Package ‘gprofiler2’

August 27, 2020

Type Package
Title Interface to the ‘g:Profiler’ Toolset
Version 0.2.0
Author Liis Kolberg <liis.kolberg@ut.ee>, Uku Raudvere <uku.raudvere@ut.ee>
Maintainer Liis Kolberg <liis.kolberg@ut.ee>

The main tools are:
1) ’g:GOSt’ - functional enrichment analysis and visualization of gene lists;
2) ’g:Convert’ - gene/protein/transcript identifier conversion across various namespaces;
3) ’g:Orth’ - orthology search across species;
4) ’g:SNPense’ - mapping SNP rs identifiers to chromosome positions, genes and variant effects

This package is an R interface corresponding to the 2019 update of ‘g:Profiler’ and provides access to ‘g:Profiler’ for versions ‘e94_eg41_p11’ and higher. See the package ‘gProfileR’ for accessing older versions from the ‘g:Profiler’ toolkit.

Index

<table>
<thead>
<tr>
<th>gconvert</th>
<th>Gene ID conversion.</th>
</tr>
</thead>
</table>

Description

Interface to the g:Profiler tool g:Convert (https://biit.cs.ut.ee/gprofiler/convert) that uses the information in Ensembl databases to handle hundreds of types of identifiers for genes, proteins, transcripts, microarray probesets, etc, for many species, experimental platforms and biological databases. The input is flexible: it accepts a mixed list of IDs and recognises their types automatically. It can also serve as a service to get all genes belonging to a particular functional category.

Usage

```r
gconvert(
  query,
  organism = "hsapiens",
  target = "ENSG",
  numeric_ns = "",
  mthreshold = Inf,
  filter_na = TRUE
)
```
get_base_url

Args

query character vector that can consist of mixed types of gene IDs (proteins, transcripts, microarray IDs, etc), SNP IDs, chromosomal intervals or term IDs.

organism organism name. Organism names are constructed by concatenating the first letter of the name and the family name. Example: human - 'hsapiens', mouse - 'mmusculus'.

target target namespace.

numeric_ns namespace to use for fully numeric IDs (list of available namespaces).

mthreshold maximum number of results per initial alias to show. Shows all by default.

filter_na logical indicating whether to filter out results without a corresponding target.

Value

The output is a data.frame which is a table closely corresponding to the web interface output. The result fields are further described in the vignette.

Author(s)

Liis Kolberg <liis.kolberg@ut.ee>, Uku Raudvere <uku.raudvere@ut.ee>

Examples

gconvert(c("POU5F1", "SOX2", "NANOG"), organism = "hsapiens", target="AFFY_HG_U133_PLUS_2")

g_base_url Get the current base URL.

Description

Get the current base URL.

Usage

g_base_url()

g_tls_version Get the TLS version for SSL.

Description

Get the TLS version for SSL.

Usage

g_tls_version()
get_user_agent  
*Get current user agent string.*

**Description**

Get the HTTP User-Agent string.

**Usage**

```r
get_user_agent()
```

gorth  
*Orthology search.*

**Description**

Interface to the g:Profiler tool g:Orth ([https://biit.cs.ut.ee/gprofiler/orth](https://biit.cs.ut.ee/gprofiler/orth)) that, given a target organism, retrieves the genes of the target organism that are similar in sequence to the source organism genes in the input.

**Usage**

```r
gorth(
    query,
    source_organism = "hsapiens",
    target_organism = "mmusculus",
    numeric_ns = "",
    mthreshold = Inf,
    filter_na = TRUE
)
```

**Arguments**

- `query` character vector of gene IDs to be translated.
- `source_organism` name of the source organism. Organism names are constructed by concatenating the first letter of the name and the family name. Example: human - 'hsapiens', mouse - 'mmusculus'.
- `target_organism` name of the target organism. Organism names are constructed by concatenating the first letter of the name and the family name. Example: human - 'hsapiens', mouse - 'mmusculus'.
- `numeric_ns` namespace to use for fully numeric IDs (list of available namespaces).
- `mthreshold` maximum number of ortholog names per gene to show.
- `filter_na` logical indicating whether to filter out results without a corresponding target name.
gost

Value

The output is a data.frame which is a table closely corresponding to the web interface output. The result fields are further described in the vignette.

Author(s)

Liis Kolberg <liis.kolberg@ut.ee>, Uku Raudvere <uku.raudvere@ut.ee>

Examples

gorth(c("Klf4","Pax5","Sox2","Nanog"), source_organism="mmusculus", target_organism="hsapiens")

---

gost  

Description

Interface to the g:Profiler tool g:GOSt (https://biit.cs.ut.ee/gprofiler/gost) for functional enrichments analysis of gene lists. In case the input 'query' is a list of gene vectors, results for multiple queries will be returned in the same data frame with column 'query' indicating the corresponding query name. If 'multi_query' is selected, the result is a data frame for comparing multiple input lists, just as in the web tool.

Usage

gost(
  query,  
  organism = "hsapiens",  
  ordered_query = FALSE,  
  multi_query = FALSE,  
  significant = TRUE,  
  exclude_iea = FALSE,  
  measure_underrepresentation = FALSE,  
  ecodes = FALSE,  
  user_threshold = 0.05,  
  correction_method = c("g_SCS", "bonferroni", "fdr", "false_discovery_rate", "gSCS", "analytical"),  
  domain_scope = c("annotated", "known", "custom", "custom_annotated"),  
  custom_bg = NULL,  
  numeric_ns = "",  
  sources = NULL,  
  as_short_link = FALSE
)

Arguments

query character vector, or a (named) list of character vectors for multiple queries, that can consist of mixed types of gene IDs (proteins, transcripts, microarray IDs, etc), SNP IDs, chromosomal intervals or term IDs.

organism organism name. Organism names are constructed by concatenating the first letter of the name and the family name. Example: human - 'hsapiens', mouse - 'mmusculus'.

ordered_query in case input gene lists are ranked this option may be used to get GSEA style p-values.

multi_query in case of multiple gene lists, returns comparison table of these lists. If enabled, the result data frame has columns named 'p_values', 'gconvert_sizes', 'intersection_sizes' with vectors showing values in the order of input queries. Set 'multi_gconvert' to FALSE and simply input query as list of multiple gene vectors to get the results in a long format.

significant whether all or only statistically significant results should be returned.

exclude_iea exclude GO electronic annotations (IEA).

measure_underrepresentation measure underrepresentation.

evcodes include evidence codes to the results. Note that this can decrease performance and make the query slower. In addition, a column 'intersection' is created that contains the gene id-s that intersect between the query and term. This parameter does not work if 'multi_query' is set to TRUE.

user_threshold custom p-value threshold for significance, results with smaller p-value are tagged as significant. We don’t recommend to set it higher than 0.05.

correction_method the algorithm used for multiple testing correction, one of "gSCS" (synonyms: "analytical", "g_SCS"), "fdr" (synonyms: "false_discovery_rate"), "bonferroni".

domain_scope how to define statistical domain, one of "annotated", "known", "custom" or "custom_annotated".

custom_bg vector of gene names to use as a statistical background. If given, the domain_scope is by default set to "custom", if domain_scope is set to "custom_annotated", then this is used instead.

numeric_ns namespace to use for fully numeric IDs (list of available namespaces).

sources a vector of data sources to use. Currently, these include GO (GO:BP, GO:MF, GO:CC to select a particular GO branch), KEGG, REAC, TF, MIRNA, CORUM, HP, HPA, WP. Please see the g:GOSt web tool for the comprehensive list and details on incorporated data sources.

as_short_link indicator to return results as short-link to the g:Profiler web tool. If set to TRUE, then the function returns the results URL as a character string instead of the data.frame.

Value

A named list where 'result' contains data.frame with the enrichment analysis results and 'meta' contains metadata needed for Manhattan plot. If the input consisted of several lists the corresponding
list is indicated with a variable 'query'. When requesting a 'multi_query', either TRUE or FALSE, the columns of the resulting data frame differ. If 'evcodes' is set, the return value includes columns 'evidence_codes' and 'intersection'. The latter conveys info about the intersecting genes between the corresponding query and term.

The result fields are further described in the vignette.

If 'as_short_link' is set to TRUE, then the result is a character short-link to see and share corresponding results via the g:Profiler web tool.

Author(s)
Liis Kolberg <liis.kolberg@ut.ee>, Uku Raudvere <uku.raudvere@ut.ee>

Examples

gostres <- gost(c("X:1000:1000000", "rs17396340", "GO:0005005", "ENSG00000156103", "NLRP1"))

gostplot(gostres, capped = TRUE, interactive = TRUE, pal = c("GO:MF" = "#dc3912", "GO:BP" = "#ff9900", "GO:CC" = "#109618", KEGG = "#dd4477", REAC = "#3366cc", WP = "#0099c6", TF = "#5574a6", MIRNA = "#22aa99", HPA = "#6633cc", CORUM = "#66aa00", HP = "#990099")

Description
This function creates a Manhattan plot out of the results from gprofiler2::gost(). The plot is very similar to the one shown in the g:GOSt web tool.

Usage
gostplot(
gostres, capped = TRUE, interactive = TRUE, pal = c("GO:MF" = "#dc3912", "GO:BP" = "#ff9900", "GO:CC" = "#109618", KEGG = "#dd4477", REAC = "#3366cc", WP = "#0099c6", TF = "#5574a6", MIRNA = "#22aa99", HPA = "#6633cc", CORUM = "#66aa00", HP = "#990099")
)

Arguments
gostres named list from gost() function (with names 'result' and 'meta')
capped whether the -log10(p-values) would be capped if >= 16, just as in the web options.
interactive if enabled, returns interactive plot using 'plotly'. If disabled, static 'ggplot()' object is returned.
pal values mapped to relevant colors for data sources.
**gsnpense**

**Value**
The output is either a plotly object (if interactive = TRUE) or a ggplot object (if interactive = FALSE).

**Author(s)**
Liis Kolberg <liis.kolberg@ut.ee>

**Examples**
```
gostres <- gost(c("Klf4", "Pax5", "Sox2", "Nanog"), organism = "mmusculus")
gostplot(gostres)
```

---

**gsnpense**

*Convert SNP rs identifiers to genes.*

**Description**
Interface to the g:Profiler tool g:SNPense ([https://biit.cs.ut.ee/gprofiler/snpense](https://biit.cs.ut.ee/gprofiler/snpense)) that maps SNP rs identifiers to chromosome positions, genes and variant effects. Available only for human variants.

**Usage**
```
gsnpense(query, filter_na = TRUE)
```

**Arguments**
- `query` vector of SNP IDs to be translated (should start with prefix ’rs’).
- `filter_na` logical indicating whether to filter out results without a corresponding target name.

**Value**
The output is a data.frame which is a table closely corresponding to the web interface output. Columns 'ensgs' and 'gene_names' can contain list of multiple values.

The result fields are further described in the vignette.

**Author(s)**
Liis Kolberg <liis.kolberg@ut.ee>, Uku Raudvere <uku.raudvere@ut.ee>

**Examples**
```
gsnpense(c("rs11734132", "rs7961894", "rs4305276", "rs17396340", "rs3184504"))
```
mapViridis

Map vector of numeric values to Viridis color scale.

Description

Map vector of numeric values to Viridis color scale.

Usage

mapViridis(values, domain_min = 0, domain_max = 50, n = 256)

Arguments

values vector of numeric values (mostly -log10(p-values))
domain_min numeric value that corresponds to the 'yellow' in the color scale
domain_max numeric value that corresponds to the 'dark blue' in the color scale
n number of bins to generate from the color scale

Value

The output is a corresponding vector of colors from the Viridis color scale with domain in range(domain_min, domain_max).

Author(s)

Liis Kolberg <liis.kolberg@ut.ee>

publish_gostplot

Create and save an annotated Manhattan plot of enrichment results.

Description

This function allows to highlight a list of selected terms on the Manhattan plot created with the gprofiler2::gostplot() function. The resulting plot is saved to a publication ready image if `filename` is specified. The plot is very similar to the one shown in the g:GOSt web tool after clicking on circles.

Usage

publish_gostplot(
  p,
  highlight_terms = NULL,
  filename = NULL,
  width = NA,
  height = NA
)
Arguments

- **p**: ggplot object from `gostplot(gostres, interactive = FALSE)` function
- **highlight_terms**: vector of selected term IDs from the analysis or a (subset) data.frame that has a column called 'term_id'. No annotation is added if set to NULL.
- **filename**: file name to create on disk and save the annotated plot. Filename extension should be from c("png", "pdf", "jpeg", "tiff", "bmp").
- **width**: plot width in inches. If not supplied, the size of current graphics device is used.
- **height**: plot height in inches. If not supplied, the size of current graphics device is used.

Value

The output is a ggplot object.

Author(s)

Liis Kolberg <liis.kolberg@ut.ee>

Examples

```r
  gostres <- gost(c("Klf4", "Pax5", "Sox2", "Nanog"), organism = "mmusculus")
  p <- gostplot(gostres, interactive = FALSE)
  publish_gostplot(p, highlight_terms = c("GO:0001010", "REAC:R-MMU-8939245"))
```

---

**publish_gosttable**  
Create and save a table with the functional enrichment analysis results.

Description

This function creates a table mainly for the results from gost() function. However, if the input at least contains columns named 'term_id' and 'p_value' then any enrichment results data frame can be visualised in a table with this function.

Usage

```r
  publish_gosttable(
    gostres,
    highlight_terms = NULL,
    use_colors = TRUE,
    show_columns = c("source", "term_name", "term_size", "intersection_size"),
    filename = NULL,
    ggplot = TRUE
  )
```
random_query

Arguments

gostres  named list from gost() function (with names 'result' and 'meta') or a data frame that has columns named "term_id" and "p_value(s)".
highlight_terms  vector of selected term IDs from the analysis or a (subset) data.frame that has a column called 'term_id'. All data is shown if set to NULL.
use_colors  if enabled, the p-values are highlighted in the viridis colorscale just as in g:Profiler, otherwise the table has no background colors.
show_columns  names of additional columns to show besides term_id and p_value. By default the output table shows additional columns named "source", "term_name", "term_size", "intersection_size"
filename  file name to create on disk and save the annotated plot. Filename extension should be from c("png", "pdf", "jpeg", "tiff", "bmp").
ggplot  if FALSE, then the function returns a gtable object.

Details

The output table is very similar to the one shown under the Manhattan plot.

Value

The output is a ggplot object.

Author(s)

Liis Kolberg <liis.kolberg@ut.ee>

Examples

gostres <- gost(c("Klf4", "Pax5", "Sox2", "Nanog"), organism = "mmusculus")
publish_gosttable(gostres, highlight_terms = c("GO:0001010", "REAC:R-MMU-8939245"))

random_query  Generate a random gene list for testing.

Description

This function returns a vector of randomly selected genes from the selected organism.

Usage

random_query(organism = "hsapiens")

Arguments

organism  organism name. Organism names are constructed by concatenating the first letter of the name and the family name. Example: human - 'hsapiens', mouse - 'mmusculus'.
Value

a character vector containing randomly selected gene IDs from the selected organism.

Author(s)

Liis Kolberg <liis.kolberg@ut.ee>

Examples

random_genes <- random_query()

---

set_base_url

*Set the base URL.*

**Description**

Function to change the g:Profiler base URL. Useful for overriding the default URL (http://biit.cs.ut.ee/gprofiler) with the beta (http://biit.cs.ut.ee/gprofiler_beta) or an archived version (available starting from the version e94_eg41_p11, e.g. http://biit.cs.ut.ee/gprofiler_archive3/e94_eg41_p11).

**Usage**

set_base_url(url)

**Arguments**

url the base URL.

---

set_tls_version

*Set the TLS version to use for SSL*

**Description**

Set the TLS version. Could be useful at environments where SSL was built without TLS 1.2 support.

**Usage**

set_tls_version(v)

**Arguments**

v version: "1.2" (default), "1.1" (fallback)
set_user_agent

Set custom user agent string.

Description
Set the HTTP User-Agent string. Useful for overriding the default user agent for packages that depend on gprofiler2 functionality.

Usage
set_user_agent(ua, append = F)

Arguments
ua
the user agent string.
append
logical indicating whether to append the passed string to the default user agent string.

upload_GMT_file
Upload custom annotations for functional enrichment analysis in g:GOSt.

Description
Upload your own annotation data using files in the Gene Matrix Transposed file format (GMT) for functional enrichment analysis in g:GOSt. The accepted file is either a single annotations file (with the extension .gmt) or a compressed directory of multiple annotation GMT files (with the extension .zip). The GMT format is a tab-separated list of gene annotation sets where every line represents a separate gene setfunctional term. The first column defines the function ID, second defines a short name/description of the function and the following columns are the list of genes related to the specific function in that row.

Usage
upload_GMT_file(gmtfile)

Arguments
gmtfile
the filepath of the GMT file to be uploaded. The file extension should be .gmt or .zip in case of multiple GMT files. If the filepath does not contain an absolute path, the filename is relative to the current working directory.

Details
The uploaded filename is used to define source name in the g:GOSt results.
**Value**

A string that denotes the ID of the uploaded custom annotations in the g:Profiler database. After the GMT file upload this unique ID can be used as a value for the argument ‘organism’ in the `gost()` function to perform functional enrichment analysis based on these custom data.

No need to repeatedly upload the same custom GMT file(s) every time you want to do the enrichment analysis. The custom ID can also be used in the web tool as a token under the Custom GMT options.

**Author(s)**

Liis Kolberg <liis.kolberg@ut.ee>

**Examples**

```r
## Not run: custom_id <- upload_GMT_file("path/to/file.gmt")
```
