Package ‘ggside’

May 17, 2021

Type Package
Title Side Grammar Graphics
Version 0.1.0
Maintainer Justin Landis <jtlandis314@gmail.com>
Description The grammar of graphics as shown in ‘ggplot2’ has provided an expressive API for users to build plots. ‘ggside’ extends ‘ggplot2’ by allowing users to add graphical information about one of the main panel’s axis using a familiar ‘ggplot2’ style API with tidy data. This package is particularly useful for visualizing metadata on a discrete axis, or summary graphics on a continuous axis such as a boxplot or a density distribution.
License MIT + file LICENSE
Encoding UTF-8
RoxygenNote 7.1.1
VignetteBuilder knitr
Depends ggplot2 (>= 3.0.0)
Imports grid, gtable, rlang, scales, glue, stats
Suggests tidyr, dplyr, testthat, knitr, rmarkdown, vdiffr, ggdendro, viridis
NeedsCompilation no

as_ggsideFacet

Extending base ggproto classes for ggside

Description

S3 class that converts old Facet into one that is compatible with ggside. Can also update ggside on the object. Typically, the new ggproto will inherit from the object being replaced.

check_scales_collapse is a helper function that is meant to be called after the inherited Facet's compute_layout method

sidePanelLayout is a helper function that is meant to be called after the inherited Facet's compute_layout method and after check_scales_collapse

map_data_ggside is the mapping function used to replace all map_data method on FacetSideNull, FacetSideGrid, and FacetSideWrap. It is exported for conveniences of extensibility.

Usage

as_ggsideFacet(facet, ggside)

check_scales_collapse(data, params)

sidePanelLayout(layout, ggside)

map_data_ggside(data, layout, params)
Arguments

- **facet** Facet ggproto Object to replace
- **ggside** ggside object to update
- **data** data passed through ggproto object
- **params** parameters passed through ggproto object
- **layout** layout computed by inherited ggproto Facet compute_layout method

Value

ggproto object that can be added to a ggplot object

Extended Facets

The following is a list ggplot2 facets that are available to use by ggside base.

- FacetNull -> FacetSideNull
- FacetGrid -> FacetSideGrid
- FacetWrap -> FacetSideWrap

---

**geom_xsidebar**

Side bar Charts

Description

The *xside* and *yside* variants of geom_bar is geom_xsidebar and geom_ysidebar. These variants both inherit from geom_bar and only differ on where they plot data relative to main panels.

The *xside* and *yside* variants of geom_col is geom_xsidecol and geom_ysidecol. These variants both inherit from geom_col and only differ on where they plot data relative to main panels.

Usage

```r
geom_xsidebar(
  mapping = NULL,
  data = NULL,
  stat = "count",
  position = "stack",
  ...,
  width = NULL,
  na.rm = FALSE,
  orientation = "x",
  show.legend = NA,
  inherit.aes = TRUE
)

geom_ysidebar(
```

```r
```
geom_xsidebar

mapping = NULL,
data = NULL,
stat = "count",
position = "stack",
...
width = NULL,
na.rm = FALSE,
orientation = "y",
show.legend = NA,
inherit.aes = TRUE

geom_xsidecol(
mapping = NULL,
data = NULL,
position = "stack",
...
width = NULL,
na.rm = FALSE,
show.legend = NA,
inherit.aes = TRUE

geom_ysidecol(
mapping = NULL,
data = NULL,
position = "stack",
...
width = NULL,
na.rm = FALSE,
show.legend = NA,
inherit.aes = TRUE,
orientation = "y"
)

Arguments

mapping  Set of aesthetic mappings created by \texttt{aes()} or \texttt{aes()}. If specified and \texttt{inherit.aes} = \texttt{TRUE} (the default), it is combined with the default mapping at the top level of the plot. You must supply \texttt{mapping} if there is no plot mapping.
data  The data to be displayed in this layer. There are three options:
   If \texttt{NULL}, the default, the data is inherited from the plot data as specified in the call to \texttt{ggplot()}.  
   A \texttt{data.frame}, or other object, will override the plot data. All objects will be fortified to produce a data frame. See \texttt{fortify()} for which variables will be created.
   A function will be called with a single argument, the plot data. The return value must be a \texttt{data.frame}, and will be used as the layer data. A function
can be created from a formula (e.g. \( \sim \text{head}(x, 10) \)).

**stat**

Override the default connection between `geom_bar()` and `stat_count()`.

**position**

Position adjustment, either as a string, or the result of a call to a position adjustment function.

... Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = \"red\"` or `size = 3`. They may also be parameters to the paired geom/stat.

**width**

Bar width. By default, set to 90% of the resolution of the data.

**na.rm**

If `FALSE`, the default, missing values are removed with a warning. If `TRUE`, missing values are silently removed.

**orientation**

The orientation of the layer. The default (`NA`) automatically determines the orientation from the aesthetic mapping. In the rare event that this fails it can be given explicitly by setting `orientation` to either "x" or "y". See the Orientation section for more detail.

**show.legend**

Logical. Should this layer be included in the legends? `NA`, the default, includes if any aesthetics are mapped. `FALSE` never includes, and `TRUE` always includes. It can also be a named logical vector to finely select the aesthetics to display.

**inherit.aes**

If `FALSE`, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. `borders()`.

**Value**

XLayer or YLayer object to be added to a ggplot object

**Aesthetics**

Required aesthetics are in bold.

- `x`
- `y`
- `fill` or `xfill` Fill color of the xsidebar
- `fill` or `yfill` Fill color of the ysidebar
- `width` specifies the width of each bar
- `height` specifies the height of each bar
- `alpha` Transparency level of xfill or yfill
- `size` size of the border line.

**See Also**

`geom_xsidehistogram, geom_ysidehistogram`
Examples

```r
p <- ggplot(iris, aes(Sepal.Width, Sepal.Length, color = Species, fill = Species)) + geom_point()

#sidebar - uses StatCount
p +
geom_xsidebar() +
geom_ysidebar()

#sidecol - uses Global mapping
p +
geom_xsidecol() +
geom_ysidecol()
```

Description

The `xside` and `yside` variants of `geom_boxplot` is `geom_xsideboxplot` and `geom_ysideboxplot`.

Usage

```r
geom_xsideboxplot(
  mapping = NULL,
  data = NULL,
  stat = "boxplot",
  position = "dodge2",
  ...,
  outlier.colour = NULL,
  outlier.color = NULL,
  outlier.fill = NULL,
  outlier.shape = 19,
  outlier.size = 1.5,
  outlier.stroke = 0.5,
  outlier.alpha = NULL,
  notch = FALSE,
  notchwidth = 0.5,
  varwidth = FALSE,
  na.rm = FALSE,
  orientation = "x",
  show.legend = NA,
  inherit.aes = TRUE
)
```

```r
geom_ysideboxplot(
```
geom_xsideboxplot

mapping = NULL,
data = NULL,
stat = "boxplot",
position = "dodge2",
...
outlier.colour = NULL,
outlier.color = NULL,
outlier.fill = NULL,
outlier.shape = 19,
outlier.size = 1.5,
outlier.stroke = 0.5,
outlier.alpha = NULL,
notch = FALSE,
notchwidth = 0.5,
varwidth = FALSE,
na.rm = FALSE,
orientation = "y",
show.legend = NA,
inherit.aes = TRUE
)

Arguments

mapping Set of aesthetic mappings created by \texttt{aes()} or \texttt{aes().} If specified and \texttt{inherit.aes} = \texttt{TRUE} (the default), it is combined with the default mapping at the top level of the plot. You must supply \texttt{mapping} if there is no plot mapping.

data The data to be displayed in this layer. There are three options:

If \texttt{NULL}, the default, the data is inherited from the plot data as specified in the call to \texttt{ggplot()}.

A \texttt{data.frame}, or other object, will override the plot data. All objects will be fortified to produce a data frame. See \texttt{fortify()} for which variables will be created.

A function will be called with a single argument, the plot data. The return value must be a \texttt{data.frame}, and will be used as the layer data. A function can be created from a formula (e.g. \texttt{~ head(.x,10)}).

stat Use to override the default connection between \texttt{geom_boxplot()} and \texttt{stat_boxplot()}.

position Position adjustment, either as a string, or the result of a call to a position adjustment function.

... Other arguments passed on to \texttt{layer()}. These are often aesthetics, used to set an aesthetic to a fixed value, like colour = \texttt{"red"} or size = 3. They may also be parameters to the paired geom/stat.

outlier.colour Default aesthetics for outliers. Set to \texttt{NULL} to inherit from the aesthetics used for the box.

In the unlikely event you specify both US and UK spellings of colour, the US spelling will take precedence.

Sometimes it can be useful to hide the outliers, for example when overlaying the raw data points on top of the boxplot. Hiding the outliers can be achieved
by setting `outlier.shape = NA`. Importantly, this does not remove the outliers, it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.

**outlier.color** Default aesthetics for outliers. Set to `NULL` to inherit from the aesthetics used for the box.
In the unlikely event you specify both US and UK spellings of `colour`, the US spelling will take precedence.
Sometimes it can be useful to hide the outliers, for example when overlaying the raw data points on top of the boxplot. Hiding the outliers can be achieved by setting `outlier.shape = NA`. Importantly, this does not remove the outliers, it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.

**outlier.fill** Default aesthetics for outliers. Set to `NULL` to inherit from the aesthetics used for the box.
In the unlikely event you specify both US and UK spellings of `colour`, the US spelling will take precedence.
Sometimes it can be useful to hide the outliers, for example when overlaying the raw data points on top of the boxplot. Hiding the outliers can be achieved by setting `outlier.shape = NA`. Importantly, this does not remove the outliers, it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.

**outlier.shape** Default aesthetics for outliers. Set to `NULL` to inherit from the aesthetics used for the box.
In the unlikely event you specify both US and UK spellings of `colour`, the US spelling will take precedence.
Sometimes it can be useful to hide the outliers, for example when overlaying the raw data points on top of the boxplot. Hiding the outliers can be achieved by setting `outlier.shape = NA`. Importantly, this does not remove the outliers, it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.

**outlier.size** Default aesthetics for outliers. Set to `NULL` to inherit from the aesthetics used for the box.
In the unlikely event you specify both US and UK spellings of `colour`, the US spelling will take precedence.
Sometimes it can be useful to hide the outliers, for example when overlaying the raw data points on top of the boxplot. Hiding the outliers can be achieved by setting `outlier.shape = NA`. Importantly, this does not remove the outliers, it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.

**outlier.stroke** Default aesthetics for outliers. Set to `NULL` to inherit from the aesthetics used for the box.
In the unlikely event you specify both US and UK spellings of `colour`, the US spelling will take precedence.
Sometimes it can be useful to hide the outliers, for example when overlaying the raw data points on top of the boxplot. Hiding the outliers can be achieved by setting `outlier.shape = NA`. Importantly, this does not remove the outliers,
outlier.alpha  Default aesthetics for outliers. Set to NULL to inherit from the aesthetics used for the box.

In the unlikely event you specify both US and UK spellings of colour, the US spelling will take precedence.

Sometimes it can be useful to hide the outliers, for example when overlaying the raw data points on top of the boxplot. Hiding the outliers can be achieved by setting outlier.shape = NA. Importantly, this does not remove the outliers, it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.

notch  If FALSE (default) make a standard box plot. If TRUE, make a notched box plot. Notches are used to compare groups; if the notches of two boxes do not overlap, this suggests that the medians are significantly different.

notchwidth  For a notched box plot, width of the notch relative to the body (defaults to notchwidth = 0.5).

varwidth  If FALSE (default) make a standard box plot. If TRUE, boxes are drawn with widths proportional to the square-roots of the number of observations in the groups (possibly weighted, using the weight aesthetic).

na.rm  If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.

orientation  The orientation of the layer. The default (NA) automatically determines the orientation from the aesthetic mapping. In the rare event that this fails it can be given explicitly by setting orientation to either "x" or "y". See the Orientation section for more detail.

show.legend  logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

inherit.aes  If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders().

Value
XLayer or YLayer object to be added to a ggplot object

debugExamples

ggplot(df, aes(UpperCase, LowerCase)) +

Examples
geom_tile(aes(fill = Combo_Index))

#sideboxplots
#Note - Mixing discrete and continuous axis scales
#using xsideboxplots when the y aesthetic was previously
#mapped with a continuous variable will prevent
#any labels from being plotted. This is a feature that
#will hopefully be added to ggside in the future.

p1 + geom_xsideboxplot(aes(y = Combo_Index)) +
    geom_ysideboxplot(aes(x = Combo_Index))

#sideboxplots with swapped orientation
#Note - Discrete before Continuous
#If you are to mix Discrete and Continuous variables on
#one axis, ggplot2 prefers the discrete variable to be mapped
#BEFORE the continuous.

ggplot(iris, aes(Sepal.Width, Sepal.Length, color = Species)) +
    geom_xsideboxplot(aes(y = Species), orientation = "y") +
    geom_point()

#Alternatively, you can recast discrete as a factor and then
#a numeric

ggplot(iris, aes(Sepal.Width, Sepal.Length, color = Species)) +
    geom_point() +
    geom_xsideboxplot(aes(y = as.numeric(Species)), orientation = "y") +
    geom_ysideboxplot(aes(x = as.numeric(Species)), orientation = "x")

---

**geom_xsideboxplot**

**Side density distributions**

**Description**

The `xside` and `yside` variants of `geom_density` is `geom_xsideboxplot` and `geom_ysideboxplot`.

**Usage**

```r
geom_xsideboxplot(
  mapping = NULL,
  data = NULL,
  stat = "density",
  position = "identity",
  ...,
  na.rm = FALSE,
  orientation = "x",
  show.legend = NA,
  inherit.aes = TRUE,
  outline.type = "upper"
```

Arguments

mapping Set of aesthetic mappings created by \code{aes()} or \code{aes_()}. If specified and \code{inherit.aes} = \code{TRUE} (the default), it is combined with the default mapping at the top level of the plot. You must supply \code{mapping} if there is no plot mapping.

data The data to be displayed in this layer. There are three options:
If \code{NULL}, the default, the data is inherited from the plot data as specified in the call to \code{ggplot()}. A \code{data.frame}, or other object, will override the plot data. All objects will be fortified to produce a data frame. See \code{fortify()} for which variables will be created.
A function will be called with a single argument, the plot data. The return value must be a \code{data.frame}, and will be used as the layer data. A function can be created from a formula (e.g. \code{~ head(.x, 10)}).

stat Use to override the default connection between \code{geom_density()} and \code{stat_density()}.

position Position adjustment, either as a string, or the result of a call to a position adjustment function.

... Other arguments passed on to \code{layer()}. These are often aesthetics, used to set an aesthetic to a fixed value, like \code{colour = "red"} or \code{size = 3}. They may also be parameters to the paired geom/stat.

na.rm If \code{FALSE}, the default, missing values are removed with a warning. If \code{TRUE}, missing values are silently removed.

orientation The orientation of the layer. The default (\code{NA}) automatically determines the orientation from the aesthetic mapping. In the rare event that this fails it can be given explicitly by setting \code{orientation} to either \code{"x"} or \code{"y"}. See the \code{Orientation} section for more detail.

show.legend logical. Should this layer be included in the legends? \code{NA}, the default, includes if any aesthetics are mapped. \code{FALSE} never includes, and \code{TRUE} always includes. It can also be a named logical vector to finely select the aesthetics to display.

inherit.aes If \code{FALSE}, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. \code{borders()}.
Outline Type

Type of the outline of the area; "both" draws both the upper and lower lines, "upper"/"lower" draws the respective lines only. "full" draws a closed polygon around the area.

Value

XLayer or YLayer object to be added to a ggplot object

Examples

```r
ggplot(mpg, aes(displ, hwy, colour = class)) +
  geom_point(size = 2) +
  geom_xsidefreqpoly() +
  geom_ysidefreqpoly() +
  theme(axis.text.x = element_text(angle = 90, vjust = .5))

ggplot(mpg, aes(displ, hwy, colour = class)) +
  geom_point(size = 2) +
  geom_xsidefreqpoly(aes(y = after_stat(count)), position = "stack") +
  geom_ysidefreqpoly(aes(x = after_stat(scaled))) +
  theme(axis.text.x = element_text(angle = 90, vjust = .5))
```

Description

The xside and yside variants of `geom_freqpoly` is `geom_xsidefreqpoly` and `geom_ysidefreqpoly`.

Usage

```r
geom_xsidefreqpoly(
  mapping = NULL,
  data = NULL,
  stat = "bin",
  position = "identity",
  ...,
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE
)

geom_ysidefreqpoly(
  mapping = NULL,
  data = NULL,
  stat = "bin",
  ...,
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE
)
geom_xsidefreqpoly

position = "identity",
..., 
na.rm = FALSE,
show.legend = NA,
inherit.aes = TRUE)
}

Arguments

mapping Set of aesthetic mappings created by aes() or aes_.() If specified and inherit.aes = TRUE (the default), it is combined with the default mapping at the top level of the plot. You must supply mapping if there is no plot mapping.
data The data to be displayed in this layer. There are three options:
If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot().
A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created.
A function will be called with a single argument, the plot data. The return value must be a data.frame, and will be used as the layer data. A function can be created from a formula (e.g. ~ head(.x, 10)).
stat Use to override the default connection between geom_histogram()/geom_freqpoly() and stat_bin().
positional Position adjustment, either as a string, or the result of a call to a position adjustment function.
... Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.
na.rm If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.
show.legend logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
inherit.aes If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders().

Value

XLayer or YLayer object to be added to a ggplot object

Examples

ggplot(diamonds, aes(price, carat, colour = cut)) + geom_point() + geom_xsidefreqpoly(aes(y=after_stat(count)),binwidth = 500) + geom_ysidefreqpoly(aes(x=after_stat(count)),binwidth = .2)
Description

The xside and yside variants of `geom_histogram` is `geom_xsidehistogram` and `geom_ysidehistogram`. These variants both inherit from `geom_histogram` and only differ on where they plot data relative to main panels.

Usage

```r
geom_xsidehistogram(
  mapping = NULL,
  data = NULL,
  stat = "bin",
  position = "stack",
  ...
  binwidth = NULL,
  bins = NULL,
  na.rm = FALSE,
  orientation = "x",
  show.legend = NA,
  inherit.aes = TRUE
)

geom_ysidehistogram(
  mapping = NULL,
  data = NULL,
  stat = "bin",
  position = "stack",
  ...
  binwidth = NULL,
  bins = NULL,
  na.rm = FALSE,
  orientation = "y",
  show.legend = NA,
  inherit.aes = TRUE
)
```

Arguments

- **mapping**: Set of aesthetic mappings created by `aes()` or `aes()`. If specified and `inherit.aes = TRUE` (the default), it is combined with the default mapping at the top level of the plot. You must supply mapping if there is no plot mapping.
- **data**: The data to be displayed in this layer. There are three options:
  - If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.

---

**geom_xsidehistogram**  
Side Histograms

---

The xside and yside variants of `geom_histogram` is `geom_xsidehistogram` and `geom_ysidehistogram`. These variants both inherit from `geom_histogram` and only differ on where they plot data relative to main panels.

Usage

```r
geom_xsidehistogram(
  mapping = NULL,
  data = NULL,
  stat = "bin",
  position = "stack",
  ...
  binwidth = NULL,
  bins = NULL,
  na.rm = FALSE,
  orientation = "x",
  show.legend = NA,
  inherit.aes = TRUE
)

geom_ysidehistogram(
  mapping = NULL,
  data = NULL,
  stat = "bin",
  position = "stack",
  ...
  binwidth = NULL,
  bins = NULL,
  na.rm = FALSE,
  orientation = "y",
  show.legend = NA,
  inherit.aes = TRUE
)
```

Arguments

- **mapping**: Set of aesthetic mappings created by `aes()` or `aes()`. If specified and `inherit.aes = TRUE` (the default), it is combined with the default mapping at the top level of the plot. You must supply mapping if there is no plot mapping.
- **data**: The data to be displayed in this layer. There are three options:
  - If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
geom_xsidehistogram

A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created.

A function will be called with a single argument, the plot data. The return value must be a data.frame, and will be used as the layer data. A function can be created from a formula (e.g. ~ head(.x,10)).

stat Use to override the default connection between geom_histogram()/geom_freqpoly() and stat_bin().

position Position adjustment, either as a string, or the result of a call to a position adjustment function.

... Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

binwidth The width of the bins. Can be specified as a numeric value or as a function that calculates width from unscaled x. Here, "unscaled x" refers to the original x values in the data, before application of any scale transformation. When specifying a function along with a grouping structure, the function will be called once per group. The default is to use the number of bins in bins, covering the range of the data. You should always override this value, exploring multiple widths to find the best to illustrate the stories in your data.

The bin width of a date variable is the number of days in each time; the bin width of a time variable is the number of seconds.

bins Number of bins. Overridden by binwidth. Defaults to 30.

na.rm If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.

orientation The orientation of the layer. The default (NA) automatically determines the orientation from the aesthetic mapping. In the rare event that this fails it can be given explicitly by setting orientation to either "x" or "y". See the Orientation section for more detail.

show.legend logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

inherit.aes If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders().

Value

XLayer or YLayer object to be added to a ggplot object

Aesthetics

geom_*sidehistogram uses the same aesthetics as geom_*sidebar()
Examples

```r
p <- ggplot(iris, aes(Sepal.Width, Sepal.Length, color = Species, fill = Species)) + geom_point()

# sidehistogram
p + geom_xsidehistogram(binwidth = 0.1) + geom_ysidehistogram(binwidth = 0.1)

p + geom_xsidehistogram(aes(y = after_stat(density)), binwidth = 0.1) + geom_ysidehistogram(aes(x = after_stat(density)), binwidth = 0.1)
```

---

**geom_xsideline**  
**Side line plot**

Description

The `xside` and `yside` of `geom_line`. The `xside` and `yside` variants of `geom_path`

Usage

```r
geom_xsideline(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  na.rm = FALSE,
  orientation = NA,
  show.legend = NA,
  inherit.aes = TRUE,
  ...)
```

```r
geom_ysideline(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  na.rm = FALSE,
  orientation = NA,
  show.legend = NA,
  inherit.aes = TRUE,
  ...)
```

```r
geom_xsidepath(
```
geom_xsideline

mapping = NULL,
data = NULL,
stat = "identity",
position = "identity",
...
lineend = "butt",
linejoin = "round",
linemitre = 10,
arrow = NULL,
na.rm = FALSE,
show.legend = NA,
inherit.aes = TRUE
)

geom_ysidepath(
  mapping = NULL,
data = NULL,
stat = "identity",
position = "identity",
...
lineend = "butt",
linejoin = "round",
linemitre = 10,
arrow = NULL,
na.rm = FALSE,
show.legend = NA,
inherit.aes = TRUE
)

Arguments

mapping  Set of aesthetic mappings created by aes() or aes_( ). If specified and inherit.aes = TRUE (the default), it is combined with the default mapping at the top level of the plot. You must supply mapping if there is no plot mapping.
data      The data to be displayed in this layer. There are three options:
            If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot().
            A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created.
            A function will be called with a single argument, the plot data. The return value must be a data.frame, and will be used as the layer data. A function can be created from a formula (e.g. ~ head(.x,10)).
stat      The statistical transformation to use on the data for this layer, as a string.
position  Position adjustment, either as a string, or the result of a call to a position adjustment function.
na.rm     If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.
orientation

The orientation of the layer. The default (NA) automatically determines the orientation from the aesthetic mapping. In the rare event that this fails it can be given explicitly by setting orientation to either "x" or "y". See the Orientation section for more detail.

show.legend

logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

inherit.aes

If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders().

... Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

lineend

Line end style (round, butt, square).

linejoin

Line join style (round, mitre, bevel).

linemitre

Line mitre limit (number greater than 1).

arrow

Arrow specification, as created by grid::arrow().

Value

XLayer or YLayer object to be added to a ggplot object

Examples

#sideline
ggplot(economics, aes(date, pop)) +
  geom_xsideline(aes(y = unemploy)) +
  geom_col()

Description

The ggside variants of geom_point is geom_xsidepoint() and geom_ysidepoint(). Both variants inherit from geom_point, thus the only difference is where the data is plotted. The xside variant will plot data along the x-axis, while the yside variant will plot data along the y-axis.

Usage

geom_xsidepoint(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...)
Arguments

- **mapping**
  Set of aesthetic mappings created by `aes()` or `aes()`. If specified and `inherit.aes = TRUE` (the default), it is combined with the default mapping at the top level of the plot. You must supply `mapping` if there is no plot mapping.

- **data**
  The data to be displayed in this layer. There are three options:
  - If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
  - A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.
  - A function will be called with a single argument, the plot data. The return value must be a `data.frame`, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x,10)`).

- **stat**
  The statistical transformation to use on the data for this layer, as a string.

- **position**
  Position adjustment, either as a string, or the result of a call to a position adjustment function.

- **...**
  Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.

- **na.rm**
  If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.

- **show.legend**
  logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

- **inherit.aes**
  If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. `borders()`.

Value

XLayer or YLayer object to be added to a ggplot object
Examples

```r
ggplot(diamonds, aes(depth, table, alpha = .2)) +
  geom_point() +
  geom_ysidepoint(aes(x = price)) +
  geom_xsidepoint(aes(y = price)) +
  theme(
    ggside.panel.scale = .3
  )
```

---

**geom_xsidepoint**  
**Side line Segments**

Description

The `xside` and `yside` of `geom_segment`.

Usage

```r
geom_xsidepoint(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  arrow = NULL,
  arrow.fill = NULL,
  lineend = "butt",
  linejoin = "round",
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE
)
```

```r
geom_ysidepoint(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  arrow = NULL,
  arrow.fill = NULL,
  lineend = "butt",
  linejoin = "round",
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE
)
```
Arguments

mapping Set of aesthetic mappings created by `aes()` or `aes_()`. If specified and `inherit.aes = TRUE` (the default), it is combined with the default mapping at the top level of the plot. You must supply `mapping` if there is no plot mapping.

data The data to be displayed in this layer. There are three options:
If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.
A function will be called with a single argument, the plot data. The return value must be a `data.frame`, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x, 10)`).

stat The statistical transformation to use on the data for this layer, as a string.

position Position adjustment, either as a string, or the result of a call to a position adjustment function.

... Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.

arrow specification for arrow heads, as created by `arrow()`.

arrow.fill fill colour to use for the arrow head (if closed). `NULL` means use `colour` aesthetic.

lineend Line end style (round, butt, square).

linejoin Line join style (round, mitre, bevel).

na.rm If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.

show.legend logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

inherit.aes If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. `borders()`.

Value

XLayer or YLayer object to be added to a ggplot object

Examples

library(dplyr)
library(tidyr)
library(ggdendro)
# dendrogram with geom_xsidegment
df0 <- mutate(diamonds, 
colcl = interaction(color, clarity,
df1 <- df0 %>%
group_by(color, clarity, colclar, cut) %>%
summarise(m_price = mean(price))
df <- df1 %>%
pivot_wider(id_cols = colclar,
  names_from = cut,
  values_from = m_price,
  values_fill = 0L)
mat <- as.matrix(df[,2:6])
rownames(mat) <- df["colclar"]
dst <- dist(mat)
hc_x <- hclust(dst)
lvls <- rownames(mat)[hc_x$order]
df["colclar"] <- factor(df["colclar"], levels = lvls)
dendro_x <- dendro_data(hc_x)

p <- ggplot(df1, aes(x = colclar, cut)) +
geom_tile(aes(fill = m_price)) +
viridis::scale_fill_viridis(option = "magma") +
theme(axis.text.x = element_text(angle = 90, vjust = .5))
p +
geom_xsidetext(data = dendro_x$segments,aes(x = x, y = y, xend = xend, yend = yend))

**geom_xsidetext**  Side text

**Description**

The *xside* and *yside* variants of *geom_text*.

**Usage**

```r
geom_xsidetext(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  parse = FALSE,
  nudge_x = 0,
  nudge_y = 0,
  check_overlap = FALSE,
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE
)
```
Arguments

mapping  Set of aesthetic mappings created by aes() or aes(). If specified and inherit.aes = TRUE (the default), it is combined with the default mapping at the top level of the plot. You must supply mapping if there is no plot mapping.

data  The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot().

A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created.

A function will be called with a single argument, the plot data. The return value must be a data.frame, and will be used as the layer data. A function can be created from a formula (e.g. ~ head(.x,10)).

stat  The statistical transformation to use on the data for this layer, as a string.

position  Position adjustment, either as a string, or the result of a call to a position adjustment function. Cannot be jointly specified with nudge_x or nudge_y.

...  Other arguments passed on to layer(). These are often aesthetics, used to set an aesthetic to a fixed value, like colour = "red" or size = 3. They may also be parameters to the paired geom/stat.

parse  If TRUE, the labels will be parsed into expressions and displayed as described in ?plotmath.

nudge_x  Horizontal and vertical adjustment to nudge labels by. Useful for offsetting text from points, particularly on discrete scales. Cannot be jointly specified with position.

nudge_y  Horizontal and vertical adjustment to nudge labels by. Useful for offsetting text from points, particularly on discrete scales. Cannot be jointly specified with position.

check_overlap  If TRUE, text that overlaps previous text in the same layer will not be plotted. check_overlap happens at draw time and in the order of the data. Therefore data should be arranged by the label column before calling geom_label() or geom_text().
na.rm
If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.

show.legend
logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

inherit.aes
If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. \code{borders()}.

Value
XLayer or YLayer object to be added to a ggplot object

\begin{itemize}
  \item \code{geom_xsidetile} \hspace{1cm} Side tile plot
\end{itemize}

Description
The \code{xside} and \code{yside} variants of \code{geom_tile}

Usage

\begin{verbatim}
geom_xsidetile(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ..., 
  linejoin = "mitre",
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE
)
\end{verbatim}

\begin{verbatim}
geom_ysidetile(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ..., 
  linejoin = "mitre",
  na.rm = FALSE,
  show.legend = NA,
  inherit.aes = TRUE
)
\end{verbatim}
Arguments

mapping Set of aesthetic mappings created by `aes()` or `aes()`. If specified and `inherit.aes` = TRUE (the default), it is combined with the default mapping at the top level of the plot. You must supply `mapping` if there is no plot mapping.

data The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.
A function will be called with a single argument, the plot data. The return value must be a data.frame, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x, 10)`).

stat The statistical transformation to use on the data for this layer, as a string.

position Position adjustment, either as a string, or the result of a call to a position adjustment function.

... Other arguments passed on to `layer()`. These are often aesthetics, used to set an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also be parameters to the paired geom/stat.

linejoin Line join style (round, mitre, bevel).

na.rm If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.

show.legend logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

inherit.aes If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. `borders()`.

Value

XLayer or YLayer object to be added to a ggplot object

Examples

```r
library(dplyr)
library(tidyr)
df <- mutate(diamonds,
  colclar = interaction(color, clarity, sep = "_", drop = TRUE)) %>%
  group_by(color, clarity, colclar, cut) %>%
  summarise(m_price = mean(price))

xside_data <- df %>%
  ungroup() %>%
  select(colclar, clarity, color) %>%
  mutate_all(~factor(as.character(.x), levels = levels(.x))) %>%
```
pivot_longer(cols = c(clarity, color)) %>% distinct()

p <- ggplot(df, aes(x = colclar, cut)) +
  geom_tile(aes(fill = m_price)) +
  viridis::scale_fill_viridis(option = "magma") +
  theme(axis.text.x = element_blank())

p + geom_xsidetile(data = xside_data, aes(y = name, xfill = value)) +
  guides(xfill = guide_legend(nrow = 8))

---

### geom_xsideviolin

**Side Violin plots**

#### Description

The `xside` and `yside` variants of `geom_violin`.

#### Usage

```r
geom_xsideviolin(
  mapping = NULL,
  data = NULL,
  stat = "ydensity",
  position = "dodge",
  ...,
  draw_quantiles = NULL,
  trim = TRUE,
  scale = "area",
  na.rm = FALSE,
  orientation = NA,
  show.legend = NA,
  inherit.aes = TRUE
)
```

```r
geom_ysideviolin(
  mapping = NULL,
  data = NULL,
  stat = "ydensity",
  position = "dodge",
  ...,
  draw_quantiles = NULL,
  trim = TRUE,
  scale = "area",
  na.rm = FALSE,
  orientation = "y",
  show.legend = NA,
  inherit.aes = TRUE
)
```
Arguments

mapping Set of aesthetic mappings created by \texttt{aes()} or \texttt{aes()}. If specified and \texttt{inherit.aes} = \texttt{TRUE} (the default), it is combined with the default mapping at the top level of the plot. You must supply \texttt{mapping} if there is no plot mapping.

data The data to be displayed in this layer. There are three options:
If \texttt{NULL}, the default, the data is inherited from the plot data as specified in the call to \texttt{ggplot()}.
A \texttt{data.frame}, or other object, will override the plot data. All objects will be fortified to produce a data frame. See \texttt{fortify()} for which variables will be created.
A function will be called with a single argument, the plot data. The return value must be a \texttt{data.frame}, and will be used as the layer data. A function can be created from a formula (e.g. \texttt{~ head(.x,10)}).

stat Use to override the default connection between \texttt{geom_violin()} and \texttt{stat_ydensity()}.

position Position adjustment, either as a string, or the result of a call to a position adjustment function.

... Other arguments passed on to \texttt{layer()}. These are often aesthetics, used to set an aesthetic to a fixed value, like \texttt{colour = "red"} or \texttt{size = 3}. They may also be parameters to the paired geom/stat.

draw_quantiles If not (\texttt{NULL}) (default), draw horizontal lines at the given quantiles of the density estimate.

trim If \texttt{TRUE} (default), trim the tails of the violins to the range of the data. If \texttt{FALSE}, don’t trim the tails.

scale if "area" (default), all violins have the same area (before trimming the tails). If "count", areas are scaled proportionally to the number of observations. If "width", all violins have the same maximum width.

na.rm If \texttt{FALSE}, the default, missing values are removed with a warning. If \texttt{TRUE}, missing values are silently removed.

orientation The orientation of the layer. The default (\texttt{NA}) automatically determines the orientation from the aesthetic mapping. In the rare event that this fails it can be given explicitly by setting \texttt{orientation} to either "x" or "y". See the Orientation section for more detail.

show.legend logical. Should this layer be included in the legends? \texttt{NA}, the default, includes if any aesthetics are mapped. \texttt{FALSE} never includes, and \texttt{TRUE} always includes. It can also be a named logical vector to finely select the aesthetics to display.

inherit.aes If \texttt{FALSE}, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. \texttt{borders()}. 

Value

\texttt{XLayer} or \texttt{YLayer} object to be added to a \texttt{ggplot} object

See Also

\texttt{geom_*sideboxplot}
Examples

```r
df <- expand.grid(UpperCase = LETTERS, LowerCase = letters)
df$Combo_Index <- as.integer(df$UpperCase)*as.integer(df$LowerCase)

p1 <- ggplot(df, aes(UpperCase, LowerCase)) +
  geom_tile(aes(fill = Combo_Index))

# sideviolins
# Note - Mixing discrete and continuous axis scales
# using xsideviolins when the y aesthetic was previously
# mapped with a continuous variable will prevent
# any labels from being plotted. This is a feature that
# will hopefully be added to ggside in the future.

p1 + geom_xsideviolin(aes(y = Combo_Index)) +
  geom_ysideviolin(aes(x = Combo_Index))

# sideviolins with swapped orientation
# Note - Discrete before Continuous
# If you are to mix Discrete and Continuous variables on
# one axis, ggplot2 prefers the discrete variable to be mapped
# BEFORE the continuous.

ggplot(iris, aes(Sepal.Width, Sepal.Length, color = Species)) +
  geom_xsideviolin(aes(y = Species), orientation = "y") +
  geom_point()

# Alternatively, you can recast the value as a factor and then
# a numeric

ggplot(iris, aes(Sepal.Width, Sepal.Length, color = Species)) +
  geom_point() +
  geom_xsideviolin(aes(y = as.numeric(Species)), orientation = "y") +
  geom_ysideviolin(aes(x = as.numeric(Species)), orientation = "x")
```

ggside options

Description

Set characteristics of side panels

Usage

```r
ggside(x.pos = "top", y.pos = "right", scales = "fixed", collapse = NULL)
```

Arguments

- `x.pos`  x side panel can either take "top" or "bottom"
**y.pos**

y side panel can either take "right" or "left"

**scales**

Determines side panel’s unaligned axis scale. Inputs are similar to facet_* scales function. Default is set to "fixed", but "free_x", "free_y" and "free" are acceptable inputs. For example, xside panels are aligned to the x axis of the main panel. Setting "free" or "free_y" will cause all y scales of the x side Panels to be independent.

**collapse**

Determines if side panels should be collapsed into a single panel. Set "x" to collapse all x side panels, set "y" to collapse all y side panels, set "all" to collapse both x and y side panels.

**Value**

a object of class ‘ggside_options’ or to be added to a ggplot

**See Also**

For more information regarding the ggside api: see xside or yside

---

**ggside-scales-continuous**

*Position scales for continuous data ggside scales*

---

**Description**

The xside and yside variants of scale_x_continuous/scale_y_continuous, scale_xsidex_continuous enables better control on how the y-axis is rendered on the xside panel and scale_ysidex_continuous enables better control on how the x-axis is rendered on the yside panel.

**Arguments**

**name**

The name of the scale. Used as the axis or legend title. If waiver(), the default, the name of the scale is taken from the first mapping used for that aesthetic. If NULL, the legend title will be omitted.

**breaks**

One of:

- NULL for no breaks
- waiver() for the default breaks computed by the transformation object
- A numeric vector of positions
- A function that takes the limits as input and returns breaks as output (e.g., a function returned by `scales::extended_breaks()`)  

**minor_breaks**

One of:

- NULL for no minor breaks
- waiver() for the default breaks (one minor break between each major break)
- A numeric vector of positions
- A function that given the limits returns a vector of minor breaks.
n.breaks
An integer guiding the number of major breaks. The algorithm may choose a slightly different number to ensure nice break labels. Will only have an effect if breaks = waiver(). Use NULL to use the default number of breaks given by the transformation.

labels
One of:
• NULL for no labels
• waiver() for the default labels computed by the transformation object
• A character vector giving labels (must be same length as breaks)
• A function that takes the breaks as input and returns labels as output

limits
One of:
• NULL to use the default scale range
• A numeric vector of length two providing limits of the scale. Use NA to refer to the existing minimum or maximum
• A function that accepts the existing (automatic) limits and returns new limits. Note that setting limits on positional scales will remove data outside of the limits. If the purpose is to zoom, use the limit argument in the coordinate system (see coord_cartesian()).

expand
For position scales, a vector of range expansion constants used to add some padding around the data to ensure that they are placed some distance away from the axes. Use the convenience function expansion() to generate the values for the expand argument. The defaults are to expand the scale by 5% on each side for continuous variables, and by 0.6 units on each side for discrete variables.

oob
One of:
• Function that handles limits outside of the scale limits (out of bounds).
• The default (scales::censor()) replaces out of bounds values with NA.
• scales::squish() for squishing out of bounds values into range.
• scales::squish_infinite() for squishing infinite values into range.

na.value
Missing values will be replaced with this value.

trans
For continuous scales, the name of a transformation object or the object itself. Built-in transformations include "asn", "atanh", "boxcox", "date", "exp", "hms", "identity", "log", "log10", "log1p", "log2", "logit", "modulus", "probability", "probit", "pseudo_log", "reciprocal", "reverse", "sqrt" and "time".
A transformation object bundles together a transform, its inverse, and methods for generating breaks and labels. Transformation objects are defined in the scales package, and are called <name>_trans (e.g., scales::boxcox_trans()). You can create your own transformation with scales::trans_new().

guide
A function used to create a guide or its name. See guides() for more information.

position
For position scales, The position of the axis. left or right for y axes, top or bottom for x axes.

Value

ggscale_continuous object inheriting from ggplot2::ScaleContinuousPosition
**ggside-scales-discrete**

*Position scales for discrete data in ggside*

---

**Description**

The `xside` and `yside` variants of `scale_x_discrete/scale_y_discrete`. `scale_xsidey_discrete` enables better control on how the y-axis is rendered on the xside panel and `scale_ysidex_discrete` enables better control on how the x-axis is rendered on the yside panel.

**Arguments**

- **expand**
  For position scales, a vector of range expansion constants used to add some padding around the data to ensure that they are placed some distance away from the axes. Use the convenience function `expansion()` to generate the values for the expand argument. The defaults are to expand the scale by 5% on each side for continuous variables, and by 0.6 units on each side for discrete variables.

- **guide**
  A function used to create a guide or its name. See `guides()` for more information.

- **position**
  For position scales, The position of the axis. left or right for y axes, top or bottom for x axes.

**Value**

- `ggside_scale` object inheriting from `ggplot2::ScaleDiscretePosition`

---

**ggside-theme**

*ggside custom themes*

---

**Description**

The following are the theme elements defined in `ggside`.

**Elements**

- `ggside.panel.scale` - sets the scaling of side panels relative to the plotting width of the main panels. Default is set to 0.1, i.e. 0.1/1
- `ggside.panel.scale.x` - same as `ggside.panel.scale` except only for the xside panel.
- `ggside.panel.scale.y` - same as `ggside.panel.scale` except only for the yside panel.
- `ggside.panel.spacing` - sets how much spacing should be used between the main panels and the side panels. default is unit(2,"pt")
- `ggside.panel.spacing.x` - same as `ggside.panel.spacing` except only for the space between the main panel and the yside panel.
- `ggside.panel.spacing.y` - same as `ggside.panel.spacing` except only for the space between the main panel and the xside panel.
is.ggside  

Check ggside objects

Description

Check ggside objects

Usage

is.ggside(x)

is.ggside_layer(x)

is.ggside_options(x)

is.ggside_scale(x)

Arguments

x  
Object to test

Value

A logical value

position_rescale  

Rescale x or y onto new range in margin

Description

Take the range of the specified axis and rescale it to a new range about a midpoint. By default the range will be calculated from the associated main plot axis mapping. The range will either be the resolution or 5% of the axis range, depending if original data is discrete or continuous respectively. Each layer called with position_rescale will possess an instance value that indexes with axis rescale. By default, each position_rescale will dodge the previous call unless instance is specified to a previous layer.

Usage

position_rescale(
    rescale = "y",
    midpoint = NULL,
    range = NULL,
    location = NULL,
    instance = NULL
)
position_yrescale(
    rescale = "y",
    midpoint = NULL,
    range = NULL,
    location = NULL,
    instance = NULL
)

position_xrescale(
    rescale = "x",
    midpoint = NULL,
    range = NULL,
    location = NULL,
    instance = NULL
)

Arguments

rescale character value of "x" or "y". specifies which mapping data will be rescaled
midpoint default set to NULL. Center point about which the rescaled x/y values will re- side.
range default set to NULL and auto generates from main mapping range. Specifies the size of the rescaled range.
location specifies where position_rescale should try to place midpoint. If midpoint is specified, location is ignored and placed at the specified location.
instance integer that indexes rescaled axis calls. instance may be specified and if a previous layer with the same instance exists, then the same midpoint and range are used for rescaling. x and y are indexed independently.

Format

An object of class PositionRescale (inherits from Position, ggproto, gg) of length 10.

Value

a ggproto object inheriting from 'Position' and can be added to a ggplot

scale_xcolour

<table>
<thead>
<tr>
<th>scale_xcolour</th>
<th>Scales for the *colour aesthetics</th>
</tr>
</thead>
</table>

Description

These are the various scales that can be applied to the xsidebar or ysidebar colour aesthetics, such as xcolour and ycolour. They have the same usage as existing standard ggplot2 scales.
scale_xfill

Value

returns a ggproto object to be added to a ggplot

- scale_ycolour_gradientn

scale_xfill  Scales for the *fill aesthetics

Description

These are the various scales that can be applied to the xsidebar or ysidebar fill aesthetics, such as xfill and yfill. They have the same usage as existing standard ggplot2 scales.

Value

returns a ggproto object to be added to a ggplot

### stat_summarise

| stat_summarise | Summarise by grouping variable |

#### Description

Applies a function to a specified grouping variable
Usage

stat_summarise(
  mapping = NULL,
  data = NULL,
  geom = "bar",
  position = "identity",
  ..., 
  fun = NULL,
  args = list(),
  show.legend = NA,
  inherit.aes = TRUE
)

stat_summarize(
  mapping = NULL,
  data = NULL,
  geom = "bar",
  position = "identity",
  ..., 
  fun = NULL,
  args = list(),
  show.legend = NA,
  inherit.aes = TRUE
)

Arguments

mapping Set of aesthetic mappings created by \texttt{aes()} or \texttt{aes().} If specified and \texttt{inherit.aes = TRUE} (the default), it is combined with the default mapping at the top level of the plot. You must supply \texttt{mapping} if there is no plot mapping.

data The data to be displayed in this layer. There are three options:
If \texttt{NULL}, the default, the data is inherited from the plot data as specified in the call to \texttt{ggplot()}. A \texttt{data.frame}, or other object, will override the plot data. All objects will be fortified to produce a data frame. See \texttt{fortify()} for which variables will be created.
A function will be called with a single argument, the plot data. The return value must be a \texttt{data.frame}, and will be used as the layer data. A function can be created from a formula (e.g. \texttt{~ head(.x,10)}).

geom The geometric object to use display the data

position Position adjustment, either as a string, or the result of a call to a position adjustment function.

... additional arguments to pass to \texttt{layer}.

fun Summarising function to use. If no function provided it will default to \texttt{length}.

args List of additional arguments passed to the function.
show.legend logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

inherit.aes If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders().

Format

An object of class StatSummarise (inherits from Stat, ggproto, gg) of length 5.

Value

A Layer object to be added to a ggplot

Aesthetics

Using stat_summarise requires that you use domain as an aesthetic mapping. This allows you to summarise other data instead of assuming that x is the function’s domain.

Examples

library(tidyr)
i <- gather(iris,"key","value",-Species)
ggplot(i, aes(Species, fill = key, domain = value)) +
  geom_bar(aes(y = after_stat(summarise)), stat = "summarise", fun = mean) +
  stat_summarise(aes(y = after_stat(summarise),
      label = after_stat(summarise),
      position = position_stack(vjust = .5), geom = "text", fun = mean)

Description

These ggproto classes are slightly modified from their respective inherited ggproto class. The biggest difference is exposing ‘x/yfill’, ‘x/ycolour’, and ‘x/ycolor’ as viable aesthetic mappings.

Usage

use_xside_aes(data)
use_yside_aes(data)
parse_side_aes(data, params)
Arguments

data       data passed internally
params     params available to ggproto object

Value

ggproto object that is usually passed to layer

---

**xsides**

*The xsides geometries*

**Description**

xsides refers to the api of ggside. Any geom_ with xsides will plot its respective geometry along the x-axis per facet panel. By default the xsides panel will plot above the main panel. This xsides panel will always share the same scale as it’s main panel, but is expected to have a separate y-axis scaling.

**Value**

geom_xsides* return a XLayer object to be added to a ggplot

**New Aesthetics**

All xsides Geometries have xfill, xcolour/xcolor available for aesthetic mappings. These mappings behave exactly like the default counterparts except that they are considered separate scales. All xsides geometries will use xfill over fill, but will default to fill if xfill is not provided. The same goes for xcolour in respects to colour. This comes in handy if you wish to map both fill to one geometry as continuous, you can still map xfill for a separate xsides geometry without conflicts. See more information in vignette("ggside").

**Exported Geometries**

The following are the xsides variants of the ggplot2 Geometries

- geom_xsidebar
- geom_xsideboxplot
- geom_xsidecol
- geom_xsidedensity
- geom_xsidefreqpoly
- geom_xsidehistogram
- geom_xsideline
- geom_xsidepath
- geom_xsidepoint
- geom_xsidetext
- geom_xsidetile
- geom_xsideviolin
yside geometries

Description

yside refers to the api of ggside. Any geom_ with yside will plot its respective geometry along the y-axis per facet panel. The yside panel will plot to the right of the main panel by default. This yside panel will always share the same scale as it’s main panel, but is expected to have a separate x-axis scaling.

Value

geom_y-side* return a YLayer object to be added to a ggplot

New Aesthetics

All yside Geometries have yfill, ycolour/ycolor available for aesthetic mappings. These mappings behave exactly like the default counterparts except that they are considered separate scales. All yside geometries will use yfill over fill, but will default to fill if yfill is not provided. The same goes for ycolour in respects to colour. This comes in handy if you wish to map both fill to one geometry as continuous, you can still map yfill for a separate yside geometry without conflicts. See more information in vignette("ggside").
