Package ‘ggstatsplot’

May 27, 2022

Type Package

Title 'ggplot2' Based Plots with Statistical Details

Version 0.9.3

Maintainer Indrajeet Patil <patilindrajeet.science@gmail.com>

Description Extension of 'ggplot2'. 'ggstatsplot' creates graphics with details from statistical tests included in the plots themselves. It provides an easier syntax to generate information-rich plots for statistical analysis of continuous (violin plots, scatterplots, histograms, dot plots, dot-and-whisker plots) or categorical (pie and bar charts) data. Currently, it supports the most common types of statistical approaches and tests: parametric, nonparametric, robust, and Bayesian versions of t-test/ANOVA, correlation analyses, contingency table analysis, meta-analysis, and regression analyses.

Description

{ggstatsplot} is an extension of {ggplot2} package. It creates graphics with details from statistical tests included in the plots themselves. It provides an easier API to generate information-rich plots for statistical analysis of continuous (violin plots, scatterplots, histograms, dot plots, dot-and-whisker plots) or categorical (pie and bar charts) data. Currently, it supports the most common types of statistical tests: parametric, nonparametric, robust, and Bayesian versions of t-test/ANOVA, correlation analyses, contingency table analysis, meta-analysis, and regression analyses.

Details

ggstatsplot

The main functions are:

- `ggbetweenstats()` function to produce information-rich comparison plot between different groups or conditions with {ggplot2} and details from the statistical tests in the subtitle.
- `ggwithinstats()` function to produce information-rich comparison plot within different groups or conditions with {ggplot2} and details from the statistical tests in the subtitle.
- `ggscatterstats()` function to produce {ggplot2} scatterplots along with a marginal distribution plots from {ggside} package and details from the statistical tests in the subtitle.
- `ggpiestats()` function to produce pie chart with details from the statistical tests in the subtitle.
- `ggbarstats()` function to produce stacked bar chart with details from the statistical tests in the subtitle.
- `gghistostats()` function to produce histogram for a single variable with results from one sample test displayed in the subtitle.
- `ggdotplotstats()` function to produce Cleveland-style dot plots/Charts for a single variable with labels and results from one sample test displayed in the subtitle.
- `ggcorrmat()` function to visualize the correlation matrix.
- `ggcoefstats()` function to visualize results from regression analyses.
- `combine_plots()` helper function to combine multiple {ggstatsplot} plots using patchwork::wrap_plots().

For more documentation, see the dedicated Website.

**bugs_long**

*Tidy version of the "Bugs" dataset.*

**Description**

Tidy version of the "Bugs" dataset.

**Usage**

`bugs_long`

**Format**

A data frame with 372 rows and 6 variables

- subject. Dummy identity number for each participant.
- gender. Participant’s gender (Female, Male).
- region. Region of the world the participant was from.
- education. Level of education.
- condition. Condition of the experiment the participant gave rating for (LDLF: low freighteningness and low disgustingness; LFHD: low freighteningness and high disgustingness; HFHD: high freighteningness and low disgustingness; HFHD: high freighteningness and high disgustingness).
- desire. The desire to kill an arthropod was indicated on a scale from 0 to 10.

**Details**

This data set, "Bugs", provides the extent to which men and women want to kill arthropods that vary in freighteningness (low, high) and disgustingness (low, high). Each participant rates their attitudes towards all anthropods. Subset of the data reported by Ryan et al. (2013).

**Source**

**Examples**

```r
dim(bugs_long)
head(bugs_long)
dplyr::glimpse(bugs_long)
```
bugs_wide

Wide-format version of the "Bugs" dataset.

Usage

bugs_wide

Format

A data frame with 93 rows and 6 variables

- subject. Dummy identity number for each participant.
- gender. Participant’s gender (Female, Male).
- region. Region of the world the participant was from.
- education. Level of education.
- ldlf,ldhf,hdlf,hdfh. The desire to kill an arthropod was indicated on a scale from 0 to 10 in each condition of the experiment (LDLF: low frighteningness and low disgustingness; LFHD: low frighteningness and high disgustingness; HFHD: high frighteningness and low disgustingness; HFHD: high frighteningness and high disgustingness).

Details

This data set, "Bugs", provides the extent to which men and women want to kill arthropods that vary in frighteningness (low, high) and disgustingness (low, high). Each participant rates their attitudes towards all anthropods. Subset of the data reported by Ryan et al. (2013).

Examples

dim(bugs_wide)
head(bugs_wide)
dplyr::glimpse(bugs_wide)
combine_plots

Combining and arranging multiple plots in a grid

Description

Wrapper around patchwork::wrap_plots that will return a combined grid of plots with annotations. In case you want to create a grid of plots, it is highly recommended that you use {patchwork} package directly and not this wrapper around it which is mostly useful with {ggstatsplot} plots. It is exported only for backward compatibility.

Usage

```r
combine_plots(
  plotlist,
  plotgrid.args = list(),
  annotation.args = list(),
  guides = "collect",
  ...
)
```

Arguments

- `plotlist` A list containing `ggplot` objects.
- `plotgrid.args` A list of additional arguments passed to `patchwork::wrap_plots`, except for guides argument which is already separately specified here.
- `annotation.args` A list of additional arguments passed to `patchwork::plot_annotation`.
- `guides` A string specifying how guides should be treated in the layout. 'collect' will collect guides below to the given nesting level, removing duplicates. 'keep' will stop collection at this level and let guides be placed alongside their plot. auto will allow guides to be collected if a upper level tries, but place them alongside the plot if not. If you modify default guide "position" with theme(legend.position=...) while also collecting guides you must apply that change to the overall patchwork (see example).
- `...` Currently ignored.

Value

Combined plot with annotation labels

Examples

```r
# loading the necessary libraries
library(ggplot2)

# preparing the first plot
p1 <- ggplot(
```
# preparing the first plot
p1 <- ggplot(
  data = subset(iris, iris$Species == "setosa"),
  aes(x = Sepal.Length, y = Sepal.Width)
) +
  geom_point() +
  labs(title = "setosa")

# preparing the second plot
p2 <- ggplot(
  data = subset(iris, iris$Species == "versicolor"),
  aes(x = Sepal.Length, y = Sepal.Width)
) +
  geom_point() +
  labs(title = "versicolor")

# combining the plot with a title and a caption
combine_plots(
  plotlist = list(p1, p2),
  plotgrid.args = list(nrow = 1),
  annotation.args = list(
    tag_levels = "a",
    title = "Dataset: Iris Flower dataset",
    subtitle = "Edgar Anderson collected this data",
    caption = "Note: Only two species of flower are displayed",
    theme = theme(
      plot.subtitle = element_text(size = 20),
      plot.title = element_text(size = 30)
    )
  )
)

---

**extract_stats**

Extracting data frames from `{ggstatsplot}` plots

**Description**

Extracting data frames from `{ggstatsplot}` plots

**Usage**

`extract_stats(p, ...)`

**Arguments**

- `p` A plot from `{ggstatsplot}` package
- `...` Ignored
Details

This is a convenience function to extract data frames with statistical details that are used to create expressions displayed in \{ggstatsplot\} plots as subtitle, caption, etc. Note that all of this analysis is carried out by the \{statsExpressions\} package.

The only exception is the ggcorrmat() function. But, if a data frame is what you want, you shouldn’t be using ggcorrmat() anyway. You can use correlation::correlation() function which provides tidy data frames by default. This also works if the data entered is grouped (a la dplyr::group_by()). This is also the function used internally by \{ggstatsplot\} to extract a data frame used to create a plot.

Value

A list of tibbles containing summaries of various statistical analyses.

Examples

```r
if (require("PMCMRplus")) {
  set.seed(123)
  library(ggstatsplot)

  # in case of group comparisons
  p <- ggbetweenstats(mtcars, cyl, mpg)
  extract_stats(p)

  # the exact details depend on the function
  extract_stats(ggbarstats(mtcars, cyl, am))
}
```

---

**ggbarstats**  
*Stacked bar charts with statistical tests*

Description

Bar charts for categorical data with statistical details included in the plot as a subtitle.

Usage

```r
ggbarstats(
  data,
  x,
  y,
  counts = NULL,
  type = "parametric",
  paired = FALSE,
  results.subtitle = TRUE,
  label = "percentage",
)```
label.args = list(alpha = 1, fill = "white"),
k = 2L,
proportion.test = results.subtitle,
perc.k = 0L,
bf.message = TRUE,
ratio = NULL,
conf.level = 0.95,
sampling.plan = "indepMulti",
fixed.margin = "rows",
prior.concentration = 1,
title = NULL,
subtitle = NULL,
caption = NULL,
legend.title = NULL,
xlab = NULL,
ylab = NULL,
ggtheme = ggstatsplot::theme_ggstatsplot(),
package = "RColorBrewer",
palette = "Dark2",
ggplot.component = NULL,
output = "plot",
...)

Arguments

data A data frame (or a tibble) from which variables specified are to be taken. Other
data types (e.g., matrix, table, array, etc.) will not be accepted. Additionally, grouped data frames from {dplyr} should be ungrouped before they are entered as data.

x The variable to use as the rows in the contingency table. Please note that if there are empty factor levels in your variable, they will be dropped.

y The variable to use as the columns in the contingency table. Please note that if there are empty factor levels in your variable, they will be dropped. Default is NULL. If NULL, one-sample proportion test (a goodness of fit test) will be run for the x variable. Otherwise an appropriate association test will be run. This argument can not be NULL for ggbarstats function.

counts The variable in data containing counts, or NULL if each row represents a single observation.

type A character specifying the type of statistical approach:

• "parametric"
• "nonparametric"
• "robust"
• "bayes"

You can specify just the initial letter.
paired Logical indicating whether data came from a within-subjects or repeated measures design study (Default: FALSE). If TRUE, McNemar's test expression will be returned. If FALSE, Pearson's chi-square test will be returned.

results.subtitle Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.

label Character decides what information needs to be displayed on the label in each pie slice. Possible options are "percentage" (default), "counts", "both".

label.args Additional aesthetic arguments that will be passed to geom_label.

k Number of digits after decimal point (should be an integer) (Default: k = 2L).

proportion.test Decides whether proportion test for x variable is to be carried out for each level of y. Defaults to results.subtitle. In ggbarsstats, only p-values from this test will be displayed.

perc.k Numeric that decides number of decimal places for percentage labels (Default: 0L).

bf.message Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).

ratio A vector of proportions: the expected proportions for the proportion test (should sum to 1). Default is NULL, which means the null is equal theoretical proportions across the levels of the nominal variable. This means if there are two levels this will be ratio = c(0.5,0.5) or if there are four levels this will be ratio = c(0.25,0.25,0.25,0.25), etc.

conf.level Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

sampling.plan Character describing the sampling plan. Possible options are "indepMulti" (independent multinomial; default), "poisson", "jointMulti" (joint multinomial), "hypergeom" (hypergeometric). For more, see ?BayesFactor::contingencyTableBF().

fixed.margin For the independent multinomial sampling plan, which margin is fixed ("rows" or "cols"). Defaults to "rows".

prior.concentration Specifies the prior concentration parameter, set to 1 by default. It indexes the expected deviation from the null hypothesis under the alternative, and corresponds to Gunel and Dickey's (1974) "a" parameter.

xlab Label for x axis variable. If NULL (default), variable name for x will be used.

ylab Labels for y axis variable. If NULL (default), variable name for y will be used.
ggtheme
A \{ggplot2\} theme. Default value is ggstatsplot::theme_ggstatsplot(). Any of the \{ggplot2\} themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.). But note that sometimes these themes will remove some of the details that ggstatsplot plots typically contains. For example, if relevant, ggbetweenstats() shows details about multiple comparison test as a label on the secondary Y-axis. Some themes (e.g. ggthemes::theme_fivethirtyeight()) will remove the secondary Y-axis and thus the details as well.

package, palette
Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running View(paletteer::palettes_d_names).

ggplot.component
A ggplot component to be added to the plot prepared by \{ggstatsplot\}. This argument is primarily helpful for grouped_ variants of all primary functions. Default is NULL. The argument should be entered as a \{ggplot2\} function or a list of \{ggplot2\} functions.

output
Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set results.subtitle = FALSE, then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when type = "parametric" and bf.message = TRUE, otherwise this will return a NULL.

... Currently ignored.

Details

  ggbars(mtcars, x = vs, y = cyl)
Box/Violin plots for between-subjects comparisons

Description

A combination of box and violin plots along with jittered data points for between-subjects designs with statistical details included in the plot as a subtitle.

Usage

ggbetweenstats(
data, x, y, plot.type = "boxviolin", type = "parametric", pairwise.comparisons = TRUE, pairwise.display = "significant", p.adjust.method = "holm", effsize.type = "unbiased", bf.prior = 0.707, bf.message = TRUE, results.subtitle = TRUE, xlab = NULL, ylab = NULL, caption = NULL, title = NULL, subtitle = NULL, k = 2L, var.equal = FALSE, conf.level = 0.95, nboot = 100L, tr = 0.2, centrality.plotting = TRUE, centrality.type = type, centrality.point.args = list(size = 5, color = "darkred"), centrality.label.args = list(size = 3, nudge_x = 0.4, segment.linetype = 4, min.segment.length = 0), outlier.tagging = FALSE, outlier.label = NULL, outlier.coef = 1.5, outlier.shape = 19, outlier.color = "black", outlier.label.args = list(size = 3), point.args = list(position = ggplot2::position_jitterdodge(dodge.width = 0.6), alpha = 0.4, size = 3, stroke = 0), violin.args = list(width = 0.5, alpha = 0.2),
Arguments

data  A data frame (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will not be accepted. Additionally, grouped data frames from `{dplyr}` should be ungrouped before they are entered as data.

x  The grouping (or independent) variable from `data`. In case of a repeated measures or within-subjects design, if `subject.id` argument is not available or not explicitly specified, the function assumes that the data has already been sorted by such an id by the user and creates an internal identifier. So if your data is not sorted, the results can be inaccurate when there are more than two levels in `x` and there are NAs present. The data is expected to be sorted by user in subject-1, subject-2, ..., pattern.

y  The response (or outcome or dependent) variable from `data`.

plot.type  Character describing the type of plot. Currently supported plots are "box" (for only boxplots), "violin" (for only violin plots), and "boxviolin" (for a combination of box and violin plots; default).

type  A character specifying the type of statistical approach:

- "parametric"
- "nonparametric"
- "robust"
- "bayes"

You can specify just the initial letter.

pairwise.comparisons  Logical that decides whether pairwise comparisons are to be displayed (default: TRUE). Please note that only significant comparisons will be shown by default. To change this behavior, select appropriate option with `pairwise.display` argument. The pairwise comparison dataframes are prepared using the pairwise_comparisons function. For more details about pairwise comparisons, see the documentation for that function.

pairwise.display  Decides which pairwise comparisons to display. Available options are:

- "significant" (abbreviation accepted: "s")
- "non-significant" (abbreviation accepted: "ns")
- "all"
You can use this argument to make sure that your plot is not uber-cluttered when you have multiple groups being compared and scores of pairwise comparisons being displayed.

**p.adjust.method**

Adjustment method for p-values for multiple comparisons. Possible methods are: "holm" (default), "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "none".

**effsize.type**

Type of effect size needed for parametric tests. The argument can be "eta" (partial eta-squared) or "omega" (partial omega-squared).

**bf.prior**

A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors and posterior estimates. In addition to numeric arguments, several named values are also recognized: "medium", "wide", and "ultrawide", corresponding to r scale values of 1/2, sqrt(2)/2, and 1, respectively. In case of an ANOVA, this value corresponds to scale for fixed effects.

**bf.message**

Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).

**results.subtitle**

Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.

**xlab**

Label for x axis variable. If NULL (default), variable name for x will be used.

**ylab**

Labels for y axis variable. If NULL (default), variable name for y will be used.

**caption**

The text for the plot caption. This argument is relevant only if bf.message = FALSE.

**title**

The text for the plot title.

**subtitle**

The text for the plot subtitle. Will work only if results.subtitle = FALSE.

**k**

Number of digits after decimal point (should be an integer) (Default: k = 2L).

**var.equal**

a logical variable indicating whether to treat the two variances as being equal. If TRUE then the pooled variance is used to estimate the variance otherwise the Welch (or Satterthwaite) approximation to the degrees of freedom is used.

**conf.level**

Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

**nboot**

Number of bootstrap samples for computing confidence interval for the effect size (Default: 100L).

**tr**

Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.

**centrality.plotting**

Logical that decides whether centrality tendency measure is to be displayed as a point with a label (Default: TRUE). Function decides which central tendency measure to show depending on the type argument.

- **mean** for parametric statistics
- **median** for non-parametric statistics
- **trimmed mean** for robust statistics
• **MAP estimator** for Bayesian statistics

If you want default centrality parameter, you can specify this using centrality.type argument.

**centrality.type**

Decides which centrality parameter is to be displayed. The default is to choose the same as type argument. You can specify this to be:

- "parametric" (for mean)
- "nonparametric" (for median)
- robust (for trimmed mean)
- bayes (for MAP estimator)

Just as type argument, abbreviations are also accepted.

**centrality.point.args**, **centrality.label.args**

A list of additional aesthetic arguments to be passed to geom_point and ggrepel::geom_label_repel geoms, which are involved in mean plotting.

**outlier.tagging**

Decides whether outliers should be tagged (Default: FALSE).

**outlier.label**

Label to put on the outliers that have been tagged. This can't be the same as x argument.

**outlier.coef**

Coefficient for outlier detection using Tukey's method. With Tukey's method, outliers are below (1st Quartile) or above (3rd Quartile) outlier.coef times the Inter-Quartile Range (IQR) (Default: 1.5).

**outlier.shape**

Hiding the outliers can be achieved by setting outlier.shape = NA. Importantly, this does not remove the outliers, it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.

**outlier.color**

Default aesthetics for outliers (Default: "black").

**outlier.label.args**

A list of additional aesthetic arguments to be passed to ggrepel::geom_label_repel for outlier label plotting.

**point.args**

A list of additional aesthetic arguments to be passed to the geom_point displaying the raw data.

**violin.args**

A list of additional aesthetic arguments to be passed to the geom_violin.

**ggsignif.args**

A list of additional aesthetic arguments to be passed to ggsignif::geom_signif.

**gghtheme**

A ggplot2 theme. Default value is ggstatsplot::theme_ggstatsplot(). Any of the ggplot2 themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.). But note that sometimes these themes will remove some of the details that ggstatsplot plots typically contains. For example, if relevant, ggbetweenstats() shows details about multiple comparison test as a label on the secondary Y-axis. Some themes (e.g. ggthemes::theme_fivethirtyeight()) will remove the secondary Y-axis and thus the details as well.

**package, palette**

Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running View(paletteer::palettes_d_names).
ggplot.component

A ggplot component to be added to the plot prepared by (ggstatsplot). This argument is primarily helpful for grouped_ variants of all primary functions. Default is NULL. The argument should be entered as a (ggplot2) function or a list of (ggplot2) functions.

output

Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set results.subtitle = FALSE, then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when type = "parametric" and bf.message = TRUE, otherwise this will return a NULL.

... Currently ignored.

  # simple function call with the defaults
  ggbetweenstats(mtcars, am, mpg)

  # more detailed function call
  ggbetweenstats(
    data = morley,
    x = Expt,
    y = Speed,
    type = "robust",
    xlab = "The experiment number",
    ylab = "Speed-of-light measurement",
    pairwise.comparisons = TRUE,
    p.adjust.method = "fdr",
    outlier.tagging = TRUE,
    outlier.label = Run
  )
}
```
### ggcoefstats

**Dot-and-whisker plots for regression analyses**

**Description**

Plot with the regression coefficients’ point estimates as dots with confidence interval whiskers and other statistical details included as labels.

**Usage**

```r
ggcoefstats(
  x,
  output = "plot", 
  statistic = NULL,
  conf.int = TRUE,
  conf.level = 0.95,
  k = 2L,
  exclude.intercept = FALSE,
  effsize = "eta",
  meta.analytic.effect = FALSE,
  meta.type = "parametric",
  bf.message = TRUE,
  sort = "none",
  xlab = NULL,
  ylab = NULL,
  title = NULL,
  subtitle = NULL,
  caption = NULL,
  only.significant = FALSE,
  point.args = list(size = 3, color = "blue"),
  errorbar.args = list(height = 0),
  vline = TRUE,
  vline.args = list(size = 1, linetype = "dashed"),
  stats.labels = TRUE,
  stats.label.color = NULL,
  stats.label.args = list(size = 3, direction = "y", min.segment.length = 0),
  package = "RColorBrewer",
  palette = "Dark2",
  ggtheme = ggstatsplot::theme_ggstatsplot(),
  ...
)
```

**Arguments**

- **x** A model object to be tidied, or a tidy data frame containing results from a regression model. Function internally uses `parameters::model_parameters()` to get a tidy dataframe. If a dataframe is entered, it *must* contain at the minimum...
two columns named term (names of predictors) and estimate (corresponding estimates of coefficients or other quantities of interest).

**output**
Character describing the expected output from this function: "plot" (visualization of regression coefficients) or "tidy" (tidy dataframe of results parameters::model_parameters) or "glance" (object from performance::model_performance).

**statistic**
Which statistic is to be displayed (either "t" or "f" or "z" or "ch1") in the label. This is relevant if the x argument is a dataframe.

**conf.int**
Logical. Decides whether to display confidence intervals as error bars (Default: TRUE).

**conf.level**
Numeric deciding level of confidence or credible intervals (Default: 0.95).

**k**
Number of digits after decimal point (should be an integer) (Default: k = 2L).

**exclude.intercept**
Logical that decides whether the intercept should be excluded from the plot (Default: FALSE).

**effsize**
Character describing the effect size to be displayed: "eta" (default) or "omega". This argument is relevant only for models objects with F-statistic.

**meta.analytic.effect**
Logical that decides whether subtitle for meta-analysis via linear (mixed-effects) models (default: FALSE). If TRUE, input to argument subtitle will be ignored. This will be mostly relevant if a data frame with estimates and their standard errors is entered.

**meta.type**
Type of statistics used to carry out random-effects meta-analysis. If "parametric" (default), metafor::rma function will be used. If "robust", metaplus::metaplus function will be used. If "bayes", metaBMA::meta_random function will be used.

**bf.message**
Logical that decides whether results from running a Bayesian meta-analysis assuming that the effect size $d$ varies across studies with standard deviation $t$ (i.e., a random-effects analysis) should be displayed in caption. Defaults to TRUE.

**sort**
If "none" (default) do not sort, "ascending" sort by increasing coefficient value, or "descending" sort by decreasing coefficient value.

**xlab**
Label for x axis variable. If NULL (default), variable name for x will be used.

**ylab**
Labels for y axis variable. If NULL (default), variable name for y will be used.

**title**
The text for the plot title.

**subtitle**
The text for the plot subtitle. The input to this argument will be ignored if meta.analytic.effect is set to TRUE.

**caption**
The text for the plot caption. This argument is relevant only if bf.message = FALSE.

**only.significant**
If TRUE, only stats labels for significant effects is shown (Default: FALSE). This can be helpful when a large number of regression coefficients are to be displayed in a single plot. Relevant only when the output is a plot.

**point.args**
Additional arguments that will be passed to geom_point geom. Please see documentation for that function to know more about these arguments.
errorbar.args Additional arguments that will be passed to geom_errorbarh geom. Please see documentation for that function to know more about these arguments.

vline Decides whether to display a vertical line (Default: "TRUE").

evline.args Additional arguments that will be passed to geom_vline geom. Please see documentation for that function to know more about these arguments.

stats.labels Logical. Decides whether the statistic and p-values for each coefficient are to be attached to each dot as a text label using ggrepel (Default: TRUE).

stats.label.color Color for the labels. If set to NULL, colors will be chosen from the specified package (Default: "RColorBrewer") and palette (Default: "Dark2").

stats.label.args Additional arguments that will be passed to ggrepel::geom_label_repel geom. Please see documentation for that function to know more about these arguments.

package, palette Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running View(paletteer::palettes_d_names).

ggtheme A {ggplot2} theme. Default value is ggstatsplot::theme_ggstatsplot(). Any of the (ggplot2) themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.). But note that sometimes these themes will remove some of the details that ggstatsplot plots typically contains. For example, if relevant, ggbetweenstats() shows details about multiple comparison test as a label on the secondary Y-axis. Some themes (e.g. ggthemes::theme_fivethirtyeight()) will remove the secondary Y-axis and thus the details as well.

... Additional arguments to tidying method. For more, see parameters::model_parameters.

Details

For details, see: https://indrajeetpatil.github.io/ggstatsplot/articles/web_only/ggcoefstats.html

Note

1. In case you want to carry out meta-analysis, you will be asked to install the needed packages ({metafor}, {metaplus}, or {metaBMA}) for meta-analysis (if unavailable).

2. All rows of regression estimates where either of the following quantities is NA will be removed if labels are requested: estimate, statistic, p.value.

3. Given the rapid pace at which new methods are added to these packages, it is recommended that you install the GitHub versions of {parameters} and {performance} in order to make most of this function.

Examples

# for reproducibility
set.seed(123)
library(ggstatsplot)
# model object
mod <- lm(formula = mpg ~ cyl * am, data = mtcars)

# to get a plot
ggcoefstats(mod, output = "plot")

# to get a tidy dataframe
ggcoefstats(mod, output = "tidy")

# to get a glance summary
ggcoefstats(mod, output = "glance")

---

**ggcorrmat** *Visualization of a correlation matrix*

**Description**

Correlation matrix or a dataframe containing results from pairwise correlation tests. The package internally uses `ggcorrplot::ggcorrplot` for creating the visualization matrix, while the correlation analysis is carried out using the `correlation::correlation` function.

**Usage**

```r
ggcorrmat(
  data,
  cor.vars = NULL,
  cor.vars.names = NULL,
  output = "plot",
  matrix.type = "upper",
  type = "parametric",
  tr = 0.2,
  partial = FALSE,
  k = 2L,
  sig.level = 0.05,
  conf.level = 0.95,
  bf.prior = 0.707,
  p.adjust.method = "holm",
  pch = "cross",
  ggcorrplot.args = list(method = "square", outline.color = "black", pch.cex = 14),
  package = "RColorBrewer",
  palette = "Dark2",
  colors = c("#E69F00", "white", "#009E73"),
  gtheme = ggstatsplot::theme_ggstatsplot(),
  ggplot.component = NULL,
  title = NULL,
  subtitle = NULL,
)```
caption = NULL,
...
)

Arguments

data Dataframe from which variables specified are preferentially to be taken.
cor.vars List of variables for which the correlation matrix is to be computed and visual-
ized. If NULL (default), all numeric variables from data will be used.
cor.vars.names Optional list of names to be used for cor.vars. The names should be entered in
the same order.
output Character that decides expected output from this function. If "plot", the visual-
ization matrix will be returned. If "dataframe" (or literally anything other than "plot"), a dataframe containing all details from statistical analyses (e.g., correlation coefficients, statistic values, p-values, no. of observations, etc.) will be returned.
matrix.type Character, "upper" (default), "lower", or "full", display full matrix, lower
triangular or upper triangular matrix.
type A character specifying the type of statistical approach:
  • "parametric"
  • "nonparametric"
  • "robust"
  • "bayes"
You can specify just the initial letter.
tr Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.
partial Can be TRUE for partial correlations. For Bayesian partial correlations, "full" instead of pseudo-Bayesian partial correlations (i.e., Bayesian correlation based on frequentist partialization) are returned.
k Number of digits after decimal point (should be an integer) (Default: k = 2L).
sig.level Significance level (Default: 0.05). If the p-value in p-value matrix is bigger than sig.level, then the corresponding correlation coefficient is regarded as insignificant and flagged as such in the plot. Relevant only when output = "plot".
conf.level Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).
bf.prior A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors and posterior estimates. In addition to numeric arguments, several named values are also recognized: "medium", "wide", and "ultrawide", corresponding to r scale values of 1/2, sqrt(2)/2, and 1, respectively. In case of an ANOVA, this value corresponds to scale for fixed effects.
p.adjust.method
Adjustment method for p-values for multiple comparisons. Possible methods are: "holm" (default), "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "none".

pch
Decides the point shape to be used for insignificant correlation coefficients (only valid when insig = "pch"). Default: pch = "cross".

ggcorrplot.args
A list of additional (mostly aesthetic) arguments that will be passed to ggcorrplot::ggcorrplot function. The list should avoid any of the following arguments since they are already internally being used: corr, method, p.mat, sig.level, ggtheme, colors, lab, pch, legend.title, digits.

package, palette
Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running View(paletteer::palettes_d_names).

colors
A vector of 3 colors for low, mid, and high correlation values. If set to NULL, manual specification of colors will be turned off and 3 colors from the specified palette from package will be selected.

ggtheme
A \{ggplot2\} theme. Default value is ggstatsplot::theme.ggstatsplot(). Any of the \{ggplot2\} themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.). But note that sometimes these themes will remove some of the details that \{ggstatsplot\} plots typically contains. For example, if relevant, ggbetweenstats() shows details about multiple comparison test as a label on the secondary Y-axis. Some themes (e.g., ggthemes::theme_fivethirtyeight()) will remove the secondary Y-axis and thus the details as well.

ggplot.component
A \{ggplot\} component to be added to the plot prepared by \{ggstatsplot\}. This argument is primarily helpful for grouped_ variants of all primary functions. Default is NULL. The argument should be entered as a \{ggplot2\} function or a list of \{ggplot2\} functions.

title
The text for the plot title.
subtitle
The text for the plot subtitle. Will work only if results.subtitle = FALSE.
caption
The text for the plot caption. This argument is relevant only if bf.message = FALSE.

Details
For details, see: https://indrajeetpatil.github.io/ggstatsplot/articles/web_only/ggcorrmat.html

Examples

# for reproducibility
set.seed(123)
library(ggstatsplot)

# to get a plot (assumes that `ggcorrplot` is installed)
if (require("ggcorrplot")) ggcorrmat(iris)

# to get a dataframe

ggcorrmat(
  data = ggplot2::msleep,
  cor.vars = sleep_total:bodywt,
  partial = TRUE,
  output = "dataframe"
)

---

**ggdotplotstats**  
*Dot plot/chart for labeled numeric data.*

Description

A dot chart (as described by William S. Cleveland) with statistical details from one-sample test.

Usage

```
ggdotplotstats(
  data,  
  x,  
  y,  
  xlab = NULL,  
  ylab = NULL,  
  title = NULL,  
  subtitle = NULL,  
  caption = NULL,  
  type = "parametric",  
  test.value = 0,  
  bf.prior = 0.707,  
  bf.message = TRUE,  
  effsize.type = "g",  
  conf.level = 0.95,  
  tr = 0.2,  
  k = 2L,  
  results.subtitle = TRUE,  
  point.args = list(color = "black", size = 3, shape = 16),  
  centrality.plotting = TRUE,  
  centrality.type = type,  
  centrality.line.args = list(color = "blue", size = 1, linetype = "dashed"),  
  ggplot.component = NULL,
```
ggtheme = ggstatsplot::theme_ggstatsplot(),
output = "plot",
...)

Arguments

data  A data frame (or a tibble) from which variables specified are to be taken. Other
data types (e.g., matrix, table, array, etc.) will not be accepted. Additionally, grouped data frames from \{dplyr\} should be ungrouped before they are entered as data.

x  A numeric variable from the dataframe data.

y  Label or grouping variable.

xlab  Label for x axis variable. If NULL (default), variable name for x will be used.

ylab  Labels for y axis variable. If NULL (default), variable name for y will be used.

title  The text for the plot title.

subtitle  The text for the plot subtitle. Will work only if results.subtitle = FALSE.

caption  The text for the plot caption. This argument is relevant only if bf.message = FALSE.

type  A character specifying the type of statistical approach:

- "parametric"
- "nonparametric"
- "robust"
- "bayes"

You can specify just the initial letter.

test.value  A number indicating the true value of the mean (Default: 0).

bf.prior  A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors and posterior estimates. In addition to numeric arguments, several named values are also recognized: "medium", "wide", and "ultrawide", corresponding to $r$ scale values of 1/2, $\sqrt{2}/2$, and 1, respectively. In case of an ANOVA, this value corresponds to scale for fixed effects.

bf.message  Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).

effsize.type  Type of effect size needed for parametric tests. The argument can be "d" (for Cohen’s $d$) or "g" (for Hedge’s $g$).

conf.level  Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

tr  Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.

k  Number of digits after decimal point (should be an integer) (Default: k = 2L).

results.subtitle  Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.
**point.args**
A list of additional aesthetic arguments passed to `geom_point`.

**centrality.plotting**
Logical that decides whether centrality tendency measure is to be displayed as a point with a label (Default: TRUE). Function decides which central tendency measure to show depending on the `type` argument.

- **mean** for parametric statistics
- **median** for non-parametric statistics
- **trimmed mean** for robust statistics
- **MAP estimator** for Bayesian statistics

If you want default centrality parameter, you can specify this using `centrality.type` argument.

**centrality.type**
Decides which centrality parameter is to be displayed. The default is to choose the same as `type` argument. You can specify this to be:

- "parametric" (for **mean**)
- "nonparametric" (for **median**)
- robust (for **trimmed mean**)
- bayes (for **MAP estimator**)

Just as `type` argument, abbreviations are also accepted.

**centrality.line.args**
A list of additional aesthetic arguments to be passed to the `geom_line` used to display the lines corresponding to the centrality parameter.

**ggplot.component**
A ggplot component to be added to the plot prepared by `{ggstatsplot}`). This argument is primarily helpful for grouped variants of all primary functions. Default is NULL. The argument should be entered as a `{ggplot2}` function or a list of `{ggplot2}` functions.

**ggtheme**
A `{ggplot2}` theme. Default value is `{ggstatsplot}:theme_ggstatsplot()`.
Any of the `{ggplot2}` themes (e.g., `theme_bw()`), or themes from extension packages are allowed (e.g., `{ggthemes}:theme_fivethirtyeight()`, `{hrbrthemes}:theme_ipsum_ps()`, etc.). But note that sometimes these themes will remove some of the details that `{ggstatsplot}` plots typically contains. For example, if relevant, `{ggetweenstats()}` shows details about multiple comparison test as a label on the secondary Y-axis. Some themes (e.g. `{ggthemes}:theme_fivethirtyeight()`) will remove the secondary Y-axis and thus the details as well.

**output**
Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set `results.subtitle = FALSE`, then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when `type = "parametric"` and `bf.message = TRUE`, otherwise this will return a NULL.

... Currently ignored.

**Details**
For details, see: https://indrajeetpatil.github.io/ggstatsplot/articles/web_only/ggdotplotstats.html

grouped_gghistostats, gghistostats, grouped_ggdotplotstats

Examples

```
# for reproducibility
set.seed(123)

# plot
ggdotplotstats(
  data = ggplot2::mpg,
  x = cty,
  y = manufacturer,
  title = "Fuel economy data",
  xlab = "city miles per gallon"
)
```

### gghistostats

**Histogram for distribution of a numeric variable**

**Description**

Histogram with statistical details from one-sample test included in the plot as a subtitle.

**Usage**

```
gghistostats(
  data,
  x,
  binwidth = NULL,
  xlab = NULL,
  title = NULL,
  subtitle = NULL,
  caption = NULL,
  type = "parametric",
  test.value = 0,
  bf.prior = 0.707,
  bf.message = TRUE,
  effsize.type = "g",
  conf.level = 0.95,
  tr = 0.2,
  k = 2L,
  ggtheme = ggstatsplot::theme_ggstatsplot(),
  results.subtitle = TRUE,
  bin.args = list(color = "black", fill = "grey50", alpha = 0.7),
  centrality.plotting = TRUE,
)```
Arguments

data A data frame (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will not be accepted. Additionally, grouped data frames from \{dplyr\} should be ungrouped before they are entered as data.

x A numeric variable from the dataframe data.

binwidth The width of the histogram bins. Can be specified as a numeric value, or a function that calculates width from x. The default is to use the \(\max(x) - \min(x) / \sqrt{N}\). You should always check this value and explore multiple widths to find the best to illustrate the stories in your data.

xlab Label for x axis variable. If NULL (default), variable name for x will be used.

title The text for the plot title.

subtitle The text for the plot subtitle. Will work only if results.subtitle = FALSE.

caption The text for the plot caption. This argument is relevant only if bf.message = FALSE.

type A character specifying the type of statistical approach:

- "parametric"
- "nonparametric"
- "robust"
- "bayes"

You can specify just the initial letter.

test.value A number indicating the true value of the mean (Default: 0).

bf.prior A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors and posterior estimates. In addition to numeric arguments, several named values are also recognized: "medium", "wide", and "ultrawide", corresponding to \(r\) scale values of 1/2, \(\sqrt{2}/2\), and 1, respectively. In case of an ANOVA, this value corresponds to scale for fixed effects.

bf.message Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).

effsize.type Type of effect size needed for parametric tests. The argument can be "d" (for Cohen’s d) or "g" (for Hedge’s g).

conf.level Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).
Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of `tr`, which is by default set to 0.2. Lowering the value might help.

Number of digits after decimal point (should be an integer) (Default: k = 2L).

A `{ggplot2}` theme. Default value is `ggstatsplot::theme_ggstatsplot()`. Any of the `{ggplot2}` themes (e.g., `theme_bw()`), or themes from extension packages are allowed (e.g., `ggthemes::theme_fivethirtyeight()`, `hrbrthemes::theme_ipsum_ps()` etc.). But note that sometimes these themes will remove some of the details that `{ggstatsplot}` plots typically contains. For example, if relevant, `ggbetweenstats()` shows details about multiple comparison test as a label on the secondary Y-axis. Some themes (e.g. `ggthemes::theme_fivethirtyeight()`) will remove the secondary Y-axis and thus the details as well.

Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.

A list of additional aesthetic arguments to be passed to the `stat_bin` used to display the bins. Do not specify `binwidth` argument in this list since it has already been specified using the dedicated argument.

Logical that decides whether centrality tendency measure is to be displayed as a point with a label (Default: TRUE). Function decides which central tendency measure to show depending on the `type` argument.

- **mean** for parametric statistics
- **median** for non-parametric statistics
- **trimmed mean** for robust statistics
- **MAP estimator** for Bayesian statistics

If you want default centrality parameter, you can specify this using `centrality.type` argument.

Decides which centrality parameter is to be displayed. The default is to choose the same as `type` argument. You can specify this to be:

- "parametric" (for **mean**)
- "nonparametric" (for **median**)
- robust (for **trimmed mean**)
- bayes (for **MAP estimator**)

Just as `type` argument, abbreviations are also accepted.

A list of additional aesthetic arguments to be passed to the `geom_line` used to display the lines corresponding to the centrality parameter.

A logical value that decides whether to super-impose a normal curve using `stats::dnorm(mean(x), sd(x))`. Default is FALSE.

A list of additional aesthetic arguments to be passed to the normal curve.
ggpiestats

Pie charts with statistical tests

Description

Pie charts for categorical data with statistical details included in the plot as a subtitle.
Usage

ggpiestats(
  data,
  x,
  y = NULL,
  counts = NULL,
  type = "parametric",
  paired = FALSE,
  results.subtitle = TRUE,
  label = "percentage",
  label.args = list(direction = "both"),
  label.repel = FALSE,
  k = 2L,
  proportion.test = results.subtitle,
  perc.k = 0L,
  bf.message = TRUE,
  ratio = NULL,
  conf.level = 0.95,
  sampling.plan = "indepMulti",
  fixed.margin = "rows",
  prior.concentration = 1,
  title = NULL,
  subtitle = NULL,
  caption = NULL,
  legend.title = NULL,
  ggtheme = ggstatsplot::theme_ggstatsplot(),
  package = "RColorBrewer",
  palette = "Dark2",
  ggplot.component = NULL,
  output = "plot",
  ...
)

Arguments

data A data frame (or a tibble) from which variables specified are to be taken. Other
data types (e.g., matrix, table, array, etc.) will not be accepted. Additionally, grouped
data frames from {dplyr} should be ungrouped before they are entered as data.
x The variable to use as the rows in the contingency table. Please note that if there are
empty factor levels in your variable, they will be dropped.
y The variable to use as the columns in the contingency table. Please note that if
there are empty factor levels in your variable, they will be dropped. Default is NULL. If NULL, one-sample proportion test (a goodness of fit test) will be run
for the x variable. Otherwise an appropriate association test will be run. This argument can not be NULL for ggbarstats function.
counts The variable in data containing counts, or NULL if each row represents a single
observation.
**type**

A character specifying the type of statistical approach:
- "parametric"
- "nonparametric"
- "robust"
- "bayes"

You can specify just the initial letter.

**paired**

Logical indicating whether data came from a within-subjects or repeated measures design study (Default: FALSE). If TRUE, McNemar's test expression will be returned. If FALSE, Pearson's chi-square test will be returned.

**results.subtitle**

Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.

**label**

Character decides what information needs to be displayed on the label in each pie slice. Possible options are "percentage" (default), "counts", "both".

**label.args**

Additional aesthetic arguments that will be passed to geom_label.

**label.repel**

Whether labels should be repelled using ggrepel package. This can be helpful in case the labels are overlapping.

**k**

Number of digits after decimal point (should be an integer) (Default: k = 2L).

**proportion.test**

Decides whether proportion test for x variable is to be carried out for each level of y. Defaults to results.subtitle. In ggbarstats, only p-values from this test will be displayed.

**perc.k**

Numeric that decides number of decimal places for percentage labels (Default: 0L).

**bf.message**

Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).

**ratio**

A vector of proportions: the expected proportions for the proportion test (should sum to 1). Default is NULL, which means the null is equal theoretical proportions across the levels of the nominal variable. This means if there are two levels this will be ratio = c(0.5, 0.5) or if there are four levels this will be ratio = c(0.25, 0.25, 0.25, 0.25), etc.

**conf.level**

Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

**sampling.plan**

Character describing the sampling plan. Possible options are "indepMulti" (independent multinomial; default), "poisson", "jointMulti" (joint multinomial), "hypergeom" (hypergeometric). For more, see ?BayesFactor::contingencyTableBF().

**fixed.margin**

For the independent multinomial sampling plan, which margin is fixed ("rows" or "cols"). Defaults to "rows".

**prior.concentration**

Specifies the prior concentration parameter, set to 1 by default. It indexes the expected deviation from the null hypothesis under the alternative, and corresponds to Gunel and Dickey's (1974) "a" parameter.

**title**

The text for the plot title.
subtitle  The text for the plot subtitle. Will work only if results.subtitle = FALSE.
caption  The text for the plot caption. This argument is relevant only if bf.message = FALSE.
legend.title  Title text for the legend.
ggtheme  A \{ggplot2\} theme. Default value is ggstatsplot::theme_ggstatsplot(). Any of the \{ggplot2\} themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.). But note that sometimes these themes will remove some of the details that ggstatsplot plots typically contains. For example, if relevant, ggbetweenstats() shows details about multiple comparison test as a label on the secondary Y-axis. Some themes (e.g. ggthemes::theme_fivethirtyeight()) will remove the secondary Y-axis and thus the details as well.
package, palette  Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running View(paletteer::palettes_d_names).
ggplot.component  A ggplot component to be added to the plot prepared by \{ggstatsplot\}. This argument is primarily helpful for grouped_ variants of all primary functions. Default is NULL. The argument should be entered as a \{ggplot2\} function or a list of \{ggplot2\} functions.
output  Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set results.subtitle = FALSE, then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when type = "parametric" and bf.message = TRUE, otherwise this will return a NULL.
...

---

**ggscatterstats**  
*Scatterplot with marginal distributions and statistical results*

**Description**

Scatterplots from `{ggplot2}` combined with marginal densigram (density + histogram) plots with statistical details.

**Usage**

```r
ggscatterstats(
  data,
  x,
  y,
  type = "parametric",
  conf.level = 0.95,
  bf.prior = 0.707,
  bf.message = TRUE,
  tr = 0.2,
  k = 2L,
  results.subtitle = TRUE,
  label.var = NULL,
  label.expression = NULL,
  marginal = TRUE,
  xfill = "#009E73",
  yfill = "#D55E00",
  point.args = list(size = 3, alpha = 0.4, stroke = 0, na.rm = TRUE),
  point.width.jitter = 0,
  point.height.jitter = 0,
  point.label.args = list(size = 3, max.overlaps = 1e+06),
  smooth.line.args = list(size = 1.5, color = "blue", method = "lm", formula = y ~ x,
    na.rm = TRUE),
  xsidehistogram.args = list(fill = xfill, color = "black", na.rm = TRUE),
  ysidehistogram.args = list(fill = yfill, color = "black", na.rm = TRUE),
  xlab = NULL,
  ylab = NULL,
  title = NULL,
  subtitle = NULL,
  caption = NULL,
  ggtheme = ggstatsplot::theme_ggstatsplot(),
  ggplot.component = NULL,
  output = "plot",
  ...
)
```
Arguments

**data**
A data frame (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will **not** be accepted. Additionally, grouped data frames from `{dplyr}` should be ungrouped before they are entered as data.

**x**
The column in `data` containing the explanatory variable to be plotted on the x-axis.

**y**
The column in `data` containing the response (outcome) variable to be plotted on the y-axis.

**type**
A character specifying the type of statistical approach:

- "parametric"
- "nonparametric"
- "robust"
- "bayes"

You can specify just the initial letter.

**conf.level**
Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

**bf.prior**
A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors and posterior estimates. In addition to numeric arguments, several named values are also recognized: "medium", "wide", and "ultrawide", corresponding to r scale values of 1/2, sqrt(2)/2, and 1, respectively. In case of an ANOVA, this value corresponds to scale for fixed effects.

**bf.message**
Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for **parametric test** (Default: `TRUE`).

**tr**
Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of `tr`, which is by default set to 0.2. Lowering the value might help.

**k**
Number of digits after decimal point (should be an integer) (Default: `k = 2L`).

**results.subtitle**
Decides whether the results of statistical tests are to be displayed as a subtitle (Default: `TRUE`). If set to `FALSE`, only the plot will be returned.

**label.var**
Variable to use for points labels entered as a symbol (e.g. `var1`).

**label.expression**
An expression evaluating to a logical vector that determines the subset of data points to label (e.g. `y < 4 & z < 20`). While using this argument with `{purrr::pmap}`, you will have to provide a quoted expression (e.g. `quote(y < 4 & z < 20)`).

**marginal**
Decides whether marginal distributions will be plotted on axes using `{ggside}` functions. The default is `TRUE`. The package `{ggside}` must already be installed by the user.

**xfill, yfill**
Character describing color fill for x and y axes marginal distributions (default: "#009E73" (for x) and "#D55E00" (for y)). Note that the defaults are colorblind-friendly.
**point.args**
A list of additional aesthetic arguments to be passed to `geom_point` geom used to display the raw data points.

**point.width.jitter, point.height.jitter**
Degree of jitter in x and y direction, respectively. Defaults to 0 (0%) of the resolution of the data. Note that the jitter should not be specified in the `point.args` because this information will be passed to two different geoms: one displaying the points and the other displaying the *labels* for these points.

**point.label.args**
A list of additional aesthetic arguments to be passed to `ggrepel::geom_label_repel` geom used to display the labels.

**smooth.line.args**
A list of additional aesthetic arguments to be passed to `geom_smooth` geom used to display the regression line.

**xsidehistogram.args, ysidehistogram.args**
A list of arguments passed to respective `geom_s` from `ggside` package to change the marginal distribution histograms plots.

**xlab**
Label for x axis variable. If NULL (default), variable name for x will be used.

**ylab**
Labels for y axis variable. If NULL (default), variable name for y will be used.

**title**
The text for the plot title.

**subtitle**
The text for the plot subtitle. Will work only if `results.subtitle = FALSE`.

**caption**
The text for the plot caption. This argument is relevant only if `bf.message = FALSE`.

**ggtheme**
A `{ggplot2}` theme. Default value is `ggstatsplot::theme_ggstatsplot()`. Any of the `{ggplot2}` themes (e.g., `theme_bw()`), or themes from extension packages are allowed (e.g., `ggthemes::theme_fivethirtyeight()`, `hrbrthemes::theme_ipsum_ps()` etc.). But note that sometimes these themes will remove some of the details that `ggstatsplot` plots typically contains. For example, if relevant, `ggbetweenstats()` shows details about multiple comparison test as a label on the secondary Y-axis. Some themes (e.g., `ggthemes::theme_fivethirtyeight()`) will remove the secondary Y-axis and thus the details as well.

**ggplot.component**
A ggplot component to be added to the plot prepared by `ggstatsplot`). This argument is primarily helpful for grouped_ variants of all primary functions. Default is NULL. The argument should be entered as a `{ggplot2}` function or a list of `{ggplot2}` functions.

**output**
Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set `results.subtitle = FALSE`, then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when `type = "parametric"` and `bf.message = TRUE`, otherwise this will return a NULL.

... Currently ignored.

**Details**
For details, see: https://indrajeetpatil.github.io/ggstatsplot/articles/web_only/ggscatterstats.html
Note

The plot uses ggrepel::geom_label_repel to attempt to keep labels from over-lapping to the largest degree possible. As a consequence plot times will slow down massively (and the plot file will grow in size) if you have a lot of labels that overlap.

grouped_ggscatterstats, ggcorrmat, grouped_ggcorrmat

Examples

```r
# to get reproducible results from bootstrapping
set.seed(123)
library(ggstatsplot)
library(dplyr, warn.conflicts = FALSE)

# creating dataframe with rownames converted to a new column
mtcars_new <- as_tibble(mtcars, rownames = "car")

# simple function call with the defaults
if (require("ggside")) {
  ggscatterstats(
    data = mtcars_new,
    x = wt,
    y = mpg,
    label.var = car,
    label.expression = wt < 4 & mpg < 20
  ) + # making further customization with `ggplot2` functions
    geom_rug(sides = "b")
}
```

**ggwithinstats**  
Box/Violin plots for repeated measures comparisons

Description

A combination of box and violin plots along with raw (unjittered) data points for within-subjects designs with statistical details included in the plot as a subtitle.

Usage

```r
ggwithinstats(
  data,
  x,
  y,
  type = "parametric",
  pairwise.comparisons = TRUE,
  pairwise.display = "significant",
```
p.adjust.method = "holm",
effsize.type = "unbiased",
bf.prior = 0.707,
bf.message = TRUE,
results.subtitle = TRUE,
xlab = NULL,
ylab = NULL,
caption = NULL,
title = NULL,
subtitle = NULL,
k = 2L,
conf.level = 0.95,
nboot = 100L,
tr = 0.2,
centrality.plotting = TRUE,
centrality.type = type,
centrality.point.args = list(size = 5, color = "darkred"),
centrality.label.args = list(size = 3, nudge_x = 0.4, segment.linetype = 4),
centrality.path = TRUE,
centrality.path.args = list(size = 1, color = "red", alpha = 0.5),
point.args = list(size = 3, alpha = 0.5),
point.path = TRUE,
point.path.args = list(alpha = 0.5, linetype = "dashed"),
outlier.tagging = FALSE,
outlier.label = NULL,
outlier.coef = 1.5,
outlier.label.args = list(size = 3),
boxplot.args = list(width = 0.2, alpha = 0.5),
violin.args = list(width = 0.5, alpha = 0.2),
ggsignif.args = list(textsize = 3, tip_length = 0.01),
ggtheme = ggstatsplot::theme_ggstatsplot(),
package = "RColorBrewer",
palette = "Dark2",
ggplot.component = NULL,
output = "plot",
...
)

Arguments

data
A data frame (or a tibble) from which variables specified are to be taken. Other
data types (e.g., matrix, table, array, etc.) will not be accepted. Additionally,
only grouped data frames from {dplyr} should be ungrouped before they are entered
as data.

x
The grouping (or independent) variable from data. In case of a repeated mea-
sures or within-subjects design, if subject.id argument is not available or not
explicitly specified, the function assumes that the data has already been sorted
by such an id by the user and creates an internal identifier. So if your data is
not sorted, the results can be inaccurate when there are more than two levels
in x and there are NAs present. The data is expected to be sorted by user in
subject-1,subject-2, ..., pattern.

y
The response (or outcome or dependent) variable from data.

type
A character specifying the type of statistical approach:
- "parametric"
- "nonparametric"
- "robust"
- "bayes"

You can specify just the initial letter.

pairwise.comparisons
Logical that decides whether pairwise comparisons are to be displayed (default:
TRUE). Please note that only significant comparisons will be shown by default.
To change this behavior, select appropriate option with pairwise.display argu-
ment. The pairwise comparison dataframes are prepared using the pairwise.comparisons
function. For more details about pairwise comparisons, see the documentation
for that function.

pairwise.display
Decides which pairwise comparisons to display. Available options are:
- "significant" (abbreviation accepted: "s")
- "non-significant" (abbreviation accepted: "ns")
- "all"

You can use this argument to make sure that your plot is not uber-cluttered when
you have multiple groups being compared and scores of pairwise comparisons
being displayed.

p.adjust.method
Adjustment method for p-values for multiple comparisons. Possible methods
are: "holm" (default), "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "none".

effsize.type
Type of effect size needed for parametric tests. The argument can be "eta"
(partial eta-squared) or "omega" (partial omega-squared).

bf.prior
A number between 0.5 and 2 (default 0.707), the prior width to use in calcu-
lating Bayes factors and posterior estimates. In addition to numeric arguments,
several named values are also recognized: "medium", "wide", and "ultrawide",
corresponding to r scale values of 1/2, sqrt(2)/2, and 1, respectively. In case of
an ANOVA, this value corresponds to scale for fixed effects.

bf.message
Logical that decides whether to display Bayes Factor in favor of the null hypoth-
esis. This argument is relevant only for parametric test (Default: TRUE).

results.subtitle
Decides whether the results of statistical tests are to be displayed as a subtitle
(Default: TRUE). If set to FALSE, only the plot will be returned.

xlab
Label for x axis variable. If NULL (default), variable name for x will be used.

ylab
Labels for y axis variable. If NULL (default), variable name for y will be used.
caption The text for the plot caption. This argument is relevant only if `bf.message = FALSE`.

title The text for the plot title.

subtitle The text for the plot subtitle. Will work only if `results.subtitle = FALSE`.

k Number of digits after decimal point (should be an integer) (Default: k = 2L).

conf.level Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

nboot Number of bootstrap samples for computing confidence interval for the effect size (Default: 100L).

tr Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.

centrality.plotting Logical that decides whether centrality tendency measure is to be displayed as a point with a label (Default: TRUE). Function decides which central tendency measure to show depending on the type argument.

- **mean** for parametric statistics
- **median** for non-parametric statistics
- **trimmed mean** for robust statistics
- **MAP estimator** for Bayesian statistics

If you want default centrality parameter, you can specify this using `centrality.type` argument.

centrality.type Decides which centrality parameter is to be displayed. The default is to choose the same as type argument. You can specify this to be:

- "parametric" (for mean)
- "nonparametric" (for median)
- robust (for trimmed mean)
- bayes (for MAP estimator)

Just as type argument, abbreviations are also accepted.

centrality.point.args, centrality.label.args A list of additional aesthetic arguments to be passed to `geom_point` and `ggrepel::geom_label_repel` geoms, which are involved in mean plotting.

centrality.path.args, point.path.args A list of additional aesthetic arguments passed on to `geom_path` connecting raw data points and mean points.

point.args A list of additional aesthetic arguments to be passed to the `geom_point` displaying the raw data.

point.path, centrality.path Logical that decides whether individual data points and means, respectively, should be connected using `geom_path`. Both default to TRUE. Note that `point.path` argument is relevant only when there are two groups (i.e., in case of a t-test). In case of large number of data points, it is advisable to set `point.path = FALSE` as these lines can overwhelm the plot.
outlier.tagging
Decides whether outliers should be tagged (Default: FALSE).

outlier.label
Label to put on the outliers that have been tagged. This can't be the same as x argument.

outlier.coef
Coefficient for outlier detection using Tukey's method. With Tukey's method, outliers are below (1st Quartile) or above (3rd Quartile) outlier.coef times the Inter-Quartile Range (IQR) (Default: 1.5).

outlier.label.args
A list of additional aesthetic arguments to be passed to ggrepel::geom_label_repel for outlier label plotting.

boxplot.args
A list of additional aesthetic arguments passed on to geom_boxplot.

violin.args
A list of additional aesthetic arguments to be passed to the geom_violin.

ggsignif.args
A list of additional aesthetic arguments to be passed to ggsignif::geom_signif.

ggtheme
A ggplot2 theme. Default value is ggstatsplot::theme_ggstatsplot(). Any of the {ggplot2} themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.). But note that sometimes these themes will remove some of the details that ggstatsplot plots typically contains. For example, if-relevant, ggbetweenstats() shows details about multiple comparison test as a label on the secondary Y-axis. Some themes (e.g. ggthemes::theme_fivethirtyeight()) will remove the secondary Y-axis and thus the details as well.

package, palette
Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running View(paletteer::palettes_d_names).

ggplot.component
A ggplot component to be added to the plot prepared by ggstatsplot. This argument is primarily helpful for grouped variants of all primary functions. Default is NULL. The argument should be entered as a ggplot2 function or a list of ggplot2 functions.

output
Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set results.subtitle = FALSE, then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when type = "parametric" and bf.message = TRUE, otherwise this will return a NULL.

... Currently ignored.

Details
For details, see: https://indrajeetpatil.github.io/ggstatsplot/articles/web_only/ggwithinstats.html

Examples

```r
# setup
set.seed(123)
library(ggstatsplot)
library(dplyr, warn.conflicts = FALSE)

# two groups (*t*-test)
ggwithinstats(
  data = filter(bugs_long, condition %in% c("HDHF", "HDLF")),
  x    = condition,
  y    = desire
)

# more than two groups (anova)
library(WRS2)

ggwithinstats(
  data = WineTasting,
  x    = Wine,
  y    = Taste,
  type = "r",
  outlier.tagging = TRUE,
  outlier.label    = Taster
)
```

grouped_ggbarstats

**Grouped bar charts with statistical tests**

Description

Helper function for ggstatsplot::ggbarstats to apply this function across multiple levels of a given factor and combining the resulting plots using ggstatsplot::combine_plots.

Usage

```r
grouped_ggbarstats(
  data, ...
  grouping.var,
  output = "plot",
  plotgrid.args = list(),
  annotation.args = list()
)
```
Arguments

data A data frame (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will not be accepted. Additionally, grouped data frames from \{dplyr\} should be ungrouped before they are entered as data.

Arguments passed on to \texttt{ggbarstats}

\texttt{x} The variable to use as the rows in the contingency table. Please note that if there are empty factor levels in your variable, they will be dropped.

\texttt{y} The variable to use as the columns in the contingency table. Please note that if there are empty factor levels in your variable, they will be dropped. Default is NULL. If NULL, one-sample proportion test (a goodness of fit test) will be run for the \texttt{x} variable. Otherwise an appropriate association test will be run. This argument can not be NULL for \texttt{ggbarstats} function.

\texttt{proportion.test} Decides whether proportion test for \texttt{x} variable is to be carried out for each level of \texttt{y}. Defaults to results subtitle. In \texttt{ggbarstats}, only \textit{p}-values from this test will be displayed.

\texttt{perc.k} Numeric that decides number of decimal places for percentage labels (Default: 0L).

\texttt{label} Character decides what information needs to be displayed on the label in each pie slice. Possible options are "percentage" (default), "counts", "both".

\texttt{label.args} Additional aesthetic arguments that will be passed to \texttt{geom_label}.

\texttt{legend.title} Title text for the legend.

\texttt{bf.message} Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).

\texttt{results.subtitle} Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.

\texttt{subtitle} The text for the plot subtitle. Will work only if \texttt{results.subtitle} = FALSE.

\texttt{caption} The text for the plot caption. This argument is relevant only if \texttt{bf.message} = FALSE.

\texttt{ggplot.component} A \texttt{ggplot} component to be added to the plot prepared by \{ggstatsplot\}. This argument is primarily helpful for \texttt{grouped_} variants of all primary functions. Default is NULL. The argument should be entered as a \{ggplot2\} function or a list of \{ggplot2\} functions.

\texttt{package,palette} Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running \texttt{View(paletteer::palettes_d_names)}.

\texttt{ggtheme} A \{ggplot2\} theme. Default value is \texttt{ggstatsplot::theme_ggstatsplot()}. Any of the \{ggplot2\} themes (e.g., \texttt{theme_bw()}), or themes from extension packages are allowed (e.g., \texttt{ggthemes::theme_fivethirtyeight()}, \texttt{hrbrthemes::theme_ipsum_ps()}, etc.). But note that sometimes these themes will remove some of the details that \texttt{ggstatsplot} plots typically
contains. For example, if relevant, `ggbetweenstats()` shows details about multiple comparison test as a label on the secondary Y-axis. Some themes (e.g. `ggthemes::theme_fivethirtyeight()`) will remove the secondary Y-axis and thus the details as well.

type A character specifying the type of statistical approach:
- "parametric"
- "nonparametric"
- "robust"
- "bayes"

You can specify just the initial letter.

k Number of digits after decimal point (should be an integer) (Default: `k = 2L`).

conf.level Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

paired Logical indicating whether data came from a within-subjects or repeated measures design study (Default: `FALSE`). If `TRUE`, McNemar's test expression will be returned. If `FALSE`, Pearson's chi-square test will be returned.

counts The variable in data containing counts, or `NULL` if each row represents a single observation.
ratio A vector of proportions: the expected proportions for the proportion test (should sum to 1). Default is `NULL`, which means the null is equal theoretical proportions across the levels of the nominal variable. This means if there are two levels this will be `ratio = c(0.5,0.5)` or if there are four levels this will be `ratio = c(0.25,0.25,0.25,0.25)`, etc.

sampling.plan Character describing the sampling plan. Possible options are "indepMulti" (independent multinomial; default), "poisson", "jointMulti" (joint multinomial), "hypergeom" (hypergeometric). For more, see `?BayesFactor::contingencyTableBF()`.

fixed.margin For the independent multinomial sampling plan, which margin is fixed ("rows" or "cols"). Defaults to "rows".

prior.concentration Specifies the prior concentration parameter, set to 1 by default. It indexes the expected deviation from the null hypothesis under the alternative, and corresponds to Gunel and Dickey's (1974) "a" parameter.

xlab Label for x axis variable. If `NULL` (default), variable name for x will be used.

ylab Labels for y axis variable. If `NULL` (default), variable name for y will be used.

**grouping.var** A single grouping variable.

**output** Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set `results.subtitle = FALSE`, then this will return a `NULL`. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when `type = "parametric"` and `bf.message = TRUE`, otherwise this will return a `NULL`.

**plotgrid.args** A list of additional arguments passed to `patchwork::wrap_plots`, except for `guides` argument which is already separately specified here.
grouped_ggbetweenstats

annotation.args

A list of additional arguments passed to patchwork::plot_annotation.

Details

Examples

# for reproducibility
set.seed(123)
library(ggstatsplot)
library(dplyr, warn.conflicts = FALSE)

# let's create a smaller dataframe
diamonds_short <- ggplot2::diamonds %>%
  filter(cut %in% c("Very Good", "Ideal")) %>%
  filter(clarity %in% c("SI1", "SI2", "VS1", "VS2")) %>%
  sample_frac(size = 0.05)

# plot
grouped_ggbarstats(
  data = diamonds_short,
  x = color,
  y = clarity,
  grouping.var = cut,
  plotgrid.args = list(nrow = 2)
)

grouped_ggbetweenstats

Violin plots for group or condition comparisons in between-subjects designs repeated across all levels of a grouping variable.

Description

Helper function for ggstatsplot::ggbetweenstats to apply this function across multiple levels of a given factor and combining the resulting plots using ggstatsplot::combine_plots.
Usage

grouped_ggbetweenstats(
  data,
  ...,
  grouping.var,
  output = "plot",
  plotgrid.args = list(),
  annotation.args = list()
)

Arguments

data A data frame (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will not be accepted. Additionally, grouped data frames from \{dplyr\} should be ungrouped before they are entered as data.

plot.type Character describing the type of plot. Currently supported plots are "box" (for only boxplots), "violin" (for only violin plots), and "boxviolin" (for a combination of box and violin plots; default).

xlab Label for x axis variable. If NULL (default), variable name for x will be used.

ylab Labels for y axis variable. If NULL (default), variable name for y will be used.

pairwise.comparisons Logical that decides whether pairwise comparisons are to be displayed (default: TRUE). Please note that only significant comparisons will be shown by default. To change this behavior, select appropriate option with pairwise.display argument. The pairwise comparison dataframes are prepared using the pairwise_comparisons function. For more details about pairwise comparisons, see the documentation for that function.

p.adjust.method Adjustment method for p-values for multiple comparisons. Possible methods are: "holm" (default), "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "none".

pairwise.display Decides which pairwise comparisons to display. Available options are:
  • "significant" (abbreviation accepted: "s")
  • "non-significant" (abbreviation accepted: "ns")
  • "all"

You can use this argument to make sure that your plot is not uber-cluttered when you have multiple groups being compared and scores of pairwise comparisons being displayed.

bf.message Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).
results.subtitle Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.

subtitle The text for the plot subtitle. Will work only if results.subtitle = FALSE.

caption The text for the plot caption. This argument is relevant only if bf.message = FALSE.

outlier.color Default aesthetics for outliers (Default: "black").

outlier.tagging Decides whether outliers should be tagged (Default: FALSE).

outlier.label Label to put on the outliers that have been tagged. This can’t be the same as x argument.

outlier.shape Hiding the outliers can be achieved by setting outlier.shape = NA. Importantly, this does not remove the outliers, it only hides them, so the range calculated for the y-axis will be the same with outliers shown and outliers hidden.

outlier.label.args A list of additional aesthetic arguments to be passed to ggrepel::geom_label_repel for outlier label plotting.

outlier.coef Coefficient for outlier detection using Tukey’s method. With Tukey’s method, outliers are below (1st Quartile) or above (3rd Quartile) outlier.coef times the Inter-Quartile Range (IQR) (Default: 1.5).

centrality.plotting Logical that decides whether centrality tendency measure is to be displayed as a point with a label (Default: TRUE). Function decides which central tendency measure to show depending on the type argument.

- **mean** for parametric statistics
- **median** for non-parametric statistics
- **trimmed mean** for robust statistics
- **MAP estimator** for Bayesian statistics

If you want default centrality parameter, you can specify this using centrality.type argument.

centrality.type Decides which centrality parameter is to be displayed. The default is to choose the same as type argument. You can specify this to be:

- "parametric" (for mean)
- "nonparametric" (for median)
- robust (for trimmed mean)
- bayes (for MAP estimator)

Just as type argument, abbreviations are also accepted.

point.args A list of additional aesthetic arguments to be passed to the geom_point displaying the raw data.

violin.args A list of additional aesthetic arguments to be passed to the geom_violin.

ggplot.component A ggplot component to be added to the plot prepared by ggstatsplot. This argument is primarily helpful for grouped_ variants of all primary functions. Default is NULL. The argument should be entered as a (ggplot2) function or a list of (ggplot2) functions.
package, palette Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running `View(paletteer::palettes_d_names)`.

centrality.point.args, centrality.label.args A list of additional aesthetic arguments to be passed to `geom_point` and `ggrepel::geom_label_repel` geoms, which are involved in mean plotting.

ggsignif.args A list of additional aesthetic arguments to be passed to `ggsignif::geom_signif`.

ggtheme A `{ggplot2}` theme. Default value is `ggstatsplot::theme_ggstatsplot()`.

Any of the `{ggplot2}` themes (e.g., `theme_bw()`), or themes from extension packages are allowed (e.g., `ggthemes::theme_fivethirtyeight()`, `hrbrthemes::theme_ipsum_ps()`, etc.). But note that sometimes these themes will remove some of the details that `{ggstatsplot}` plots typically contains. For example, if relevant, `ggbetweenstats()` shows details about multiple comparison test as a label on the secondary Y-axis. Some themes (e.g. `ggthemes::theme_fivethirtyeight()`) will remove the secondary Y-axis and thus the details as well.

x The grouping (or independent) variable from data. In case of a repeated measures or within-subjects design, if `subject.id` argument is not available or not explicitly specified, the function assumes that the data has already been sorted by such an id by the user and creates an internal identifier. So if your data is not sorted, the results can be inaccurate when there are more than two levels in `x` and there are NAs present. The data is expected to be sorted by user in `subject-1,subject-2, ..., pattern`.

y The response (or outcome or dependent) variable from data.

type A character specifying the type of statistical approach:

- "parametric"
- "nonparametric"
- "robust"
- "bayes"

You can specify just the initial letter.

k Number of digits after decimal point (should be an integer) (Default: `k = 2L`).

conf.level Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

effsize.type Type of effect size needed for parametric tests. The argument can be "eta" (partial eta-squared) or "omega" (partial omega-squared).

var.equal a logical variable indicating whether to treat the two variances as being equal. If `TRUE` then the pooled variance is used to estimate the variance otherwise the Welch (or Satterthwaite) approximation to the degrees of freedom is used.

bf.prior A number between 0.5 and 2 (default `0.707`), the prior width to use in calculating Bayes factors and posterior estimates. In addition to numeric arguments, several named values are also recognized: "medium", "wide", and "ultrawide", corresponding to r scale values of 1/2, sqrt(2)/2, and 1, respectively. In case of an ANOVA, this value corresponds to scale for fixed effects.
tr Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.

nboot Number of bootstrap samples for computing confidence interval for the effect size (Default: 100L).

grouping.var A single grouping variable.

output Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set results.subtitle = FALSE, then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when type = "parametric" and bf.message = TRUE, otherwise this will return a NULL.

plotgrid.args A list of additional arguments passed to patchwork::wrap_plots, except for guides argument which is already separately specified here.

annotation.args A list of additional arguments passed to patchwork::plot_annotation.

  y = rating,
  grouping.var = mpaa,
  ggplot.component = scale_y_continuous(
```
grouped_ggcorrmat

Visualization of a correlalogram (or correlation matrix) for all levels of a grouping variable

Description

Helper function for ggstatsplot::ggcorrmat to apply this function across multiple levels of a given factor and combining the resulting plots using ggstatsplot::combine_plots.

Usage

grouped_ggcorrmat(
  data,
  ..., grouping.var,
  output = "plot",
  plotgrid.args = list(),
  annotation.args = list()
)

Arguments

data
  Dataframe from which variables specified are preferentially to be taken.

...         Arguments passed on to ggcorrmat

cor.vars
  List of variables for which the correlation matrix is to be computed and visualized. If NULL (default), all numeric variables from data will be used.

cor.vars.names
  Optional list of names to be used for cor.vars. The names should be entered in the same order.

partial
  Can be TRUE for partial correlations. For Bayesian partial correlations, "full" instead of pseudo-Bayesian partial correlations (i.e., Bayesian correlation based on frequentist partialization) are returned.

matrix.type
  Character, "upper" (default), "lower", or "full", display full matrix, lower triangular or upper triangular matrix.

sig.level
  Significance level (Default: 0.05). If the p-value in p-value matrix is bigger than sig.level, then the corresponding correlation coefficient is regarded as insignificant and flagged as such in the plot. Relevant only when output = "plot".
colors  A vector of 3 colors for low, mid, and high correlation values. If set to
NULL, manual specification of colors will be turned off and 3 colors from
the specified palette from package will be selected.
pch  Decides the point shape to be used for insignificant correlation coefficients
(only valid when insig = "pch"). Default: pch = "cross".
ggcorrplot.args  A list of additional (mostly aesthetic) arguments that will be
passed to ggcorrplot::ggcorrplot function. The list should avoid any of
the following arguments since they are already internally being used: corr,
method, p.mat, sig.level, ggtheme, colors, lab, pch, legend.title,
digits.
type  A character specifying the type of statistical approach:
• "parametric"
• "nonparametric"
• "robust"
• "bayes"
You can specify just the initial letter.
k  Number of digits after decimal point (should be an integer) (Default: k = 2L).
conf.level  Scalar between 0 and 1. If unspecified, the defaults return 95%
confidence/credible intervals (0.95).
tr  Trim level for the mean when carrying out robust tests. In case of an error,
try reducing the value of tr, which is by default set to 0.2. Lowering the
value might help.
bf.prior  A number between 0.5 and 2 (default 0.707), the prior width to use
in calculating Bayes factors and posterior estimates. In addition to numeric
arguments, several named values are also recognized: "medium", "wide",
and "ultrawide", corresponding to r scale values of 1/2, sqrt(2)/2, and 1,
respectively. In case of an ANOVA, this value corresponds to scale for fixed
effects.
p.adjust.method  Adjustment method for p-values for multiple comparisons.
   Possible methods are: "holm" (default), "hochberg", "hommel", "bonferroni",
   "BH", "BY", "fdr", "none".
subtitle  The text for the plot subtitle. Will work only if results.subtitle = FALSE.
caption  The text for the plot caption. This argument is relevant only if bf.message
   = FALSE.
.ggplot.component  A ggplot component to be added to the plot prepared by
   {ggstatsplot}. This argument is primarily helpful for grouped_ variants
   of all primary functions. Default is NULL. The argument should be entered
   as a {ggplot2} function or a list of {ggplot2} functions.
package,palette  Name of the package from which the given palette is to be
   extracted. The available palettes and packages can be checked by running
   View(paletteer::palettes_d_names).
ggtheme  A {ggplot2} theme. Default value is ggstatsplot::theme_ggstatsplot().
   Any of the {ggplot2} themes (e.g., theme_bw()), or themes from exten-
   sion packages are allowed (e.g., ggthemes::theme_fivethirtyeight(),
   hrbrthemes::theme_ipsum_ps(), etc.). But note that sometimes these
themes will remove some of the details that \{ggstatsplot\} plots typically contains. For example, if relevant, \texttt{ggbetweenstats()} shows details about multiple comparison test as a label on the secondary Y-axis. Some themes (e.g. \texttt{ggthemes::theme_fivethirtyeight()}) will remove the secondary Y-axis and thus the details as well.

- **grouping.var**: A single grouping variable.
- **output**: Character that decides expected output from this function. If "plot", the visualization matrix will be returned. If "dataframe" (or literally anything other than "plot"), a dataframe containing all details from statistical analyses (e.g., correlation coefficients, statistic values, p-values, no. of observations, etc.) will be returned.

- **plotgrid.args**: A list of additional arguments passed to \texttt{patchwork::wrap_plots}, except for \texttt{guides} argument which is already separately specified here.

- **annotation.args**: A list of additional arguments passed to \texttt{patchwork::plot_annotation}.

### Details

### Examples

```r
# for reproducibility
set.seed(123)
library(ggstatsplot)

# for plot
if (require("ggcorrplot")) {
  grouped_ggcorrmat(
    data = iris,
    grouping.var = Species,
    type = "robust",
    p.adjust.method = "holm",
    plotgrid.args = list(ncol = 1),
    annotation.args = list(tag_levels = "i")
  )
}

# for dataframe
grouped_ggcorrmat(
  data = ggplot2::msleep,
  grouping.var = vore,
  type = "bayes",
  output = "dataframe"
)
```
grouped_ggdotplotstats

Grouped histograms for distribution of a labeled numeric variable

Description

Helper function for ggstatsplot::ggdotplotstats to apply this function across multiple levels of a given factor and combining the resulting plots using ggstatsplot::combine_plots.

Usage

```r
grouped_ggdotplotstats(
  data,
  ..., 
  grouping.var,
  output = "plot",
  plotgrid.args = list(),
  annotation.args = list()
)
```

Arguments

- `data` A data frame (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will not be accepted. Additionally, grouped data frames from `{dplyr}` should be ungrouped before they are entered as data.
- `...` Arguments passed on to `ggdotplotstats`
- `y` Label or grouping variable.
- `point.args` A list of additional aesthetic arguments passed to `geom_point`.
- `centrality.line.args` A list of additional aesthetic arguments to be passed to the `geom_line` used to display the lines corresponding to the centrality parameter.
- `x` A numeric variable from the dataframe `data`.
- `type` A character specifying the type of statistical approach:
  - "parametric"
  - "nonparametric"
  - "robust"
  - "bayes"
  You can specify just the initial letter.
- `test.value` A number indicating the true value of the mean (Default: 0).
- `k` Number of digits after decimal point (should be an integer) (Default: `k = 2L`).
conf.level Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

tr Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.

bf.prior A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors and posterior estimates. In addition to numeric arguments, several named values are also recognized: "medium", "wide", and "ultrawide", corresponding to \( r \) scale values of 1/2, \( \sqrt{2}/2 \), and 1, respectively. In case of an ANOVA, this value corresponds to scale for fixed effects.

effsize.type Type of effect size needed for parametric tests. The argument can be "d" (for Cohen's \( d \)) or "g" (for Hedge's \( g \)).

xlab Label for x axis variable. If NULL (default), variable name for x will be used.

bf.message Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).

results.subtitle Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.

subtitle The text for the plot subtitle. Will work only if results.subtitle = FALSE.

caption The text for the plot caption. This argument is relevant only if bf.message = FALSE.

centrality.plotting Logical that decides whether centrality tendency measure is to be displayed as a point with a label (Default: TRUE). Function decides which central tendency measure to show depending on the type argument.

- **mean** for parametric statistics
- **median** for non-parametric statistics
- **trimmed mean** for robust statistics
- **MAP estimator** for Bayesian statistics

If you want default centrality parameter, you can specify this using centrality.type argument.

centrality.type Decides which centrality parameter is to be displayed. The default is to choose the same as type argument. You can specify this to be:

- "parametric" (for **mean**)
- "nonparametric" (for **median**)
- robust (for **trimmed mean**)
- bayes (for **MAP estimator**)

Just as type argument, abbreviations are also accepted.

ggplot.component A ggplot component to be added to the plot prepared by \{ggstatsplot\}. This argument is primarily helpful for grouped_ variants of all primary functions. Default is NULL. The argument should be entered as a \{ggplot2\} function or a list of \{ggplot2\} functions.
ggtheme A ggplot2 theme. Default value is ggstatsplot::theme_ggstatsplot(). Any of the ggplot2 themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.). But note that sometimes these themes will remove some of the details that ggstatsplot plots typically contains. For example, if relevant, ggbetweenstats() shows details about multiple comparison test as a label on the secondary Y-axis. Some themes (e.g., ggthemes::theme_fivethirtyeight()) will remove the secondary Y-axis and thus the details as well.

ylab Labels for y axis variable. If NULL (default), variable name for y will be used.

grouping.var A single grouping variable.

output Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set results.subtitle = FALSE, then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when type = "parametric" and bf.message = TRUE, otherwise this will return a NULL.

plotgrid.args A list of additional arguments passed to patchwork::wrap_plots, except for guides argument which is already separately specified here.

annotation.args A list of additional arguments passed to patchwork::plot_annotation.

grouped_gghistostats

Grouped histograms for distribution of a numeric variable

Description

Helper function for ggstatsplot::gghistostats to apply this function across multiple levels of a given factor and combining the resulting plots using ggstatsplot::combine_plots.

Usage

grouped_gghistostats(
  data,
  x,
  grouping.var,
  binwidth = NULL,
  output = "plot",
  plotgrid.args = list(),
  annotation.args = list(),
  ...
)

Arguments

data  A data frame (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will not be accepted. Additionally, grouped data frames from {dplyr} should be ungrouped before they are entered as data.

x A numeric variable from the dataframe data.

grouping.var A single grouping variable.

binwidth The width of the histogram bins. Can be specified as a numeric value, or a function that calculates width from x. The default is to use the \( \frac{\max(x) - \min(x)}{\sqrt{N}} \). You should always check this value and explore multiple widths to find the best to illustrate the stories in your data.

output Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set results.subtitle = FALSE, then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when type = "parametric" and bf.message = TRUE, otherwise this will return a NULL.

plotgrid.args A list of additional arguments passed to patchwork::wrap_plots, except for guides argument which is already separately specified here.
annotation.args

A list of additional arguments passed to `patchwork::plot_annotation`. Arguments passed on to `gghistostats`

normal.curve A logical value that decides whether to super-impose a normal curve using `stats::dnorm(mean(x), sd(x))`. Default is FALSE.

normal.curve.args A list of additional aesthetic arguments to be passed to the normal curve.

bin.args A list of additional aesthetic arguments to be passed to the `stat_bin` used to display the bins. Do not specify `binwidth` argument in this list since it has already been specified using the dedicated argument.

centrality.line.args A list of additional aesthetic arguments to be passed to the `geom_line` used to display the lines corresponding to the centrality parameter.

type A character specifying the type of statistical approach:

- "parametric"
- "nonparametric"
- "robust"
- "bayes"

You can specify just the initial letter.

test.value A number indicating the true value of the mean (Default: 0).

k Number of digits after decimal point (should be an integer) (Default: k = 2L).

conf.level Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

tr Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of `tr`, which is by default set to 0.2. Lowering the value might help.

bf.prior A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors and posterior estimates. In addition to numeric arguments, several named values are also recognized: "medium", "wide", and "ultrawide", corresponding to $r$ scale values of $1/2$, $\sqrt{2}/2$, and $1$, respectively. In case of an ANOVA, this value corresponds to scale for fixed effects.

effsize.type Type of effect size needed for parametric tests. The argument can be "d" (for Cohen's $d$) or "g" (for Hedge's $g$).

xlab Label for x axis variable. If NULL (default), variable name for $x$ will be used.

bf.message Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).

results.subtitle Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.

subtitle The text for the plot subtitle. Will work only if `results.subtitle` = FALSE.

caption The text for the plot caption. This argument is relevant only if `bf.message` = FALSE.
centrality.plotting Logical that decides whether centrality tendency measure is to be displayed as a point with a label (Default: TRUE). Function decides which central tendency measure to show depending on the type argument.
- mean for parametric statistics
- median for non-parametric statistics
- trimmed mean for robust statistics
- MAP estimator for Bayesian statistics

If you want default centrality parameter, you can specify this using centrality.type argument.

centrality.type Decides which centrality parameter is to be displayed. The default is to choose the same as type argument. You can specify this to be:
- "parameteric" (for mean)
- "nonparametric" (for median)
- robust (for trimmed mean)
- bayes (for MAP estimator)

Just as type argument, abbreviations are also accepted.

ggplot.component A ggplot component to be added to the plot prepared by {ggstatsplot}. This argument is primarily helpful for grouped_ variants of all primary functions. Default is NULL. The argument should be entered as a (ggplot2) function or a list of (ggplot2) functions.

ggtheme A (ggplot2) theme. Default value is ggstatsplot::theme_ggstatsplot(). Any of the (ggplot2) themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.). But note that sometimes these themes will remove some of the details that {ggstatsplot} plots typically contains. For example, if relevant, ggbetweenstats() shows details about multiple comparison test as a label on the secondary Y-axis. Some themes (e.g. ggthemes::theme_fivethirtyeight()) will remove the secondary Y-axis and thus the details as well.

Examples

# for reproducibility
set.seed(123)
library(ggstatsplot)

# plot
grouped_ggpiestats(
    data = iris,
    x = Sepal.Length,
    test.value = 5,
    grouping.var = Species,
    plotgrid.args = list(nrow = 1),
    annotation.args = list(tag_levels = "i")
)

---

**grouped_ggpiestats**  
*Grouped pie charts with statistical tests*

**Description**

Helper function for `ggstatsplot::ggpiestats` to apply this function across multiple levels of a given factor and combining the resulting plots using `ggstatsplot::combine_plots`.

**Usage**

```r
grouped_ggpiestats(
    data, 
    ..., 
    grouping.var, 
    output = "plot", 
    plotgrid.args = list(), 
    annotation.args = list()
)
```

**Arguments**

- **data** A data frame (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will **not** be accepted. Additionally, grouped data frames from `{dplyr}` should be ungrouped before they are entered as data.

- **...** Arguments passed on to `ggpiestats`

- **x** The variable to use as the **rows** in the contingency table. Please note that if there are empty factor levels in your variable, they will be dropped.

- **y** The variable to use as the **columns** in the contingency table. Please note that if there are empty factor levels in your variable, they will be dropped. Default is NULL. If NULL, one-sample proportion test (a goodness of fit test) will be run for the x variable. Otherwise an appropriate association test will be run. This argument can not be NULL for `ggbarstats` function.

- **proportion.test** Decides whether proportion test for x variable is to be carried out for each level of y. Defaults to `results.subtitle`. In `ggbarstats`, only p-values from this test will be displayed.
perc.k Numeric that decides number of decimal places for percentage labels (Default: 0L).

label Character decides what information needs to be displayed on the label in each pie slice. Possible options are "percentage" (default), "counts", "both".

label.args Additional aesthetic arguments that will be passed to geom_label.

label.repel Whether labels should be repelled using ggrepel package. This can be helpful in case the labels are overlapping.

legend.title Title text for the legend.

bf.message Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).

results.subtitle Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.

subtitle The text for the plot subtitle. Will work only if results.subtitle = FALSE.

caption The text for the plot caption. This argument is relevant only if bf.message = FALSE.

ggplot.component A ggplot component to be added to the plot prepared by ggstatsplot. This argument is primarily helpful for grouped_ variants of all primary functions. Default is NULL. The argument should be entered as a ggplot2 function or a list of ggplot2 functions.

package,palette Name of the package from which the given palette is to be extracted. The available palettes and packages can be checked by running View(palettereer::palettes_d_names).

ggtheme A ggplot2 theme. Default value is ggstatsplot::theme_ggstatsplot(). Any of the (ggplot2) themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.). But note that sometimes these themes will remove some of the details that ggstatsplot plots typically contains. For example, if relevant, ggbetweenstats() shows details about multiple comparison test as a label on the secondary Y-axis. Some themes (e.g. ggthemes::theme_fivethirtyeight()) will remove the secondary Y-axis and thus the details as well.

type A character specifying the type of statistical approach:
  • "parametric"
  • "nonparametric"
  • "robust"
  • "bayes"  
You can specify just the initial letter.

k Number of digits after decimal point (should be an integer) (Default: k = 2L).

conf.level Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

paired Logical indicating whether data came from a within-subjects or repeated measures design study (Default: FALSE). If TRUE, McNemar's test
expression will be returned. If FALSE, Pearson’s chi-square test will be returned.

counts The variable in data containing counts, or NULL if each row represents a single observation.

ratio A vector of proportions: the expected proportions for the proportion test (should sum to 1). Default is NULL, which means the null is equal theoretical proportions across the levels of the nominal variable. This means if there are two levels this will be ratio = c(0.5, 0.5) or if there are four levels this will be ratio = c(0.25, 0.25, 0.25, 0.25), etc.

sampling.plan Character describing the sampling plan. Possible options are "indepMulti" (independent multinomial; default), "poisson", "jointMulti" (joint multinomial), "hypergeom" (hypergeometric). For more, see ?BayesFactor::contingencyTableBF.

fixed.margin For the independent multinomial sampling plan, which margin is fixed ("rows" or "cols"). Defaults to "rows".

prior.concentration Specifies the prior concentration parameter, set to 1 by default. It indexes the expected deviation from the null hypothesis under the alternative, and corresponds to Gunel and Dickey’s (1974) "a" parameter.

grouping.var A single grouping variable.

output Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set results.subtitle = FALSE, then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when type = "parametric" and bf.message = TRUE, otherwise this will return a NULL.

plotgrid.args A list of additional arguments passed to patchwork::wrap_plots, except for guides argument which is already separately specified here.

annotation.args A list of additional arguments passed to patchwork::plot_annotation.

grouped_ggscatterstats

*Scatterplot with marginal distributions for all levels of a grouping variable*

**Description**

Grouped scatterplots from `{ggplot2}` combined with marginal distribution plots with statistical details added as a subtitle.

**Usage**

```r
grouped_ggscatterstats(
  data,
  ..., 
  grouping.var,
  output = "plot",
  plotgrid.args = list(),
  annotation.args = list()
)
```

**Arguments**

- `data` A data frame (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will not be accepted. Additionally, grouped data frames from `{dplyr}` should be ungrouped before they are entered as data.

- `...` Arguments passed on to `ggscatterstats`

  - `label.var` Variable to use for points labels entered as a symbol (e.g. `var1`).
  - `label.expression` An expression evaluating to a logical vector that determines the subset of data points to label (e.g. `y < 4 & z < 20`). While using this argument with `purrr::pmap`, you will have to provide a quoted expression (e.g. `quote(y < 4 & z < 20)`).
  - `point.label.args` A list of additional aesthetic arguments to be passed to `ggrepel::geom_label_repel` geom used to display the labels.
  - `smooth.line.args` A list of additional aesthetic arguments to be passed to `geom_smooth` geom used to display the regression line.
  - `point.args` A list of additional aesthetic arguments to be passed to `geom_point` geom used to display the raw data points.
  - `marginal` Decides whether marginal distributions will be plotted on axes using `ggside` functions. The default is `TRUE`. The package `ggside` must already be installed by the user.
  - `point.width.jitter`, `point.height.jitter` Degree of jitter in x and y direction, respectively. Defaults to 0 (0%) of the resolution of the data. Note that the jitter should not be specified in the `point.args` because this information will be passed to two different geoms: one displaying the *points* and the other displaying the *labels* for these points.
xfill, yfill Character describing color fill for x and y axes marginal distributions (default: "#009E73" (for x) and "#D55E00" (for y)). Note that the defaults are colorblind-friendly.

xsidestatistic.args, ysidestatistic.args A list of arguments passed to respective geom_s from ggside package to change the marginal distribution histograms plots.

x The column in data containing the explanatory variable to be plotted on the x-axis.

y The column in data containing the response (outcome) variable to be plotted on the y-axis.

type A character specifying the type of statistical approach:
- "parametric"
- "nonparametric"
- "robust"
- "bayes"

You can specify just the initial letter.

k Number of digits after decimal point (should be an integer) (Default: k = 2L).

conf.level Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

tr Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.

bf.prior A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors and posterior estimates. In addition to numeric arguments, several named values are also recognized: "medium", "wide", and "ultrawide", corresponding to r scale values of 1/2, sqrt(2)/2, and 1, respectively. In case of an ANOVA, this value corresponds to scale for fixed effects.

xlab Label for x axis variable. If NULL (default), variable name for x will be used.

ylab Labels for y axis variable. If NULL (default), variable name for y will be used.

tbf.message Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).

results.subtitle Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.

subtitle The text for the plot subtitle. Will work only if results.subtitle = FALSE.

caption The text for the plot caption. This argument is relevant only if bf.message = FALSE.

ggplot.component A ggplot component to be added to the plot prepared by {ggstatsplot}. This argument is primarily helpful for grouped_ variants of all primary functions. Default is NULL. The argument should be entered as a {ggplot2} function or a list of {ggplot2} functions.
ggtheme A {ggplot2} theme. Default value is ggstatsplot::theme_ggstatsplot(). Any of the {ggplot2} themes (e.g., theme_bw()), or themes from extension packages are allowed (e.g., ggthemes::theme_fivethirtyeight(), hrbrthemes::theme_ipsum_ps(), etc.). But note that sometimes these themes will remove some of the details that {ggstatsplot} plots typically contains. For example, if relevant, ggbetweenstats() shows details about multiple comparison test as a label on the secondary Y-axis. Some themes (e.g. ggthemes::theme_fivethirtyeight()) will remove the secondary Y-axis and thus the details as well.

grouping.var A single grouping variable.
output Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set results.subtitle = FALSE, then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when type = "parametric" and bf.message = TRUE, otherwise this will return a NULL.
plotgrid.args A list of additional arguments passed to patchwork::wrap_plots, except for guides argument which is already separately specified here.
annotation.args A list of additional arguments passed to patchwork::plot_annotation.

Details

For details, see: https://indrajeetpatil.github.io/ggstatsplot/articles/web_only/ggscatterstats.html

Examples

# to ensure reproducibility
set.seed(123)
library(ggstatsplot)
library(dplyr, warn.conflicts = FALSE)
library(ggplot2)

# basic function call
grouped_ggscatterstats(
  data = filter(movies_long, genre == "Comedy" | genre == "Drama"),
  x = length,
  y = rating,
  type = "robust",
  grouping.var = genre,
  ggplot.component = list(geom_rug(sides = "b"))
)

# using labeling
# (also show how to modify basic plot from within function call)
grouped_ggscatterstats(
  data = filter(ggplot2::mpg, cyl != 5),
  x = displ,
  y = hwy,
  grouping.var = cyl,
  type = "robust",
  label.var = manufacturer,
  label.expression = hwy > 25 & displ > 2.5,
  ggplot.component = scale_y_continuous(sec.axis = dup_axis())
)

# labeling without expression

grouped_ggscatterstats(
  data = filter(movies_long, rating == 7, genre %in% c("Drama", "Comedy")),
  x = budget,
  y = length,
  grouping.var = genre,
  bf.message = FALSE,
  label.var = "title",
  annotation.args = list(tag_levels = "a")
)

grouped_ggwithinstats

Violin plots for group or condition comparisons in within-subjects designs repeated across all levels of a grouping variable.

Description

A combined plot of comparison plot created for levels of a grouping variable.

Usage

grouped_ggwithinstats(
  data,
  ..., grouping.var,
  output = "plot",
  plotgrid.args = list(),
  annotation.args = list()
)

Arguments

data A data frame (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will not be accepted. Additionally, grouped data frames from {dplyr} should be ungrouped before they are entered as data.

... Arguments passed on to ggwithinstats
point.path, centrality.path Logical that decides whether individual data points and means, respectively, should be connected using geom_path. Both default to TRUE. Note that point.path argument is relevant only when there are two groups (i.e., in case of a t-test). In case of large number of data points, it is advisable to set point.path = FALSE as these lines can overwhelm the plot.

centrality.path.args, point.path.args A list of additional aesthetic arguments passed on to geom_path connecting raw data points and mean points.

boxplot.args A list of additional aesthetic arguments passed on to geom_boxplot.

xlab Label for x axis variable. If NULL (default), variable name for x will be used.

ylab Labels for y axis variable. If NULL (default), variable name for y will be used.

pairwise.comparisons Logical that decides whether pairwise comparisons are to be displayed (default: TRUE). Please note that only significant comparisons will be shown by default. To change this behavior, select appropriate option with pairwise.display argument. The pairwise comparison dataframes are prepared using the pairwise_comparisons function. For more details about pairwise comparisons, see the documentation for that function.

p.adjust.method Adjustment method for p-values for multiple comparisons. Possible methods are: "holm" (default), "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "none".

pairwise.display Decides which pairwise comparisons to display. Available options are:

- "significant" (abbreviation accepted: "s")
- "non-significant" (abbreviation accepted: "ns")
- "all"

You can use this argument to make sure that your plot is not uber-cluttered when you have multiple groups being compared and scores of pairwise comparisons being displayed.

bf.message Logical that decides whether to display Bayes Factor in favor of the null hypothesis. This argument is relevant only for parametric test (Default: TRUE).

results.subtitle Decides whether the results of statistical tests are to be displayed as a subtitle (Default: TRUE). If set to FALSE, only the plot will be returned.

subtitle The text for the plot subtitle. Will work only if results.subtitle = FALSE.

caption The text for the plot caption. This argument is relevant only if bf.message = FALSE.

outlier.tagging Decides whether outliers should be tagged (Default: FALSE).

outlier.label Label to put on the outliers that have been tagged. This can't be the same as x argument.
outlier.label.args A list of additional aesthetic arguments to be passed to
ggrepel::geom_label_repel for outlier label plotting.
outlier.coef Coefficient for outlier detection using Tukey’s method. With
Tukey’s method, outliers are below (1st Quartile) or above (3rd Quartile)
outlier.coef times the Inter-Quartile Range (IQR) (Default: 1.5).
centrality.plotting Logical that decides whether centrality tendency mea-
sure is to be displayed as a point with a label (Default: TRUE). Function
decides which central tendency measure to show depending on the type
argument.
  • mean for parametric statistics
  • median for non-parametric statistics
  • trimmed mean for robust statistics
  • MAP estimator for Bayesian statistics
If you want default centrality parameter, you can specify this using centrality.type
argument.
centrality.type Decides which centrality parameter is to be displayed. The
default is to choose the same as type argument. You can specify this to be:
  • "parametric" (for mean)
  • "nonparametric" (for median)
  • robust (for trimmed mean)
  • bayes (for MAP estimator)
Just as type argument, abbreviations are also accepted.
point.args A list of additional aesthetic arguments to be passed to the geom_point
displaying the raw data.
violin.args A list of additional aesthetic arguments to be passed to the geom_violin.
ggplot.component A ggplot component to be added to the plot prepared by
{ggstatsplot}. This argument is primarily helpful for grouped_ variants
of all primary functions. Default is NULL. The argument should be entered
as a (ggplot2) function or a list of (ggplot2) functions.
package,palette Name of the package from which the given palette is to be
extracted. The available palettes and packages can be checked by running
View(paletteer::palettes_d_names).
centrality.point.args,centrality.label.args A list of additional aes-
thetic arguments to be passed to geom_point and ggrepel::geom_label_repel
geoms, which are involved in mean plotting.
ggsignif.args A list of additional aesthetic arguments to be passed to ggsignif::geom_signif.
ggtheme A {ggplot2} theme. Default value is ggstatsplot::theme_ggstatsplot().
Any of the (ggplot2) themes (e.g., theme_bw()), or themes from exten-
sion packages are allowed (e.g., ggthemes::theme_fivethirtyeight(),
hrbrthemes::theme_ipsum_ps(), etc.). But note that sometimes these
themes will remove some of the details that {ggstatsplot} plots typically
contains. For example, if relevant, ggbetweenstats() shows details about
multiple comparison test as a label on the secondary Y-axis. Some themes
(e.g. ggthemes::theme_fivethirtyeight()) will remove the secondary
Y-axis and thus the details as well.
x The grouping (or independent) variable from data. In case of a repeated measures or within-subjects design, if subject.id argument is not available or not explicitly specified, the function assumes that the data has already been sorted by such an id by the user and creates an internal identifier. So if your data is not sorted, the results can be inaccurate when there are more than two levels in x and there are NAs present. The data is expected to be sorted by user in subject-1, subject-2, ..., pattern.

y The response (or outcome or dependent) variable from data.

type A character specifying the type of statistical approach:
- "parametric"
- "nonparametric"
- "robust"
- "bayes"

You can specify just the initial letter.

k Number of digits after decimal point (should be an integer) (Default: k = 2L).

conf.level Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

effsize.type Type of effect size needed for parametric tests. The argument can be "eta" (partial eta-squared) or "omega" (partial omega-squared).

bf.prior A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors and posterior estimates. In addition to numeric arguments, several named values are also recognized: "medium", "wide", and "ultrawide", corresponding to r scale values of 1/2, sqrt(2)/2, and 1, respectively. In case of an ANOVA, this value corresponds to scale for fixed effects.

tr Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.

nboot Number of bootstrap samples for computing confidence interval for the effect size (Default: 100L).

grouping.var A single grouping variable.

output Character that describes what is to be returned: can be "plot" (default) or "subtitle" or "caption". Setting this to "subtitle" will return the expression containing statistical results. If you have set results.subtitle = FALSE, then this will return a NULL. Setting this to "caption" will return the expression containing details about Bayes Factor analysis, but valid only when type = "parametric" and bf.message = TRUE, otherwise this will return a NULL.

plotgrid.args A list of additional arguments passed to patchwork::wrap_plots, except for guides argument which is already separately specified here.

annotation.args A list of additional arguments passed to patchwork::plot_annotation.

**iris_long**

*Edgar Anderson’s Iris Data in long format.*

**Description**

Edgar Anderson’s Iris Data in long format.

**Usage**

`iris_long`

**Format**

A data frame with 600 rows and 5 variables

- id. Dummy identity number for each flower (150 flowers in total).
- Species. The species are *Iris setosa*, *versicolor*, and *virginica*.
- attribute. What attribute is being measured ("Sepal" or "Petal").
- measure. What aspect of the attribute is being measured ("Length" or "Width").
- value. Value of the measurement.
movies_long

Details

This famous (Fisher’s or Anderson’s) iris data set gives the measurements in centimeters of the variables sepal length and width and petal length and width, respectively, for 50 flowers from each of 3 species of iris. The species are Iris setosa, versicolor, and virginica.

This is a modified dataset from datasets package.

Examples

dim(iris_long)
head(iris_long)
dplyr::glimpse(iris_long)

movies_long

Movie information and user ratings from IMDB.com (long format).

Description

Movie information and user ratings from IMDB.com (long format).

Usage

movies_long

Format

A data frame with 1,579 rows and 8 variables

- title. Title of the movie.
- year. Year of release.
- budget. Total budget (if known) in US dollars
- length. Length in minutes.
- rating. Average IMDB user rating.
- votes. Number of IMDB users who rated this movie.
- mpaa. MPAA rating.
- genre. Different genres of movies (action, animation, comedy, drama, documentary, romance, short).

Details

Modified dataset from ggplot2movies package.

The internet movie database, https://imdb.com/, is a website devoted to collecting movie data supplied by studios and fans. It claims to be the biggest movie database on the web and is run by amazon.
Source

https://CRAN.R-project.org/package=ggplot2movies

Examples

dim(movies_long)
head(movies_long)
dplyr::glimpse(movies_long)

theme_ggstatsplot  Default theme used in {ggstatsplot}

Description

Common theme used across all plots generated in {ggstatsplot} and assumed by the author to be aesthetically pleasing to the user/reader. The theme is a wrapper around theme_bw().

All {ggstatsplot} functions have a ggtheme parameter that let you choose a different theme.

Usage

theme_ggstatsplot()

Value

A ggplot object with the theme_ggstatsplot theme overlaid.

Examples

library(ggplot2)
library(ggstatsplot)

ggplot(mtcars, aes(xwt, mpg)) +
  geom_point() +
  theme_ggstatsplot()

Titanic_full  Titanic dataset.

Description

Titanic dataset.

Usage

Titanic_full
Format

A data frame with 2201 rows and 5 variables

- id. Dummy identity number for each person.
- Class. 1st, 2nd, 3rd, Crew.
- Sex. Male, Female.
- Age. Child, Adult.
- Survived. No, Yes.

Details

This data set provides information on the fate of passengers on the fatal maiden voyage of the ocean liner 'Titanic', summarized according to economic status (class), sex, age and survival.

This is a modified dataset from datasets package.

Examples

dim(Titanic_full)
head(Titanic_full)
dplyr::glimpse(Titanic_full)
