Package ‘hdm’

June 17, 2016

Type Package
Title High-Dimensional Metrics
Version 0.2.0
Date 2016-06-14
Depends R (>= 3.0.0)
Description Implementation of selected high-dimensional statistical and
econometric methods for estimation and inference. Efficient estimators and
uniformly valid confidence intervals for various low-dimensional causal/
structural parameters are provided which appear in high-dimensional
approximately sparse models. Including functions for fitting heteroscedastic
robust Lasso regressions with non-Gaussian errors and for instrumental variable
(IV) and treatment effect estimation in a high-dimensional setting. Moreover,
the methods enable valid post-selection inference and rely on a theoretically
grounded, data-driven choice of the penalty.
License GPL-3

Description

This package implements methods for estimation and inference in a high-dimensional setting.

Details

Package: hdm
Type: Package
Version: 0.1
Date: 2015-05-25
License: GPL-3

hdm-package

hdm: High-Dimensional Metrics
This package provides efficient estimators and uniformly valid confidence intervals for various low-dimensional causal/structural parameters appearing in high-dimensional approximately sparse models. The package includes functions for fitting heteroskedastic robust Lasso regressions with non-Gaussian errors and for instrumental variable (IV) and treatment effect estimation in a high-dimensional setting. Moreover, the methods enable valid post-selection inference. Moreover, a theoretically grounded, data-driven choice of the penalty level is provided.

AJR data set

Description

Dataset on settler mortality.

Format

- **Mort** Settler mortality
- **logMort** logarithm of Mort
- **Latitude** Latitude
- **Latitude2** Latitude^2
- **Africa** Africa
- **Asia** Asia
- **Namer** North America
- **Samer** South America
- **Neo** Neo-Europe
- **GDP** GDP
- **Exprop** Average protection against expropriation risk
Details

Data set was analysed in Acemoglu et al. (2001). A detailed description of the data can be found at http://economics.mit.edu/faculty/acemoglu/data/ajr2001

References

Examples

data(AJR)

---

**BLP**

*BLP data set*

---

Description

Automobile data set from the US.

Format

- **model.name** model name
- **model.id** model id
- **firm.id** firm id
- **cdid** cdid
- **id** id
- **price** log price
- **mpg** miles per gallon
- **mpd** miles per dollar
- **hpwt** horse power per weight
- **air** air conditioning (binary variable)
- **space** size of the car
- **share** market share
- **outshr** share s0
- **y** outcome variable defined as log(share) - log(outshr)
- **trend** time trend

Details

Data set was analysed in Berry, Levinsohn and Pakes (1995). The data stem from annual issues of the Automotive News Market Data Book. The data set includes information on all models marketed during the the period beginning 1971 and ending in 1990 containing 2217 model/years from 997 distinct models. A detailed description is given in BLP (1995, 868–871). The internal function *constructIV* constructs instrumental variables along the lines described and used in BLP (1995).

Examples

data(BLP)

cps2012
cps2012 data set

Description

Census data from the US for the year 2012.

Format

lnw  log of hourly wage (annual earnings / annual hours)
female  female indicator
married status  six indicators: widowed, divorced, separated, nevermarried, and married (omitted)
education attainment  six indicators: hsd08, hsd911, hsg, cg, ad, and sc (omitted)
region indicators  four indicators: mw, so, we, and ne (omitted)
potential experience  (max[0, age - years of education - 7]): exp1, exp2 (divided by 100), exp3 (divided by 1000), exp4 (divided by 10000)
weight  March Supplement sampling weight
year  CPS year

Details

The CPS is a monthly U.S. household survey conducted jointly by the U.S. Census Bureau and the Bureau of Labor Statistics. The data comprise the year 2012. This data set was used in Mulligan and Rubinstein (2008). The sample comprises white non-hipanic, ages 25-54, working full time full year (35+ hours per week at least 50 weeks), exclude living in group quarters, self-employed, military, agricultural, and private household sector, allocated earning, inconsistent report on earnings and employment, missing data.

EminentDomain  

*Eminent Domain data set*

**Description**

Dataset on judicial eminent domain decisions.

**Format**

- **y**: economic outcome variable
- **x**: set of exogenous variables
- **d**: eminent domain decisions
- **z**: set of potential instruments

**Details**

Data set was analyzed in Belloni et al. (2012). They estimate the effect of judicial eminent domain decisions on economic outcomes with instrumental variables (IV) in a setting high a large set of potential IVs. A detailed description of the data can be found at [https://www.econometricsociety.org/publications/econometrica/2012/11/01/sparse-models-and-methods-optimal-instruments-application](https://www.econometricsociety.org/publications/econometrica/2012/11/01/sparse-models-and-methods-optimal-instruments-application). The data set contains four "sub-data sets" which differ mainly in the dependent variables: repeat-sales FHFA/OFHEO house price index for metro (FHFA) and non-metro (NM) area, the Case-Shiller home price index (CS), and state-level GDP from the Bureau of Economic Analysis - all transformed with the logarithm. The structure of each subdata set is comparable and given above.

Growth Data  

*Growth data set*

**Description**

Data set of growth compiled by Barro Lee.
**Format**

Dataframe with the following variables:

- **outcome** dependent variable: national growth rates in GDP per capita for the periods 1965-1975 and 1975-1985
- **x** covariates which might influence growth

**Details**

The data set contains growth data of Barro-Lee. The Barro Lee data consists of a panel of 138 countries for the period 1960 to 1985. The dependent variable is national growth rates in GDP per capita for the periods 1965-1975 and 1975-1985. The growth rate in GDP over a period from $t_1$ to $t_2$ is commonly defined as $\log(GDP_{t_1}/GDP_{t_2})$. The number of covariates is $p=62$. The number of complete observations is 90.

**Source**

**References**

### lambdaCalculation

**Function for Calculation of the penalty parameter**

**Description**

This function implements different methods for calculation of the penalization parameter $\lambda$. Further details can be found under rlasso.

**Usage**

```r
lambdaCalculation(penalty = list(homoscedastic = FALSE, X.dependent.lambda = FALSE, lambda.start = NULL, c = 1.1, gamma = 0.1), y = NULL, x = NULL)
```
Arguments

penalty \hspace{1cm} list with options for the calculation of the penalty.
  \hspace{1cm} • c and gamma constants for the penalty with default c=1.1 and gamma=0.1
  \hspace{1cm} • homoscedastic logical, if homoscedastic errors are considered (default FALSE). Option none is described below.
  \hspace{1cm} • X.dependent.lambda if independent or dependent design matrix X is assumed for calculation of the parameter \( \lambda \)
  \hspace{1cm} • numSim number of simulations for the X-dependent methods
  \hspace{1cm} • lambda.start initial penalization value, compulsory for method "none"

y \hspace{1cm} residual which is used for calculation of the variance or the data-dependent loadings

x \hspace{1cm} matrix of regressor variables

Value

The functions returns a list with the penalty \( \lambda \) which is the product of \( \lambda \) and \( \text{ups} \). \( \text{ups} \) denotes either the variance (independent case) or the data-dependent loadings for the regressors. method gives the selected method for the calculation.

LassoShooting.fit \hspace{1cm} Shooting Lasso

Description

Implementation of the Shooting Lasso (Fu, 1998) with variable dependent penalization weights.

Usage

\[
\text{LassoShooting.fit}(x, y, \lambda, \text{control} = \text{list}(\text{maxIter} = 1000, \text{optTol} = 10^{-5}, \text{zeroThreshold} = 10^{-6}), XX = \text{NULL}, Xy = \text{NULL}, \text{beta.start} = \text{NULL})
\]

Arguments

x \hspace{1cm} matrix of regressor variables (\( n \) times \( p \) where \( n \) denotes the number of observations and \( p \) the number of regressors)

y \hspace{1cm} dependent variable (vector or matrix)

lambda \hspace{1cm} vector of length \( p \) of penalization parameters for each regressor

control \hspace{1cm} list with control parameters: \text{maxIter} maximal number of iterations, \text{optTol} tolerance for parameter precision, \text{zeroThreshold} threshold applied to the estimated coefficients for numerical issues.

XX \hspace{1cm} optional, precalculated matrix \( t(X) \ast X \)

Xy \hspace{1cm} optional, precalculated matrix \( t(X) \ast y \)

beta.start \hspace{1cm} start value for beta
Details

The function implements the Shooting Lasso (Fu, 1998) with variable dependent penalization. The arguments \texttt{XX} and \texttt{Xy} are optional and allow to use precalculated matrices which might improve performance.

Value

- \texttt{coefficients} estimated coefficients by the Shooting Lasso Algorithm
- \texttt{coef.list} matrix of coefficients from each iteration
- \texttt{num.it} number of iterations run

References

**pension**

---

**Pension 401(k) data set**

**Description**

Data set on financial wealth and 401(k) plan participation

**Format**

Dataframe with the following variables (amongst others):

- \texttt{p401} participation in 401(k)
- \texttt{e401} eligibility for 401(k)
- \texttt{a401} 401(k) assets
- \texttt{tw} total wealth (in US $)
- \texttt{tfa} financial assets (in US $)
- \texttt{net_tfa} net financial assets (in US $)
- \texttt{nifa} non-401k financial assets (in US $)
- \texttt{net_nifa} net non-401k financial assets
- \texttt{net_n401} net non-401(k) assets (in US $)
- \texttt{ira} individual retirement account (IRA)
- \texttt{inc} income (in US $)
- \texttt{age} age
- \texttt{fsize} family size
- \texttt{marr} married
- \texttt{pira} participation in IRA
db  defined benefit pension
hown home owner
educ education (in years)
male male
twoearn two earners
nohs, hs, smcol, col dummies for education: no high-school, high-school, some college, college
hmort home mortgage (in US $)
hequity home equity (in US $)
hval home value (in US $)

Details
The sample is drawn from the 1991 Survey of Income and Program Participation (SIPP) and consists of 9,915 observations. The observational units are household reference persons aged 25-64 and spouse if present. Households are included in the sample if at least one person is employed and no one is self-employed. The data set was analysed in Chernozhukov and Hansen (2004) and Belloni et al. (2014) where further details can be found. They examine the effects of 401(k) plans on wealth using data from the Survey of Income and Program Participation using 401(k) eligibility as an instrument for 401(k) participation.

predict.rlassologit  Methods for S3 object rlassologit

Description
Objects of class rlassologit are constructed by rlassologit. print.rlassologit prints and displays some information about fitted rlassologit objects. summary.rlassologit summarizes information of a fitted rlassologit object. predict.rlassologit predicts values based on a rlassologit object. model.matrix.rlassologit constructs the model matrix of a lasso object.
**Usage**

```r
## S3 method for class 'rlassologit'
predict(object, newdata = NULL, type = "response", ...)

## S3 method for class 'rlassologit'
model.matrix(object, ...)  

## S3 method for class 'rlassologit'
print(x, all = TRUE, digits = max(3L, getOption("digits") - 3L), ...)  

## S3 method for class 'rlassologit'
summary(object, all = TRUE, digits = max(3L, getOption("digits") - 3L), ...)  
```

**Arguments**

- `object`: an object of class `rlassologit`
- `newdata`: new data set for prediction
- `type`: type of prediction required. The default ("response") is on the scale of the response variable; the alternative "link" is on the scale of the linear predictors.
- `...`: arguments passed to the print function and other methods
- `x`: an object of class `rlassologit`
- `all`: logical, indicates if coefficients of all variables (TRUE) should be displayed or only the non-zero ones (FALSE)
- `digits`: significant digits in printout

---

**Description**

Objects of class `rlasso` are constructed by `rlasso`. `print.rlasso` prints and displays some information about fitted `rlasso` objects. `summary.rlasso` summarizes information of a fitted `rlasso` object. `predict.rlasso` predicts values based on a `rlasso` object. `model.matrix.rlasso` constructs the model matrix of a `rlasso` object.

**Usage**

```r
## S3 method for class 'rlasso'
print(x, all = TRUE, digits = max(3L, getOption("digits") - 3L), ...)  

## S3 method for class 'rlasso'
```
summary(object, all = TRUE, digits = max(3L, getOption("digits") - 3L), ...)

## S3 method for class 'rlasso'
model.matrix(object, ...)

## S3 method for class 'rlasso'
predict(object, newdata = NULL, ...)

Arguments

x an object of class rlasso
all logical, indicates if coefficients of all variables (TRUE) should be displayed or only the non-zero ones (FALSE)
digits significant digits in printout
... arguments passed to the print function and other methods
object an object of class rlasso
newdata new data set for prediction. An optional data frame in which to look for variables with which to predict. If omitted, the fitted values are returned.

Description

Objects of class rlassoEffects are constructed by rlassoEffects. print.rlassoEffects prints and displays some information about fitted rlassoEffect objects. summary.rlassoEffects summarizes information of a fitted rlassoEffect object and is described at summary.rlassoEffects. confint.rlassoEffects extracts the confidence intervals. plot.rlassoEffects plots the estimates with confidence intervals.

Usage

## S3 method for class 'rlassoEffects'
print(x, digits = max(3L, getOption("digits") - 3L), ...)

## S3 method for class 'rlassoEffects'
confint(object, parm, level = 0.95, joint = FALSE, ...)

## S3 method for class 'rlassoEffects'
plot(x, joint = FALSE, level = 0.95, main = "", xlab = "coef", ylab = "", xlim = NULL, ...)
Arguments

- `x`: an object of class `rlassoEffects`
- `digits`: significant digits in printout
- `...`: arguments passed to the print function and other methods.
- `object`: an object of class `rlassoEffects`
- `parm`: a specification of which parameters are to be given confidence intervals among the variables for which inference was done, either a vector of numbers or a vector of names. If missing, all parameters are considered.
- `level`: confidence level required
- `joint`: logical, if TRUE joint confidence intervals are calculated.
- `main`: an overall title for the plot
- `xlab`: a title for the x axis
- `ylab`: a title for the y axis
- `xlim`: vector of length two giving lower and upper bound of x axis

Methods for S3 object `rlassoIV`

Description

Objects of class `rlassoIV` are constructed by `rlassoIV`. `print.rlassoIV` prints and displays some information about fitted `rlassoIV` objects. `summary.rlassoIV` summarizes information of a fitted `rlassoIV` object. `confint.rlassoIV` extracts the confidence intervals.

Usage

```r
## S3 method for class 'rlassoIV'
print(x, digits = max(3L,getOption("digits") - 3L), ...)

## S3 method for class 'rlassoIV'
summary(object, digits = max(3L,getOption("digits") - 3L), ...)

## S3 method for class 'rlassoIV'
confint(object, parm, level = 0.95, ...)
```

Arguments

- `x`: an object of class `rlassoIV`
- `digits`: significant digits in printout
- `...`: arguments passed to the print function and other methods
- `object`: An object of class `rlassoIV`
parm  a specification of which parameters are to be given confidence intervals, either a vector of numbers or a vector of names. If missing, all parameters are considered.

level  confidence level required.

Description

Objects of class rlassoIVselectX are constructed by rlassoIVselectX. print.rlassoIVselectX prints and displays some information about fitted rlassoIVselectX objects. summary.rlassoIVselectX summarizes information of a fitted rlassoIVselectX object. confint.rlassoIVselectX extracts the confidence intervals.

Usage

## S3 method for class 'rlassoIVselectX'
print(x, digits = max(3L,getOption("digits") - 3L),
     ...)  

## S3 method for class 'rlassoIVselectX'
summary(object, digits = max(3L,getOption("digits") - 3L),
         ...)  

## S3 method for class 'rlassoIVselectX'
confint(object, parm, level = 0.95, ...)  

Arguments

x  an object of class rlassoIVselectX
digits  significant digits in printout
...  arguments passed to the print function and other methods
object  an object of class rlassoIVselectX
parm  a specification of which parameters are to be given confidence intervals, either a vector of numbers or a vector of names. If missing, all parameters are considered.
level  the confidence level required.
print.rlassoIVselectZ  Methods for S3 object rlassoIVselectZ

Description

Objects of class rlassoIVselectZ are constructed by rlassoIVselectZ. print.rlassoIVselectZ prints and displays some information about fitted rlassoIVselectZ objects. summary.rlassoIVselectZ summarizes information of a fitted rlassoIVselectZ object. confint.rlassoIVselectZ extracts the confidence intervals.

Usage

```r
## S3 method for class 'rlassoIVselectZ'
print(x, digits = max(3L,getOption("digits") - 3L),
      ...)  
## S3 method for class 'rlassoIVselectZ'
summary(object, digits = max(3L,getOption("digits")
      - 3L), ...)  
## S3 method for class 'rlassoIVselectZ'
confint(object, parm, level = 0.95, ...)
```

Arguments

- `x`: an object of class rlassoIVselectZ
- `digits`: significant digits in printout
- `...`: arguments passed to the print function and other methods
- `object`: an object of class rlassoIVselectZ
- `parm`: a specification of which parameters are to be given confidence intervals, either a vector of numbers or a vector of names. If missing, all parameters are considered.
- `level`: confidence level required.

print.rlassologitEffects  Methods for S3 object rlassologitEffects

Description

Objects of class rlassologitEffects are constructed by rlassologitEffects or rlassologitEffect. print.rlassologitEffects prints and displays some information about fitted rlassologitEffect objects. summary.rlassologitEffects summarizes information of a fitted rlassologitEffects object. confint.rlassologitEffects extracts the confidence intervals.
Usage

## S3 method for class 'rlassologiteffects'
print(x, digits = max(3L,getOption("digits") - 3L), ...)

## S3 method for class 'rlassologiteffects'
summary(object, digits = max(3L, getOption("digits") - 3L), ...)

## S3 method for class 'rlassologiteffects'
confint(object, parm, level = 0.95, joint = FALSE, ...)

Arguments

- `x`: an object of class `rlassologiteffects`
- `digits`: number of significant digits in printout
- `...`: arguments passed to the print function and other methods
- `object`: an object of class `rlassologiteffects`
- `parm`: a specification of which parameters are to be given confidence intervals, either a vector of numbers or a vector of names. If missing, all parameters are considered.
- `level`: confidence level required.
- `joint`: logical, if joint confidence intervals should be calculated

print.rlasso

Methods for S3 object rlasso

Description

Objects of class `rlasso` are constructed by `rlassoATE`, `rlassoATET`, `rlassoATE`, `rlassoLATET`, `rlasso`. `print.rlasso` prints and displays some information about fitted `rlasso` objects. `summary.rlasso` summarizes information of a fitted `rlasso` object. `confint.rlasso` extracts the confidence intervals.

Usage

## S3 method for class 'rlasso'
print(x, digits = max(3L,getOption("digits") - 3L), ...)

## S3 method for class 'rlasso'
summary(object, digits = max(3L,getOption("digits") - 3L), ...)

## S3 method for class 'rlasso'
confint(object, parm, level = 0.95, ...)
Arguments

- **x**: an object of class `rlassoTE`
- **digits**: number of significant digits in printout
- **...**: arguments passed to the print function and other methods
- **object**: an object of class `rlassoTE`
- **parm**: a specification of which parameters are to be given confidence intervals, either a vector of numbers or a vector of names. If missing, all parameters are considered.
- **level**: confidence level required.

Description

Objects of class `tsls` are constructed by `tsls`. `print.tls` prints and displays some information about fitted `tsls` objects. `summary.tls` summarizes information of a fitted `tsls` object.

Usage

```r
## S3 method for class 'tsls'
print(x, digits = max(3L,getOption("digits") - 3L), ...)

## S3 method for class 'tsls'
summary(object, digits = max(3L,getOption("digits") - 3L), ...
```

Arguments

- **x**: an object of class `tsls`
- **digits**: significant digits in printout
- **...**: arguments passed to the print function and other methods
- **object**: an object of class `tsls`
rlasso: Function for Lasso estimation under homoscedastic and heteroscedastic non-Gaussian disturbances

Description

The function estimates the coefficients of a Lasso regression with data-driven penalty under homoscedasticity and heteroscedasticity with non-Gaussian noise and X-dependent or X-independent design. The method of the data-driven penalty can be chosen. The object which is returned is of the S3 class rlasso.

Usage

rlasso(x, ...)

## S3 method for class 'formula'

rlasso(formula, data, post = TRUE, intercept = TRUE,
model = TRUE, penalty = list(homoscedastic = FALSE, X.dependent.lambda =
FALSE, lambda.start = NULL, c = 1.1, gamma = 0.1/log(n)),
control = list(numIter = 15, tol = 10^-5, threshold = NULL), ...)

## Default S3 method:

rlasso(x, y, post = TRUE, intercept = TRUE,
model = TRUE, penalty = list(homoscedastic = FALSE, X.dependent.lambda =
FALSE, lambda.start = NULL, c = 1.1, gamma = 0.1/log(n)),
control = list(numIter = 15, tol = 10^-5, threshold = NULL), ...)

Arguments

x regressors (vector, matrix or object can be coerced to matrix)
...

further arguments (only for consistent definition of methods)

formula an object of class "formula" (or one that can be coerced to that class): a symbolic
description of the model to be fitted in the form y~x
data an optional data frame, list or environment (or object coercible by as.data.frame
to a data frame) containing the variables in the model. If not found in data, the
variables are taken from environment(formula), typically the environment from
which rlasso is called.

post logical. If TRUE, post-Lasso estimation is conducted.

intercept logical. If TRUE, intercept is included which is not penalized.

model logical. If TRUE (default), model matrix is returned.

penalty list with options for the calculation of the penalty.

• c and gamma constants for the penalty with default c=1.1 and gamma=0.1
• homoscedastic logical, if homoscedastic errors are considered (default FALSE). Option none is described below.
• \( X.\) dependent.\( \lambda \) logical, \( \text{TRUE} \), if the penalization parameter depends on the design of the matrix \( x \). \( \text{FALSE} \), if independent of the design matrix (default).

• \( \text{numSim} \) number of simulations for the dependent methods, default=5000

• \( \text{lambda.start} \) initial penalization value, compulsory for method "none"

• \( \text{control} \) list with control values. \( \text{numIter} \) number of iterations for the algorithm for the estimation of the variance and data-driven penalty, i.e. loadings, \( \text{tol} \) tolerance for improvement of the estimated variances. \( \text{threshold} \) is applied to the final estimated lasso coefficients. Absolute values below the threshold are set to zero.

• \( y \) dependent variable (vector, matrix or object can be coerced to matrix)

Details

The function estimates the coefficients of a Lasso regression with data-driven penalty under homoscedasticity / heteroscedasticity and non-Gaussian noise. The options homoscedastic is a logical with \( \text{FALSE} \) by default. Moreover, for the calculation of the penalty parameter it can be chosen, if the penalization parameter depends on the design matrix (\( X.\) dependent.\( \lambda \)=\( \text{TRUE} \)) or independent (default, \( X.\) dependent.\( \lambda \)=\( \text{FALSE} \)). The default value of the constant \( c \) is 1.1 in the post-Lasso case and 0.5 in the Lasso case. A special option is to set homoscedastic to none and to supply a values \( \text{lambda.start} \). Then this value is used as penalty parameter with independent design and heteroscedastic errors to weight the regressors. For details of the implementation of the Algorithm for estimation of the data-driven penalty, in particular the regressor-independent loadings, we refer to Appendix A in Belloni et al. (2012). When the option "none" is chosen for homoscedastic (together with \( \text{lambda.start} \)), \( \lambda \) is set to \( \text{lambda.start} \) and the regressor-independent loadings and heteroscedasticity are used. The options "X-dependent" and "X-independent" under homoscedasticity are described in Belloni et al. (2013).

The option post=\( \text{TRUE} \) conducts post-lasso estimation, i.e. a refit of the model with the selected variables.

Value

\rlasso\ returns an object of class \rlasso.\ An object of class "rlasso" is a list containing at least the following components:

- \( \text{coefficients} \) parameter estimates
- \( \text{beta} \) parameter estimates (named vector of coefficients without intercept)
- \( \text{intercept} \) value of the intercept
- \( \text{index} \) index of selected variables (logical vector)
- \( \text{lambda} \) data-driven penalty term for each variable, product of \( \text{lambda0} \) (the penalization parameter) and the loadings
- \( \text{lambda0} \) penalty term
- \( \text{loadings} \) loading for each regressor
- \( \text{residuals} \) residuals, response minus fitted values
- \( \text{sigma} \) root of the variance of the residuals
- \( \text{iter} \) number of iterations
call function call
options options
model model matrix (if model = TRUE in function call)

Xnew = matrix(rnorm(n*p), ncol=p) # new X
colnames(Xnew) <- paste("v", 1:p, sep="")
Ynew = Xnew%*%beta + rnorm(n) # new Y
yhat = predict(reg.lasso, newdata = Xnew)
```

---

**rlassoATE**

*Functions for estimation of treatment effects*

**Description**

This class of functions estimates the average treatment effect (ATE), the ATE of the treated (ATET), the local average treatment effects (LATE) and the LATE of the treated (LATET). The estimation methods rely on immunized / orthogonal moment conditions which guarantee valid post-selection inference in a high-dimensional setting. Further details can be found in Belloni et al. (2014).

**Usage**

```r
rlassoATE(x, ...)
```

## Default S3 method:
rlassoATE(x, d, y, bootstrap = "none", nRep = 500, ...)

## S3 method for class 'formula'
rlassoATE(formula, data, bootstrap = "none", nRep = 500,
rlassoATE(x, ...)  

## Default S3 method:  
rlassoATE(x, d, y, bootstrap = "none", nRep = 500, ...)  

## S3 method for class 'formula'  
rlassoATE(formula, data, bootstrap = "none", nRep = 500, ...)  

rlassoLATE(x, ...)  

## Default S3 method:  
rlassoLATE(x, d, y, z, bootstrap = "none", nRep = 500,  
post = TRUE, intercept = TRUE, ...)  

## S3 method for class 'formula'  
rlassoLATE(formula, data, bootstrap = "none", nRep = 500,  
post = TRUE, intercept = TRUE, ...)  

rlassoLATET(x, ...)  

## Default S3 method:  
rlassoLATET(x, d, y, z, bootstrap = "none", nRep = 500,  
post = TRUE, intercept = TRUE, ...)  

## S3 method for class 'formula'  
rlassoLATET(formula, data, bootstrap = "none", nRep = 500,  
post = TRUE, intercept = TRUE, ...)  

**Arguments**

- **x**: exogenous variables
- **d**: treatment variable (binary)
- **y**: outcome variable / dependent variable
- **bootstrap**: bootstrap method which should be employed: 'none', 'Bayes', 'normal', 'wild'
- **nRep**: number of replications for the bootstrap
- **formula**: An object of class `formula` of the form "y ~ x + d | x" with y the outcome variable, d treatment variable, and x exogenous variables.
- **data**: An optional data frame, list or environment (or object coercible by as.data.frame to a data frame) containing the variables in the model. If not found in data, the variables are taken from environment(formula), typically the environment from which rlassoATE is called.
- **z**: instrumental variables (binary)
post logical. If TRUE, post-lasso estimation is conducted.
intercept logical. If TRUE, intercept is included which is not penalized.

Details
Details can be found in Belloni et al. (2014).

Value
Functions return an object of class rlassoTE with estimated effects, standard errors and individual effects in the form of a list.

References

rlassoEffects rigorous Lasso for Linear Models: Inference

Description
Estimation and inference of (low-dimensional) target coefficients in a high-dimensional linear model.

Usage
rlassoEffects(x, ...)

## Default S3 method:
rlassoEffects(x, y, index = c(1:ncol(x)),
  method = "partialling out", I3 = NULL, post = TRUE, ...)

## S3 method for class 'formula'
rlassoEffects(formula, data, I, method = "partialling out",
  included = NULL, post = TRUE, ...)

rlassoEffect(x, y, d, method = "double selection", I3 = NULL, post = TRUE,
  ...)

Arguments

x matrix of regressor variables serving as controls and potential treatments. For rlassoEffect it contains only controls, for rlassoEffects both controls and potential treatments. For rlassoEffects it must have at least two columns.

y outcome variable (vector or matrix)
index vector of integers, logicals or variables names indicating the position (column) of variables (integer case), logical vector of length of the variables (TRUE or FALSE) or the variable names of x which should be used for inference / as treatment variables.

method method for inference, either 'partially out' (default) or 'double selection'.

I3 For the 'double selection'-method the logical vector I3 has same length as the number of variables in x; indicates if variables (TRUE) should be included in any case to the model and they are exempt from selection. These variables should not be included in the index; hence the intersection with index must be the empty set. In the case of partially out it is ignored.

post logical, if post Lasso is conducted with default TRUE.

formula An element of class formula specifying the linear model.

data an optional data frame, list or environment (or object coercible by as.data.frame to a data frame) containing the variables in the model. If not found in data, the variables are taken from environment(formula), typically the environment from which the function is called.

I An one-sided formula specifying the variables for which inference is conducted.

included One-sided formula of variables which should be included in any case (only for method="double selection").

d variable for which inference is conducted (treatment variable)

... parameters passed to the rlasso function.

Details

The functions estimates (low-dimensional) target coefficients in a high-dimensional linear model. An application is e.g. estimation of a treatment effect \( \alpha_0 \) in a setting of high-dimensional controls. The user can choose between the so-called post-double-selection method and partially out. The idea of the double selection method is to select variables by Lasso regression of the outcome variable on the control variables and the treatment variable on the control variables. The final estimation is done by a regression of the outcome on the treatment effect and the union of the selected variables in the first two steps. In partially out first the effect of the regressors on the outcome and the treatment variable is taken out by Lasso and then a regression of the residuals is conducted. The resulting estimator for \( \alpha_0 \) is normal distributed which allows inference on the treatment effect. It presents a wrap function for rlassoEffect which does inference for a single variable.

Value

The function returns an object of class rlassoEffects with the following entries:

coefficients vector with estimated values of the coefficients for each selected variable

se standard error (vector)

t t-statistic

pval p-value

samplesize sample size of the data set

index index of the variables for which inference is performed
References

Examples

```r
library(hdm); library(ggplot2)
set.seed(1)
n = 100 # sample size
p = 100 # number of variables
s = 3 # number of non-zero variables
X = matrix(rnorm(n*p), ncol=p)
colnames(X) <- paste("X", 1:p, sep="")
beta = c(rep(3, s), rep(0, p-s))
y = 1 + X%*%beta + rnorm(n)
data = data.frame(cbind(y, X))
colnames(data)[1] <- "y"
fm = paste("y ~ ", paste(colnames(X), collapse=" + "))
fm = as.formula(fm)
lasso.effect = rlassoEffects(x, y, index=c(1,2,3,50))
lasso.effect = rlassoEffects(fm, I = ~ X1 + X2 + X3 + X50, data=data)
print(lasso.effect)
summary(lasso.effect)
confint(lasso.effect)
```

---

```r
rlassoIV
Post-Selection and Post-Regularization Inference in Linear Models with Many Controls and Instruments
```

Description

The function estimates a treatment effect in a setting with very many controls and very many instruments (even larger than the sample size).

Usage

```r
rlassoIV(x, ...)
```

## Default S3 method:
rlassoIV(x, d, y, z, select.Z = TRUE, select.X = TRUE, post = TRUE, ...)

## S3 method for class 'formula'
rlassoIV(formula, data, select.Z = TRUE, select.X = TRUE, post = TRUE, ...)

rlassoIVmult(x, d, y, z, select.Z = TRUE, select.X = TRUE, ...)
Arguments

- **x**: matrix of exogenous variables
- **d**: endogenous variable
- **y**: outcome / dependent variable (vector or matrix)
- **z**: matrix of instrumental variables
- **select.Z**: logical, indicating selection on the instruments.
- **select.X**: logical, indicating selection on the exogenous variables.
- **post**: logical, whether post-Lasso should be conducted (default=TRUE)
- **formula**: An object of class `formula` of the form "y ~ x + d | x + z" with y the outcome variable, d endogenous variable, z instrumental variables, and x exogenous variables.
- **data**: an optional data frame, list or environment (or object coercible by as.data.frame to a data frame) containing the variables in the model. If not found in data, the variables are taken from environment(formula), typically the environment from which rlassoIV is called.
- **...**: arguments passed to the function rlasso

Details

The implementation for selection on x and z follows the procedure described in Chernozhukov et al. (2015) and is built on 'triple selection' to achieve an orthogonal moment function. The function returns an object of S3 class rlassoIV. Moreover, it is wrap function for the case that selection should be done only with the instruments Z (rlassoIVselectZ) or with the control variables X (rlassoIVselectX) or without selection (tsls). Exogenous variables x are automatically used as instruments and added to the instrument set z.

Value

an object of class rlassoIV containing at least the following components:

- **coefficients**: estimated parameter value
- **se**: variance-covariance matrix

References

Examples

```r
## Not run:
data(EminentDomain)
z <- EminentDomain$logGDP$z # instruments
x <- EminentDomain$logGDP$x # exogenous variables
y <- EminentDomain$logGDP$y # outcome variable
d <- EminentDomain$logGDP$d # treatment / endogenous variable
```
```r
lasso.IV.Z = rlassoIV(x=x, d=d, y=y, z=z, select.X=FALSE, select.Z=TRUE)
summary(lasso.IV.Z)
confint(lasso.IV.Z)

## End(Not run)
```

**rlassoIVselectX**  
*Instrumental Variable Estimation with Selection on the exogenous Variables by Lasso*

**Description**

This function estimates the coefficient of an endogenous variable by employing Instrument Variables in a setting where the exogenous variables are high-dimensional and hence selection on the exogenous variables is required. The function returns an element of class `rlassoIVselectX`.

**Usage**

`rlassoIVselectX(x, ...)`

## Default S3 method:
`rlassoIVselectX(x, d, y, z, post = TRUE, ...)`

## S3 method for class 'formula'
`rlassoIVselectX(formula, data, post = TRUE, ...)`

**Arguments**

- `x`: exogenous variables in the structural equation (matrix)
- `d`: endogenous variables in the structural equation (vector or matrix)
- `y`: outcome or dependent variable in the structural equation (vector or matrix)
- `z`: set of potential instruments for the endogenous variables.
- `post`: logical. If TRUE, post-lasso estimation is conducted.
- `formula`: An object of class `formula` of the form " y ~ x + d | x + z" with y the outcome variable, d endogenous variable, z instrumental variables, and x exogenous variables.
- `data`: An optional data frame, list or environment (or object coercible by as.data.frame to a data frame) containing the variables in the model. If not found in data, the variables are taken from environment(formula), typically the environment from which `rlassoIVselectX` is called.
- `...`: arguments passed to the function `rlasso`

**Details**

The implementation is a special case of of Chernozhukov et al. (2015). The option `post=TRUE` conducts post-lasso estimation for the Lasso estimations, i.e. a refit of the model with the selected variables. Exogenous variables `x` are automatically used as instruments and added to the instrument set `z`. 
**Value**

An object of class `rlassoIVselectX` containing at least the following components:

- `coefficients`: estimated parameter vector
- `vcov`: variance-covariance matrix
- `residuals`: residuals
- `samplesize`: sample size

**References**

**Examples**

```r
library(hdm)
data(AJR); y = AJR$GDP; d = AJR$Exprop; z = AJR$LogMort
x = model.matrix(~ -1 + (Latitude + Latitude2 + Africa + Asia + Namer + Samer)^2, data=AJR)
dim(x)
#AJR.Xselect = rlassoIV(x=x, d=d, y=y, z=z, select.X=TRUE, select.Z=FALSE)
AJR.Xselect = rlassoIV(GDP ~ Exprop + (Latitude + Latitude2 + Africa + Asia + Namer + Samer)^2 | logMort + (Latitude + Latitude2 + Africa + Asia + Namer + Samer)^2, 
data=AJR, select.X=TRUE, select.Z=FALSE)
summary(AJR.Xselect)
confint(AJR.Xselect)
```

---

**rlassoIVselectZ**

**Instrumental Variable Estimation with Lasso**

**Description**

This function selects the instrumental variables in the first stage by Lasso. First stage predictions are then used in the second stage as optimal instruments to estimate the parameter vector. The function returns an element of class `rlassoIVselectZ`.

**Usage**

```r
rlassoIVselectZ(x, ...)  
```

**Default S3 method:**

```
rlassoIVselectZ(x, d, y, z, post = TRUE, intercept = TRUE, ...)  
```

**S3 method for class 'formula':**

```
rlassoIVselectZ(formula, data, post = TRUE, intercept = TRUE, ...)  
```
Arguments

- **x**: exogenous variables in the structural equation (matrix)
- **d**: endogenous variables in the structural equation (vector or matrix)
- **y**: outcome or dependent variable in the structural equation (vector or matrix)
- **z**: set of potential instruments for the endogenous variables. Exogenous variables serve as their own instruments.
- **post**: logical. If TRUE, post-lasso estimation is conducted.
- **intercept**: logical. If TRUE, intercept is included in the second stage equation.
- **formula**: An object of class `Formula` of the form " y ~ x + d | x + z" with y the outcome variable, d endogenous variable, z instrumental variables, and x exogenous variables.
- **data**: An optional data frame, list or environment (or object coercible by as.data.frame to a data frame) containing the variables in the model. If not found in data, the variables are taken from environment(formula), typically the environment from which `rlassoIVselectZ` is called.
- **...**: arguments passed to the function `rlasso`.

Details

The implementation follows the procedure described in Belloni et al. (2012). Option `post=TRUE` conducts post-lasso estimation, i.e. a refit of the model with the selected variables, to estimate the optimal instruments. The parameter vector of the structural equation is then fitted by two-stage least square (tsls) estimation.

Value

An object of class `rlassoIVselectZ` containing at least the following components:

- **coefficients**: estimated parameter vector
- **vcov**: variance-covariance matrix
- **residuals**: residuals
- **samplesize**: sample size

References

rlassologit

rlassologit: Function for logistic Lasso estimation

Description

The function estimates the coefficients of a logistic Lasso regression with data-driven penalty. The method of the data-driven penalty can be chosen. The object which is returned is of the S3 class rlassologit.

Usage

rlassologit(x, ...)

## S3 method for class 'formula'
rlassologit(formula, data, post = TRUE, intercept = TRUE,
  model = TRUE, penalty = list(lambda = NULL, c = 1.1, gamma = 0.1/log(n)),
  control = list(threshold = NULL, ...))

## Default S3 method:
rlassologit(x, y, post = TRUE, intercept = TRUE,
  model = TRUE, penalty = list(lambda = NULL, c = 1.1, gamma = 0.1/log(n)),
  control = list(threshold = NULL, ...))

Arguments

x regressors (matrix)

... further parameters passed to glmnet

formula an object of class 'formula' (or one that can be coerced to that class): a symbolic description of the model to be fitted in the form y~x.

data an optional data frame, list or environment.

post logical. If TRUE, post-lasso estimation is conducted.

intercept logical. If TRUE, intercept is included which is not penalized.

model logical. If TRUE (default), model matrix is returned.

penalty list with options for the calculation of the penalty. c and gamma constants for the penalty.

control list with control values. threshold is applied to the final estimated lasso coefficients. Absolute values below the threshold are set to zero.

y dependent variable (vector or matrix)

Details

The function estimates the coefficients of a Logistic Lasso regression with data-driven penalty. The option post=TRUE conducts post-lasso estimation, i.e. a refit of the model with the selected variables.
Value

`rlassologit` returns an object of class `rlassologit`. An object of class `rlassologit` is a list containing at least the following components:

- `coefficients`: parameter estimates
- `beta`: parameter estimates (without intercept)
- `intercept`: value of intercept
- `index`: index of selected variables (logicals)
- `lambda`: penalty term
- `residuals`: residuals
- `sigma`: root of the variance of the residuals
- `call`: function call
- `options`: options

References

Examples

```r
## Not run:
library(hdm)
## DGP
set.seed(2)
n <- 250
p <- 100
px <- 10
X <- matrix(rnorm(n*p), ncol=p)
beta <- c(rep(px), rep(0,p-px))
intercept <- 1
P <- exp(intercept + X %*% beta)/(1+exp(intercept + X %*% beta))
y <- rbinom(length(y), size=1, prob=P)
## fit rlassologit object
rlassologit.reg <- rlassologit(y~X)
## methods
summary(rlassologit.reg, all=F)
print(rlassologit.reg)
predict(rlassologit.reg, type='response')
X3 <- matrix(rnorm(n*p), ncol=p)
predict(rlassologit.reg, newdata=X3)
## End(Not run)
```
Description

The function estimates (low-dimensional) target coefficients in a high-dimensional logistic model.

Usage

\[
\text{rlassologiteffects}(x, \ldots)
\]

## Default S3 method:
\[
\text{rlassologiteffects}(x, y, \text{index} = \text{c}(1: \text{ncol}(x)), \text{I3} = \text{NULL}, \\
\text{post} = \text{TRUE}, \ldots)
\]

## S3 method for class 'formula'
\[
\text{rlassologiteffects}(\text{formula}, \text{data}, \text{I}, \text{included} = \text{NULL}, \\
\text{post} = \text{TRUE}, \ldots)
\]

\[
\text{rlassologiteffect}(x, y, d, \text{I3} = \text{NULL}, \text{post} = \text{TRUE})
\]

Arguments

- **x**: matrix of regressor variables serving as controls and potential treatments. For \text{rlassologiteffect} it contains only controls, for \text{rlassologiteffects} both controls and potential treatments. For \text{rlassologiteffects} it must have at least two columns.
- **y**: outcome variable
- **index**: vector of integers, logical or names indicating the position (column) or name of variables of \(x\) which should be used as treatment variables.
- **I3**: logical vector with same length as the number of controls; indicates if variables (\text{TRUE}) should be included in any case.
- **post**: logical. If \text{TRUE}, post-Lasso estimation is conducted.
- **formula**: An element of class \text{formula} specifying the linear model.
- **data**: an optional data frame, list or environment (or object coercible by \text{as.data.frame} to a data frame) containing the variables in the model. If not found in data, the variables are taken from \text{environment(formula)}, typically the environment from which the function is called.
- **I**: An one-sided formula specifying the variables for which inference is conducted.
- **included**: One-sided formula of variables which should be included in any case.
- **d**: variable for which inference is conducted (treatment variable)
- **...**: additional parameters
summary.rlassoEffects

Details
The functions estimates (low-dimensional) target coefficients in a high-dimensional logistic model. An application is e.g. estimation of a treatment effect $\alpha_0$ in a setting of high-dimensional controls. The function is a wrap function for rlassologitEffect which does inference for only one variable (d).

Value
The function returns an object of class rlassologitEffects with the following entries:

- coefficients: estimated value of the coefficients
- se: standard errors
- t: t-statistics
- pval: p-values
- samplesize: sample size of the data set
- I: index of variables of the union of the lasso regressions

A. Belloni, V. Chernozhukov, Y. Wei (2013). Honest confidence regions for a regression parameter in logistic regression with a large number of controls. cemmap working paper CWP67/13.

summary.rlassoEffects  Summary method for class rlassoEffects

Description
Summary method for class rlassoEffects

Usage

```r
## S3 method for class 'rlassoEffects'
summary(object, ...)

## S3 method for class 'summary.rlassoEffects'
print(x, digits = max(3L,getOption("digits") ~ 3L), ...)
```

Arguments

- object: an object of class rlassoEffects, usually a result of a call to rlassoEffects
- ...: further arguments passed to or from other methods.
- x: an object of class summary.rlassoEffects, usually a result of a call or summary.rlassoEffects
- digits: the number of significant digits to use when printing.
**Details**

Summary of objects of class `rlassoEffects`

---

**tsls**

*Two-Stage Least Squares Estimation (TSLS)*

---

**Description**

The function does Two-Stage Least Squares Estimation (TSLS).

**Usage**

tsls(x, ...)

```r
## Default S3 method:
tsls(x, d, y, z, intercept = TRUE, homoscedastic = TRUE, ...
```

```r
## S3 method for class 'formula'
tsls(formula, data, intercept = TRUE,
     homoscedastic = TRUE, ...)
```

**Arguments**

- **x**: exogenous variables
- **...**: further arguments (only for consistent definition of methods)
- **d**: endogenous variables
- **y**: outcome variable
- **z**: instruments
- **intercept**: logical, if intercept should be included
- **homoscedastic**: logical, if homoscedastic (TRUE, default) or heteroscedastic errors (FALSE) should be calculated.
- **formula**: An object of class Formula of the form "y ~ x + d | x + z" with y the outcome variable, d endogenous variable, z instrumental variables, and x exogenous variables.
- **data**: An optional data frame, list or environment (or object coercible by `as.data.frame` to a data frame) containing the variables in the model. If not found in data, the variables are taken from environment(formula), typically the environment from which `ttsls` is called.

**Details**

The function computes tsls estimate (coefficients) and variance-covariance-matrix assuming homoskedasticity for outcome variable y where d are endogenous variables in structural equation, x are exogenous variables in structural equation and z are instruments. It returns an object of class `tsls` for which the methods `print` and `summary` are provided.
Value

The function returns a list with the following elements

- coefficients: coefficients
- vcov: variance-covariance matrix
- residuals: outcome minus predicted values
- call: function call
- samplesize: sample size
- se: standard error
