Package ‘ggrastr’

December 8, 2021

Type Package

Title Rasterize Layers for 'ggplot2'

Version 1.0.1

Description Rasterize only specific layers of a 'ggplot2' plot while simultaneously keeping all labels and text in vector format. This allows users to keep plots within the reasonable size limit without losing vector properties of the scale-sensitive information.

License MIT + file LICENSE

Encoding UTF-8

Imports ggplot2 (>= 2.1.0), Cairo (>= 1.5.9), ggbeeswarm, grid, png, ragg

Depends R (>= 3.2.2)

RoxygenNote 7.1.2

Suggests knitr, maps, rmarkdown, sf

VignetteBuilder knitr

R topics documented:

  geom_beeswarm_rast ........................................... 2
  geom_boxplot_jitter ............................................. 3
  geom_jitter_rast ............................................... 5
This geom is similar to `geom_beeswarm`, but creates a raster layer

**Usage**

```r
geom_beeswarm_rast(
  ..., 
  priority = c("ascending", "descending", "density", "random", "none"),
  cex = 1,
  groupOnX = NULL,
  dodge.width = 0,
  raster.dpi =getOption("ggrastr.default.dpi", 300),
  dev = "cairo",
  scale = 1
)
```

**Arguments**

- `...` Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.
- `priority` string Method used to perform point layout (see `ggbeeswarm::position_beeswarm`).
- `cex` numeric Scaling for adjusting point spacing (see `ggbeeswarm::position_beeswarm`)
- `groupOnX` boolean Whether jitter be added to the x axis (default=NULL). if TRUE then jitter is added to the x axis and if FALSE jitter is added to the y axis. (The default NULL causes the function to guess which axis is the categorical axis based on the number of unique entries in each). Refer to see `ggbeeswarm::position_beeswarm` for more details.
- `dodge.width` numeric Amount by which points from different aesthetic groups will be dodged (default=0). This requires that one of the aesthetics is a factor. Refer to see `ggbeeswarm::position_beeswarm` for more details.
- `raster.dpi` integer Resolution of the rastered image in dots per inch (default=300).
- `dev` string Specifies the device used, which can be one of: "cairo", "ragg" or "ragg_png" (default="cairo").
geom_boxplot_jitter

scale numeric Scaling factor to modify the raster object size (default=1). The parameter 'scale=1' results in an object size that is unchanged, 'scale'>1 increase the size, and 'scale'<1 decreases the size. These parameters are passed to 'height' and 'width' of grid::grid.raster(). Please refer to 'rasterise()' and 'grid::grid.raster()' for more details.

Value

geom_beeswarm plot with rasterized layer

Examples

library(ggplot2)
library(ggrastr)

ggplot(mtcars) + geom_beeswarm_rast(aes(x = factor(cyl), y = mpg), raster.dpi = 600, cex = 1.5)

geom_boxplot_jitter This geom is similar to geom_boxplot, but allows to jitter outlier points and to raster points layer.

Description

This geom is similar to geom_boxplot, but allows to jitter outlier points and to raster points layer.

Usage

geom_boxplot_jitter(
  mapping = NULL,
  data = NULL,
  dev = "cairo",
  stat = "boxplot",
  position = "dodge",
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE,
  ...,
  outlier.jitter.width = NULL,
  outlier.jitter.height = 0,
  raster.dpi =getOption("ggrastr.default.dpi", 300),
  scale = 1
)
Arguments

mapping Set of aesthetic mappings created by aes() or aes_. If specified and inherit.aes = TRUE (the default), it is combined with the default mapping at the top level of the plot. You must supply mapping if there is no plot mapping.

data The data to be displayed in this layer. There are three options:
If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot().
A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created.
A function will be called with a single argument, the plot data. The return value must be a data.frame, and will be used as the layer data. A function can be created from a formula (e.g. ~ head(.x,10)).

dev string Specifies the device used, which can be one of: "cairo", "ragg" or "ragg_png" (default="cairo").

stat Use to override the default connection between geom_boxplot() and stat_boxplot().

position Position adjustment, either as a string, or the result of a call to a position adjustment function.

na.rm If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.

show.legend logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

inherit.aes If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders().

... Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

outlier.jitter.width numeric Amount of horizontal jitter (default=NULL). The jitter is added in both positive and negative directions, so the total spread is twice the value specified here. If NULL, no jitter performed.

outlier.jitter.height numeric Amount of horizontal jitter (default=0). The jitter is added in both positive and negative directions, so the total spread is twice the value specified here.

raster.dpi integer Resolution of the rastered image (default=300). Ignored if raster == FALSE.

scale numeric Scaling factor to modify the raster object size (default=1). The parameter ‘scale=1’ results in an object size that is unchanged, ‘scale’>1 increase the size, and ‘scale’<1 decreases the size. These parameters are passed to ‘height’ and ‘width’ of grid::grid.raster(). Please refer to ‘rasterise()’ and ‘grid::grid.raster()’ for more details.
**Value**

gem_boxplot plot with rasterized layer

**Aesthetics**

gem_boxplot() understands the following aesthetics (required aesthetics are in bold):

- `x` or `y`
- `lower` or `xlower`
- `upper` or `xupper`
- `middle` or `xmiddle`
- `ymin` or `xmin`
- `ymax` or `xmax`
- `alpha`
- `colour`
- `fill`
- `group`
- `linetype`
- `shape`
- `size`
- `weight`

Learn more about setting these aesthetics in vignette("ggplot2-specs").

**Examples**

```r
library(ggplot2)
library(ggrastr)

yvalues = rt(1000, df=3)
xvalues = as.factor(1:1000 %% 2)
ggplot() + geom_boxplot_jitter(aes(y=yvalues, x=xvalues), outlier.jitter.width = 0.1, raster = TRUE)
```

---

**geom_jitter_rast**  
*This geom is similar to geom_jitter, but creates a raster layer*

**Description**

This geom is similar to geom_jitter, but creates a raster layer
Usage

```r
geom_jitter_rast(
  ..., 
  raster.dpi = getOption("ggrastr.default.dpi", 300), 
  dev = "cairo", 
  scale = 1 
)
```

Arguments

... Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.

- `raster.dpi` integer Resolution of the rastered image in dots per inch (default=300).
- `dev` string Specifies the device used, which can be one of: "cairo", "ragg" or "ragg_png" (default="cairo").
- `scale` numeric Scaling factor to modify the raster object size (default=1). The parameter `scale=1` results in an object size that is unchanged, `scale>1` increase the size, and `scale<1` decreases the size. These parameters are passed to `height` and `width` of `grid::grid.raster()`. Please refer to `rasterise()` and `grid::grid.raster()` for more details.

Value

`geom_point_rast` plot with rasterized layer

Aesthetics

`geom_point()` understands the following aesthetics (required aesthetics are in bold):

- x
- y
- alpha
- colour
- fill
- group
- shape
- size
- stroke

Learn more about setting these aesthetics in vignette("ggplot2-specs").
Examples

```r
library(ggplot2)
library(ggrastr)

ggplot(mpg) + geom_jitter_rast(aes(x = factor(cyl), y = hwy), raster.dpi = 600)
```

Description

This geom is similar to `geom_point`, but creates a raster layer

Usage

```r
geom_point_rast(
  ..., 
  raster.dpi =getOption("ggrastr.default.dpi", 300),
  dev = "cairo",
  scale = 1
)
```

Arguments

- `...` Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.
- `raster.dpi` integer Resolution of the rastered image in dots per inch (default=300).
- `dev` string Specifies the device used, which can be one of: "cairo", "ragg" or "ragg_png" (default="cairo").
- `scale` numeric Scaling factor to modify the raster object size (default=1). The parameter 'scale=1' results in an object size that is unchanged, 'scale'>1 increase the size, and 'scale'<1 decreases the size. These parameters are passed to 'height' and 'width' of grid::grid.raster(). Please refer to 'rasterise()' and 'grid::grid.raster()' for more details.

Value

`geom_point` plot with rasterized layer
Aesthetics

geom_point() understands the following aesthetics (required aesthetics are in bold):

- x
- y
- alpha
- colour
- fill
- group
- shape
- size
- stroke

Learn more about setting these aesthetics in vignette("ggplot2-specs").

Examples

library(ggplot2)
library(ggrastr)

ggplot() + geom_point_rast(aes(x=rnorm(1000), y=rnorm(1000)), raster.dpi=600)

geom_quasirandom_rast
This geom is similar to geom_quasirandom, but creates a raster layer

Description

This geom is similar to geom_quasirandom, but creates a raster layer

Usage

geom_quasirandom_rast(
  ..., 
  width = NULL,
  varwidth = FALSE,
  bandwidth = 0.5,
  nbins = NULL,
  method = "quasirandom",
  groupOnX = NULL,
  dodge.width = 0,
  raster.dpi = getOption("ggrastr.default.dpi", 300),
  dev = "cairo",
  scale = 1
)
Arguments

Other arguments passed on to \texttt{layer()}. These are often aesthetics, used to set an aesthetic to a fixed value, like \texttt{colour = "red"} or \texttt{size = 3}. They may also be parameters to the paired geom/stat.

- \texttt{width} the maximum amount of spread (default: 0.4)
- \texttt{varwidth} vary the width by the relative size of each group
- \texttt{bandwidth} the bandwidth adjustment to use when calculating density Smaller numbers (< 1) produce a tighter "fit". (default: 0.5)
- \texttt{nbins} the number of bins used when calculating density (has little effect with quasirandom/random distribution)
- \texttt{method} the method used for distributing points (quasirandom, pseudorandom, smiley or frowney)
- \texttt{groupOnX} if \texttt{TRUE} then jitter is added to the x axis and if \texttt{FALSE} jitter is added to the y axis. Prior to v0.6.0, the default NULL causes the function to guess which axis is the categorical one based on the number of unique entries in each. This could result in unexpected results when the x variable has few unique values and so in v0.6.0 the default was changed to always jitter on the x axis unless \texttt{groupOnX=FALSE}. Also consider \texttt{coord_flip}.
- \texttt{dodge.width} Amount by which points from different aesthetic groups will be dodged. This requires that one of the aesthetics is a factor.
- \texttt{raster.dpi} integer Resolution of the rastered image in dots per inch (default=300).
- \texttt{dev} string Specifies the device used, which can be one of: \texttt{"cairo"}, \texttt{"ragg"} or \texttt{"ragg.png"} (default=\texttt{"cairo"}).
- \texttt{scale} numeric Scaling factor to modify the raster object size (default=1). The parameter 'scale=1' results in an object size that is unchanged, 'scale'>1 increase the size, and 'scale'<1 decreases the size. These parameters are passed to 'height' and 'width' of \texttt{grid::grid.raster()}. Please refer to 'rasterise()' and 'grid::grid.raster()' for more details.

Value

\texttt{geom_quasirandom} plot with rasterized layer

Aesthetics

\texttt{geom_point()} understands the following aesthetics (required aesthetics are in bold):

- \texttt{x}
- \texttt{y}
- \texttt{alpha}
- \texttt{colour}
- \texttt{fill}
- \texttt{group}
- \texttt{shape}
• size
• stroke

Learn more about setting these aesthetics in vignette("ggplot2-specs").

Examples

```r
library(ggplot2)
library(ggrastr)

ggplot(mtcars) + geom_quasirandom_rast(aes(x = factor(cyl), y = mpg), raster.dpi = 600)
```

---

**geom_tile_rast**  
This geom is similar to **geom_tile**, but creates a raster layer

Description

This geom is similar to **geom_tile**, but creates a raster layer

Usage

```r
geom_tile_rast(
  ..., 
  raster.dpi =getOption("ggrastr.default.dpi", 300),
  dev = "cairo",
  scale = 1
)
```

Arguments

...  
Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

raster.dpi  
integer Resolution of the rastered image in dots per inch (default=300).

dev  
string Specifies the device used, which can be one of: "cairo", "ragg" or "ragg_png" (default="cairo").

scale  
numeric Scaling factor to modify the raster object size (default=1). The parameter 'scale=1' results in an object size that is unchanged, 'scale'>1 increase the size, and 'scale'<1 decreases the size. These parameters are passed to 'height' and 'width' of grid::grid.raster(). Please refer to 'rasterise()' and 'grid::grid.raster()' for more details.

Value

geom_tile plot with rasterized layer
geom_violin_rast

Aesthetics

geom_tile() understands the following aesthetics (required aesthetics are in bold):

- x
- y
- alpha
- colour
- fill
- group
- height
- linetype
- size
- width

Learn more about setting these aesthetics in vignette("ggplot2-specs").

Examples

library(ggplot2)
library(ggrastr)

coords <- expand.grid(1:100, 1:100)
coords$Value <- 1 / apply(as.matrix(coords), 1, function(x) sum((x - c(50, 50))^2)^0.01)
ggplot(coords) + geom_tile_rast(aes(x=Var1, y=Var2, fill=Value))

geom_violin_rast

This geom is similar to geom_violin, but creates a raster layer

Description

This geom is similar to geom_violin, but creates a raster layer

Usage

geom_violin_rast(
  ..., 
  raster.dpi =getOption("ggrastr.default.dpi", 300),
  dev = "cairo",
  scale = 1
)
Arguments

Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.

- `raster.dpi` integer Resolution of the rastered image in dots per inch (default=300).
- `dev` string Specifies the device used, which can be one of: "cairo", "ragg" or "ragg_png" (default="cairo").
- `scale` numeric Scaling factor to modify the raster object size (default=1). The parameter 'scale=1' results in an object size that is unchanged, 'scale'>1 increase the size, and 'scale'<1 decreases the size. These parameters are passed to 'height' and 'width' of grid::grid.raster(). Please refer to 'rasterise()' and 'grid::grid.raster()' for more details.

Value

`geom_violin_rast` plot with rasterized layer

Aesthetics

`geom_violin()` understands the following aesthetics (required aesthetics are in bold):

- x
- y
- alpha
- colour
- fill
- group
- linetype
- size
- weight

Learn more about setting these aesthetics in vignette("ggplot2-specs").

Examples

```r
library(ggplot2)
library(ggrastr)

ggplot(mpg) + geom_violin_rast(aes(x = factor(cyl), y = hwy), raster.dpi = 600)
```
rasterise

Rasterise ggplot layers Takes a ggplot object or a layer as input and renders their graphical output as a raster.

Description

Rasterise ggplot layers Takes a ggplot object or a layer as input and renders their graphical output as a raster.

Usage

rasterise(input, ...)

## S3 method for class 'Layer'
rasterise(input, dpi = NULL, dev = "cairo", scale = 1, ...)

## S3 method for class 'list'
rasterise(input, dpi = NULL, dev = "cairo", scale = 1, ...)

## S3 method for class 'ggplot'
rasterise(
  input,
  layers = c("Point", "Tile"),
  dpi = NULL,
  dev = "cairo",
  scale = 1,
  ...
)

rasterize(input, ...)

Arguments

input ggplot plot object to rasterize
... other arguments
dpi integer Sets the desired resolution in dots per inch (default=NULL).
dev string Specifies the device used, which can be one of: "cairo", "ragg" or "ragg_png" (default="cairo").
scale numeric Scaling factor to modify the raster object size (default=1). The parameter 'scale=1' results in an object size that is unchanged, 'scale'>1 increase the size, and 'scale'<1 decreases the size. These parameters are passed to 'height' and 'width' of grid::grid.raster(). Please refer to 'rasterise()' and 'grid::grid.raster()' for more details.
layers list of layer types that should be rasterized
Details

The default dpi (NULL (i.e. let the device decide)) can conveniently be controlled by setting the option "ggrastr.default.dpi" (e.g. options("ggrastr.default.dpi" = 30) for drafting).

Value

A modified Layer object.

Author(s)

Teun van den Brand <t.vd.brand@nki.nl>

Examples

```r
require(ggplot2)
# 'rasterise()' is used to wrap layers
ggplot(pressure, aes(temperature, pressure)) +
   rasterise(geom_line())

# The 'dpi' argument controls resolution
ggplot(faithful, aes(eruptions, waiting)) +
   rasterise(geom_point(), dpi = 5)

# The 'dev' argument offers a few options for devices
require(ragg)
.ggplot(diamonds, aes(carat, depth, z = price)) +
   rasterise(stat_summary_hex(), dev = "ragg")

# The 'scale' argument allows you to render a 'big' plot in small window, or vice versa.
ggplot(faithful, aes(eruptions, waiting)) +
   rasterise(geom_point(), scale = 4)
```

---

theme_pdf | Pretty theme
---|---

Description

Pretty theme

Usage

```r
theme_pdf(show.ticks = TRUE, legend.pos = NULL)
```

Arguments

- `show.ticks`: boolean Whether to show x- and y-ticks (default=TRUE).
- `legend.pos`: Vector with x and y position of the legend (default=NULL).
Value

ggplot2 with plot ticks and positioned legend

Examples

```r
library(ggplot2)
library(ggrastr)

data = rnorm(100)
colors = (1:100/100)
ggplot() + geom_point(aes(x=data, y=data, color=colors)) + theme_pdf(FALSE, legend.pos=c(1, 1))
```
