Package ‘hutils’

October 5, 2019

Type Package
Title Miscellaneous R Functions and Aliases
Version 1.5.1
Date 2019-10-05
Maintainer Hugh Parsonage <hugh.parsonage@gmail.com>
Description Provides utility functions for, and drawing on, the 'data.table' package. The package also collates useful miscellaneous functions extending base R not available elsewhere. The name is a portmanteau of 'utils' and the author.

BugReports https://github.com/hughparsonage/hutils/issues

License GPL-3
Depends R (>= 3.3.0)
Imports data.table (< 2.0.0), magrittr (< 2.0.0), stats, utils, fastmatch (< 2.0.0), grDevices
Suggests testthat (>= 2.1.0), datasets, desc, dplyr, digest, Hmisc, microbenchmark, knitr, rmarkdown, nycflights13, geosphere, ggplot2, readr, rcheology, survey, tibble, tidyr, withr (>= 2.0.0)

RoxygenNote 6.1.1

Encoding UTF-8
VignetteBuilder knitr

NeedsCompilation no
Author Hugh Parsonage [aut, cre], Michael Frasco [ctb], Ben Hamner [ctb]

Description

Provides utility functions for, and drawing on, the 'data.table' package. The package also collates useful miscellaneous functions extending base R not available elsewhere. The name is a portmanteau of 'utils' and the author.

Details

The package attempts to provide lightweight, fast, and stable functions for common operations.

By lightweight, I mean in terms of dependencies: we import package: data.table and package: fastmatch which do require compilation, but in C. Otherwise, all dependencies do not require compilation.

By fast, I mean essentially as fast as possible without using compilation.

By stable, I mean that unit tests should not change unless the major version also changes. To make this completely transparent, tests include the version of their introduction and are guaranteed to not be modified (not even in the sense of adding extra, independent tests) while the major version is 1. Tests that do not include the version in their filename may be modified from version to version (though this will be avoided).

ahull

Maximum area given x and y coordinates

Description

Present since hutils 1.2.0.

Usage

ahull(DT, x = DT$x, y = DT$y, minH = 0, minW = 0, maximize = "area", incl_negative = FALSE)

Arguments

DT, x, y Coordinates of a curve containing a rectangle. Either as a list, DT, containing columns x and y.
minH The minimum height of the rectangles.
minW The minimum width of the rectangles.
maximize How the rectangle should be selected. Currently, only "area" supported.
incl_negative Should areas below the x-axis be considered?
Value

A data.table: The coordinates of a rectangle, from (0, 0), (1, 0), (1, 1), (0, 1), south-west clockwise, that is contained within the area of the chart for positive values only.

Examples

ahull(, c(0, 1, 2, 3, 4), c(0, 1, 2, 0, 0))

<table>
<thead>
<tr>
<th>aliases</th>
<th>Aliases</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Description

These simple aliases can be useful to avoid operator precedence ambiguity, or to make use of indents from commas within your text editor. The all-caps versions accept single-length (capable of ‘short-circuits’) logical conditions only.

Neither and nors are identical except have slightly different short-circuits. NOR uses negation once so may be quicker if the first argument is very, very prompt.

Usage

AND(x, y)
OR(x, y)
nor(x, y)
neither(x, y)
NOR(x, y)
NEITHER(x, y)
pow()
XOR(x, y)

Arguments

x, y Logical conditions.
all_same_sign

Determine whether a vector is all of the same sign

Description

Present since hutils 1.2.0.

Usage

all_same_sign(x)

Arguments

x
A numeric vector.

Value

TRUE if all elements of x have the same sign. Zero is a separate sign from positive and negative. All vectors of length-1 or length-0 return TRUE, even if x = NA, (since although the value is unknown, it must have a unique sign), and non-numeric x.

Examples

all_same_sign(1:10)
all_same_sign(1:10 - 1)
all_same_sign(0)
all_same_sign(NA)
all_same_sign(c(NA, 1))
all_same_sign("surprise?")
all_same_sign(c(0, 0.1 + 0.2 - 0.3))

if (requireNamespace("microbenchmark", quietly = TRUE)) {
  library(microbenchmark)
  microbenchmark(base = length(unique(sign(1:1e5), nmax = 3)) == 1L,
                  all_same_sign(1:1e5))
}

# Unit: microseconds
# expr  min  lq median  uq  max neval cld
# base 2012 2040 2322 2047 9324  100 b
# all_same_sign(1:1e+05) 86 86 94 89 93 290  100 a
any_grepl  

*Does the pattern appear anywhere?*

**Description**

Shortcut for `any(grepl(...))`, mostly for consistency.

**Usage**

```r
any_grepl(x, pattern, perl = TRUE, ignore.case = FALSE, fixed = FALSE, quiet = FALSE)
```

**Arguments**

- `x` A character vector.
- `pattern`, `perl`, `ignore.case`, `fixed` As in `grep`.
- `quiet` (logical, default: `FALSE`) If `TRUE`, silences any messages.

**Details**

From version v 1.4.0, `any_grepl(a, bb)` will be internally reversed to `any_grepl(bb, a)` if `length(bb) > 1` and `length(a) == 1`.

**Examples**

```r
any_grepl(c("A_D_E", "KØj"), "[a-z]")
```

---

**auc**  

*AUC*

**Description**

Returns the area under the curve ("AUC") of a receiver-operating characteristic curve for the given predicted and actual values.

**Usage**

```r
auc(actual, pred)
```
average_bearing

Arguments

- **actual**: Logical vector: TRUE for positive class. If not a logical vector, the result is interpreted as one if safe to do so, viz. if actual contains precisely two unique values and is either a numeric vector, an ordered factor, or the unique values are FALSE and TRUE (case-insensitively). Anything else is an error.

- **pred**: Numeric (double) vector the same length as actual giving the predicted probability of TRUE. Must be a numeric vector the same length as actual.

Source

Source code based on Metrics::auc from Ben Hamner and Michael Frasco and Erin LeDell from the Metrics package.

average_bearing Average of bearings

Description

Average of bearings

Usage

average_bearing(theta1, theta2, average_of_opposite = NULL)

average_bearing_n(thetas)
coalesce

Arguments

theta1, theta2  Bearings, expressed in degrees.

average_of_opposite

The average of opposing bearings (e.g. average of north and south) is not well-defined. If NULL, the result for opposing vectors is undefined; if "right", returns theta1 + 90; if "left" then theta2 + 90. Can also be a single numeric to provide a specific value when the vectors point in opposite directions.

thetas  A vector of bearings.

Value

For ‘average_bearing’, the bearing bisecting the two bearings.
For ‘average_bearing_n’, the average bearing of the bearing.

Examples

average_bearing(0, 90)
average_bearing(0, 270)
average_bearing(90, 180)

average_bearing(0, 180)
average_bearing(0, 180, average_of_opposite = 3)
average_bearing(0, 180, average_of_opposite = "left")

average_bearing_n(1:179)

coalesce  Find first non-missing element

Description

Lightweight version of `dplyr::coalesce`, with all the vices and virtues that come from such an approach. Very similar logic (and timings to `dplyr::coalesce`), though no ability to use quosures etc. One exception is that if x does not contain any missing values, it is returned immediately, and ignores .... For example, `dplyr::coalesce(1:2,1:3)` is an error, but `hutils::coalesce(1:2,1:3)` is not.

Usage

coalessce(x, ...)

Arguments

x  A vector

...  Successive vectors whose values will replace the corresponding values in x if the value is (still) missing.
Value

x with missing values replaced by the first non-missing corresponding elements in .... That is, if .... = A,B,C and x[i] is missing, then x[i] is replaced by A[i]. If x[i] is still missing (i.e. A[i] was itself NA), then it is replaced by B[i], C[i] until it is no longer missing or the list has been exhausted.

Source

Original source code but obviously inspired by dplyr::coalesce.

Examples

coalesce(c(1, NA, NA, 4), c(1, 2, NA, NA), c(3, 4, 5, NA))

Description

Simply a wrapper around dev.copy2pdf, but without the need to remember that an A4 sheet of paper is 8.27 in by 11.69 in.

Usage

dev_copy2a4(filename, ...)

Arguments

filename A string giving the name of the PDF file to write to, must end in .pdf.

... Other parameters passed to pdf.

Value

As in dev2.
### dir2

**List many files**

(Windows only) Same as **list.files** but much faster. Present since v1.4.0.

#### Usage

```r
dir2(path = ".", file_ext = NULL, full.names = TRUE,
    recursive = TRUE, pattern = NULL, fixed = FALSE, perl = TRUE &&
    missing(fixed) && !fixed, ignore.case = FALSE, invert = FALSE,
    .dont_use = FALSE)
```

#### Arguments

- **path**: A string representing the trunk path to search within.
- **file_ext**: A string like '*.txt' or '.csv' to limit the result to files with that extension.
- **full.names**: TRUE by default.
- **recursive**: TRUE by default.
- **pattern, perl, ignore.case, fixed, invert**: As in grep but with different defaults. Used to filter files with extension `file_ext`.
- **.dont_use**: Only used for tests to simulate non-Windows systems.

#### Value

The same as **list.files**, a character vector of files sought.

---

### drop_col

**Drop column or columns**

#### Description

Drop column or columns

#### Usage

```r
drop_col(DT, var, checkDT = TRUE)
drop_cols(DT, vars, checkDT = TRUE)
```
Drop columns whose names match a pattern

drop_colr

Arguments

DT  A data.table.
var  Quoted column to drop.
checkDT  Should the function check DT is a data.table?
vars  Character vector of columns to drop. Only the intersection is dropped; if any
vars are not in names(DT), no warning is emitted.

Value

DT with specified columns removed.

Examples

if (requireNamespace("data.table", quietly = TRUE)) {
  library(data.table)
  DT <- data.table(x = 1, y = 2, z = 3)
  
drop_col(DT, "x")
}
### drop_constant_cols  
**Drop constant columns**

**Description**  
Drops columns that have only one value in a data.table.

**Usage**

```r
drop_constant_cols(DT, copy = FALSE)
```

**Arguments**

- **DT**: A data.table.
- **copy** (logical, default: FALSE) Whether the data.table should be copied before any columns are dropped. If FALSE, the default, columns are dropped from DT by reference.

**Details**

If DT is a data.frame that is not a data.table, constant columns are still dropped, but since DT will be copied, copy should be set to TRUE to avoid a warning. If DT is a data.frame and all but one of the columns are constant, a data.frame will still be returned, as opposed to the values of the sole remaining column, which is the default behaviour of base data.frame.

If all columns are constant, drop_constant_cols returns a Null data table if DT is a data.table, but a data frame with 0 columns and nrow(DT) otherwise.

**Examples**

```r
library(data.table)
X <- data.table(x = c(1, 1), y = c(1, 2))
drop_constant_cols(X)
```

### drop_empty_cols  
**Drop empty columns**

**Description**  
Removes columns from a data.table where all the values are missing.

**Usage**

```r
drop_empty_cols(DT, copy = FALSE)
```
Arguments

DT
A data.table.

copy
Copies the data.table so the original can be retained. Not applicable if DT is not a data.table. If FALSE, the default, DT itself will be modified.

duplicated_rows
Return duplicated rows of data.table

Description

This function differs from duplicated in that it returns both the duplicate row and the row which has been duplicated. This may prove useful in combination with the by argument for determining whether two observations are identical across more than just the specified columns.

Usage

duplicated_rows(DT, by = names(DT), na.rm = FALSE, order = TRUE, copyDT = TRUE, na.last = FALSE)

Arguments

DT
A data.table.

by
Character vector of columns to evaluate duplicates over.

na.rm
(logical) Should NAs in by be removed before returning duplicates? (Default FALSE.)

order
(logical) Should the result be ordered so that duplicate rows are adjacent? (Default TRUE.)

copyDT
(logical) Should DT be copied prior to detecting duplicates. If FALSE, the ordering of DT will be changed by reference.

na.last
(logical) If order is TRUE, should NAs be ordered first or last?. Passed to data.table::setorderv.

Value

Duplicate rows of DT by by. For interactive use.

Examples

if (requireNamespace("data.table", quietly = TRUE)) {
  library(data.table)

  DT <- data.table(x = rep(1:4, 3),
                   y = rep(1:2, 6),
                   z = rep(1:3, 4))
# No duplicates
duplicated_rows(DT)

# x and y have duplicates
duplicated_rows(DT, by = c("x", "y"), order = FALSE)

# By default, the duplicate rows are presented adjacent to each other.
duplicated_rows(DT, by = c("x", "y"))

find_pattern_in

Find string pattern in (text) file

Description

Find string pattern in (text) file

Usage

find_pattern_in(file_contents, basedir = ".", dir_recursive = TRUE,
reader = readLines, include.comments = FALSE, comment.char = NULL,
use.OS = FALSE, file_pattern = "\.(R|r)(nw|md)?$",
file_contents_perl = TRUE, file_contents_fixed = FALSE,
file_contents_ignore_case = FALSE, file.ext = NULL,
which_lines = c("first", "all"))

Arguments

- **file_contents**: A perl-regular expression as a search query.
- **basedir**: The root of the directory tree in which files will be searched recursively.
- **dir_recursive**: (logical, default: TRUE) Search within subdirectories of basedir?
- **reader**: A function, akin to `base::readLines`, the default, that accepts a filename and returns a character vector.
- **include.comments**: If FALSE, the default, comments (i.e. anything after a #) are not searched.
- **comment.char**: If include.comments is FALSE, what character marks a comment character? By default, NULL, which sets the correct comment symbol for R and TeX files.
- **use.OS**: Use the operating system to determine file list. Only available on Windows. If it fails, a fall-back option (using `dir`) is used.
- **file_pattern**: A regular expression passed to `list.files(pattern = file.ext)`. By default, ".(R|r)(nw|md)?$", i.e. all R and Sweave files. (Does not have to be a file extension.)
- **file_contents_perl**: (logical, default: TRUE) Should file_contents be interpreted as a perl regex?
file_contents_fixed
(logical, default: FALSE) Should file_contents be interpreted as a fixed regex?

file_contents-ignore_case
(logical, default: FALSE) As in grep.

file.ext
A file extension passed to the operating system if use.OS is used.

which_lines
One of "first" and "all". If "first" only the first match in any file is returned in the result; if "all", all matches are.

Details
For convenience, if file_contents appears to be a directory and basedir does not, the arguments are swapped, but with a warning.

Value
A data.table, showing the matches per file.

---

generate_LaTeX_manual  Generate LaTeX manual of installed package

Description
Generate LaTeX manual of installed package

Usage

generate_LaTeX_manual(pkg, launch = TRUE)

Arguments

pkg  Quoted package name (must be installed).
launche Should the PDF created be launched using the viewer (TRUE by default)?

Value
See system. Called for its side-effect: creates a PDF in the current working directory. Requires a TeX distribution.

Source

https://stackoverflow.com/a/30608000/1664978
**haversine_distance**  
*Distance between two points on the Earth*

**Description**
Distance between two points on the Earth

**Usage**
```r
haversine_distance(lat1, lon1, lat2, lon2)
```

**Arguments**
- `lat1, lon1, lat2, lon2`
  That latitudes and longitudes of the two points.

**Details**
This is reasonably accurate for distances in the order of 1 to 1000 km.

**Value**
The distance in kilometres between the two points.

**Examples**
```
# Distance from YMEL to YSSY
haversine_distance(-37 - 40/60, 144 + 50/60, -33 - 56/60, 151 + 10/60)
```

---

**if_else**  
*Vectorized if*

**Description**
Lightweight `dplyr::if_else` with the virtues and vices that come from such an approach. Attempts to replicate `dplyr::if_else` but written in base R for faster compile time. `hutils::if_else` should be faster than `dplyr::if_else` ... when it works, but will not work on lists or on factors. Additional attributes may be dropped.

**Usage**
```r
if_else(condition, true, false, missing = NULL)
```
implies

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>condition</td>
<td>Logical vector. Where condition is TRUE/FALSE, use the corresponding true/false value. They must have the same typeof as each other and be the same length as condition or length-one.</td>
</tr>
<tr>
<td>true, false</td>
<td>If condition is NA, use the corresponding na value. Like true and false, must be of the same type and have the same length as condition, unless it has length one.</td>
</tr>
<tr>
<td>missing</td>
<td>If condition is NA, use the corresponding na value. Like true and false, must be of the same type and have the same length as condition, unless it has length one.</td>
</tr>
</tbody>
</table>

Details

If the result is expected to be a factor then the conditions for type safety are strict and may be made stricter in future.

Value

Where condition is TRUE, the corresponding value in true; where condition is FALSE, the corresponding value in false. Where condition is NA, then the corresponding value in na – unless na is NULL (the default) in which case the value will be NA (with the same type as true.)

Source

Original code but obviously heavily inspired by [https://CRAN.R-project.org/package=dplyr](https://CRAN.R-project.org/package=dplyr).

# Logical implies

Description

Returns the result of $x \implies y$.

Usage

\[
\text{implies}(x, y)
\]

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x, y</td>
<td>Logical vectors of the same length.</td>
</tr>
</tbody>
</table>

Value

Logical implies: TRUE unless x is TRUE and y is FALSE.

NA in either x or y results in NA if and only if the result is unknown. In particular NA %implies% TRUE is TRUE and FALSE %implies% NA is TRUE.

If x or y are length-one, the function proceeds as if the length-one vector were recycled to the length of the other.
Examples

```r
library(data.table)
CJ(x = c(TRUE,
     FALSE),
   y = c(TRUE,
     FALSE))[, `x => y` := x %implies% y][]
```

#> x y x => y
#> 1: FALSE FALSE TRUE
#> 2: FALSE TRUE TRUE
#> 3: TRUE FALSE FALSE
#> 4: TRUE TRUE TRUE

# NA results:
#> 5: NA NA NA
#> 6: NA FALSE NA
#> 7: NA TRUE TRUE
#> 8: FALSE NA TRUE
#> 9: TRUE NA NA

---

isAttached

Is a package attached?

Description

Is a package attached?

Usage

```r
isAttached(pkg)
```

Arguments

`pkg`

Either character or unquoted.

Value

TRUE if `pkg` is attached.
**isTrueFalse**  

*Logical assertions*

**Description**

Logical assertions

**Usage**

```r
isTrueFalse(x)
```

**Arguments**

- `x` An object whose values are to be checked.

**Value**

For `isTrueFalse`, TRUE if and only if `x` is TRUE or FALSE identically (perhaps with attributes).

---

**longest_affix**  

*Longest common prefix/suffix*

**Description**

Longest common prefix/suffix

**Usage**

```r
trim_common_affixes(x, .x = NULL, na.rm = TRUE, prefixes = TRUE, suffixes = TRUE, warn_if_no_prefix = TRUE, warn_if_no_suffix = TRUE)

longest_suffix(x, .x = NULL, na.rm = TRUE, warn_if_no_suffix = TRUE)

longest_prefix(x, .x = NULL, na.rm = TRUE, warn_if_no_prefix = TRUE)
```

**Arguments**

- `x` A character vector.
- `.x` If NULL, the default, ignored. May be used if `x` is known to be free of NAs.
- `na.rm` (logical, default: TRUE) If FALSE, an NA in `x` means "" is the only common affix. If NA, the longest prefix/suffix is `NA_character_` (provided anyNA(x)). If anyNA(x) == FALSE na.rm has no effect.
- `prefixes` (logical, default: TRUE) If TRUE, trim prefixes.
suffixes (logical, default: TRUE) If TRUE, trim suffixes.

warn_if_no_prefix, warn_if_no_suffix
(logical, default: TRUE) If FALSE, if x has no common affixes the warning is suppressed. (If no common prefix/suffix then the common affix returned will be "" (the empty string.).)

Value

The longest common substring in x either at the start or end of each string. For trim_common_affixes x with common prefix and common suffix removed.

Examples

longest_prefix(c("totalx", "totaly", "totalz"))
longest_suffix(c("ztotal", "ytotal", "xtotal"))

mean_na

Proportion of values that are NA.

Description

Proportion of values that are NA.

Usage

mean_na(v)

Arguments

v A vector.

Value

A double, mean(is.na(v)).
Mode

Statistical mode

Description
Present since hutils 1.4.0. The most common element.

Usage
Mode(x)

Arguments
x  A vector for which the mode is desired.

Value
The most common element of x.
If the mode is not unique, only one of these values is returned, for simplicity.
If x has length zero, Mode(x) = x.

mutate_ntile
Add a column of ntiles to a data table

Description
Add a column of ntiles to a data table

Usage
mutate_ntile(DT, col, n, weights = NULL, by = NULL, keyby = NULL, 
new.col = NULL, character.only = FALSE, overwrite = TRUE, 
check.na = FALSE)

Arguments
DT  A data.table.
col  The column name (quoted or unquoted) for which quantiles are desired.
n  A positive integer, the number of groups to split col.
weights  If NULL, the default, use unweighted quantiles. Otherwise, a string designating the column that is passed to weighted_ntile.
by, keyby  Produce a grouped quantile column, as in data.table. keyby will set a key on the result (i.e. order by keyby).
new.col If not NULL, the name of the column to be added. If NULL (the default) a name will be inferred from n. (For example, n = 100 will be <col>Percentile).

character.only (logical, default: FALSE) Do not contemplate col to be an unquoted column name.

overwrite (logical, default: TRUE) If TRUE and new.col already exists in DT, the column will be overwritten. If FALSE, attempting to overwrite an existing column is an error.

check.na (logical, default: FALSE) If TRUE, NAs in DT[[col]] will throw an error. If NA’s are present, the corresponding n-tile may take any value.

Value

DT with a new integer column new.col containing the quantiles. If DT is not a data.table its class may be preserved unless keyby is used, where it will always be a data.table.

Examples

library(data.table)
DT <- data.table(x = 1:20, y = 2:1)
mutate_ntile(DT, "x", n = 10)
mutate_ntile(DT, "x", n = 5)
mutate_ntile(DT, "x", n = 10, by = "y")
mutate_ntile(DT, "x", n = 10, keyby = "y")

y <- "x"
DT <- data.table(x = 1:20, y = 2:1)
mutate_ntile(DT, y, n = 5) # Use DT$y
mutate_ntile(DT, y, n = 5, character.only = TRUE) # Use DT$x

mutate_other Group infrequent entries into 'Other category'

Description

Useful when you want to constrain the number of unique values in a column by keeping only the most common values.

Usage

mutate_other(.data, var, n = 5, count, by = NULL, var.weight = NULL, mass = NULL, copy = TRUE, other.category = "Other")
Arguments

- `.data` Data containing variable.
- `var` Variable containing infrequent entries, to be collapsed into "Other".
- `n` Threshold for total number of categories above "Other".
- `count` Threshold for total count of observations before "Other".
- `by` Extra variables to group by when calculating `n` or `count`.
- `var.weight` Variable to act as a weight: var's where the sum of this variable exceeds `mass` will be kept, others set to `other.category`.
- `mass` Threshold for sum of `var.weight`: any var where the aggregated sum of `var.weight` exceeds `mass` will be kept and other var will be set to `other.category`. By default (`mass = NULL`), the value of `mass` is $-\infty$, with a warning. You may set it explicitly to $-\text{Inf}$ if you really want to avoid a warning that this function will have no effect.
- `copy` Should `.data` be copied? Currently only `TRUE` is supported.
- `other.category` Value that infrequent entries are to be collapsed into. Defaults to "Other".

Value

- `.data` but with `var` changed so that infrequent values have the same value (`other.category`).

Examples

```r
library(data.table)
library(magrittr)

DT <- data.table(City = c("A", "A", "B", "B", "C", "D"),
                 value = c(1, 9, 4, 4, 5, 11))

DT %>%
  mutate_other("City", var.weight = "value", mass = 10) %>%
  .[]
```

---

ngrep  

Anti-grep

Description

It is not simple to negate a regular expression. This obviates the need takes the long way round: negating the corresponding `grepl` call.

Usage

```r
ngrep(pattern, x, value = FALSE, ...)
```
Arguments

x, value, pattern

As in `grep`.

... Arguments passed to `grep`. 

Value

If value is FALSE (the default), indices of x which do not match the pattern; if TRUE, the values of x themselves.

Examples

```r
grep("[a-h]", letters)
grep("[a-h]", letters)

`grep("[gu]", txt, value = TRUE)`
grep("[gu]", txt, value = TRUE)
```

---

**provide.dir**

*Provide directory*

**Description**

Provide directory. Create directory only if it does not exist.

**Usage**

`provide.dir(path, ...)`

**Arguments**

path Path to create.

... Passed to `dir.create`.

**Value**

path on success, the empty string character(1) on failure.
provide.file  

Describe a file

Description

Present since hutils v1.5.0.

Usage

provide.file(path, on_failure = "")

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>A string. The path to a filename that requires existence.</td>
</tr>
<tr>
<td>on_failure</td>
<td>The return value on failure. By default, an empty string.</td>
</tr>
</tbody>
</table>

Value

path for success. Or on_failure if the path cannot be provided.

replace_pattern_in  

Replace string pattern in text file

Description

Replace string pattern in text file

Usage

replace_pattern_in(file_contents, replace, basedir = ".", dir_recursive = TRUE, reader = readLines, file_pattern = "\.(R|r)(nw|md)?\$", file_contents_perl = TRUE, file_contents_fixed = FALSE, file_contents_ignore_case = FALSE, writer = writeLines)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_contents</td>
<td>Character string containing a regular expression to be matched in the given character vector. Passed to pattern in gsub.</td>
</tr>
<tr>
<td>replace</td>
<td>The replacement, passed to replacement in gsub.</td>
</tr>
<tr>
<td>basedir</td>
<td>The root of the directory tree in which files will be searched recursively.</td>
</tr>
<tr>
<td>dir_recursive</td>
<td>(logical, default: TRUE) Search within subdirectories of basedir?</td>
</tr>
<tr>
<td>reader</td>
<td>A function, akin to base::readLines, the default, that accepts a filename and returns a character vector.</td>
</tr>
</tbody>
</table>
file_pattern  A regular expression passed to `list.files(pattern = file.ext)`. By default, 
"\.(R|r)(nw|md)?\$", i.e. all R and Sweave files. (Does not have to be a file 
extension.)

file_contents_perl  
(logical, default: TRUE) Should `file_contents` be interpreted as a perl regex?

file_contents_fixed  
(logical, default: FALSE) Should `file_contents` be interpreted as a fixed 
regex?

file_contents_ignore_case  
(logical, default: FALSE) As in `grep`.

writer  A function that will rewrite the file from the character vector read in.

---

**report_error**  
*Report errors and warnings*

**Description**

Provides a consistent style for errors and warnings.

**Usage**

```r
report_error(faulty_input, error_condition, requirement, context = NULL, 
advice, hint = NULL, halt = TRUE)
```

**Arguments**

- **faulty_input**: Unquoted function argument that is the cause of the error condition.
- **error_condition**: A sentence explaining the condition that invoked the error.
- **requirement**: A sentence that explains what is required.
- **context**: (Optional) A sentence that contextualizes the error
- **advice**: Advice for the user to avoid the error.
- **hint**: If the input can be guessed,
- **halt**: (logical, default: TRUE) Should the function signal an error and halt?
RQ

Shorthand for requireNamespace

Description

Present since hutils v1.2.0. Alias for if (!requireNamespace(pkg, quietly = TRUE)) yes else no. Typical use-case would be RQ(pkg, install.packages("pkg")].

Default values for yes and no from hutils v1.5.0.

This function is not recommended for use in scripts as it is a bit cryptic; its use-case is for bash scripts and the like where calls like this would otherwise be frequent and cloud the message.

Usage

RQ(pkg, yes = NULL, no = NULL)

Arguments

pkg  Package to test whether the package is not yet installed.
yes  Response if pkg is not installed.
no   (optional) Response if pkg is installed.

Examples

## Not run:
RQ("dplyr", "dplyr needs installing")

## End(Not run)

samp  Safer sampler

Description

Present since hutils v1.4.0. Same as sample, but avoiding the behaviour when length(x) == 1L.

Usage

samp(x, size = length(x), replace = size > length(x), loud = TRUE, prob = NULL)
selector

Fast selection of data.table columns

Description
Present since hutils 1.2.0.

Usage
selector(DT, ..., cols = NULL, preserve.key = TRUE, shallow = FALSE)

Arguments
- DT: A data.table.
- ...: Unquoted columns names.
- cols: Character vector of column names.
- preserve.key: (logical, default: TRUE) Reapply the key (if DT has one)?
- shallow: (logical, default: FALSE) Should the result be a shallow copy of DT’s columns or should the columns be assigned by reference? If TRUE, any modification to the result also modifies the selected columns in DT.

Arguments
- x: A vector.
- size: A non-negative integer, the number of items to return.
- replace: Should the sampling be done with replacement? Defaults to TRUE if size > length(x), with a message.
- loud: If TRUE, the default, any behaviour known to be different from sample is flagged with a message.
- prob: As in sample.

Examples
samp(1:5)
sample(1:5)
samp(1:5, size = 10) # no error
tryCatch(sample(1:5, size = 10),
  error = function(e) print(e$m))
samp(5, size = 3)
sample(5, size = 3)
**select_grep**

**Value**

DT with the selected columns.

**Examples**

```r
RQ("nycflights13", no = {
  library(nycflights13)
  library(data.table)
  fs <- as.data.table(flights)
  fs1 <- selector(fs, year, month, day, arr_delay)
  fs1[, arr_delay := NA]
})
```

---

**select_grep**  
*Select names matching a pattern*

**Description**

Select names matching a pattern

**Usage**

```r
select_grep(DT, patterns, .and = NULL, .but.not = NULL, ignore.case = FALSE, perl = TRUE, fixed = FALSE, useBytes = FALSE, invert = FALSE, .warn.fixed.mismatch = TRUE)
```

**Arguments**

- **DT**  
  A data.frame.

- **patterns**  
  Regular expressions to be matched against the names of DT. If `length(patterns)` > 1 the patterns are concatenated using alternation.

- **.and**  
  Character or integer positions of names to select, regardless of whether or not they are matched by `patterns`.

- **.but.not**  
  Character or integer positions of names to drop, regardless of whether or not they are matched by `patterns` or whether they are explicitly added by `.and`.

- **ignore.case, perl, fixed, useBytes, invert**  
  Arguments passed to `grep`. Note that `perl = TRUE` by default (unlike `grep`) unless `fixed = TRUE` (and `perl` is missing).

- **.warn.fixed.mismatch**  
  (logical, default: TRUE) If TRUE, the default, selecting `fixed = TRUE` with `perl = TRUE` or `ignore.case = TRUE` results in `perl` and `ignore.case` being reset to FALSE with a warning (as in `grep`), even if it makes no difference to the columns eventually selected. If FALSE unambiguous results are allowed; if `ignore.case = TRUE` and `fixed = TRUE`, the result is **unambiguous** if select_grep(DT, tolower(patterns), fixed = TRUE) and select_grep(DT, toupper(patterns), fixed = TRUE) are identical.
select_which

Select columns satisfying a condition

Description
Select columns satisfying a condition

Usage
select_which(DT, Which, .and.dots = NULL, checkDT = TRUE)

Arguments
- DT: A data.table.
- Which: A function that takes a vector and returns TRUE or FALSE. TRUE columns are selected.
- .and.dots: Optional extra columns to include. May be a character vector of names(DT) or numeric (positions) or logical. If provided, the columns so added (if they do not satisfy Which) will be after all the columns Which do so satisfy.
- checkDT: If TRUE (the default), an informative error message is provided if DT is not a data.table.

Value
DT with the selected variables.

Examples
library(data.table)
DT <- data.table(x = 1:5, y = letters[1:5], AB = c(NA, TRUE, FALSE))
select_which(DT, anyNA, .and.dots = "y")
Description

Reorder columns of a data.table (via setcolorder) so that particular columns appear first (or last), or in a particular order.

Usage

```r
set_cols_first(DT, cols, intersection = TRUE)
set_cols_last(DT, cols, intersection = TRUE)
set_colsuborder(DT, cols, intersection = TRUE)
```

Arguments

- **DT**: A data.table.
- **cols**: Character vector of columns to put before (after) all others or, in the case of `set_colsuborder`, a vector of columns in the order requested.
- **intersection**: Use the intersection of the names of `DT` and `cols`. If `FALSE` any `cols` are not the names of `DT`, the function may error on behalf of `data.table`. Not available for `set_colsuborder`.

Details

In the case of `set_colsuborder` the group of columns `cols` occupy the same positions in `DT` but in a different order. See examples.

Examples

```r
library(data.table)

DT <- data.table(y = 1:5, z = 11:15, x = letters[1:5])
set_cols_first(DT, "x")[]
set_cols_last(DT, "x")[]
set_colsuborder(DT, c("x", "y"))[]
```
Description

Swap values simultaneously. Present since hutils 1.4.0.

Usage

```r
x %<->% value
```

Arguments

- `x`, `value`: Objects whose values are to be reassigned by swapping.

Value

```
NULL invisibly. Called for its side-effect: the values of x and value are swapped. So
```

```r
x %<->% value
```

is equivalent to

```r
temp <- x
x <- value
value <- temp
rm(temp)
```

Examples

```r
a <- 1
b <- 2
a %<->% b
a
b
```
**Switch**

**Vectorized switch**

---

**Description**

Present since hutils 1.2.0. Vectorized version of switch. Used to avoid or make clearer the result of `if_else(Expr == ,..1,if_else(Expr == ,..2,...))`

**Usage**

```
Switch(Expr, ..., DEFAULT, IF_NA = NULL, MUST_MATCH = FALSE)
```

**Arguments**

- **Expr**: A character vector.
- **...**: As in `switch`, a list of named alternatives. Unlike `switch`, unnamed vectors are taken to match "". Likewise, NA values in `Expr` must be assigned via `IF_NA`.
- **DEFAULT**: A mandatory default value should any name of ... be left unmatched.
- **IF_NA**: Optional value to replace missing (NA_character_) values in `Expr`.
- **MUST_MATCH**: (logical, default: FALSE) Must every value in `Expr` be matched by a conversion in ...? If TRUE any output equal to the value of `DEFAULT` is an error.

**Value**

For every element of ... whose name matches an element of `Expr`, that element’s value.

**Examples**

```
Switch(c("a", "b", "c", "a"),
   "a" = 1,
   "b" = 2,
   "c" = 3,
   "4" = 4,
   DEFAULT = 0)
```

---

**unique-keys**

**Unique keys**

---

**Description**

A data.table’s key need not be unique, but there are frequently circumstances where non-unique keys can wreak havoc. `has_unique_key` reports the existence of a unique key, and `set_unique_key` both sets and ensures the uniqueness of keys.
weight2rows

Usage

has_unique_key(DT)

set_unique_key(DT, ...)

Arguments

DT
A data.table

... keys to set

Value

has_unique_key returns TRUE if DT has a unique key, FALSE otherwise. set_unique_key runs setkey(DT,...) then checks whether the key is unique, returning the keyed data.table if the key is unique, or an error message otherwise.

weight2rows

Expand a weighted data frame to an equivalent unweighted

Description

Present since v1.0.0. Argument rows.out available since v1.3.0; rows.out < 1 supported since v1.4.0. Argument discard_weight.var available since v1.3.0.

Usage

weight2rows(DT, weight.var, rows.out = NULL, discard_weight.var = FALSE)

Arguments

DT
A data.table. Will be converted to one if possible.

weight.var
Variable in DT to be used as weights.

rows.out
If not NULL (the default) specifies the number of rows in the result; otherwise the number of rows will be sum(DT[[weight.var]]). (Due to rounding, this figures are inexact.) Since v1.4.0, if 0 < rows.out < 1 then taken to be a sample of the unweighted table. (So rows.out = 0.1 would give a 10% sample.)

discard_weight.var
If FALSE, the default, weight.var in DT will be 1 for each row in the result or a new weight if rows.out is given. Otherwise, TRUE drops the column entirely.

Value

DT but with the number of rows expanded to sum(DT[[weight.var]]) to reflect the weighting.
## weighted_ntile

**Weighted (ranked) quantiles**

### Description

Weighted (ranked) quantiles

### Usage

```r
weighted_ntile(vector, weights = rep(1, times = length(vector)), n)
```

### Arguments

- **vector**: The vector for which quantiles are desired.
- **weights**: The weights associated with the vector. None should be NA or zero.
- **n**: The number of quantiles desired.

### Details

With a short-length vector, or with weights of a high variance, the results may be unexpected.

### Value

A vector of integers corresponding to the ntiles. (As in dplyr::ntile.)

### Examples

```r
weighted_ntile(1:10, n = 5)
weighted_ntile(1:10, weights = c(rep(4, 5), rep(1, 5)), n = 5)
```
**Description**

quantile when the values are weighted

**Usage**

weighted_quantile(v, w = NULL, p = (0:4)/4, v_is_sorted = FALSE)

**Arguments**

- **v**: A vector from which sample quantiles are desired.
- **w**: Weights corresponding to each v.
- **p**: Numeric vector of probabilities. Missing values or values outside [0, 1] raise an error.
- **v_is_sorted**: (logical, default: FALSE) If TRUE, ordering v is assumed to be sorted. Only set to TRUE when it is certain that v is sorted (as within groups of tables).

**Value**

A vector the same length as p, the quantiles corresponding to each element of p.

---

**%ein%**

*Exists and (not) in*

**Description**

A common blunder in R programming is to mistype one of a set of filters without realizing. This function will error if any member of the values to be matched against is not present.

**Usage**

lhs %ein% rhs

lhs %enotin% rhs

**Arguments**

- **lhs**: Values to be matched
- **rhs**: Values to be matched against.
Value

Same as `%in%` and `%notin%`, unless an element of rhs is not present in lhs, in which case, an error.

Examples

```r
# Incorrectly assumed to include two Species
iris[iris$Species %in% c("setosa", "versicolour"), ]
## Not run:
# Error:
iris[iris$Species %ein% c("setosa", "versicolour"), ]
## End(Not run)
```

%notchin%

Negation of in (character)

Description

Negation of in (character)

Usage

```r
x %notchin% y
```

Arguments

- **x**: Values to be matched.
- **y**: Values to be matched against.

Details

If `y` is NULL, then `x` is `TRUE` for consistency with `%in%`. If `x` and `y` are not both character, the function simply falls back to `%in%` rather than erroring.

%notin%

Negation of in

Description

Negation of in

Usage

```r
x %notin% y
```
Arguments

x  Values to be matched
y  Values to be matched against.

Details

If y is NULL, then x is TRUE for consistency with %in%. Note that the function uses fmatch internally for performance on large y. Accordingly, y will be modified by adding a .match.hash attribute and thus must not be used in packages where y is a constant, or for things like names of data.table.

%pin%  Partial in

Description

Analogue of %in% but indicating partial match of the left operand.

Usage

x %pin% Y

Arguments

x  The values to be matched. Same as %in%.
Y  A vector of values (perl regular expressions) to be matched against.

Value

TRUE for every x for which any grepl is TRUE.

Examples

x <- c("Sydney Airport", "Melbourne Airport")

x %pin% c("Syd", "Melb")
