the paired geom/stat.

Aesthetics

`geom_edge_point` understands the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x**
- **y**

- edge_shape
- edge_colour
- edge_size
- edge_alpha
- filter

Edge aesthetic name expansion

In order to avoid excessive typing edge aesthetic names are automatically expanded. Because of this it is not necessary to write `edge_colour` within the `aes()` call as `colour` will automatically be renamed appropriately.

  ggtitle("Zachary' Karate Club")
```

geom_edge_span

Draw edges as vertical spans

Description

This edge geom is mainly intended for use with [fabric](#) layouts. It draws edges as vertical segments with an optional end shape adornment. Due to the special nature of fabric layouts where nodes are not a single point in space but a line, this geom doesn't derive the x position from the location of the terminal nodes, but defaults to using the `edge_x` variable calculated by the fabric layout. If this geom is used with other layouts `xand` and `xend` must be given explicitly.

Usage

```
geom_edge_span(  
  mapping = NULL,  
  data = get_edges("short"),  
  position = "identity",  
  end_shape = NA,  
  arrow = NULL,  
  n = 100,  
  lineend = "butt",  
  linejoin = "round",  
  linemitre = 1,  
  label_colour = "black",  
  label_alpha = 1,  
  label_parse = FALSE,  
  check_overlap = FALSE,  
  angle_calc = "rot",  
  force_flip = TRUE,  
  label_dodge = NULL,  
  label_push = NULL,  
  show.legend = NA,  
  ...  
)
```

```
geom_edge_span2(  
  mapping = NULL,  
  data = get_edges("long"),  
  position = "identity",  
  end_shape = NA,  
  arrow = NULL,  
  n = 100,  
  lineend = "butt",  
  linejoin = "round",  
  linemitre = 1,  
  label_colour = "black",  
  label_alpha = 1,  
  label_parse = FALSE,  
  check_overlap = FALSE,  
  angle_calc = "rot",  
  force_flip = TRUE,  
  label_dodge = NULL,  
  label_push = NULL,  
  show.legend = NA,  
  ...  
)
```

```
geom_edge_span0(  
  mapping = NULL,  
  data = get_edges(),
```

```

    position = "identity",
    end_shape = NA,
    arrow = NULL,
    lineend = "butt",
    show.legend = NA,
    ...
  )

```

Arguments

mapping	Set of aesthetic mappings created by <code>ggplot2::aes()</code> or <code>ggplot2::aes_()</code> . By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.
data	The return of a call to <code>get_edges()</code> or a data.frame giving edges in correct format (see details for for guidance on the format). See <code>get_edges()</code> for more details on edge extraction.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
end_shape	The adornment to put at the ends of the span. The naming follows the conventions of the shape aesthetic in <code>ggplot2::geom_point()</code>
arrow	Arrow specification, as created by <code>grid::arrow()</code> .
n	The number of points to create along the path.
lineend	Line end style (round, butt, square).
linejoin	Line join style (round, mitre, bevel).
linemitre	Line mitre limit (number greater than 1).
label_colour	The colour of the edge label. If NA it will use the colour of the edge.
label_alpha	The opacity of the edge label. If NA it will use the opacity of the edge.
label_parse	If TRUE, the labels will be parsed into expressions and displayed as described in <code>grDevices::plotmath()</code> .
check_overlap	If TRUE, text that overlaps previous text in the same layer will not be plotted. <code>check_overlap</code> happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling <code>geom_label()</code> or <code>geom_text()</code> .
angle_calc	Either 'none', 'along', or 'across'. If 'none' the label will use the angle aesthetic of the geom. If 'along' The label will be written along the edge direction. If 'across' the label will be written across the edge direction.
force_flip	Logical. If <code>angle_calc</code> is either 'along' or 'across' should the label be flipped if it is on it's head. Default to TRUE.
label_dodge	A <code>grid::unit()</code> giving a fixed vertical shift to add to the label in case of <code>angle_calc</code> is either 'along' or 'across'
label_push	A <code>grid::unit()</code> giving a fixed horizontal shift to add to the label in case of <code>angle_calc</code> is either 'along' or 'across'

show.legend logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

... Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.

Aesthetics

`geom_edge_span` and `geom_edge_span0` understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x**
- **y**
- **xend**
- **yend**
- edge_colour
- edge_width
- edge_linetype
- edge_alpha
- filter

`geom_edge_span2` understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x**
- **y**
- **group**
- edge_colour
- edge_width
- edge_linetype
- edge_alpha
- filter

`geom_edge_span` and `geom_edge_span2` furthermore takes the following aesthetics.

- start_cap
- end_cap
- label
- label_pos
- label_size
- angle
- hjust
- vjust
- family
- fontface
- lineheight

Computed variables

index The position along the path (not computed for the *0 version)

Edge variants

Many `geom_edge_*` layers comes in 3 flavors depending on the level of control needed over the drawing. The default (no numeric postfix) generate a number of points (n) along the edge and draws it as a path. Each point along the line has a numeric value associated with it giving the position along the path, and it is therefore possible to show the direction of the edge by mapping to this e.g. `colour = stat(index)`. The version postfixed with a "2" uses the "long" edge format (see `get_edges()`) and makes it possible to interpolate node parameter between the start and end node along the edge. It is considerable less performant so should only be used if this is needed. The version postfixed with a "0" draws the edge in the most performant way, often directly using an appropriate `grob` from the `grid` package, but does not allow for gradients along the edge.

Often it is beneficial to stop the drawing of the edge before it reaches the node, for instance in cases where an arrow should be drawn and the arrowhead shouldn't lay on top or below the node point. `geom_edge_*` and `geom_edge_*2` supports this through the `start_cap` and `end_cap` aesthetics that takes a `geometry()` specification and dynamically caps the termini of the edges based on the given specifications. This means that if `end_cap = circle(1, 'cm')` the edges will end at a distance of 1cm even during resizing of the plot window.

All `geom_edge_*` and `geom_edge_*2` have the ability to draw a label along the edge. The reason this is not a separate geom is that in order for the label to know the location of the edge it needs to know the edge type etc. Labels are drawn by providing a label aesthetic. The `label_pos` can be used to specify where along the edge it should be drawn by supplying a number between 0 and 1. The `label_size` aesthetic can be used to control the size of the label. Often it is needed to have the label written along the direction of the edge, but since the actual angle is dependent on the plot dimensions this cannot be calculated beforehand. Using the `angle_calc` argument allows you to specify whether to use the supplied angle aesthetic or whether to draw the label along or across the edge.

Edge aesthetic name expansion

In order to avoid excessive typing edge aesthetic names are automatically expanded. Because of this it is not necessary to write `edge_colour` within the `aes()` call as `colour` will automatically be renamed appropriately.

Examples

```

require(tidygraph)
gr <- play_smallworld(n_dim = 3, dim_size = 3, order = 1, p_rewire = 0.6)

# Standard use
ggraph(gr, 'fabric', sort.by = node_rank_fabric()) +
  geom_node_range(colour = 'grey80') +
  geom_edge_span()

# Add end shapes
ggraph(gr, 'fabric', sort.by = node_rank_fabric()) +
  geom_node_range(colour = 'grey80') +
  geom_edge_span(end_shape = 'circle')

# If the layout include shadow edges these can be styled differently
ggraph(gr, 'fabric', sort.by = node_rank_fabric(), shadow.edges = TRUE) +
  geom_node_range(colour = 'grey80') +
  geom_edge_span(aes(colour = shadow_edge), end_shape = 'square') +
  scale_edge_colour_manual(values = c('FALSE' = 'black', 'TRUE' = 'grey'))

```

geom_edge_tile

Draw edges as glyphs

Description

This geom draws edges as tiles with their x-position defined by the x-position of the start node, and the y-position defined by the y-position of the end node. As such it will result in a matrix layout when used in conjunction with [layout_tbl_graph_matrix\(\)](#)

Usage

```

geom_edge_tile(
  mapping = NULL,
  data = get_edges(),
  position = "identity",
  mirror = FALSE,
  show.legend = NA,
  ...
)

```

Arguments

mapping	Set of aesthetic mappings created by ggplot2::aes() or ggplot2::aes_() . By default x, y, xend, yend, group and circular are mapped to x, y, xend, yend, edge.id and circular in the edge data.
data	The return of a call to get_edges() or a data.frame giving edges in correct format (see details for for guidance on the format). See get_edges() for more details on edge extraction.

position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
mirror	Logical. Should edge points be duplicated on both sides of the diagonal. Intended for undirected graphs. Default to FALSE
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
...	Other arguments passed on to <code>layer()</code> . These are often aesthetics, used to set an aesthetic to a fixed value, like <code>colour = "red"</code> or <code>size = 3</code> . They may also be parameters to the paired geom/stat.

Aesthetics

`geom_edge_tile` understands the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x**
- **y**
- edge_fill
- edge_colour
- edge_size
- edge_alpha
- filter

Edge aesthetic name expansion

In order to avoid excessive typing edge aesthetic names are automatically expanded. Because of this it is not necessary to write `edge_colour` within the `aes()` call as `colour` will automatically be renamed appropriately.

```

geom_node_arc_bar *Show nodes as thick arcs*

Description

This geom is equivalent in functionality to `ggforce::geom_arc_bar()` and allows for plotting of nodes as arcs with an inner and outer radius scaled by the coordinate system. Its main use is currently in sunburst plots as created with circular partition layouts

Usage

```

geom_node_arc_bar(
  mapping = NULL,
  data = NULL,
  position = "identity",
  show.legend = NA,
  ...
)

```

Arguments

mapping	Set of aesthetic mappings created by <code>ggplot2::aes()</code> or <code>ggplot2::aes_()</code> . By default x and y are mapped to <code>x0</code> and <code>y0</code> in the node data.
data	The data to be displayed in this layer. There are three options: If <code>NULL</code> , the default, the data is inherited from the plot data as specified in the call to <code>ggplot()</code> . A <code>data.frame</code> , or other object, will override the plot data. All objects will be fortified to produce a data frame. See <code>fortify()</code> for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a <code>data.frame</code> , and will be used as the layer data. A function can be created from a formula (e.g. <code>~ head(.x, 10)</code>).
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? <code>NA</code> , the default, includes if any aesthetics are mapped. <code>FALSE</code> never includes, and <code>TRUE</code> always includes. It can also be a named logical vector to finely select the aesthetics to display.

... Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.

Aesthetics

`geom_node_point` understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x0**
- **y0**
- **r0**
- **r**
- **start**
- **end**
- alpha
- colour
- fill
- shape
- size
- stroke
- filter

require(tidygraph)
gr <- tbl_graph(flare$vertices, flare$edges)
ggraph(gr, 'partition', circular = TRUE, weight = size) +
  geom_node_arc_bar()
```

geom_node_circle	<i>Show nodes as circles</i>
------------------	------------------------------

Description

This geom is equivalent in functionality to `ggforce::geom_circle()` and allows for plotting of nodes as circles with a radius scaled by the coordinate system. Because of the geoms reliance on the coordinate system it will only produce true circles when combined with `ggplot2::coord_fixed()`

Usage

```
geom_node_circle(
  mapping = NULL,
  data = NULL,
  position = "identity",
  show.legend = NA,
  ...
)
```

Arguments

mapping	Set of aesthetic mappings created by <code>ggplot2::aes()</code> or <code>ggplot2::aes_()</code> . By default x and y are mapped to x0 and y0 in the node data.
data	The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to <code>ggplot()</code> . A <code>data.frame</code> , or other object, will override the plot data. All objects will be fortified to produce a data frame. See <code>fortify()</code> for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a <code>data.frame</code> , and will be used as the layer data. A function can be created from a formula (e.g. <code>~ head(.x, 10)</code>).
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
...	Other arguments passed on to <code>layer()</code> . These are often aesthetics, used to set an aesthetic to a fixed value, like <code>colour = "red"</code> or <code>size = 3</code> . They may also be parameters to the paired geom/stat.

Aesthetics

`geom_node_circle` understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

geom_node_point *Show nodes as points*

Description

This geom is equivalent in functionality to `ggplot2::geom_point()` and allows for simple plotting of nodes in different shapes, colours and sizes.

Usage

```
geom_node_point(
  mapping = NULL,
  data = NULL,
  position = "identity",
  show.legend = NA,
  ...
)
```

Arguments

mapping	Set of aesthetic mappings created by <code>ggplot2::aes()</code> or <code>ggplot2::aes_()</code> . By default x and y are mapped to x and y in the node data.
data	The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to <code>ggplot()</code> . gr <- create_notable('bull') %>%
  mutate(class = sample(letters[1:3], n(), replace = TRUE))

gggraph(gr, 'stress') + geom_node_point()
```

geom_node_range *Show nodes as a line spanning a horizontal range*

Description

This geom is most useful together with the [fabric](#) layout for showing the horizontal span of each node.

Usage

```
geom_node_range(
  mapping = NULL,
  data = NULL,
  position = "identity",
  show.legend = NA,
  ...
)
```

Arguments

mapping	Set of aesthetic mappings created by <code>ggplot2::aes()</code> or <code>ggplot2::aes_()</code> . By default x is mapped to <code>xmin</code> , <code>xend</code> is mapped to <code>xmax</code> and <code>y</code> and <code>yend</code> are mapped to <code>y</code> in the node data.

geom_node_text

Annotate nodes with text

Description

These geoms are equivalent in functionality to [ggplot2::geom_text\(\)](#) and [ggplot2::geom_label\(\)](#) and allows for simple annotation of nodes.

Usage

```
geom_node_text(
  mapping = NULL,
  data = NULL,
  position = "identity",
  parse = FALSE,
  nudge_x = 0,
  nudge_y = 0,
  check_overlap = FALSE,
  show.legend = NA,
  repel = FALSE,
  ...
)

geom_node_label(
  mapping = NULL,
  data = NULL,
  position = "identity",
  parse = FALSE,
  nudge_x = 0,
  nudge_y = 0,
  label.padding = unit(0.25, "lines"),
  label.r = unit(0.15, "lines"),
  label.size = 0.25,
  show.legend = NA,
  repel = FALSE,
  ...
)
```

Arguments

mapping	Set of aesthetic mappings created by <code>ggplot2::aes()</code> or <code>ggplot2::aes_()</code> . By default x and y are mapped to x and y in the node data.
data	The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to <code>ggplot()</code> . A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See <code>fortify()</code> for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a data.frame, and will be used as the layer data. A function can be created from a formula (e.g. <code>~ head(.x, 10)</code>).
position	Position adjustment, either as a string, or the result of a call to a position adjustment function. Cannot be jointly specified with <code>nudge_x</code> or <code>nudge_y</code> .
parse	If TRUE, the labels will be parsed into expressions and displayed as described in <code>?plotmath</code> .

nudge_x, nudge_y	Horizontal and vertical adjustment to nudge labels by. Useful for offsetting text from points, particularly on discrete scales.
check_overlap	If TRUE, text that overlaps previous text in the same layer will not be plotted. check_overlap happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling geom_label() or geom_text().
show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
repel	If TRUE, text labels will be repelled from each other to avoid overlapping, using the GeomTextRepel geom from the ggrepel package.
...	Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.
label.padding	Amount of padding around label. Defaults to 0.25 lines.
label.r	Radius of rounded corners. Defaults to 0.15 lines.
label.size	Size of label border, in mm.

Aesthetics

geom_node_text understands the following aesthetics. Bold aesthetics are automatically set, but can be overridden. Italic aesthetics are required but not set by default

- **x**
- **y**
- *label*
- alpha
- angle
- colour
- family
- fontface
- hjust
- lineheight
- size
- vjust

ggraph(gr, 'stress') +
  geom_node_label(aes(label = class), repel = TRUE)
```

geom_node_tile *Draw the rectangles in a treemap*

Description

A treemap is a space filling layout that recursively divides a rectangle to the children of the node. Often only the leaf nodes are drawn as nodes higher up in the hierarchy would obscure what is below. `geom_treemap` is a shorthand for `geom_node_treemap` as node is implicit in the case of treemap drawing

Usage

```
geom_node_tile(
  mapping = NULL,
  data = NULL,
  position = "identity",
  show.legend = NA,
  ...
)
```

Arguments

mapping	Set of aesthetic mappings created by <code>ggplot2::aes()</code> or <code>ggplot2::aes_()</code> . By default x, y, width and height are mapped to x, y, width and height in the node data.
data	The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to <code>ggplot()</code> . A <code>data.frame</code> , or other object, will override the plot data. All objects will be fortified to produce a data frame. See <code>fortify()</code> for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a <code>data.frame</code> , and will be used as the layer data. A function can be created from a formula (e.g. <code>~ head(.x, 10)</code>).
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.

show.legend logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

... Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.

Aesthetics

`geom_treemap` understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x**
- **y**
- **width**
- **height**
- alpha
- colour
- fill
- size
- stroke
- filter

Examples

```
# Create a graph of the flare class system
library(tidygraph)
flareGraph <- tbl_graph(flare$vertices, flare$edges) %>%
  mutate(
    class = map_bfs_chr(node_is_root(), .f = function(node, dist, path, ...) {
      if (dist <= 1) {
        return(shortName[node])
      }
      path$result[[nrow(path)]]
    })
  )

gggraph(flareGraph, 'treemap', weight = size) +
  geom_node_tile(aes(fill = class, filter = leaf, alpha = depth), colour = NA) +
```

```
geom_node_tile(aes(size = depth), colour = 'white') +
scale_alpha(range = c(1, 0.5), guide = 'none') +
scale_size(range = c(4, 0.2), guide = 'none')
```

geom_node_voronoi *Show nodes as voronoi tiles*

Description

This geom is equivalent in functionality to `ggforce::geom_voronoi_tile()` and allows for plotting of nodes as tiles from a voronoi tessellation. As with `ggforce::geom_voronoi_tile()` it is possible to restrict the size of the tile to a fixed radius, as well as round corners and expand/contract the tile.

Usage

```
geom_node_voronoi(
  mapping = NULL,
  data = NULL,
  position = "identity",
  show.legend = NA,
  bound = NULL,
  eps = 1e-09,
  max.radius = NULL,
  normalize = FALSE,
  asp.ratio = 1,
  expand = 0,
  radius = 0,
  ...
)
```

Arguments

mapping	Set of aesthetic mappings created by <code>ggplot2::aes()</code> or <code>ggplot2::aes_()</code> . By default x and y are mapped to x and y in the node data and group set to -1.
data	The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to <code>ggplot()</code> . A <code>data.frame</code> , or other object, will override the plot data. All objects will be fortified to produce a data frame. See <code>fortify()</code> for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a <code>data.frame</code> , and will be used as the layer data. A function can be created from a formula (e.g. <code>~ head(.x, 10)</code>).
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.

show.legend	logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
bound	The bounding rectangle for the tessellation or a custom polygon to clip the tessellation to. Defaults to NULL which creates a rectangle expanded 10% in all directions. If supplied as a bounding box it should be a vector giving the bounds in the following order: xmin, xmax, ymin, ymax. If supplied as a polygon it should either be a 2-column matrix or a data.frame containing an x and y column.
eps	A value of epsilon used in testing whether a quantity is zero, mainly in the context of whether points are collinear. If anomalous errors arise, it is possible that these may averted by adjusting the value of eps upward or downward.
max.radius	The maximum distance a tile can extend from the point of origin. Will in effect clip each tile to a circle centered at the point with the given radius. If normalize = TRUE the radius will be given relative to the normalized values
normalize	Should coordinates be normalized prior to calculations. If x and y are in wildly different ranges it can lead to tessellation and triangulation that seems off when plotted without <code>ggplot2::coord_fixed()</code> . Normalization of coordinates solves this. The coordinates are transformed back after calculations.
asp.ratio	If normalize = TRUE the x values will be multiplied by this amount after normalization.
expand	A numeric or unit vector of length one, specifying the expansion amount. Negative values will result in contraction instead. If the value is given as a numeric it will be understood as a proportion of the plot area width.
radius	As expand but specifying the corner radius.
...	Other arguments passed on to <code>layer()</code> . These are often aesthetics, used to set an aesthetic to a fixed value, like <code>colour = "red"</code> or <code>size = 3</code> . They may also be parameters to the paired geom/stat.

Aesthetics

`geom_node_voronoi` understand the following aesthetics. Bold aesthetics are automatically set, but can be overridden.

- **x**
- **y**
- alpha
- colour
- fill
- shape
- size
- stroke
- filter

  geom_edge_link(alpha = 0.3) +
  geom_node_point()
```

`get_con`*Create a connection extractor function*

Description

Connections within the `ggraph` terminology are links between nodes that are not part of the network structure itself. In that sense connections do not affect the layout calculation in any way and will not be drawn by the standard `geom_edge_*` functions. A connection does not need to only be defined by a start and end node, but can include intermediary nodes. `get_con` helps in creating connection data by letting you specify start and end nodes and automatically finds the shortest path within the graph structure that connects the given points. If this is not what is needed it is also possible to supply a list of vectors giving node indices that define a connection.

Usage

```
get_con(
  from = integer(),
  to = integer(),
  paths = NULL,
  ...,
  weight = NULL,
  mode = "all"
)
```

Arguments

from, to	The index of the start and end nodes for the connections
paths	A list of integer vectors giving the index of nodes defining connections
...	Additional information to be added to the final data output
weight	An expression to be evaluated on the edge data to provide weights for the shortest path calculations
mode	Character constant, gives whether the shortest paths to or from the given vertices should be calculated for directed graphs. If <i>out</i> then the shortest paths <i>from</i> the vertex, if <i>in</i> then <i>to</i> it will be considered. If <i>all</i> , the default, then the corresponding undirected graph will be used, ie. not directed paths are searched. This argument is ignored for undirected graphs.

Value

A function that takes a layout_ggraph object and returns the given connections

See Also

Other extractors: [get_edges\(\)](#), [get_nodes\(\)](#)

get_edges

Create edge extractor function

Description

This function returns another function that can extract edges from a ggraph_layout object. The functionality of the returned function is decided by the arguments to get_edges. The need for get_edges is mainly to pass to the data argument of the different geom_edge_* functions in order to present them with the right kind of data. In general each geom_edge_* has the default set correctly so there is only need to modify the data argument if parallel edges should be collapsed.

Usage

```
get_edges(format = "short", collapse = "none", ...)
```

Arguments

format	Either 'short' (the default) or 'long'. See details for a descriptions of the differences
collapse	Either 'none' (the default), 'all' or 'direction'. Specifies whether parallel edges should be merged. See details for more information
...	Additional data that will be cbind'ed together with the returned edge data.

Details

There are two types of return formats possible for the result of the returned function:

short In this format each edge is described in one line in the format expected for `ggplot2::geom_segment()`, that is, the start node position is encoded in the `x` and `y` column and the end node position is encoded in the `xend` and `yend` column. If node parameters are added to the edge the name of the parameters will be prefixed with `node1.` for the start node and `node2.` for the end node.

long In this format each edge consists of two rows with matching `edge_id` value. The start and end position are both encoded in the `x` and `y` column. The relative position of the rows determines which is the start and end node, the first occurring being the start node. If node parameters are added to the edge data the name of the parameters will be prefixed with `node.`

Node parameters are automatically added so it is possible to format edge aesthetics according to start or end node parameters, or interpolate edge aesthetics between start and end node parameters. Node parameters will be prefixed to avoid name clash with edge parameters. The prefix depends on the format (see above).

If the graph is not simple (it contains at most one edge between each node pair) it can be collapsed so either all edges between two nodes or all edges of the same direction between two nodes are merged. The edge parameters are taken from the first occurring edge, so if some more sophisticated summary is needed it is suggested that the graph be tidied up before plotting with `ggraph`.

Value

A `data.frame` with columns dependent on format as well as the graph type. In addition to the columns discussed in the details section, the `data.frame` will always contain the columns `from`, `to` and `circular`, the two former giving the indexes of the start and end node and the latter if the layout is circular (needed for correct formatting of some `geom_edge_*`). The graph dependent information is:

dendrogram A `label` column will hold the value of the `edgetext` attribute. In addition any value stored in the `edgePar` attribute will be added. Lastly a `direction` column will hold the relative position between the start and end nodes (needed for correct formatting of `geom_edge_elbow()`).

igraph All edge attributes of the original graph object is added as columns to the `data.frame`

See Also

Other extractors: `get_con()`, `get_nodes()`

get_nodes

Create a node extractor function

Description

This function returns another function that can extract nodes from a `ggraph_layout` object. As a `ggraph_layout` object is essentially a `data.frame` of nodes it might seem useless to provide this function, but since the node data is not necessarily available until after the `ggraph()` call it can be beneficial to be able to add information to the node data on a per-layer basis. Unlike `get_edges()` the use of `get_nodes` is not mandatory and is only required if additional data should be added to selected node layers.

Usage

```
get_nodes(...)
```

Arguments

... Additional data that should be cbind'ed together with the node data.

Value

A data.frame with the node data as well of any additional data supplied through ...

See Also

Other extractors: [get_con\(\)](#), [get_edges\(\)](#)

ggraph	<i>Create a ggraph plot</i>
--------	-----------------------------

Description

This function is the equivalent of `ggplot2::ggplot()` in ggplot2. It takes care of setting up the plot object along with creating the layout for the plot based on the graph and the specification passed in. Alternatively a layout can be prepared in advance using `create_layout` and passed as the data argument. See *Details* for a description of all available layouts.

Usage

```
ggraph(graph, layout = "auto", ...)

create_layout(graph, layout, circular, ...)

## Default S3 method:
create_layout(graph, layout, ...)

## S3 method for class 'layout_ggraph'
create_layout(graph, ...)

## S3 method for class 'tbl_graph'
create_layout(graph, layout, circular = FALSE, ...)
```

Arguments

graph	The object containing the graph. See <i>Details</i> for a list of supported classes. Or a <code>layout_ggraph</code> object as returned from <code>create_layout</code> in which case all subsequent arguments is ignored.
layout	The type of layout to create. Either a valid string, a function, a matrix, or a data.frame (see <i>Details</i>)

... Arguments passed on to the layout function.
 circular Should the layout be transformed into a radial representation. Only possible for some layouts. Defaults to FALSE

Details

Following is a short description of the different layout types available in ggraph. Each layout is further described in its own help pages. Any type of regular graph/network data can be represented as a `tbl_graph` object. Because of this the different layouts that can be applied to `tbl_graph` objects are quite diverse, but not all layouts makes sense to all types of graphs. It is up to the user to understand their data and choose an appropriate layout. For standard node-edge diagrams `igraph` defines a long range of different layout functions that are all available through the `igraph` layout where the specific layout is specified using the `algorithm` argument. In order to minimize typing all `igraph` algorithms can also be passed directly into the `layout` argument.

Any object that has an appropriate `as_tbl_graph` method can be passed into `ggraph()` and will automatically be converted underneath.

`auto` The default layout. See [layout_tbl_graph_auto\(\)](#) for further details
`igraph` Use one of the internal `igraph` layout algorithms. The algorithm is specified using the `algorithm` argument. All strings accepted by the `algorithm` argument can also be supplied directly into `layout`. See [layout_tbl_graph_igraph\(\)](#) for further details
`dendrogram` Lays out the nodes in a tree-like graph as a dendrogram with leaves set at 0 and parents 1 unit above its tallest child. See [layout_tbl_graph_dendrogram\(\)](#) for further details
`manual` Lets the user manually specify the location of each node. See [layout_tbl_graph_manual\(\)](#) for further details
`linear` Arranges the nodes linearly or circularly in order to make an arc diagram. See [layout_tbl_graph_linear\(\)](#) for further details
`matrix` Arranges nodes on a diagonal thus preparing it for use with [geom_edge_point\(\)](#) to make a matrix plot. See [layout_tbl_graph_matrix\(\)](#) for further details
`treemap` Creates a treemap from the graph, that is, a space-filing subdivision of rectangles showing a weighted hierarchy. See [layout_tbl_graph_treemap\(\)](#) for further details
`circlepack` Creates a layout showing a hierarchy as circles within circles. Conceptually equal to treemaps. See [layout_tbl_graph_circlepack\(\)](#) for further details
`partition` Create icicle or sunburst charts, where each layer subdivides the division given by the preceding layer. See [layout_tbl_graph_partition\(\)](#) for further details
`hive` Positions nodes on axes spreading out from the center based on node attributes. See [layout_tbl_graph_hive\(\)](#) for further details

Alternatively a matrix or a `data.frame` can be provided to the `layout` argument. In the former case the first column will be used as x coordinates and the second column will be used as y coordinates, further columns are dropped. In the latter case the `data.frame` is used as the layout table and must thus contain a numeric x and y column.

Lastly a function can be provided to the `layout` argument. It will be called with the graph object as its first argument and any additional argument passed into `ggraph()/create_layout()`. The function must return either a `data.frame` or an object coercible to one and have an x and y column, or an object coercible to a `tbl_graph`. In the latter case the node data is extracted and used as layout (and must thus contain an x and y column) and the graph will be added as the graph attribute.

Value

For `ggraph()` an object of class `gg` onto which layers, scales, etc. can be added. For `create_layout()` an object inheriting from `layout_ggraph`. `layout_ggraph` itself inherits from `data.frame` and can be considered as such. The `data.frame` contains the node positions in the `x` and `y` column along with additional columns generated by the specific layout, as well as node parameters inherited from the graph. Additional information is stored as attributes to the `data.frame`. The original graph object is stored in the `graph` attribute and the `circular` attribute contains a logical indicating whether the layout has been transformed to a circular representation.

[get_edges\(\)](#) for extracting edge information from the layout and [get_con\(\)](#) for extracting path information.

Examples

```
require(tidygraph)
gr <- create_notable('bull')
layout <- create_layout(gr, layout = 'igraph', algorithm = 'kk')
```

guide_edge_colourbar *Colourbar legend for edges*

Description

This function is equivalent to `ggplot2::guide_colourbar()` but works for edge aesthetics.

Usage

```
guide_edge_colourbar(
  title = waiver(),
  title.position = NULL,
  title.theme = NULL,
  title.hjust = NULL,
  title.vjust = NULL,
  label = TRUE,
  label.position = NULL,
  label.theme = NULL,
  label.hjust = NULL,
  label.vjust = NULL,
  barwidth = NULL,
  barheight = NULL,
  nbin = 20,
  raster = TRUE,
  ticks = TRUE,
  draw.ulim = TRUE,
  draw.llim = TRUE,
```

```

direction = NULL,
default.unit = "line",
reverse = FALSE,
order = 0,
...
)

```

```

guide_edge_colorbar(
  title = waiver(),
  title.position = NULL,
  title.theme = NULL,
  title.hjust = NULL,
  title.vjust = NULL,
  label = TRUE,
  label.position = NULL,
  label.theme = NULL,
  label.hjust = NULL,
  label.vjust = NULL,
  barwidth = NULL,
  barheight = NULL,
  nbin = 20,
  raster = TRUE,
  ticks = TRUE,
  draw.ulim = TRUE,
  draw.llim = TRUE,
  direction = NULL,
  default.unit = "line",
  reverse = FALSE,
  order = 0,
  ...
)

```

Arguments

<code>title</code>	A character string or expression indicating a title of guide. If <code>NULL</code> , the title is not shown. By default (<code>waiver()</code>), the name of the scale object or the name specified in <code>labs()</code> is used for the title.
<code>title.position</code>	A character string indicating the position of a title. One of "top" (default for a vertical guide), "bottom", "left" (default for a horizontal guide), or "right."
<code>title.theme</code>	A theme object for rendering the title text. Usually the object of <code>element_text()</code> is expected. By default, the theme is specified by <code>legend.title</code> in <code>theme()</code> or <code>theme</code> .
<code>title.hjust</code>	A number specifying horizontal justification of the title text.
<code>title.vjust</code>	A number specifying vertical justification of the title text.
<code>label</code>	logical. If <code>TRUE</code> then the labels are drawn. If <code>FALSE</code> then the labels are invisible.
<code>label.position</code>	A character string indicating the position of a label. One of "top", "bottom" (default for horizontal guide), "left", or "right" (default for vertical guide).

label.theme	A theme object for rendering the label text. Usually the object of <code>element_text()</code> is expected. By default, the theme is specified by <code>legend.text</code> in <code>theme()</code> .
label.hjust	A numeric specifying horizontal justification of the label text.
label.vjust	A numeric specifying vertical justification of the label text.
barwidth	A numeric or a <code>grid::unit()</code> object specifying the width of the colourbar. Default value is <code>legend.key.width</code> or <code>legend.key.size</code> in <code>theme()</code> or <code>theme</code> .
barheight	A numeric or a <code>grid::unit()</code> object specifying the height of the colourbar. Default value is <code>legend.key.height</code> or <code>legend.key.size</code> in <code>theme()</code> or <code>theme</code> .
nbin	A numeric specifying the number of bins for drawing the colourbar. A smoother colourbar results from a larger value.
raster	A logical. If TRUE then the colourbar is rendered as a raster object. If FALSE then the colourbar is rendered as a set of rectangles. Note that not all graphics devices are capable of rendering raster image.
ticks	A logical specifying if tick marks on the colourbar should be visible.
draw.ulim	A logical specifying if the upper limit tick marks should be visible.
draw.llim	A logical specifying if the lower limit tick marks should be visible.
direction	A character string indicating the direction of the guide. One of "horizontal" or "vertical."
default.unit	A character string indicating <code>grid::unit()</code> for <code>barwidth</code> and <code>barheight</code> .
reverse	logical. If TRUE the colourbar is reversed. By default, the highest value is on the top and the lowest value is on the bottom
order	positive integer less than 99 that specifies the order of this guide among multiple guides. This controls the order in which multiple guides are displayed, not the contents of the guide itself. If 0 (default), the order is determined by a secret algorithm.
...	ignored.

Value

A guide object

guide_edge_direction *Edge direction guide*

Description

This guide is intended to show the direction of edges based on the aesthetics mapped to its progression, such as changing width, colour and opacity.

Usage

```
guide_edge_direction(
  title = waiver(),
  title.position = NULL,
  title.theme = NULL,
  title.hjust = NULL,
  title.vjust = NULL,
  arrow = TRUE,
  arrow.position = NULL,
  barwidth = NULL,
  barheight = NULL,
  nbin = 500,
  direction = NULL,
  default.unit = "line",
  reverse = FALSE,
  order = 0,
  override.aes = list(),
  ...
)
```

Arguments

<code>title</code>	A character string or expression indicating a title of guide. If <code>NULL</code> , the title is not shown. By default (<code>waiver()</code>), the name of the scale object or the name specified in <code>labs()</code> is used for the title.
<code>title.position</code>	A character string indicating the position of a title. One of "top" (default for a vertical guide), "bottom", "left" (default for a horizontal guide), or "right."
<code>title.theme</code>	A theme object for rendering the title text. Usually the object of <code>element_text()</code> is expected. By default, the theme is specified by <code>legend.title</code> in <code>theme()</code> or <code>theme</code> .
<code>title.hjust</code>	A number specifying horizontal justification of the title text.
<code>title.vjust</code>	A number specifying vertical justification of the title text.
<code>arrow</code>	Logical. Should an arrow be drawn to illustrate the direction. Defaults to <code>TRUE</code>
<code>arrow.position</code>	The position of the arrow relative to the example edge.
<code>barwidth</code>	A numeric or a <code>grid::unit()</code> object specifying the width of the colourbar. Default value is <code>legend.key.width</code> or <code>legend.key.size</code> in <code>theme()</code> or <code>theme</code> .
<code>barheight</code>	A numeric or a <code>grid::unit()</code> object specifying the height of the colourbar. Default value is <code>legend.key.height</code> or <code>legend.key.size</code> in <code>theme()</code> or <code>theme</code> .
<code>nbin</code>	A numeric specifying the number of bins for drawing the colourbar. A smoother colourbar results from a larger value.
<code>direction</code>	A character string indicating the direction of the guide. One of "horizontal" or "vertical."
<code>default.unit</code>	A character string indicating <code>grid::unit()</code> for <code>barwidth</code> and <code>barheight</code> .
<code>reverse</code>	logical. If <code>TRUE</code> the colourbar is reversed. By default, the highest value is on the top and the lowest value is on the bottom

order	positive integer less than 99 that specifies the order of this guide among multiple guides. This controls the order in which multiple guides are displayed, not the contents of the guide itself. If 0 (default), the order is determined by a secret algorithm.
override.aes	A list specifying aesthetic parameters of legend key.
...	ignored.

Examples

```
gr <- tidygraph::as_tbl_graph(highschool)
ggraph(gr, layout = 'kk') +
  geom_edge_fan(aes(alpha = stat(index))) +
  guides(edge_alpha = guide_edge_direction())
```

highschool

Friendship among high school boys

Description

This dataset shows the friendship among high school boys as assessed by the question: "What fellows here in school do you go around with most often?". The question was posed twice, with one year in between (1957 and 1958) and shows the evolution in friendship between the two timepoints.

Usage

```
highschool
```

Format

The graph is stored as an unnamed edgelist with a year attribute.

from The boy answering the question

to The boy being the answer to the question

year The year the friendship was reported

Source

Coleman, J. S. *Introduction to Mathematical Sociology*. New York: Free Press, pp.450-451.

layout_tbl_graph_auto *Automatically pick a layout based on graph type*

Description

This function infers the layout from the graph structure and is the default when calling `ggraph()`. If an `x` and `y` argument is passed along, the manual layout is chosen. Otherwise if the graph is either a rooted tree or a rooted forest the layout will be dendrogram if the nodes contains a height variable or tree if not. If the tree is unrooted the unrooted layout will be used. If the tree is a DAG the sygiyama layout will be used. Otherwise the stress layout will be used (or `sparse_tree` if the graph contains more than 2000 nodes).

Usage

```
layout_tbl_graph_auto(graph, circular, ...)
```

Arguments

<code>graph</code>	A <code>tbl_graph</code> object
<code>circular</code>	Logical. Should the layout be transformed to a circular representation. Defaults to <code>FALSE</code> . Only applicable if the graph is a tree structure
<code>...</code>	Arguments passed on to the chosen layout

Value

A `data.frame` with the columns `x`, `y`, `circular` as well as any information stored as node variables in the `tbl_graph` object.

See Also

Other `layout_tbl_graph_*`: `layout_tbl_graph_backbone()`, `layout_tbl_graph_centrality()`, `layout_tbl_graph_circlepack()`, `layout_tbl_graph_dendrogram()`, `layout_tbl_graph_eigen()`, `layout_tbl_graph_fabric()`, `layout_tbl_graph_focus()`, `layout_tbl_graph_hive()`, `layout_tbl_graph_igraph()`, `layout_tbl_graph_linear()`, `layout_tbl_graph_manual()`, `layout_tbl_graph_matrix()`, `layout_tbl_graph_part`, `layout_tbl_graph_pmds()`, `layout_tbl_graph_stress()`, `layout_tbl_graph_treemap()`, `layout_tbl_graph_unroot`

layout_tbl_graph_backbone

Place node to emphasize group structure

Description

This layout is optimised for drawing small-world types of graphs often found in social networks, where distinct groups are still highly connected to the remaining graph. Typical layouts struggle with this as they attempt to minimise the edge length of all edges equally. The backbone layout is based on weighing edges based on how well they hold together communities. The end result is that communities tend to stick together despite high interconnectivity.

Usage

```
layout_tbl_graph_backbone(graph, keep = 0.2, circular = FALSE)
```

Arguments

graph	A tbl_graph object
keep	The fraction of edges to use for creating the backbone
circular	ignored

Value

A data.frame with the columns `x`, `y`, `circular` as well as any information stored as node variables in the `tbl_graph` object. Further an edge attribute called `backbone` is added giving whether the edge was selected as backbone.

Author(s)

The underlying algorithm is implemented in the `graphlayouts` package by David Schoch

layout_tbl_graph_centrality

Place nodes in circles according to centrality measure

Description

This layout places nodes in circles with the radii relative to a given centrality measure. Under the hood it use stress majorisation to place nodes optimally given the radius constraint.

Usage

```
layout_tbl_graph_centrality(
  graph,
  centrality,
  scale = TRUE,
  niter = 500,
  tolerance = 1e-04,
  tseq = seq(0, 1, 0.2),
  circular = FALSE
)
```

Arguments

graph	A <code>tbl_graph</code> object
centrality	An expression evaluating to a centrality measure for the nodes. See the different <code>centrality_*</code> () algorithms in <code>tidygraph</code> for a selection.
scale	Should the centrality measure be scaled between 0 and 100
niter	number of iterations during stress optimization
tolerance	stopping criterion for stress optimization
tseq	Transitioning steps
circular	ignored

Value

A `data.frame` with the columns `x`, `y`, `circular`, `centrality` as well as any information stored as node variables in the `tbl_graph` object.

Author(s)

The underlying algorithm is implemented in the `graphlayouts` package by David Schoch

Other `layout_tbl_graph_*`: [layout_tbl_graph_auto\(\)](#), [layout_tbl_graph_backbone\(\)](#), [layout_tbl_graph_circlepac\(\)](#), [layout_tbl_graph_dendrogram\(\)](#), [layout_tbl_graph_eigen\(\)](#), [layout_tbl_graph_fabric\(\)](#), [layout_tbl_graph_focus\(\)](#), [layout_tbl_graph_hive\(\)](#), [layout_tbl_graph_igraph\(\)](#), [layout_tbl_graph_linear\(\)](#), [layout_tbl_graph_manual\(\)](#), [layout_tbl_graph_matrix\(\)](#), [layout_tbl_graph_partition\(\)](#), [layout_tbl_graph_pmds\(\)](#), [layout_tbl_graph_stress\(\)](#), [layout_tbl_graph_treemap\(\)](#), [layout_tbl_graph_unroot\(\)](#)

 layout_tbl_graph_circlepack

Calculate nodes as circles packed within their parent circle

Description

The circle packing algorithm is basically a treemap using circles instead of rectangles. Due to the nature of circles they cannot be packed as efficiently leading to increased amount of "empty space" as compared to a treemap. This can be beneficial though, as the added empty space can aid in visually showing the hierarchy.

Usage

```
layout_tbl_graph_circlepack(  
  graph,  
  weight = NULL,  
  circular = FALSE,  
  sort.by = NULL,  
  direction = "out"  
)
```

Arguments

graph	An tbl_graph object
weight	An optional node variable to use as weight. Will only affect the weight of leaf nodes as the weight of non-leaf nodes are derived from their children.
circular	Logical. Should the layout be transformed to a circular representation. Ignored.
sort.by	The name of a node variable to sort the nodes by.
direction	The direction of the tree in the graph. 'out' (default) means that parents point towards their children, while 'in' means that children point towards their parent.

Details

The circle packing is based on the algorithm developed by Weixin Wang and collaborators which tries to find the most dense packing of circles as they are added, one by one. This makes the algorithm very dependent on the order in which circles are added and it is possible that layouts could sometimes be optimized by choosing a different ordering. The algorithm for finding the enclosing circle is the randomized incremental algorithm proposed by Emo Welzl. Both of the above algorithms are the same as used in the D3.js implementation of circle packing and their C++ implementation in ggraph is inspired by Mike Bostocks JavaScript implementation.

Value

A data.frame with the columns x, y, r, leaf, depth, circular as well as any information stored as node variables in the tbl_graph object.

Note

Circle packing is a layout intended for trees, that is, graphs where nodes only have one parent and zero or more children. If the provided graph does not fit this format an attempt to convert it to such a format will be made.

layout_tbl_graph_dendrogram

Apply a dendrogram layout to layout_tbl_graph

Description

This layout mimics the `igraph::layout_as_tree()` algorithm supplied by igraph, but puts all leaves at 0 and builds it up from there, instead of starting from the root and building it from there. The height of branch points are related to the maximum distance to an edge from the branch node, or read from a node variable.

Usage

```
layout_tbl_graph_dendrogram(
  graph,
  circular = FALSE,
  offset = pi/2,
  height = NULL,
  length = NULL,
  repel = FALSE,
  ratio = 1,
  direction = "out"
)
```

Arguments

graph	A tbl_graph object
circular	Logical. Should the layout be transformed to a circular representation. Defaults to FALSE.
offset	If circular = TRUE, where should it begin. Defaults to pi/2 which is equivalent to 12 o'clock.
height	The node variable holding the height of each node in the dendrogram. If NULL it will be calculated as the maximal distance to a leaf.
length	An edge parameter giving the length of each edge. The node height will be calculated from the maximal length to the root node (ignored if height does not evaluate to NULL)
repel	Should leafs repel each other relative to the height of their common ancestor. Will emphasize clusters
ratio	The strength of repulsion if <code>repel = TRUE</code> . Higher values will give more defined clusters
direction	The direction to the leaves. Defaults to 'out'

Value

A data.frame with the columns `x`, `y`, `circular`, `depth` and `leaf` as well as any information stored as node variables on the `tbl_graph`

Note

This function is not intended to be used directly but by setting `layout = 'dendrogram'` in `create_layout()`

Other `layout_tbl_graph_*`: `layout_tbl_graph_auto()`, `layout_tbl_graph_backbone()`, `layout_tbl_graph_centrality()`, `layout_tbl_graph_circlepack()`, `layout_tbl_graph_eigen()`, `layout_tbl_graph_fabric()`, `layout_tbl_graph_focus()`, `layout_tbl_graph_hive()`, `layout_tbl_graph_igraph()`, `layout_tbl_graph_linear()`, `layout_tbl_graph_manual()`, `layout_tbl_graph_matrix()`, `layout_tbl_graph_partition()`, `layout_tbl_graph_pmds()`, `layout_tbl_graph_stress()`, `layout_tbl_graph_treemap()`, `layout_tbl_graph_unroot()`

layout_tbl_graph_eigen

Place nodes according to their eigenvalues

Description

This layout is based on the idea of spectral layouts where node coordinates are calculated directly by decomposing a matrix representation of the graph and extracting the eigenvectors.

Usage

```
layout_tbl_graph_eigen(
  graph,
  type = "laplacian",
  eigenvector = "smallest",
  circular = FALSE
)
```

Arguments

graph	A <code>tbl_graph</code> object
type	The type of matrix to extract the eigenvectors from. Either 'laplacian' or 'adjacency'
eigenvector	The eigenvector to use for coordinates. Either 'smallest' or 'largest'
circular	ignored

Value

A data.frame with the columns `x`, `y`, `circular` as well as any information stored as node variables in the `tbl_graph` object.

Author(s)

The underlying algorithm is implemented in the `graphlayouts` package by David Schoch

See Also

Other `layout_tbl_graph_*`: [layout_tbl_graph_auto\(\)](#), [layout_tbl_graph_backbone\(\)](#), [layout_tbl_graph_centralit](#), [layout_tbl_graph_circlepack\(\)](#), [layout_tbl_graph_dendrogram\(\)](#), [layout_tbl_graph_fabric\(\)](#), [layout_tbl_graph_focus\(\)](#), [layout_tbl_graph_hive\(\)](#), [layout_tbl_graph_igraph\(\)](#), [layout_tbl_graph_linear\(\)](#), [layout_tbl_graph_manual\(\)](#), [layout_tbl_graph_matrix\(\)](#), [layout_tbl_graph_partition\(\)](#), [layout_tbl_graph_pmds\(\)](#), [layout_tbl_graph_stress\(\)](#), [layout_tbl_graph_treemap\(\)](#), [layout_tbl_graph_unroot](#)

layout_tbl_graph_fabric

Create a fabric layout

Description

This layout is a bit unusual in that it shows nodes as horizontal line ranges and edges as evenly spaced vertical spans connecting the nodes. As with the matrix layout the strength comes from better scalability but its use requires some experience recognising the patterns that different connectivity features give rise to. As with matrix layouts the ordering of nodes has huge power over the look of the plot. The `node_rank_fabric()` mimics the default ordering from the original BioFabric implementation, but other ranking algorithms from `tidygraph` can be used with the `sort.by` argument as well. Fabric layouts tend to become quite wide as the graph grows which is something that should be handled with care - e.g. by only zooming in on a specific region.

Usage

```
layout_tbl_graph_fabric(  
  graph,  
  circular = FALSE,  
  sort.by = NULL,  
  shadow.edges = FALSE  
)  
  
node_rank_fabric()
```

Arguments

graph	An tbl_graph object
circular	Ignored
sort.by	An expression providing the sorting of the nodes. If NULL the nodes will be ordered by their index in the graph.
shadow.edges	Should shadow edges be shown.

Value

A data.frame with the columns x, xmin, xmax, y, circular as well as any information stored as node variables in the tbl_graph object. Further, the edges of the graph will gain a edge_x variable giving the horizontal position of the edge as well as a shadow_edge variable denoting whether the edge is a shadow edge added by the layout.

 layout_tbl_graph_focus

Place nodes in circles based on distance to a specific node

Description

This layout constrains node placement to a radius relative to its distance to a given node. It then uses stress majorisation to find an optimal node distribution according to this constraint.

Usage

```
layout_tbl_graph_focus(
  graph,
  focus,
  weights = NULL,
  niter = 500,
  tolerance = 1e-04,
  circular = TRUE
)
```

Arguments

graph	a tbl_graph object
focus	An expression evaluating to a selected node. Can either be a single integer or a logical vector with a single TRUE element.
weights	An expression evaluated on the edge data to provide edge weights for the layout. Currently ignored for the sparse version
niter	number of iterations during stress optimization
tolerance	stopping criterion for stress optimization
circular	ignored

Value

A data.frame with the columns x, y, circular, distance as well as any information stored as node variables in the tbl_graph object.

Author(s)

The underlying algorithm is implemented in the graphlayouts package by David Schoch

layout_tbl_graph_hive *Place nodes in a Hive Plot layout*

Description

Hive plots were invented by Martin Krzywinski as a perceptually uniform and scalable alternative to standard node-edge layouts. In hive plots nodes are positioned on axes radiating out from a center based on their own information e.g. membership of a class, size of neighborhood, etc. Edges are then drawn between nodes as bezier curves. As the placement of nodes is not governed by convoluted algorithms but directly reflects the qualities of the nodes itself the resulting plot can be easier to interpret as well as compare to other graphs.

Usage

```
layout_tbl_graph_hive(  
  graph,  
  axis,  
  axis.pos = NULL,  
  sort.by = NULL,  
  divide.by = NULL,  
  divide.order = NULL,  
  normalize = TRUE,  
  center.size = 0.1,  
  divide.size = 0.05,  
  use.numeric = FALSE,  
  offset = pi/2,  
  split.axes = "none",  
  split.angle = pi/6,  
  circular = FALSE  
)
```

Arguments

graph	An tbl_graph object
axis	The node attribute to use for assigning nodes to axes
axis.pos	The relative distance to the prior axis. Default (NULL) places axes equidistant.
sort.by	The node attribute to use for placing nodes along their axis. Defaults (NULL) places nodes sequentially.

divide.by	An optional node attribute to subdivide each axis by.
divide.order	The order the axis subdivisions should appear in
normalize	Logical. Should axis lengths be equal or reflect the number of nodes in each axis. Defaults to TRUE.
center.size	The size of the blank center, that is, the start position of the axes.
divide.size	The distance between subdivided axis segments.
use.numeric	Logical, If the sort.by attribute is numeric, should these values be used directly in positioning the nodes along the axes. Defaults to FALSE which sorts the numeric values and positions them equidistant from each other.
offset	Change the overall rotation of the hive plot by changing the offset of the first axis.
split.axes	Should axes be split to show edges between nodes on the same axis? One of: 'none' Do not split axes and show in-between edges 'loops' Only split axes that contain in-between edges 'all' Split all axes
split.angle	The angular distance between the two axes resulting from a split.
circular	Ignored.

Details

In order to be able to draw all edges without edges crossing axes you should not assign nodes to axes based on a variable with more than three levels.

Value

A data.frame with the columns x, y, r, center_size, split, axis, section, angle, circular as well as any information stored as node variables in the tbl_graph object.

 layout_tbl_graph_igraph

Use igraph layout algorithms for layout_tbl_graph

Description

This layout function makes it easy to apply one of the layout algorithms supplied in igraph when plotting with ggraph. Layout names are auto completed so there is no need to write `layout_with_graphopt` or `layout_as_tree`, just `graphopt` and `tree` (though the former will also work if you want to be super explicit). Circular layout is only supported for tree-like layout (`tree` and `sugiyama`) and will throw an error when applied to other layouts.

Usage

```
layout_tbl_graph_igraph(
  graph,
  algorithm,
  circular,
  offset = pi/2,
  use.dummy = FALSE,
  ...
)
```

Arguments

<code>graph</code>	A <code>tbl_graph</code> object.
<code>algorithm</code>	The type of layout algorithm to apply. See <i>Details</i> or igraph::layout_() for links to the layouts supplied by igraph.
<code>circular</code>	Logical. Should the layout be transformed to a circular representation. Defaults to FALSE. Only applicable to <code>algorithm = 'tree'</code> and <code>algorithm = 'sugiyama'</code> .
<code>offset</code>	If <code>circular = TRUE</code> , where should it begin. Defaults to <code>pi/2</code> which is equivalent to 12 o'clock.
<code>use.dummy</code>	Logical. In the case of <code>algorithm = 'sugiyama'</code> should the dummy-infused graph be used rather than the original. Defaults to FALSE.
<code>...</code>	Arguments passed on to the respective layout functions

Details

igraph provides a huge amount of possible layouts. They are all briefly described below:

Hierarchical layouts

`tree` Uses the *Reingold-Tilford* algorithm to place the nodes below their parent with the parent centered above its children. See [igraph::as_tree\(\)](#)

`sugiyama` Designed for directed acyclic graphs (that is, hierarchies where multiple parents are allowed) it minimizes the number of crossing edges. See [igraph::with_sugiyama\(\)](#)

Standard layouts

- bipartite** Minimize edge-crossings in a simple two-row (or column) layout for bipartite graphs. See [igraph::as_bipartite\(\)](#)
- star** Place one node in the center and the rest equidistantly around it. See [igraph::as_star\(\)](#)
- circle** Place nodes in a circle in the order of their index. Consider using [layout_tbl_graph_linear\(\)](#) with `circular=TRUE` for more control. See [igraph::in_circle\(\)](#)
- nicely** Tries to pick an appropriate layout. See [igraph::nicely\(\)](#) for a description of the simple decision tree it uses
- dh** Uses *Davidson and Harels* simulated annealing algorithm to place nodes. See [igraph::with_dh\(\)](#)
- gem** Place nodes on the plane using the GEM force-directed layout algorithm. See [igraph::with_gem\(\)](#)
- graphopt** Uses the Graphopt algorithm based on alternating attraction and repulsion to place nodes. See [igraph::with_graphopt\(\)](#)
- grid** Place nodes on a rectangular grid. See [igraph::on_grid\(\)](#)
- mds** Perform a multidimensional scaling of nodes using either the shortest path or a user supplied distance. See [igraph::with_mds\(\)](#)
- sphere** Place nodes uniformly on a sphere - less relevant for 2D visualizations of networks. See [igraph::on_sphere\(\)](#)
- randomly** Places nodes uniformly random. See [igraph::randomly\(\)](#)
- fr** Places nodes according to the force-directed algorithm of Fruchterman and Reingold. See [igraph::with_fr\(\)](#)
- kk** Uses the spring-based algorithm by Kamada and Kawai to place nodes. See [igraph::with_kk\(\)](#)
- drl** Uses the force directed algorithm from the DrL toolbox to place nodes. See [igraph::with_drl\(\)](#)
- lgl** Uses the algorithm from Large Graph Layout to place nodes. See [igraph::with_lgl\(\)](#)

Value

A data.frame with the columns `x`, `y`, `circular` as well as any information stored as node variables in the `tbl_graph` object.

Note

This function is not intended to be used directly but by setting `layout = 'igraph'` in [create_layout\(\)](#)

See Also

Other `layout_tbl_graph_*`: [layout_tbl_graph_auto\(\)](#), [layout_tbl_graph_backbone\(\)](#), [layout_tbl_graph_centralit](#), [layout_tbl_graph_circlepack\(\)](#), [layout_tbl_graph_dendrogram\(\)](#), [layout_tbl_graph_eigen\(\)](#), [layout_tbl_graph_fabric\(\)](#), [layout_tbl_graph_focus\(\)](#), [layout_tbl_graph_hive\(\)](#), [layout_tbl_graph_linear\(\)](#), [layout_tbl_graph_manual\(\)](#), [layout_tbl_graph_matrix\(\)](#), [layout_tbl_graph_partition\(\)](#), [layout_tbl_graph_pmds\(\)](#), [layout_tbl_graph_stress\(\)](#), [layout_tbl_graph_treemap\(\)](#), [layout_tbl_graph_unroot](#)

 layout_tbl_graph_linear

Place nodes on a line or circle

Description

This layout puts all nodes on a line, possibly sorted by a node attribute. If `circular = TRUE` the nodes will be laid out on the unit circle instead. In the case where the `sort.by` attribute is numeric, the numeric values will be used as the x-position and it is thus possible to have uneven spacing between the nodes.

Usage

```
layout_tbl_graph_linear(
  graph,
  circular,
  sort.by = NULL,
  use.numeric = FALSE,
  offset = pi/2
)
```

Arguments

<code>graph</code>	An <code>tbl_graph</code> object
<code>circular</code>	Logical. Should the layout be transformed to a circular representation. Defaults to <code>FALSE</code> .
<code>sort.by</code>	The name of a node variable to sort the nodes by.
<code>use.numeric</code>	Logical. Should a numeric <code>sort.by</code> attribute be used as the actual x-coordinates in the layout. May lead to overlapping nodes. Defaults to <code>FALSE</code>
<code>offset</code>	If <code>circular = TRUE</code> , where should it begin. Defaults to <code>pi/2</code> which is equivalent to 12 o'clock.

Value

A `data.frame` with the columns `x`, `y`, `circular` as well as any information stored as node variables in the `tbl_graph` object.

See Also

Other `layout_tbl_graph_*`: [layout_tbl_graph_auto\(\)](#), [layout_tbl_graph_backbone\(\)](#), [layout_tbl_graph_centralit](#), [layout_tbl_graph_circlepack\(\)](#), [layout_tbl_graph_dendrogram\(\)](#), [layout_tbl_graph_eigen\(\)](#), [layout_tbl_graph_fabric\(\)](#), [layout_tbl_graph_focus\(\)](#), [layout_tbl_graph_hive\(\)](#), [layout_tbl_graph_igraph\(\)](#), [layout_tbl_graph_manual\(\)](#), [layout_tbl_graph_matrix\(\)](#), [layout_tbl_graph_partition\(\)](#), [layout_tbl_graph_pmds\(\)](#), [layout_tbl_graph_stress\(\)](#), [layout_tbl_graph_treemap\(\)](#), [layout_tbl_graph_unroot](#)

layout_tbl_graph_manual

Manually specify a layout for layout_tbl_graph

Description

This layout function lets you pass the node positions in manually. The supplied positions must match the order of the nodes in the `tbl_graph`

Usage

```
layout_tbl_graph_manual(graph, x, y, circular)
```

Arguments

<code>graph</code>	An <code>tbl_graph</code> object
<code>x, y</code>	Expressions with the x and y positions of the nodes
<code>circular</code>	Ignored

Value

A data.frame with the columns `x`, `y`, `circular` as well as any information stored as node variables in the `tbl_graph`.

See Also

Other `layout_tbl_graph_*`: [layout_tbl_graph_auto\(\)](#), [layout_tbl_graph_backbone\(\)](#), [layout_tbl_graph_centralit](#), [layout_tbl_graph_circlepack\(\)](#), [layout_tbl_graph_dendrogram\(\)](#), [layout_tbl_graph_eigen\(\)](#), [layout_tbl_graph_fabric\(\)](#), [layout_tbl_graph_focus\(\)](#), [layout_tbl_graph_hive\(\)](#), [layout_tbl_graph_igraph\(\)](#), [layout_tbl_graph_linear\(\)](#), [layout_tbl_graph_matrix\(\)](#), [layout_tbl_graph_partition\(\)](#), [layout_tbl_graph_pmds\(\)](#), [layout_tbl_graph_stress\(\)](#), [layout_tbl_graph_treemap\(\)](#), [layout_tbl_graph_unroot](#)

layout_tbl_graph_matrix

Place nodes on a diagonal

Description

This layout puts all nodes on a diagonal, thus preparing the layout for use with [geom_edge_point\(\)](#) resulting in a matrix layout. While matrix layouts excel in scalability, the interpretation of the visual is very dependent on the sorting of the nodes. Different sorting algorithms have been implemented in `tidygraph` and these can be used directly. Behrisch *et al.* (2016) have provided a nice overview of some of the different sorting algorithms and what insight they might bring, along with a rundown of different patterns to look out for.

Usage

```
layout_tbl_graph_matrix(graph, circular = FALSE, sort.by = NULL)
```

Arguments

graph	An tbl_graph object
circular	Ignored
sort.by	An expression providing the sorting of the nodes. If NULL the nodes will be ordered by their index in the graph.

Value

A data.frame with the columns x, y, circular as well as any information stored as node variables in the tbl_graph object.

See Also

Other layout_tbl_graph_*: [layout_tbl_graph_auto\(\)](#), [layout_tbl_graph_backbone\(\)](#), [layout_tbl_graph_centrality\(\)](#), [layout_tbl_graph_circlepack\(\)](#), [layout_tbl_graph_dendrogram\(\)](#), [layout_tbl_graph_eigen\(\)](#), [layout_tbl_graph_fabric\(\)](#), [layout_tbl_graph_focus\(\)](#), [layout_tbl_graph_hive\(\)](#), [layout_tbl_graph_igraph\(\)](#), [layout_tbl_graph_linear\(\)](#), [layout_tbl_graph_manual\(\)](#), [layout_tbl_graph_partition\(\)](#), [layout_tbl_graph_pmds\(\)](#), [layout_tbl_graph_stress\(\)](#), [layout_tbl_graph_treemap\(\)](#), [layout_tbl_graph_unroot\(\)](#)

layout_tbl_graph_partition

Calculate nodes as areas dividing their parent

Description

The partition layout is a way to show hierarchical data in the same way as [layout_tbl_graph_treemap\(\)](#). Instead of subdividing the parent area the partition layout shows the division of a nodes children next to the area of the node itself. As such the node positions will be very reminiscent of a reingold-tilford tree layout but by plotting nodes as areas it better communicate the total weight of a node by summing up all its children. Often partition layouts are called icicle plots or sunburst diagrams (in case a radial transform is applied).

Usage

```
layout_tbl_graph_partition(
  graph,
  weight = NULL,
  circular = FALSE,
  height = NULL,
  sort.by = NULL,
  direction = "out",
  offset = pi/2,
  const.area = TRUE
)
```

Arguments

graph	An tbl_graph object
weight	An optional node variable to use as weight. Will only affect the weight of leaf nodes as the weight of non-leaf nodes are derived from their children.
circular	Logical. Should the layout be transformed to a circular representation. If TRUE the resulting layout will be a sunburst diagram.
height	An optional node variable to use as height. If NULL all nodes will be given a height of 1.
sort.by	The name of a node variable to sort the nodes by.
direction	The direction of the tree in the graph. 'out' (default) means that parents point towards their children, while 'in' means that children point towards their parent.
offset	If circular = TRUE, where should it begin. Defaults to pi/2 which is equivalent to 12 o'clock.
const.area	Logical. Should 'height' be scaled for area proportionality when using circular = TRUE. Defaults to TRUE.

Value

If circular = FALSE A data.frame with the columns x, y, width, height, leaf, depth, circular as well as any information stored as node variables in the tbl_graph object. If circular = TRUE A data.frame with the columns x, y, r0, r, start, end, leaf, depth, circular as well as any information stored as node variables in the tbl_graph object.

Note

partition is a layout intended for trees, that is, graphs where nodes only have one parent and zero or more children. If the provided graph does not fit this format an attempt to convert it to such a format will be made.

layout_tbl_graph_pmds *Place nodes based on a multidimensional scaling of a set of pivot nodes*

Description

This layout is similar to the 'mds' layout but uses only a subset of pivot nodes for the mds calculation, making it considerably faster and thus suited for large graphs

Usage

```
layout_tbl_graph_pmds(graph, pivots, weights = NULL, circular = FALSE)
```

Arguments

graph	A tbl_graph object
pivots	The number of pivot nodes
weights	An expression evaluated on the edge data to provide edge weights for the layout. Currently ignored for the sparse version
circular	ignored

Value

A data.frame with the columns x, y, circular as well as any information stored as node variables in the tbl_graph object.

Author(s)

The underlying algorithm is implemented in the graphlayouts package by David Schoch

layout_tbl_graph_stress

Place nodes using stress majorisation

Description

This layout is related to the stress-minimization algorithm known as Kamada-Kawai (available as the 'kk' layout), but uses another optimization strategy. It generally have better runtime, quality, and stability compared to the Kamada-Kawai layout and is thus generally preferred. The sparse version of the layout have better performance (especially on larger networks) at the expense of layout quality, but will generally outperform many other algorithms for large graphs in both runtime and quality (e.g. the 'drl' layout from igraph).

Usage

```
layout_tbl_graph_stress(  
  graph,  
  weights = NULL,  
  niter = 500,  
  tolerance = 1e-04,  
  mds = TRUE,  
  bbox = 50,  
  circular = FALSE  
)  
  
layout_tbl_graph_sparse_stress(  
  graph,  
  pivots,  
  weights = NULL,  
  niter = 500,  
  circular = FALSE  
)
```

Arguments

graph	a tbl_graph object
weights	An expression evaluated on the edge data to provide edge weights for the layout. Currently ignored for the sparse version
niter	number of iterations during stress optimization

tolerance	stopping criterion for stress optimization
mds	should an MDS layout be used as initial layout (default: TRUE)
bbox	constrain dimension of output. Only relevant to determine the placement of disconnected graphs.
circular	ignored
pivots	The number of pivot nodes.

Value

A data.frame with the columns x, y, circular as well as any information stored as node variables in the tbl_graph object.

Author(s)

The underlying algorithm is implemented in the graphlayouts package by David Schoch

layout_tbl_graph_treemap

Calculate nodes as rectangles subdividing that of their parent

Description

A treemap is a space filling hierarchical layout that maps nodes to rectangles. The rectangles of the children of a node is packed into the rectangle of the node so that the size of a rectangle is a function of the size of the children. The size of the leaf nodes can be mapped arbitrarily (defaults to 1). Many different algorithms exists for dividing a rectangle into smaller bits, some optimizing the aspect ratio and some focusing on the ordering of the rectangles. See details for more discussions on this. The treemap layout was first developed by Ben Shneiderman for visualizing disk usage in the early '90 and has seen many improvements since.

Usage

```
layout_tbl_graph_treemap(
  graph,
  algorithm = "split",
  weight = NULL,
  circular = FALSE,
  sort.by = NULL,
  direction = "out",
  height = 1,
  width = 1
)
```

Arguments

graph	A <code>tbl_graph</code> object
algorithm	The name of the tiling algorithm to use. Defaults to 'split'
weight	An optional node variable to use as weight. Will only affect the weight of leaf nodes as the weight of non-leaf nodes are derived from their children.
circular	Logical. Should the layout be transformed to a circular representation. Ignored.
sort.by	The name of a node variables to sort the nodes by.
direction	The direction of the tree in the graph. 'out' (default) means that parents point towards their children, while 'in' means that children point towards their parent.
height	The height of the bounding rectangle
width	The width of the bounding rectangle

Details

Different approaches to dividing the rectangles in a treemap exists; all with their strengths and weaknesses. Currently only the split algorithm is implemented which strikes a good balance between aspect ratio and order preservation, but other, more well-known, algorithms such as squarify and slice-and-dice will eventually be implemented.

Algorithms*Split* (default)

The Split algorithm was developed by Bjorn Engdahl in order to address the downsides of both the original slice-and-dice algorithm (poor aspect ratio) and the popular squarify algorithm (no ordering of nodes). It works by finding the best cut in the ordered list of children in terms of making sure that the two rectangles associated with the split will have optimal aspect ratio.

Value

A data.frame with the columns `x`, `y`, `width`, `height`, `leaf`, `depth`, `circular` as well as any information stored as node variables in the `tbl_graph` object.

Note

Treemap is a layout intended for trees, that is, graphs where nodes only have one parent and zero or more children. If the provided graph does not fit this format an attempt to convert it to such a format will be made.

layout_tbl_graph_unrooted

Create an unrooted layout using equal-angle or equal-daylight

Description

When drawing unrooted trees the standard dendrogram layout is a bad fit as it implicitly creates a visual root node. Instead it is possible to spread the leafs out on the plane without putting any special emphasis on a particular node using an unrooted layout. The standard algorithm is the equal angle algorithm, but it can struggle with optimising the leaf distribution for large trees trees with very uneven branch length. The equal daylight algorithm modifies the output of the equal angle algorithm to better disperse the leaves, at the cost of higher computational cost and the possibility of edge crossings for very large unbalanced trees. For standard sized trees the daylight algorithm is far superior and not too heavy so it is the default.

Usage

```
layout_tbl_graph_unrooted(
  graph,
  daylight = TRUE,
  length = NULL,
  tolerance = 0.05,
  rotation_mod = 1,
  maxiter = 100,
  circular = FALSE
)
```

Arguments

graph	A tbl_graph object
daylight	Should equal-daylight adjustments be made
length	An expression evaluating to the branch length of each edge
tolerance	The threshold for mean angular adjustment before terminating the daylight adjustment
rotation_mod	A modifier for the angular adjustment of each branch. Set it below 1 to let the daylight adjustment progress more slowly
maxiter	The maximum number of iterations in the the daylight adjustment
circular	ignored

Value

A data.frame with the columns x, y, circular, leaf as well as any information stored as node variables in the tbl_graph object.

Note

Unrooted is a layout intended for undirected trees, that is, graphs with no cycles. If the provided graph does not fit this format an attempt to convert it to such a format will be made.

node_angle

Get the angle of nodes and edges

Description

These helper functions makes it easy to calculate the angle associated with nodes and edges. For nodes the angle is defined as the angle of the vector pointing towards the node position, and is thus mainly suited for circular layouts where it can be used to calculate the angle of labels. For edges it is simply the angle of the vector describing the edge.

Usage

```
node_angle(x, y, degrees = TRUE)

edge_angle(x, y, xend, yend, degrees = TRUE)
```

Arguments

x, y	A vector of positions
degrees	Logical. Should the angle be returned in degree (TRUE) or radians (FALSE). Defaults to TRUE.
xend, yend	The end position of the edge

Value

A vector with the angle of each node/edge

Examples

```
require(tidygraph)
flareGraph <- tbl_graph(flare$vertices, flare$edges)

ggraph(flareGraph, 'dendrogram', circular = TRUE) +
  geom_edge_diagonal0() +
  geom_node_text(aes(filter = leaf, angle = node_angle(x, y), label = shortName),
    hjust = 'outward', size = 2
  ) +
  expand_limits(x = c(-1.3, 1.3), y = c(-1.3, 1.3))
```

pack_circles	<i>Pack circles together</i>
--------------	------------------------------

Description

This function is a direct interface to the circle packing algorithm used by [layout_tbl_graph_circlepack](#). It takes a vector of sizes and returns the x and y position of each circle as a two-column matrix.

Usage

```
pack_circles(areas)
```

Arguments

areas	A vector of circle areas
-------	--------------------------

Value

A matrix with two columns and the same number of rows as the length of the "areas" vector. The matrix has the following attributes added: "enclosing_radius" giving the radius of the smallest enclosing circle, and "front_chain" giving the terminating members of the front chain (see Wang *et al.* 2006).

References

Wang, W., Wang, H. H., Dai, G., & Wang, H. (2006). *Visualization of large hierarchical data by circle packing*. *Chi*, 517-520.

Examples

```
library(ggforce)
sizes <- sample(10, 100, TRUE)

position <- pack_circles(sizes)
data <- data.frame(x = position[,1], y = position[,2], r = sqrt(sizes/pi))

ggplot() +
  geom_circle(aes(x0 = x, y0 = y, r = r), data = data, fill = 'steelblue') +
  geom_circle(aes(x0 = 0, y0 = 0, r = attr(position, 'enclosing_radius'))) +
  geom_polygon(aes(x = x, y = y),
              data = data[attr(position, 'front_chain'), ],
              fill = NA,
              colour = 'black')
```

scale_edge_alpha *Edge alpha scales*

Description

This set of scales defines new alpha scales for edge geoms equivalent to the ones already defined by ggplot2. See `ggplot2::scale_alpha()` for more information. The different geoms will know whether to use edge scales or the standard scales so it is not necessary to write `edge_alpha` in the call to the geom - just use `alpha`.

Usage

```
scale_edge_alpha(..., range = c(0.1, 1))

scale_edge_alpha_continuous(..., range = c(0.1, 1))

scale_edge_alpha_discrete(..., range = c(0.1, 1))

scale_edge_alpha_manual(..., values)

scale_edge_alpha_identity(..., guide = "none")
```

Arguments

...	Other arguments passed on to continuous_scale() , binned_scale , or discrete_scale() as appropriate, to control name, limits, breaks, labels and so forth.
range	Output range of alpha values. Must lie between 0 and 1.
values	a set of aesthetic values to map data values to. The values will be matched in order (usually alphabetical) with the limits of the scale, or with breaks if provided. If this is a named vector, then the values will be matched based on the names instead. Data values that don't match will be given <code>na.value</code> .
guide	Guide to use for this scale. Defaults to "none".

Value

A ggproto object inheriting from Scale

See Also

  )

scale_edge_color_viridis(
  ...,
  alpha = 1,
  begin = 0,
  end = 1,
  discrete = FALSE,
  option = "D",
  direction = 1
)

```

Arguments

... Arguments passed on to [discrete_scale](#)

palette A palette function that when called with a single integer argument (the number of levels in the scale) returns the values that they should take (e.g., [scales::hue_pal\(\)](#)).

breaks One of:

- NULL for no breaks
- [waiver\(\)](#) for the default breaks (the scale limits)
- A character vector of breaks
- A function that takes the limits as input and returns breaks as output

limits A character vector that defines possible values of the scale and their order.

drop Should unused factor levels be omitted from the scale? The default, TRUE, uses the levels that appear in the data; FALSE uses all the levels in the factor.

na.translate Unlike continuous scales, discrete scales can easily show missing values, and do so by default. If you want to remove missing values from a discrete scale, specify `na.translate = FALSE`.

scale_name The name of the scale that should be used for error messages associated with this scale.

name The name of the scale. Used as the axis or legend title. If [waiver\(\)](#), the default, the name of the scale is taken from the first mapping used for that aesthetic. If NULL, the legend title will be omitted.

labels One of:

- NULL for no labels
- [waiver\(\)](#) for the default labels computed by the transformation object
- A character vector giving labels (must be same length as breaks)
- A function that takes the breaks as input and returns labels as output

expand	For position scales, a vector of range expansion constants used to add some padding around the data to ensure that they are placed some distance away from the axes. Use the convenience function <code>expansion()</code> to generate the values for the expand argument. The defaults are to expand the scale by 5% on each side for continuous variables, and by 0.6 units on each side for discrete variables.
guide	A function used to create a guide or its name. See <code>guides()</code> for more information.
position	For position scales, The position of the axis. <code>left</code> or <code>right</code> for y axes, <code>top</code> or <code>bottom</code> for x axes.
super	The super class to use for the constructed scale
h	range of hues to use, in $[0, 360]$
c	chroma (intensity of colour), maximum value varies depending on combination of hue and luminance.
l	luminance (lightness), in $[0, 100]$
h.start	hue to start at
direction	direction to travel around the colour wheel, <code>1</code> = clockwise, <code>-1</code> = counter-clockwise
na.value	Colour to use for missing values
type	One of <code>seq</code> (sequential), <code>div</code> (diverging) or <code>qual</code> (qualitative)
palette	If a string, will use that named palette. If a number, will index into the list of palettes of appropriate type. The list of available palettes can found in the Palettes section.
values	if colours should not be evenly positioned along the gradient this vector gives the position (between 0 and 1) for each colour in the colours vector. See <code>rescale()</code> for a convenience function to map an arbitrary range to between 0 and 1.
space	colour space in which to calculate gradient. Must be <code>"Lab"</code> - other values are deprecated.
guide	Type of legend. Use <code>"colourbar"</code> for continuous colour bar, or <code>"legend"</code> for discrete colour legend.
low, high	Colours for low and high ends of the gradient.
mid	colour for mid point
midpoint	The midpoint (in data value) of the diverging scale. Defaults to 0.
colours, colors	Vector of colours to use for n-colour gradient.
start	grey value at low end of palette
end	grey value at high end of palette
alpha	pass through parameter to <code>viridis</code>
begin	The (corrected) hue in $[0,1]$ at which the <code>viridis</code> colormap begins.
discrete	generate a discrete palette? (default: <code>FALSE</code> - generate continuous palette)
option	A character string indicating the colormap option to use. Four options are available: <code>"magma"</code> (or <code>"A"</code>), <code>"inferno"</code> (or <code>"B"</code>), <code>"plasma"</code> (or <code>"C"</code>), <code>"viridis"</code> (or <code>"D"</code> , the default option) and <code>"cividis"</code> (or <code>"E"</code>).

h.start		hue to start at
direction		direction to travel around the colour wheel, 1 = clockwise, -1 = counter-clockwise
na.value		Colour to use for missing values
type		One of seq (sequential), div (diverging) or qual (qualitative)
palette		If a string, will use that named palette. If a number, will index into the list of palettes of appropriate type. The list of available palettes can found in the Palettes section.
values		if colours should not be evenly positioned along the gradient this vector gives the position (between 0 and 1) for each colour in the colours vector. See rescale() for a convenience function to map an arbitrary range to between 0 and 1.
space		colour space in which to calculate gradient. Must be "Lab" - other values are deprecated.
guide		Type of legend. Use "colourbar" for continuous colour bar, or "legend" for discrete colour legend.
low, high		Colours for low and high ends of the gradient.
mid		colour for mid point
midpoint		The midpoint (in data value) of the diverging scale. Defaults to 0.
colours, colors		Vector of colours to use for n-colour gradient.
start		grey value at low end of palette
end		grey value at high end of palette
alpha		pass through parameter to viridis
begin		The (corrected) hue in [0,1] at which the viridis colormap begins.
discrete		generate a discrete palette? (default: FALSE - generate continuous palette)
option		A character string indicating the colormap option to use. Four options are available: "magma" (or "A"), "inferno" (or "B"), "plasma" (or "C"), "viridis" (or "D", the default option) and "cividis" (or "E").

Value

A ggproto object inheriting from `Scale`

See Also

Other scale_edge_*: [scale_edge_alpha\(\)](#), [scale_edge_colour](#), [scale_edge_linetype\(\)](#), [scale_edge_shape\(\)](#), [scale_edge_size\(\)](#), [scale_edge_width\(\)](#), [scale_label_size\(\)](#)

scale_edge_linetype *Edge linetype scales*

Description

This set of scales defines new linetype scales for edge geoms equivalent to the ones already defined by ggplot2. See [ggplot2::scale_linetype\(\)](#) for more information. The different geoms will know whether to use edge scales or the standard scales so it is not necessary to write edge_linetype in the call to the geom - just use linetype.

Usage

```
scale_edge_linetype(..., na.value = "blank")

scale_edge_linetype_continuous(...)

scale_edge_linetype_discrete(..., na.value = "blank")

scale_edge_linetype_manual(..., values)

scale_edge_linetype_identity(..., guide = "none")
```

Arguments

... Arguments passed on to [discrete_scale](#)

palette A palette function that when called with a single integer argument (the number of levels in the scale) returns the values that they should take (e.g., [scales::hue_pal\(\)](#)).

breaks One of:

- NULL for no breaks
- [waiver\(\)](#) for the default breaks (the scale limits)
- A character vector of breaks
- A function that takes the limits as input and returns breaks as output

limits A character vector that defines possible values of the scale and their order.

drop Should unused factor levels be omitted from the scale? The default, TRUE, uses the levels that appear in the data; FALSE uses all the levels in the factor.

na.translate Unlike continuous scales, discrete scales can easily show missing values, and do so by default. If you want to remove missing values from a discrete scale, specify na.translate = FALSE.

aesthetics The names of the aesthetics that this scale works with.

scale_name	The name of the scale that should be used for error messages associated with this scale.
name	The name of the scale. Used as the axis or legend title. If <code>waiver()</code> , the default, the name of the scale is taken from the first mapping used for that aesthetic. If <code>NULL</code> , the legend title will be omitted.
labels	One of: <ul style="list-style-type: none"> • <code>NULL</code> for no labels • <code>waiver()</code> for the default labels computed by the transformation object • A character vector giving labels (must be same length as breaks) • A function that takes the breaks as input and returns labels as output
guide	A function used to create a guide or its name. See guides() for more information.
super	The super class to use for the constructed scale
na.value	The linetype to use for NA values.
values	a set of aesthetic values to map data values to. The values will be matched in order (usually alphabetical) with the limits of the scale, or with breaks if provided. If this is a named vector, then the values will be matched based on the names instead. Data values that don't match will be given <code>na.value</code> .
guide	Guide to use for this scale. Defaults to "none".

Value

A ggproto object inheriting from `Scale`

See Also

Other `scale_edge_*`: [scale_edge_alpha\(\)](#), [scale_edge_colour](#), [scale_edge_fill](#), [scale_edge_shape\(\)](#), [scale_edge_size\(\)](#), [scale_edge_width\(\)](#), [scale_label_size\(\)](#)

scale_edge_shape	<i>Edge shape scales</i>
------------------	--------------------------

Description

This set of scales defines new shape scales for edge geoms equivalent to the ones already defined by `ggplot2`. See [ggplot2::scale_shape\(\)](#) for more information. The different geoms will know whether to use edge scales or the standard scales so it is not necessary to write `edge_shape` in the call to the geom - just use `shape`.

Usage

```
scale_edge_shape(..., solid = TRUE)
```

```
scale_edge_shape_discrete(..., solid = TRUE)
```

```
scale_edge_shape_continuous(...)
scale_edge_shape_manual(..., values)
scale_edge_shape_identity(..., guide = "none")
```

Arguments

... Arguments passed on to [discrete_scale](#)

palette A palette function that when called with a single integer argument (the number of levels in the scale) returns the values that they should take (e.g., `scales::hue_pal()`).

breaks One of:

- NULL for no breaks
- `waiver()` for the default breaks (the scale limits)
- A character vector of breaks
- A function that takes the limits as input and returns breaks as output

limits A character vector that defines possible values of the scale and their order.

drop Should unused factor levels be omitted from the scale? The default, TRUE, uses the levels that appear in the data; FALSE uses all the levels in the factor.

na.translate Unlike continuous scales, discrete scales can easily show missing values, and do so by default. If you want to remove missing values from a discrete scale, specify `na.translate = FALSE`.

na.value If `na.translate = TRUE`, what value aesthetic value should missing be displayed as? Does not apply to position scales where NA is always placed at the far right.

aesthetics The names of the aesthetics that this scale works with.

scale_name The name of the scale that should be used for error messages associated with this scale.

name The name of the scale. Used as the axis or legend title. If `waiver()`, the default, the name of the scale is taken from the first mapping used for that aesthetic. If NULL, the legend title will be omitted.

labels One of:

- NULL for no labels
- `waiver()` for the default labels computed by the transformation object
- A character vector giving labels (must be same length as breaks)
- A function that takes the breaks as input and returns labels as output

guide A function used to create a guide or its name. See [guides\(\)](#) for more information.

super The super class to use for the constructed scale

solid Should the shapes be solid, TRUE, or hollow, FALSE?

values a set of aesthetic values to map data values to. The values will be matched in order (usually alphabetical) with the limits of the scale, or with breaks if provided. If this is a named vector, then the values will be matched based on the names instead. Data values that don't match will be given `na.value`.

guide Guide to use for this scale.

Value

A ggproto object inheriting from Scale

See Also

Other scale_edge_*: [scale_edge_alpha\(\)](#), [scale_edge_colour](#), [scale_edge_fill](#), [scale_edge_linetype\(\)](#), [scale_edge_size\(\)](#), [scale_edge_width\(\)](#), [scale_label_size\(\)](#)

scale_edge_size *Edge size scales*

Description

This set of scales defines new size scales for edge geoms equivalent to the ones already defined by ggplot2. See [ggplot2::scale_size\(\)](#) for more information. The different geoms will know whether to use edge scales or the standard scales so it is not necessary to write edge_size in the call to the geom - just use size.

Usage

```
scale_edge_size_continuous(..., range = c(1, 6))
```

```
scale_edge_radius(..., range = c(1, 6))
```

```
scale_edge_size(..., range = c(1, 6))
```

```
scale_edge_size_discrete(..., range = c(2, 6))
```

```
scale_edge_size_area(..., max_size = 6)
```

```
scale_edge_size_manual(..., values)
```

```
scale_edge_size_identity(..., guide = "none")
```

Arguments

... Arguments passed on to [continuous_scale](#)

minor_breaks One of:

- NULL for no minor breaks
- [waiver\(\)](#) for the default breaks (one minor break between each major break)
- A numeric vector of positions
- A function that given the limits returns a vector of minor breaks.

	<p>oob One of:</p> <ul style="list-style-type: none"> • Function that handles limits outside of the scale limits (out of bounds). • The default (<code>scales::censor()</code>) replaces out of bounds values with NA. • <code>scales::squish()</code> for squishing out of bounds values into range. • <code>scales::squish_infinite()</code> for squishing infinite values into range. <p>na.value Missing values will be replaced with this value.</p> <p>expand For position scales, a vector of range expansion constants used to add some padding around the data to ensure that they are placed some distance away from the axes. Use the convenience function <code>expansion()</code> to generate the values for the expand argument. The defaults are to expand the scale by 5% on each side for continuous variables, and by 0.6 units on each side for discrete variables.</p> <p>position For position scales, The position of the axis. left or right for y axes, top or bottom for x axes.</p> <p>super The super class to use for the constructed scale</p>
range	a numeric vector of length 2 that specifies the minimum and maximum size of the plotting symbol after transformation.
max_size	Size of largest points.
values	a set of aesthetic values to map data values to. The values will be matched in order (usually alphabetical) with the limits of the scale, or with breaks if provided. If this is a named vector, then the values will be matched based on the names instead. Data values that don't match will be given na.value.
guide	A function used to create a guide or its name. See <code>guides()</code> for more information.

Value

A ggproto object inheriting from Scale

Note

In ggplot2 size conflates both line width and point size into one scale. In ggraph there is also a width scale (`scale_edge_width\(\)`) that is used for linewidth. As edges are often represented by lines the width scale is the most common.

See Also

Other scale_edge_*: `scale_edge_alpha\(\)`, `scale_edge_colour`, `scale_edge_fill`, `scale_edge_linetype\(\)`, `scale_edge_shape\(\)`, `scale_edge_width\(\)`, `scale_label_size\(\)`

scale_edge_width *Edge width scales*

Description

This set of scales defines width scales for edge geoms. Of all the new edge scales defined in `ggraph`, this is the only one not having an equivalent in `ggplot2`. In essence it mimics the use of `size` in `ggplot2::geom_line()` and related. As almost all edge representations are lines of some sort, `edge_width` will be used much more often than `edge_size`. It is not necessary to spell out that it is an edge scale as the geom knows if it is drawing an edge. Just write `width` and not `edge_width` in the call to geoms.

Usage

```
scale_edge_width_continuous(..., range = c(1, 6))
```

```
scale_edge_width(..., range = c(1, 6))
```

```
scale_edge_width_discrete(..., range = c(2, 6))
```

```
scale_edge_width_manual(..., values)
```

```
scale_edge_width_identity(..., guide = "none")
```

Arguments

... Arguments passed on to `continuous_scale`

minor_breaks One of:

- NULL for no minor breaks
- `waiver()` for the default breaks (one minor break between each major break)
- A numeric vector of positions
- A function that given the limits returns a vector of minor breaks.

oob One of:

- Function that handles limits outside of the scale limits (out of bounds).
- The default (`scales:::censor()`) replaces out of bounds values with NA.
- `scales:::squish()` for squishing out of bounds values into range.
- `scales:::squish_infinite()` for squishing infinite values into range.

na.value Missing values will be replaced with this value.

expand For position scales, a vector of range expansion constants used to add some padding around the data to ensure that they are placed some distance away from the axes. Use the convenience function `expansion()` to generate the values for the `expand` argument. The defaults are to expand the scale by 5% on each side for continuous variables, and by 0.6 units on each side for discrete variables.

	position	For position scales, The position of the axis. left or right for y axes, top or bottom for x axes.
	super	The super class to use for the constructed scale
range		a numeric vector of length 2 that specifies the minimum and maximum size of the plotting symbol after transformation.
values		a set of aesthetic values to map data values to. The values will be matched in order (usually alphabetical) with the limits of the scale, or with breaks if provided. If this is a named vector, then the values will be matched based on the names instead. Data values that don't match will be given <code>na.value</code> .
guide		A function used to create a guide or its name. See guides() for more information.

Value

A ggproto object inheriting from `Scale`

See Also

Other `scale_edge_*`: [scale_edge_alpha\(\)](#), [scale_edge_colour](#), [scale_edge_fill](#), [scale_edge_linetype\(\)](#), [scale_edge_shape\(\)](#), [scale_edge_size\(\)](#), [scale_label_size\(\)](#)

scale_label_size *Edge label size scales*

Description

This set of scales defines new size scales for edge labels in order to allow for separate sizing of edges and their labels.

Usage

```
scale_label_size_continuous(..., range = c(1, 6))
```

```
scale_label_size(..., range = c(1, 6))
```

```
scale_label_size_discrete(..., range = c(2, 6))
```

```
scale_label_size_manual(..., values)
```

```
scale_label_size_identity(..., guide = "none")
```

Arguments

...	Arguments passed on to continuous_scale
minor_breaks	One of: <ul style="list-style-type: none"> • NULL for no minor breaks • waiver() for the default breaks (one minor break between each major break) • A numeric vector of positions • A function that given the limits returns a vector of minor breaks.
oob	One of: <ul style="list-style-type: none"> • Function that handles limits outside of the scale limits (out of bounds). • The default (scales:::censor()) replaces out of bounds values with NA. • scales:::squish() for squishing out of bounds values into range. • scales:::squish_infinite() for squishing infinite values into range.
na.value	Missing values will be replaced with this value.
expand	For position scales, a vector of range expansion constants used to add some padding around the data to ensure that they are placed some distance away from the axes. Use the convenience function expansion() to generate the values for the expand argument. The defaults are to expand the scale by 5% on each side for continuous variables, and by 0.6 units on each side for discrete variables.
position	For position scales, The position of the axis. left or right for y axes, top or bottom for x axes.
super	The super class to use for the constructed scale
range	a numeric vector of length 2 that specifies the minimum and maximum size of the plotting symbol after transformation.
values	a set of aesthetic values to map data values to. The values will be matched in order (usually alphabetical) with the limits of the scale, or with breaks if provided. If this is a named vector, then the values will be matched based on the names instead. Data values that don't match will be given <code>na.value</code> .
guide	A function used to create a guide or its name. See guides() for more information.

`theme_graph`*A theme tuned for graph visualizations*

Description

When plotting graphs, networks, and trees the coordinate values are often of no importance and axes are thus a distraction. `ggraph` comes with a build-in theme that removes redundant elements in order to put focus on the data. Furthermore the default behaviour is to use a narrow font so text takes up less space. Theme colour is defined by a background and foreground colour where the background defines the colour of the whole graphics area and the foreground defines the colour of the strip and border. By default strip and border is turned off as it is an unnecessary element unless facetting is used. To add a foreground colour to a plot that is already using `theme_graph` the `th_foreground` helper is provided. In order to use this appearance as default use the `set_graph_style` function. An added benefit of this is that it also changes the default text-related values in the different geoms for a completely coherent look. `unset_graph_style` can be used to revert the defaults back to their default settings (that is, they are not necessarily reverted back to what they were prior to calling `set_graph_style`). The `th_no_axes()` helper is provided to modify an existing theme so that grid and axes are removed.

Usage

```
theme_graph(  
  base_family = "Arial Narrow",  
  base_size = 11,  
  background = "white",  
  foreground = NULL,  
  border = TRUE,  
  text_colour = "black",  
  bg_text_colour = text_colour,  
  fg_text_colour = text_colour,  
  title_family = base_family,  
  title_size = 18,  
  title_face = "bold",  
  title_margin = 10,  
  title_colour = bg_text_colour,  
  subtitle_family = base_family,  
  subtitle_size = 12,  
  subtitle_face = "plain",  
  subtitle_margin = 15,  
  subtitle_colour = bg_text_colour,  
  strip_text_family = base_family,  
  strip_text_size = 10,  
  strip_text_face = "bold",  
  strip_text_colour = fg_text_colour,  
  caption_family = base_family,  
  caption_size = 9,  
  caption_face = "italic",
```

```

caption_margin = 10,
caption_colour = bg_text_colour,
plot_margin = margin(30, 30, 30, 30)
)

th_foreground(foreground = "grey80", fg_text_colour = NULL, border = FALSE)

th_no_axes()

set_graph_style(
  family = "Arial Narrow",
  face = "plain",
  size = 11,
  text_size = 11,
  text_colour = "black",
  ...
)

unset_graph_style()

```

Arguments

base_size, size, text_size, title_size, subtitle_size, strip_text_size, caption_size	The size to use for the various text elements. text_size will be used as geom defaults
background	The colour to use for the background. This theme sets all background elements except for plot.background to element_blank so this controls the background for all elements of the plot. Set to NA to remove the background (thus making the plot transparent)
foreground	The colour of foreground elements, specifically strip and border. Set to NA to remove.
border	Logical. Should border be drawn if a foreground colour is provided?
text_colour, bg_text_colour, fg_text_colour, title_colour, subtitle_colour, strip_text_colour, caption_colour	The colour of the text in the various text elements
title_margin, subtitle_margin, caption_margin	The margin to use between the text elements and the plot area
plot_margin	The plot margin
family, base_family, title_family, subtitle_family, strip_text_family, caption_family	The font to use for the different elements
face, title_face, subtitle_face, strip_text_face, caption_face	The fontface to use for the various text elements
...	Parameters passed on the theme_graph

Examples

```

library(tidygraph)
graph <- as_tbl_graph(highschool)

```

```
ggraph(graph) + geom_edge_link() + geom_node_point() + theme_graph()
```

whigs

Membership network of American Whigs

Description

This dataset shows the membership of 136 colonial Americans in 5 whig organization and is a bipartite graph. The data appeared in the appendix to David Hackett Fischer's *Paul Revere's Ride* (Oxford University Press, 1995) and compiled by Kieran Healy for the blog post [Using Metadata to Find Paul Revere](#).

Usage

whigs

Format

The data is stored as an incidence matrix with persons as rows and organizations as columns. A 0 means no membership while a one means membership.
