**Description**

These are S3 methods for `apply()` which we re-export as S3 generic function. They “overload” the `apply()` function for big rationals ("bigq") and big integers ("bigz").

**Usage**

```r
## S3 method for class 'bigz'
apply(X, MARGIN, FUN, ...)
## S3 method for class 'bigq'
apply(X, MARGIN, FUN, ...)
```
asNumeric

Arguments

X          a matrix of class bigz or bigq, see e.g., matrix.bigz.
MARGIN     1: apply function to rows; 2: apply function to columns
FUN        function to be applied
...        (optional) extra arguments for FUN(), as e.g., in lapply.

Value

The bigz and bigq methods return a vector of class "bigz" or "bigq", respectively.

Author(s)

Antoine Lucas

See Also

apply; lapply is used by our apply() method.

Examples

x <- as.bigz(matrix(1:12,3))
apply(x,1,min)
apply(x,2,max)

x <- as.bigq(x ^ 3, d = (x + 3)^2)
apply(x,1, min)
apply(x,2, sum)
## now use the "..." to pass na.rm=TRUE :
x[2,3] <- NA
apply(x,1, sum)
apply(x,1, sum, na.rm = TRUE)

asNumeric

Coerce to 'numeric', not Loosing Dimensions

Description

a number-like object is coerced to type (typeof) "numeric", keeping dim (and maybe dimnames) when present.

Usage

asNumeric(x)

Arguments

x          a “number-like” object, e.g., big integer (bigz), or mpfr, notably including matrices and arrays of such numbers.
Value

an \texttt{R} object of type (typeof) "numeric". A \texttt{matrix} or \texttt{array} if \texttt{x} had non-NULL dimension \texttt{dim}().

Methods

signature(\texttt{x = "ANY"}) the default method, which is the identity for \texttt{numeric} array.
signature(\texttt{x = "bigq"}) the method for big rationals.
signature(\texttt{x = "bigq"}) the method for big integers.
Note that package \texttt{Rmpfr} provides methods for its own number-like objects.

Author(s)

Martin Maechler

See Also

as.numeric coerces to both "numeric" and to a \texttt{vector}, whereas \texttt{asNumeric()} should keep \texttt{dim} (and other) attributes.

Examples

\begin{verbatim}
  m <- matrix(1:6, 2,3) 
  stopifnot(identical(m, asNumeric(m))) # remains matrix

  (M <- as.bigz(m) / 5) #-> "bigq" matrix
  asNumeric(M) # numeric matrix
  stopifnot(all.equal(asNumeric(M), m/5))
\end{verbatim}

BernoulliQ

\textit{Exact Bernoulli Numbers}

Description

Return the \( n \)-th Bernoulli number \( B_n \), (or \( B_n^+ \), see the reference), where \( B_1 = \pm \frac{1}{2} \).

Usage

\texttt{BernoulliQ(n, verbose = \texttt{getOption("verbose", FALSE))}}

Arguments

\begin{itemize}
  \item \texttt{n} integer \texttt{vector}, \( n \geq 0 \).
  \item \texttt{verbose} logical indicating if computation should be traced.
\end{itemize}

Value

a big rational (class "\texttt{bigq}") vector of the Bernoulli numbers \( B_n \).
Author(s)
Martin Maechler

References

See Also
Bernoulli in Rmpfr in arbitrary precision via Riemann’s \( \zeta \) function.

Bern(n) in DPQ uses standard (double precision) \( \mathbb{R} \) arithmetic for the n-th Bernoulli number.

Examples
(Bn0.10 <- BernoulliQ(0:10))

Description
Binary operators which allow the comparison of values in atomic vectors.

Usage
## S3 method for class 'bigq'
sign(x)

## S3 method for class 'bigq'
e1 < e2
## S3 method for class 'bigq'
e1 <= e2
## S3 method for class 'bigq'
e1 == e2
## S3 method for class 'bigq'
e1 >= e2
## S3 method for class 'bigq'
e1 > e2
## S3 method for class 'bigq'
e1 != e2

Arguments
x, e1, e2 Object or vector of class bigq
Examples

```r
x <- as.bigq(8000,21)
> x
[1] 8000/21
> x < 2 * x
[1] TRUE
```

---

**bigq**

*Large sized rationals*

**Description**

Class "bigq" encodes rationals encoded as ratios of arbitrary large integers (via GMP). A simple S3 class (internally a raw vector), it has been registered as formal (S4) class (via `setOldClass`), too.

**Usage**

```r
as.bigq(n, d = 1)
## S3 method for class 'bigq'
as.character(x, b=10,...)
## S3 method for class 'bigq'
as.double(x,...)
as.bigz.bigq(a, mod=NA)
is.bigq(x)
## S3 method for class 'bigq'
is.na(x)
## S3 method for class 'bigq'
print(x, quote=FALSE, initLine = TRUE, ...)
denominator(x)
numerator(x)
NA_bigq_
c_bigq(L)
```

**Arguments**

- **`n, d`**
  - either integer, numeric or string value (String value: either starting with `0x` for hexadecimal, `0b` for binary or without prefix for decimal values. Any format error results in `0`). `n` stands for numerator, `d` for denominator.

- **`a`**
  - an element of class "bigq"

- **`mod`**
  - optional modulus to convert into biginteger

- **`x`**
  - a "rational number" (vector), of class "bigq".

- **`b`**
  - base: from 2 to 36

- **`...`**
  - additional arguments passed to methods

- **`quote`**
  - (for printing:) logical indicating if the numbers should be quoted (as characters are); the default used to be TRUE (implicitly) till 2011.
initLine  (for printing:) logical indicating if an initial line (with the class and length or dimension) should be printed.

L  a list where each element contains "bigq" numbers, for c_bigq(), this allows something like an sapply() for "bigq" vectors, see sapplyQ() in the examples below.

Details

as.bigq(x) when x is numeric (aka double precision) calls the ‘GMP’ function mpq_set_d() which is documented to be exact (every finite double precision number is a rational number).
as.bigz.bigq() returns the smallest integers not less than the corresponding rationals bigq.
NA_bigq_ is computed on package load time as as.bigq(NA).

Value

An R object of (S3) class "bigq" representing the parameter value.

Author(s)

Antoine Lucas

Examples

x <- as.bigq(21,6)
x
# 7 / 2
# Wow ! result is simplified.

y <- as.bigq(5,3)

# addition works !
x + y

# You can even try multiplication, division...
x * y / 13

# and, since May 2012,
x ^ 20
stopifnot(is.bigq(x), is.bigq(x + y),
x ^ 20 == as.bigz(7)^20 / 2^20)

# convert to string, double
as.character(x)
as.double(x)

stopifnot( is.na(NA_bigq_ ) )

# Depict the "S4-class" bigq, i.e., the formal (S4) methods:
if(require("Rmpfr")) # mostly interesting there
    showMethods(class="bigq")
Bigq operators

Description

Addition, subtraction, multiplication, division, and absolute value for large rationals, i.e. "bigq" class R objects.

Usage

```
add.bigq(e1, e2)
## S3 method for class 'bigq'
e1 + e2

sub.bigq(e1, e2=NULL)
## S3 method for class 'bigq'
e1 - e2

mul.bigq(e1, e2)
## S3 method for class 'bigq'
e1 * e2

div.bigq(e1, e2)
## S3 method for class 'bigq'
e1 / e2

## S3 method for class 'bigq'
e1 ^ e2

abs(x)
```

Arguments

- `e1, e2, x` of class "bigq", or (e1 and e2) integer or string from an integer

Details

Operators can be used directly when the objects are of class "bigq": `a + b`, `a * b`, etc, and `a ^ n`, where `n` must be coercable to a biginteger ("bigz").
Value

A bigq class representing the result of the arithmetic operation.

Author(s)

Immanuel Scholz and Antoine Lucas

Examples

```r
## 1/3 + 1 = 4/3 :
as.bigq(1,3) + 1

r <- as.bigq(12, 47)
stopifnot(r ^ 3 == r*r*r)
```

Description

Class "bigz" encodes arbitrarily large integers (via GMP). A simple S3 class (internally a raw vector), it has been registered as formal (S4) class (via setOldClass), too.

Usage

```r
as.bigz(a, mod = NA)
NA_bigz_
## S3 method for class 'bigz'
as.character(x, b = 10, ...)

is.bigz(x)
## S3 method for class 'bigz'
is.na(x)
## S3 method for class 'bigz'
print(x, quote=FALSE, initLine = is.null(modulus(x)), ...)
c_bigz(L)
```

Arguments

- `a` either integer, numeric (i.e., double) or character vector.
  If character: the strings either start with "0x" for hexadecimal, "0b" for binary, "0" for octal, or without a "0*" prefix for decimal values. Formatting errors are signalled as with `stop`.
- `b` base: from 2 to 36
- `x` a “big integer number” (vector), of class "bigz".
- `...` additional arguments passed to methods
mod an integer, numeric, string or bigz of the internal modulus, see below.

quote (for printing:) logical indicating if the numbers should be quoted (as characters are); the default used to be TRUE (implicitly) till 2011.

initLine (for printing:) logical indicating if an initial line (with the class and length or dimension) should be printed. The default prints it for those cases where the class is not easily discernable from the print output.

L a list where each element contains "bigz" numbers, for c_bigz(), this allows something like an sapply() for "bigz" vectors, see sapplyZ() in the examples.

Details

Bigz’s are integers of arbitrary, but given length (means: only restricted by the host memory). Basic arithmetic operations can be performed on bigzs as addition, subtraction, multiplication, division, modulation (remainder of division), power, multiplicative inverse, calculating of the greatest common divisor, test whether the integer is prime and other operations needed when performing standard cryptographic operations.

For a review of basic arithmetics, see add.bigz.

Comparison are supported, i.e., "==", "!="", "<", "<="", ">"", and ">=".

NA_bigz_ is computed on package load time as as.bigz(NA).

Objects of class "bigz" may have a “modulus”, accessible via modulus(), currently as an attribute mod. When the object has such a modulus m, arithmetic is performed “modulo m”, mathematically “within the ring Z/mZ”. For many operations, this means

result <- mod.bigz(result, m) ## == result %% m

is called after performing the arithmetic operation and the result will have the attribute mod set accordingly. This however does not apply, e.g., for /, where a/b := ab⁻¹ and b⁻¹ is the multiplicative inverse of b with respect to ring arithmetic, or NA with a warning when the inverse does not exist. The warning can be turned off via options("gmp:warnModMismatch" = FALSE)

Powers of bigzs can only be performed, if either a modulus is going to be applied to the result bigz or if the exponent fits into an integer value. So, if you want to calculate a power in a finite group (“modulo c”), for large c do not use a ^ b %% c, but rather as.bigz(a, c) ^ b.

The following rules for the result’s modulus apply when performing arithmetic operations on bigzs:

- If none of the operand has a modulus set, the result will not have a modulus.
- If both operands have a different modulus, the result will not have a modulus, except in case of mod.bigz, where the second operand’s value is used.
- If only one of the operands has a modulus or both have a common (the same), it is set and used for the arithmetic operations, except in case of mod.bigz, where the second operand’s value is used.

Value

An R object of (S3) class “bigz”, representing the argument (x or a).
Note

x <- as.bigz(1234567890123456789012345678901234567890)

will not work as \( \mathbf{R} \) converts the number to a double, losing precision and only then convert to a "bigz" object.
Instead, use the syntax

\[
x <- \text{as.bigz}("1234567890123456789012345678901234567890")
\]

Author(s)

Immanuel Scholz

References

The GNU MP Library, see https://gmplib.org

Examples

```r
## 1+1=2
a <- as.bigz(1)
a + a

## Two non-small Mersenne primes:
two <- as.bigz(2)
p1 <- two^107 -1 ; isprime(p1); p1
p2 <- two^127 -1 ; isprime(p2); p2

stopifnot( is.na(NA_bigz_) )

## Calculate c = x^e mod n
## --------------------------------------------------------------------
x <- as.bigz("0x123456789abcdef") # my secret message
e <- as.bigz(3) # something smelling like a dangerous public RSA exponent
(n <- p1 * p2) # a product of two primes
as.character(n, b=16)# as both primes were Mersenne's..

## recreate the three numbers above [for demo below]:
n. <- n; x. <- x; e. <- e # save
Rev <- function() { n <<- n.; x <<- x.; e <<- e. }

# first way to do it right
modulus(x) <- n
c <- x ^ e ; c ; Rev()

# similar second way (makes more sense if you reuse e) to do it right
modulus(e) <- n
c2 <- x ^ e
stopifnot(identical(c2, c), is.bigz(c2)) ; Rev()
```
bigz operators

Basic Arithmetic Operators for Large Integers ("bigz")

Description

Addition, subtraction, multiplication, (integer) division, remainder of division, multiplicative inverse, power and logarithm functions.

Usage

add.bigz(e1, e2)
sub.bigz(e1, e2 = NULL)
mul.bigz(e1, e2)
div.bigz(e1, e2)
divq.bigz(e1, e2) ## == e1 %/% e2
mod.bigz(e1, e2) ## == e1 %% e2
## S3 method for class 'bigz'
abs(x)

inv.bigz(a, b,...)## == (1 / a) (modulo b)

pow.bigz(e1, e2,...)## == e1 ^ e2

## S3 method for class 'bigz'
bigz operators

```r
log(x, base=exp(1))
## S3 method for class 'bigz'
log2(x)
## S3 method for class 'bigz'
log10(x)
```

**Arguments**

- `x`  
  bigz, integer or string from an integer
- `e1, e2, a, b`  
  bigz, integer or string from an integer
- `base`  
  base of the logarithm; base e as default
- `...`  
  Additional parameters

**Details**

Operators can be used directly when objects are of class bigz: `a + b`, `log(a)`, etc.

For details about the internal modulus state, and the rules applied for arithmetic operations on big integers with a modulus, see the bigz help page.

- `a / b = div(a, b)` returns a rational number unless the operands have a (matching) modulus where `a * b^-1` results.
- `a %/% b` (or, equivalently, `divq(a, b)`) returns the quotient of simple integer division (with truncation towards zero), possibly re-adding a modulus at the end (but not using a modulus like in `a / b`).

- `r <- inv.bigz(a, m)`, the multiplicative inverse of `a` modulo `m`, corresponds to `1/a` or `a ^ -1` from above *when* `a` has modulus `m`. Note that `a` not always has an inverse modulo `m`, in which case `r` will be `NA` with a warning that can be turned off via

  ```r
  options("gmp:warnNoInv" = FALSE)
  ```

**Value**

Apart from `/` (or `div`), where rational numbers (`bigq`) may result, these functions return an object of class "bigz", representing the result of the arithmetic operation.

**Author(s)**

Immanuel Scholz and Antoine Lucas

**References**

The GNU MP Library, see [https://gmplib.org](https://gmplib.org)
Examples

```r
# 1+1=2
as.bigz(1) + 1
as.bigz(2)^10
as.bigz(2)^200

# if my.large.num.string is set to a number, this returns the least byte
(my.large.num.string <- paste(sample(0:9, 200, replace=TRUE), collapse=""))
mod.bigz(as.bigz(my.large.num.string), "0xff")

# power exponents can be up to MAX_INT in size, or unlimited if a
# bigz's modulus is set.
pow.bigz(10,10000)

## Modulo 11, 7 and 8 are inverses :
as.bigz(7, mod = 11) * 8 ## ==> 1 (mod 11)
inv.bigz(7, 11)## hence, 8
a <- 1:10
(i.a <- inv.bigz(a, 11))
d <- as.bigz(7)
a %% d # = divq(a, d)
a %/% d # = mod.bigz (a, d)

(ii <- inv.bigz(1:10, 16))
## with 5 warnings (one for each NA)
op <- options("gmp:warnNoInv" = FALSE)
i2 <- inv.bigz(1:10, 16) # no warnings
(i3 <- 1 / as.bigz(1:10, 16))
i4 <- as.bigz(1:10, 16) ^ -1
stopifnot(identical(ii, i2),
          identical(i2, i3),
          identical(i3, i4))
options(op)# revert previous options' settings

stopifnot(inv.bigz(7, 11) == 8,
          all(as.bigz(i.a, 11) * a == 1),
          identical(a %% d, divq.bigz(1:10, 7)),
          identical(a %/% d, mod.bigz (a, d))
)
```

binomQ

Exact Rational Binomial Probabilities

Description

Compute exact binomial probabilities using (big integer and) big rational arithmetic.

Usage

dbinomQ(x, size, prob, log = FALSE)
Arguments

- x, size: integer or big integer ("bigz"), will be passed to chooseZ().
- prob: the probability; should be big rational ("bigq"); if not it is coerced with a warning.
- log: logical; must be FALSE on purpose. Use log(Rmpfr::mpfr(dbinomQ(..),precB)) for the logarithm of such big rational numbers.

Value

a big rational ("bigq") of the length of (recycled) x+size+prob.

Author(s)

Martin Maechler

See Also

chooseZ; R’s (stats package) dbinom().

Examples

dbinomQ(0:8,8, as.bigq(1,2))
  # 1/256 1/32 7/64 7/32 35/128 7/32 7/64 1/32 1/256

ph16 <- dbinomQ(0:16, size=16, prob = 1/2)  # innocuous warning
ph16 <- dbinomQ(0:16, size=16, prob = as.bigq(1,2))
ph16.75 <- dbinomQ(0:16, size=16, prob = as.bigq(3,4))
ph8.75 <- dbinomQ(0:8, 8, as.bigq(3,4))
stopifnot(exprs = {
  dbinomQ(0:8,8, as.bigq(1,2)) * 2^8 == choose(8, 0:8)
  identical(ph8.75, chooseZ(8,0:8) * 3^(0:8) / 4^8)
  all.equal(ph8.75, choose (8,0:8) * 3^(0:8) / 4^8, tol=1e-15) # see exactly equal
  identical(ph16, ph16.)
  identical(ph16,
          dbinomQ(0:16, size=16, prob = as.bigz(1)/2))
  all.equal(dbinom(0:16, 16, prob=1/2), asNumeric(ph16), tol=1e-15)
  all.equal(dbinom(0:16, 16, prob=3/4), asNumeric(ph16.75), tol=1e-15)
})

cumsum

(Cumulative) Sums, Products of Large Integers and Rationals

Description

Theses are methods to ‘overload’ the sum(), cumsum() and prod() functions for big rationals and big integers.
Usage

## S3 method for class 'bigz'
cumsum(x)
## S3 method for class 'bigq'
cumsum(x)
## S3 method for class 'bigz'
sum(..., na.rm = FALSE)
## S3 method for class 'bigq'
sum(..., na.rm = FALSE)
## S3 method for class 'bigz'
prod(..., na.rm = FALSE)
## S3 method for class 'bigq'
prod(..., na.rm = FALSE)

Arguments

x, ... R objects of class bigz or bigq or 'simple' numbers.
na.rm logical indicating if missing values (NA) should be removed before the compu-
tation.

Value

return an element of class bigz or bigq.

Author(s)

Antoine Lucas

See Also

apply

Examples

x <- as.bigz(1:12)
cumsum(x)
prod(x)
sum(x)

x <- as.bigq(1:12)
cumsum(x)
prod(x)
sum(x)
Extract or Replace Parts of an Object

Description

Operators acting on vectors, arrays and lists to extract or replace subsets.

Usage

## S3 method for class 'bigz'
x[i=NULL, j=NULL, drop = TRUE]
## S3 method for class 'bigq'
x[i=NULL, j=NULL, drop = TRUE]

#_______ In the following, only the bigq method is mentioned: _______

## S3 method for class 'bigq'
c(..., recursive = FALSE)
## S3 method for class 'bigq'
rep(x, times=1, length.out=NA, each=1, ...)

Arguments

x R object of class "bigz" or "bigq", respectively.
... further arguments, notably for c().
i,j indices, see standard R subsetting and subassignment.
drop logical, unused here.
times, length.out, each integer; typically only one is specified; for more see rep (standard R, package base).
recursive unused here

Note

Unlike standard matrices, x[i] and x[i,] do the same.

Examples

a <- as.bigz(123)
## indexing "outside" --> extends the vectors (filling with NA)
a[4] <- -4

## create a vector of 3 a
c(a,a,a)

## repeat a 5 times
rep(a,5)

## with matrix
m <- matrix.bigz(1:6,3)

## these do the same:
m[1,]
m[1]
m[-c(2,3),]
m[-c(2,3)]
m[c(TRUE,FALSE,FALSE)]

## modification on matrix
m[2,-1] <- 11

---

**Extremes**

**Extrema (Maxima and Minima)**

**Description**

We provide S3 methods for `min` and `max` for big rationals (`bigq`) and big integers (`biqz`); consequently, `range()` works as well.

Similarly, S4 methods are provided for `which.min()` and `which.max()`.

**Usage**

```r
## S3 method for class 'bigz'
max(..., na.rm=FALSE)
## S3 method for class 'bigq'
max(..., na.rm=FALSE)
## S3 method for class 'bigz'
min(..., na.rm=FALSE)
## S3 method for class 'bigq'
min(..., na.rm=FALSE)

## S4 method for signature 'bigz'
which.min(x)

## S4 method for signature 'bigq'
which.max(x)
```
Factorial and Binomial Coefficient as Big Integer

Description

Efficiently compute the factorial $n!$ or a binomial coefficient $\binom{n}{k}$ as big integer (class bigz).

Usage

factorialZ(n)
chooseZ(n, k)
Arguments

n | non-negative integer (vector), for factorialZ. For chooseZ, may be a bigz big integer, also negative.
k | non-negative integer vector.

Value

a vector of big integers, i.e., of class bigz.

See Also

factorial and gamma in base R;

Examples

defactorialZ(0:10)# 1 1 2 6 ... 3628800
defactorialZ(0:40)# larger
defactorialZ(200)
n <- 1000
f1000 <- factorialZ(n)
stopifnot(1e-15 > abs(as.numeric(1 - lfactorial(n)/log(f1000))))

system.time(replicate(8, fl1e4 <<- factorialZ(10000)))
nchar(as.character(f1e4))# 35660 ... (too many to even look at ..)

chooseZ(1000, 100:102)# vectorizes
chooseZ(as.bigz(2)^120, 10)
n <- c(50, 80, 100)
k <- c(20, 30, 40)
## currently with an undesirable warning: % from methods/src/eval.c _FIXME_
stopifnot(chooseZ(n,k) == factorialZ(n) / (factorialZ(k)*factorialZ(n-k)))

factorization

Factorize a number

Description

Give all primes numbers to factor the number

Usage

factorize(n)

Arguments

n | Either integer, numeric or string value (String value: ither starting with 0x for hexadecimal, 0b for binary or without prefix for decimal values.) Or an element of class bigz.
Details

The factorization function uses the Pollard Rho algorithm.

Value

Vector of class bigz.

Author(s)

Antoine Lucas

References

The GNU MP Library, see https://gmplib.org

Examples

factorize(34455342)

formatN

Format Numbers Keeping Classes Distinguishable

Description

Format (generalized) numbers in a way that their classes are distinguishable. Contrary to format() which uses a common format for all elements of x, here, each entry is formatted individually.

Usage

formatN(x, ...)

## Default S3 method:
formatN(x, ...)

## S3 method for class 'integer'
formatN(x, ...)

## S3 method for class 'double'
formatN(x, ...)

## S3 method for class 'bigz'
formatN(x, ...)

## S3 method for class 'bigq'
formatN(x, ...)

Arguments

x any R object, typically “number-like”.

... potentially further arguments passed to methods.
Value

A character vector of the same length as x, each entry a representation of the corresponding entry in x.

Author(s)

Martin Maechler

See Also

format, including its (sophisticated) default method; as.character.

Examples

```r
## Note that each class is uniquely recognizable from its output:
formatN(-2:5)# integer
formatN(0 + -2:5)# double precision
formatN(as.bigz(-2:5))
formatN(as.bigq(-2:5, 4))
```

Usage

`frexpZ(x)`

Arguments

x integer or big integer (bigz).

Value

A list with the two components
d a numeric vector whose absolute values are either zero, or in $[\frac{1}{2}, 1)$.
exp an integer vector of the same length; note that exp == 1 + floor(log2(x)), and hence always exp > log2(x).

Author(s)

Martin Maechler
gcd.bigz

Greatest Common Divisor (GCD) and Least Common Multiple (LCM)

Description

Compute the greatest common divisor (GCD) and least common multiple (LCM) of two (big) integers.

Usage

## S3 method for class 'bigz'
gcd(a, b)
lcm.bigz(a, b)

Arguments

a,b

Either integer, numeric, bigz or a string value; if a string, either starting with 0x for hexadecimal, 0b for binary or without prefix for decimal values.

Value

An element of class bigz

Author(s)

Antoine Lucas

References

The GNU MP Library, see https://gmplib.org
gcdex

**See Also**

gcdex

**Examples**

gcd.bigz(210,342) # or also
lcm.bigz(210,342)
a <- 210 ; b <- 342
stopifnot(gcd.bigz(a,b) * lcm.bigz(a,b) == a * b)

## or
(a <- as.bigz("82696155787249022588"))
(b <- as.bigz("65175989479756205392"))
gcd(a,b) # 4
stopifnot(gcd(a,b) * lcm.bigz(a,b) == a * b)

---

**gcdex** | **Compute Bezoult Coefficient**

**Description**

 Compute g,s,t as $as + bt = g = \text{gcd}(a,b)$. s and t are also known as Bezoult coefficients.

**Usage**

gcdex(a, b)

**Arguments**

- **a**, **b**
  
either integer, numeric, character string, or of class "bigz"; If a string, either starting with "0x" for hexadecimal, "0b" for binary or without prefix for decimal values.

**Value**

- a class "bigz" vector of length 3 with (long integer) values $g, s, t$.

**Author(s)**

Antoine Lucas

**References**

The GNU MP Library, see [https://gmplib.org](https://gmplib.org)

**See Also**

**Examples**

gcdex(342, 654)

---

**Description**

Functions from `base` etc which need a \textit{copy} in the \texttt{gmp} namespace so they correctly dispatch.

**Usage**

\begin{verbatim}
outer(X, Y, FUN = ".", ...)  
\end{verbatim}

**Arguments**

\begin{itemize}
  \item \texttt{X, Y, FUN, ...}  
\end{itemize}

See \texttt{base} package help: \texttt{outer}.

**See Also**

\texttt{outer}.

**Examples**

\begin{verbatim}
twop <- as.bigz(2)^c(99:103)  
(mtow <- outer(twop, 0:2))  
stopifnot(  
  identical(dim(mtow), as.integer(c(5,3))),  
  mtow[,1] == 0,  
  identical(as.vector(mtow[,2]), twop)  
)
\end{verbatim}

---

**Description**

\texttt{gmpVersion()} returns the version of the GMP library which \texttt{gmp} is currently linked to.

**Usage**

\texttt{gmpVersion()}

gmpVersion()

---

is.whole

Whole ("Integer") Numbers

Description

Check which elements of x[] are integer valued aka “whole” numbers.

Usage

is.whole(x)

## Default S3 method:

is.whole(x)

## S3 method for class 'bigz'

is.whole(x)

## S3 method for class 'bigq'

is.whole(x)

Arguments

x

any R vector

Value

logical vector of the same length as x, indicating where x[] is integer valued.

Author(s)

Martin Maechler

See Also

is.integer(x) (base package) checks for the internal mode or class; not if x[i] are integer valued.

The is.whole() method for "mpfr" numbers.
isprime

Examples

```r
is.integer(3) # FALSE, it's internally a double
is.whole(3) # TRUE
## integer valued complex numbers (two FALSE):
is.whole(c(7, 1 + 1i, 1.2, 3.4i, 7i))
is.whole(factorialZ(20)^(10:12)) ## "bigz" are *always* whole numbers
q <- c(as.bigz(36)^50 / as.bigz(30)^40, 3, factorialZ(30:31), 12.25)
is.whole(q) # F T T T F
```

isprime(n, reps = 40)

Arguments

- **n**: integer number, to be tested.
- **reps**: integer number of primality testing repeats.

Description

Determine whether the number \( n \) is prime or not, with **three** possible answers:

- **2**: \( n \) is prime,
- **1**: \( n \) is probably prime (without being certain),
- **0**: \( n \) is composite.

Usage

```r
isprime(n, reps = 40)
```

Details

This function does some trial divisions, then some Miller-Rabin probabilistic primary tests. \( \text{reps} \) controls how many such tests are done, 5 to 10 is already a reasonable number. More will reduce the chances of a composite being returned as “probably prime”.

Value

- **0**: \( n \) is not prime
- **1**: \( n \) is probably prime
- **2**: \( n \) is prime

Author(s)

Antoine Lucas

References

The GNU MP Library, see https://gmplib.org
See Also

`nextprime`, `factorize`.
Note that for “small” \( n \), which means something like \( n < 10^7 \), non-probabilistic methods (such as `factorize()`) are fast enough.

Examples

```r
isprime(210)
isprime(71)

# All primes numbers from 1 to 100
t <- isprime(1:99)
(1:99)[t > 0]

table(isprime(1:10000)) # 0 and 2 : surely prime or not prime

primes <- function(n) {
  ## all primes <= n
  stopifnot(length(n) == 1, n <= 1e7) # be reasonable
  p <- c(2L, as.integer(seq(3, n, by=2)))
  p[isprime(p) > 0]
}

## quite quickly, but for these small numbers
## still slower than e.g., sfsmisc::primes()

system.time(p100k <- primes(100000))

## The first couple of Mersenne primes:
p.exp <- primes(1000)
Mers <- as.bigz(2) ^ p.exp - 1
isp.M <- sapply(seq_along(Mers), function(i) isprime(Mers[i], reps=256))
cbind(p.exp, isp.M)[isp.M > 0,]
Mers[isp.M > 0]
```

---

**lucnum**  
*Compute Fibonacci and Lucas numbers*

**Description**

- `fibnum` compute n-th Fibonacci number.  `fibnum2` compute (n-1)-th and n-th Fibonacci number.  
- `lucnum` compute n-th lucas number.  `lucnum2` compute (n-1)-th and n-th lucas number.

Fibonacci numbers are define by: \( F_n = F_{n-1} + F_{n-2} \)  Lucas numbers are define by: \( L_n = F_n + 2F_{n-1} \)

**Usage**

- `fibnum(n)`
- `fibnum2(n)`
- `lucnum(n)`
- `lucnum2(n)`
Arguments

n        Integer

Value

Fibonacci numbers and Lucas number.

Author(s)

Antoine Lucas

References

The GNU MP Library, see https://gmplib.org

Examples

fibnum(10)
fibnum2(10)
lucnum(10)
lucnum2(10)

matrix

Matrix manipulation with gmp

Description

Overload of “all” standard tools useful for matrix manipulation adapted to large numbers.

Usage

## S3 method for class 'bigz'
matrix(data = NA, nrow = 1, ncol = 1, byrow = FALSE, dimnames = NULL, mod = NA,...)

is.matrixZQ(x)

## S3 method for class 'bigz'
x %*% y
## S3 method for class 'bigq'
x %*% y
## S3 method for class 'bigq'
crossprod(x, y=NULL,...)
## S3 method for class 'bigz'
tcrossprod(x, y=NULL,...)
## ..... etc
Arguments

- **data** an optional data vector
- **nrow** the desired number of rows
- **ncol** the desired number of columns
- **byrow** logical. If FALSE (the default), the matrix is filled by columns, otherwise the matrix is filled by rows.
- **dimnames** not implemented for "bigz" or "bigq" matrices.
- **mod** optional modulus (when data is "bigz").
- **...** Not used
- **x, y** numeric, bigz, or bigq matrices or vectors.

Details

The extract function ("[" is the same use for vector or matrix. Hence, x[i] returns the same values as x[i,]. This is not considered a feature and may be changed in the future (with warnings).

All matrix multiplications should work as with numeric matrices.

Special features concerning the "bigz" class: the modulus can be

- **Unset**: Just play with large numbers
- **Set with a vector of size 1**: Example: matrix.bigz(1:6,nrow=2,ncol=3,mod=7) This means you work in \( \mathbb{Z}/n\mathbb{Z} \), for the whole matrix. It is the only case where the \( \%\% \) and solve functions will work in \( \mathbb{Z}/n\mathbb{Z} \).
- **Set with a vector smaller than data**: Example: matrix.bigz(1:6,nrow=2,ncol=3,mod=1:5). Then, the modulus is repeated to the end of data. This can be used to define a matrix with a different modulus at each row.
- **Set with same size as data**: Modulus is defined for each cell

Value

- **matrix()**: A matrix of class "bigz" or "bigq".
- **is.matrixZQ()**: TRUE or FALSE.
- **dim(), ncol(), etc**: integer or NULL, as for simple matrices.

Author(s)

Antoine Lucas

a.a <- crossprod(a)
aa. <- tcrossprod(a)
stopifnot(identical(a.a, crossprod(a,a)),
   identical(a.a, t(a) %*% a)
   ,
   identical(aa., tcrossprod(a,a)),
   identical(aa., a %*% t(a))
)
}

modulus

Modulus of a Big Integer
### Description

The modulus of a `bigz` number `a` is “unset” when `a` is a regular integer, `a ∈ Z`). Or the modulus can be set to `m` which means `a ∈ Z/ m · Z`), i.e., all arithmetic with `a` is performed ‘modulo `m`’.

### Usage

```r
modulus(a)
modulus(a) <- value
```

### Arguments

- **a**: R object of class "bigz"
- **value**: integer number or object of class "bigz".

### Examples

```r
x <- as.bigz(24)
modulus(x) # NULL, i.e. none

# x element of Z/31Z :
modulus(x) <- 31
x+x # 48 |-> (17 %% 31)
10*x # 240 |-> (23 %% 31)
x31 <- x

# reset modulus to "none":
modulus(x) <- NA; x; x. <- x
x <- x31
modulus(x) <- NULL; x

stopifnot(identical(x, as.bigz(24)), identical(x, x.), identical(modulus(x31), as.bigz(31)))
```

---

### nextprime

#### Next Prime Number

### Description

Return the next prime number, say `p`, with `p > n`.

### Usage

```r
nextprime(n)
```

### Arguments

- **n**: Integer
Details

This function uses probabilistic algorithm to identify primes. For practical purposes, it is adequate, the chance of a composite passing will be extremely small.

Value

A (probably) prime number

Author(s)

Antoine Lucas

References

The GNU MP Library, see https://gmplib.org

isprime and its references and examples.

Examples

nextprime(14)
## still very fast:
(p <- nextprime(1e7))
## to be really sure { isprime() gives "probably prime" } :
stopifnot(identical(p, factorize(p)))

---

**Oakley**

**RFC 2409 Oakley Groups - Parameters for Diffie-Hellman Key Exchange**

Description

RFC 2409 standardizes global unique prime numbers and generators for the purpose of secure asymmetric key exchange on the Internet.

Usage

data(Oakley1)
data(Oakley2)

Value

Oakley1 returns an object of class bigz for a 768 bit Diffie-Hellman group. The generator is stored as value with the respective prime number as modulus attribute.

Oakley2 returns an object of class bigz for a 1024 bit Diffie-Hellman group. The generator is stored as value with the respective prime number as modulus attribute.
References
The Internet Key Exchange (RFC 2409), Nov. 1998

Examples
packageDescription("gmp") # (possibly useful for debugging)
data(Oakley1)
(M1 <- modulus(Oakley1))
isprime(M1)# '1': "probably prime"
sizeinbase(M1)# 232 digits (was 309 in older version)

powm

Exponentiation function

Description
This function return $x^y \mod n$.
This function return $x^y \mod n$. pow.bigz do the same when modulus is set.

Usage
powm(x, y, n)

Arguments
x  Integer or big integer - possibly a vector
y  Integer or big integer - possibly a vector
n  Integer or big integer - possibly a vector

Value
A bigz class representing the parameter value.

Author(s)
A. L.

See Also
pow.bigz
Examples

\begin{verbatim}

powm(4, 7, 9)

x = as.bigz(4, 9)
x ^ 7
\end{verbatim}

Description

Generate a uniformly distributed random number in the range 0 to \(2^{size} - 1\), inclusive.

Usage

\begin{verbatim}

urand.bigz(nb=1, size=200, seed = 0)
\end{verbatim}

Arguments

- \(nb\): Integer: number of random numbers to be generated (size of vector returned)
- \(size\): Integer: number will be generated in the range 0 to \(2^{size} - 1\)
- \(seed\): Bigz: random seed initialisation

Value

A biginteger of class bigz.

Author(s)

Antoine Lucas

References

‘mpz\_urandomb’ from the GMP Library, see https://gmplib.org

Examples

\begin{verbatim}

# Integers are different
urand.bigz()
urand.bigz()
urand.bigz()

# Integers are the same
urand.bigz(seed="2342342342324323")
urand.bigz(seed="2342342342324323")

# Vector
urand.bigz(nb=50, size=30)
\end{verbatim}
Relational Operators

Description

Binary operators which allow the comparison of values in atomic vectors.

Usage

```r
## S3 method for class 'bigz'
sign(x)  
## S3 method for class 'bigz'
e1 == e2  
## S3 method for class 'bigz'
e1 < e2  
## S3 method for class 'bigz'
e1 >= e2
```

Arguments

- `x, e1, e2`: R object (vector or matrix-like) of class "bigz".

See Also

- `mod.bigz` for arithmetic operators.

Examples

```r
x <- as.bigz(8000)
x ^ 300 < 2 ^x
sign(as.bigz(-3:3))
sign(as.bigq(-2:2, 7))
```

roundQ

Rounding Big Rationals ("bigq") to Decimals

Description

Rounding big rationals (of class "bigq", see `as.bigq()`) to decimal digits is strictly based on a (optionally choosable) definition of rounding to integer, i.e., `digits = 0`, the default method of which we provide as `round0()`.

The users typically just call `round(x,digits)` as elsewhere, and the `round()` method will call `round(x,digits,round0=round0)`.

```r
x <- as.bigq(1)
x ^ 300 < 2 ^x
```
**roundQ**

Usage

`round0(x)`

`roundQ(x, digits = 0, r0 = round0)`

## S3 method for class 'bigq'

`round(x, digits = 0)`

Arguments

- `x`: vector of big rationals, i.e., of **class** "bigq".
- `digits`: integer number of decimal digits to round to.
- `r0`: a **function** of one argument which implements a version of `round(x,digits=0)`. The default for `roundQ()` is to use our `round0()` which implements “round to even”, as base R’s **round**.

Value

- `round0()` returns a vector of big integers, i.e., "bigz" classed.
- `roundQ(x,digits,round0)` returns a vector of big rationals, "bigq", as `x`.
- `round.bigq` is very simply defined as function(`x,digits`) `roundQ(x,digits)`.

Author(s)

Martin Maechler, ETH Zurich

References

The vignette “Exact Decimal Rounding via Rationals” from CRAN package **round**.

Wikipedia, Rounding, notably "Round half to even": [https://en.wikipedia.org/wiki/Rounding#Round_half_to_even](https://en.wikipedia.org/wiki/Rounding#Round_half_to_even)

See Also

- **round** for (double precision) numbers in base R; **roundX** from CRAN package **round**.

Examples

```r
qq <- as.bigq((-21:31), 10)
nounque(cbind(as.character(qq), asNumeric(qq)))
round0(qq) # Big Integer ("bigz")
## corresponds to R's own "round to even":
stopifnot(round0(qq) == round(asNumeric(qq)))
round(qq) # == round(qq, 0): the same as round0(qq) *but* Big Rational ("bigq")

halves <- as.bigq(1,2) + -5:12
```
## round0() is simply

```r
round0 <- function (x) {
  nU <- as.bigz.bigq(xU <- x + as.bigq(1, 2)) # traditional round: .5 rounded up
  if(any(I <- is.whole.bigq(xU))) { # I <==> x == <n>.5 : "hard case"
    I[I] <- .mod.bigz(nU[I], 2L) == 1L # rounded up is odd ==> round *down*
    nU[I] <- nU[I] - 1L
  }
  nU
}
```

## 's' for simple: rounding as you learned in school:

```r
round0s <- function(x) as.bigz.bigq(x + as.bigq(1, 2))
```

cbind(halfs, round0s(halfs), round0(halfs))

## roundQ() is simply

```r
roundQ <- function(x, digits = 0, r0 = round0) {
  ## round(x * 10^d) / 10^d -- vectorizing in both (x, digits)
  p10 <- as.bigz(10) ^ digits # class: if(all(digits >= 0)) "bigz" else "bigq"
  r0(x * p10) / p10
}
```

---

### sizeinbase

#### Description

Return an approximation to the number of character the integer X would have printed in base b. The approximation is never too small.

In case of powers of 2, function gives exact result.

#### Usage

```r
sizeinbase(a, b=10)
```

#### Arguments

- **a**: big integer, i.e. "bigz"
- **b**: base

#### Value

integer of the same length as a: the size, i.e. number of digits, of each a[i].

#### Author(s)

Antoine Lucas
References

The GNU MP Library, see https://gmplib.org

Examples

```r
sizeinbase(342343, 10)# 6 obviously

Iv <- as.bigz(2:7)^500
sizeinbase(Iv)
stopifnot(sizeinbase(Iv) == nchar(as.character(Iv)),
          sizeinbase(Iv, b=16) == nchar(as.character(Iv, b=16)))
```

solve.bigz

Solve a system of equation

Description

This generic function solves the equation \( a \times x = b \) for \( x \), where \( b \) can be either a vector or a matrix.

If \( a \) and \( b \) are rational, return is a rational matrix.

If \( a \) and \( b \) are big integers (of class bigz) solution is in \( \mathbb{Z}/n\mathbb{Z} \) if there is a common modulus, or a rational matrix if not.

Usage

```r
## S3 method for class 'bigz'
solve(a, b, ...)
## S3 method for class 'bigq'
solve(a, b, ...)
```

Arguments

- \( a, b \): A element of class bigz or bigq
- \( ... \): Unused

Details

It uses the Gauss and truncmuch algo … (to be detailed).

Value

If \( a \) and \( b \) are rational, return is a rational matrix.

If \( a \) and \( b \) are big integers (of class bigz) solution is in \( \mathbb{Z}/n\mathbb{Z} \) if there is a common modulus, of a rational matrix if not.
Stirling

Author(s)
Antoine Lucas

See Also
solve

Examples

```r
x <- matrix(1:4,2,2)  ## standard solve :
solve(x)

q <- as.bigq(x)  ## solve with rational
solve(q)

z <- as.bigz(x)
modulus(z) <- 7  ## solve in Z/7Z :
solve(z)

b <- c(1,3)
solve(q,b)
solve(z,b)

## Inversion of ("non-trivial") rational matrices :
A <- rbind(c(10, 1, 3),
           c( 4, 2, 10),
           c( 1, 8, 2))
(IA.q <- solve(as.bigq(A))) # fractions..
stopifnot(diag(3) == A %*% IA.q)# perfect

set.seed(5); B <- matrix(round(9*runif(5^2,-1,1)), 5)

(IB.q <- solve(as.bigq(B)))
stopifnot(diag(5) == B %*% IB.q, diag(5) == IB.q %*% B,
          identical(B, asNumeric(solve(IB.q))))
```

---

Stirling

Eulerian and Stirling Numbers of First and Second Kind

Description

Compute Eulerian numbers and Stirling numbers of the first and second kind, possibly vectorized for all \( k \) “at once”. 

Usage

Stirling1(n, k)
Stirling2(n, k, method = c("lookup.or.store", "direct"))
Eulerian (n, k, method = c("lookup.or.store", "direct"))

Stirling1.all(n)
Stirling2.all(n)
Eulerian.all (n)

Arguments

n
positive integer (0 is allowed for Eulerian()).
k
integer in 0:n.
method
for Eulerian() and Stirling2(), string specifying the method to be used.
"direct" uses the explicit formula (which may suffer from some cancelation
for "large" n).

Details

Eulerian numbers:
A(n, k) = the number of permutations of 1,2,..,n with exactly k ascents (or exactly k descents).

Stirling numbers of the first kind:
s(n,k) = (-1)^n-k times the number of permutations of 1,2,..,n with exactly k cycles.

Stirling numbers of the second kind:
S_n^{(k)} = the number of ways of partitioning a set of n elements into k non-empty subsets.

Value

A(n, k), s(n, k) or S(n, k) = S_n^{(k)}, respectively.
Eulerian.all(n) is the same as sapply(0:(n-1),Eulerian,n=n) (for n > 0),
Stirling1.all(n) is the same as sapply(1:n,Stirling1,n=n), and
Stirling2.all(n) is the same as sapply(1:n,Stirling2,n=n), but more efficient.

Note

For typical double precision arithmetic,
Eulerian*(n,*) overflow (to Inf) for n ≥ 172,
Stirling1*(n,*) overflow (to ±Inf) for n ≥ 171, and
Stirling2*(n,*) overflow (to Inf) for n ≥ 220.
