Package ‘huxtable’

February 15, 2024

Type Package

Title Easily Create and Style Tables for LaTeX, HTML and Other Formats

Version 5.5.6

Author David Hugh-Jones [aut, cre]

Maintainer David Hugh-Jones <davidhughjones@gmail.com>

Description Creates styled tables for data presentation. Export to HTML, LaTeX, RTF, 'Word', 'Excel', and 'PowerPoint'. Simple, modern interface to manipulate borders, size, position, captions, colours, text styles and number formatting. Table cells can span multiple rows and/or columns. Includes a 'huxreg' function for creation of regression tables, and 'quick_\*' one-liners to print data to a new document.

Quick introduction to huxtable

Description

Huxtable is a package for creating HTML and \LaTeX{} tables. It provides similar functionality to \ptable, with a simpler interface.

Quick start

To create a huxtable object, use \function{huxtable()} or \function{as_huxtable()}:  

```r
library(huxtable)
employees <- huxtable(
  Names = c("Hadley", "Yihui", "Dirk"),
  Salaries = c(1e5, 1e5, 1e5),
  add_colnames = TRUE
)
car_hux <- as_hux(mtcars)
```

You can then set properties which affect how the huxtable is displayed:

```r
# make the first row bold:
bold(employees)[1, ] <- TRUE

# change the font size everywhere:
font_size(employees) <- 10
```

Or you can use a tidyverse style with the pipe operator:

```r
library(magrittr)
employees <- employees %>%
  set_font_size(10) %>%
  set_bold(1, everywhere, TRUE)
```

For more information, see the website or read the vignette with \function{vignette("huxtable")}. See \href{https://github.com/huxtable/huxtable}{huxtable-FAQ} for frequently asked questions, including ways to get help.

To report a bug, or suggest an enhancement, visit \href{https://github.com/huxtable/huxtable}{github}. 
add_colnames

Add column or row names

Description

Add a first row of column names, or a first column of row names, to the huxtable.

Usage

add_colnames(ht, ...)
## S3 method for class 'huxtable'
add_colnames(ht, rowname = NULL, ...)

add_rownames(ht, ...)
## S3 method for class 'huxtable'
add_rownames(ht, colname = "rownames", preserve_rownames = TRUE, ...)

Arguments

ht A huxtable.
...
Arguments passed to methods.
rowname Optional row name for the new row of column names.
colname Column name for the new column of row names.
preserve_rownames
            Preserve existing row names.

Details

Note that add_colnames will change the mode of all columns to character. Also note that it will move your rows down by one: what was row 1 will now be row 2, and the column names will now be row 1.

add_colnames preserves column names. add_rownames only preserves them if asked to.

Value

The modified object.

Examples

ht <- huxtable(
    First  = rnorm(5),
    Second = rnorm(5),
    add_rownames = FALSE
)
add_rownames(ht)
add_colnames(ht)

# Out by 1:
add_rownames(add_colnames(ht))

# Better:
add_colnames(add_rownames(ht))

# Alternatively:
add_colnames(add_rownames(ht, ""))

---

add_footnote | Add a row with a footnote

Description

This adds a single row at the bottom. The first cell contains the footnote; it spans all table columns and has an optional border above.

Usage

add_footnote(ht, text, border = 0.8, number_format = NA, ...)

Arguments

- **ht**: A huxtable.
- **text**: Text for the footnote.
- **border**: Width of the footnote’s top border. Set to 0 for no border, or NULL to leave the border unchanged.
- **number_format**: Number format for the footnote cell.
- **...**: Other properties, passed to `set_cell_properties()` for the footnote cell.

Value

The modified huxtable

Examples

jams <- add_footnote(jams,
"* subject to availability")
jams
add_rows

Insert one huxtable into another

Description
These functions combine two huxtables or similar objects and return the result.

Usage
add_rows(x, y, after = nrow(x), copy_cell_props = TRUE)
add_columns(x, y, after = ncol(x), copy_cell_props = TRUE)

Arguments
x, y   Huxtables or objects that can be converted by as_hux
after  Row or column after which y is inserted. Can be 0. Can be a row or column name. The default adds y to the end of x.
copy_cell_props  Logical. Passed to rbind.huxtable() or cbind.huxtable().

Details
Arguments in ... can include copy_cell_props.

Value
A huxtable.

See Also
insert_row() and insert_column(), which insert multiple values into a single row.

Examples
ht <- hux("Gooseberry", 2.15)
add_rows(jams, ht)
add_rows(jams, ht, after = 1)

mx <- matrix(
c("Sugar", "50\%", "60\%", "40\%", "Weight (g)", 300, 250, 300),
4, 2)
add_columns(jams, mx)
**align**

*Set the horizontal alignment of cell content*

**Description**

Values may be "left", "center", "right", NA or a single character. If value is a single character (e.g. a decimal point), then the cell is aligned on this character.

**Usage**

```r
code
```

**Arguments**

- `ht` A huxtable.
- `row` A row specifier. See `rowspecs` for details.
- `col` An optional column specifier.
- `fn` A mapping function. See `mapping-functions` for details.
- `value` A character vector or matrix.
  Set to NA to reset to the default, which is "left".

**Value**

- `align()` returns the `align` property.
- `set_align()` returns the modified huxtable.

**Aligning on a decimal point**

To align cells on the decimal point, set align to "." or any other single character (e.g. ",," in European languages).

By default, huxtable aligns these cells by padding with spaces. The mechanics of this were improved for LaTeX in version 5.3.0, but are still not perfect. Using a fixed-width font may help.

If `options("huxtable.latex_siunitx_align")` is set to TRUE, then in LaTeX output, numbers in these cells will be surrounded by `\tablenum{}`. See the siunitx documentation for more details.

Note that this may have other side-effects, for example `1e3` becomes `1 \times 10^3`.

To use non-default decimal points, set both `align(ht)` and `number_format()`. See the example.

**Examples**

```r
code
```
as_flextable

Convert a huxtable for Word/Powerpoint

Description

Huxtables can be converted to `flextable::flextable()` objects, for use in Word and Powerpoint documents.

Usage

```r
as_flextable(x, ...)  
```

```r
## S3 method for class 'huxtable'  
as_flextable(x, colnames_to_header = FALSE, ...)  
```

Arguments

- `x`  
  A huxtable.

- `...`  
  Not used.

- `colnames_to_header`  
  Use huxtable column names as the header. If FALSE, the flextable will contain only a body and no header.
Details

With recent versions of "flextable" and Pandoc, huxtables can be automatically outputted from rmarkdown word_document and/or powerpoint_presentation documents. (Powerpoint presentations require pandoc version >= 2.4.0.)

Properties are supported, with the following exceptions:

- Rotation of 0, 90 or 270 is supported.
- Non-numeric widths and heights are not supported. Table heights are treated as a proportion of 9 inches; table widths are treated as a proportion of 6 inches. So e.g. height(ht) <- 0.5 will give a height of 4.5 inches.
- Table wrap and table position are not supported.
- Border style "double" is not supported and becomes "solid".
- Captions are supported with recent versions of flextable, but not caption_pos() or caption_width().

Value

an object of class flextable.

Challenge

Try to say as_flextable.huxtable ten times without pausing.

Examples

```r
ht <- hux(a = 1:3, b = 1:3)
ft <- as_flextable(ht)
## Not run:
my_doc <- officer::read_docx()
my_doc <- flextable::body_add_flextable(
  my_doc, ft)
print(my_doc, target =
  "path/to/my_doc.docx")

## End(Not run)
```

as_huxtable

Convert objects to huxtables

Description

as_huxtable or as_hux converts an object to a huxtable. Conversion methods exist for data frames and tibbles, tables, ftables, matrices and (most) vectors.
Usage

as_huxtable(x, ...)

as_hux(x, ...)

## Default S3 method:
as_huxtable(
  x,
  add_colnames =getOption("huxtable.add_colnames", TRUE),
  add_rownames = FALSE,
  autoformat =getOption("huxtable.autoformat", TRUE),
  ...
)

## S3 method for class 'grouped_df'
as_huxtable(x, ..., groups_to_headers = FALSE)

is_huxtable(x)

is_hux(x)

Arguments

x Object to convert.

... Arguments passed on to huxtable().

add_colnames If TRUE, add a first row of column names to the huxtable.

add_rownames If TRUE or a character string, add a first column of row names to the huxtable. The string gives the name for the new column (or "rownames" for TRUE).

autoformat If TRUE, automatically format columns by type. See below.

groups_to_headers Logical. Convert groups to header rows?

Details

is_hux[table] tests if an object is a huxtable.

For table objects, add_colnames and add_rownames are TRUE by default. For matrix objects, they are FALSE. Other classes use options("huxtable.add_colnames"), which is TRUE by default; add_rownames is FALSE.

For dplyr::grouped_df() objects, groups will be converted to header rows if groups_to_headers is TRUE.

Value

An object of class "huxtable".
Examples

dfr <- data.frame(a = 1:5,
    b = letters[1:5],
    stringsAsFactors = FALSE)

as_hux(dfr)

mx <- matrix(letters[1:12], 4, 3)

as_hux(mx, add_colnames = FALSE)

library(stats)

tbl <- table(Wool = warpbreaks$wool,
    Tension = warpbreaks$tension)

as_hux(tbl) # adds row and column names by default

# adding rownames:

as_hux(mtcars[1:3,], add_colnames = TRUE,
    add_rownames = "Car")

if (requireNamespace("dplyr")) {
  iris_grp <- dplyr::group_by(iris[c(1:4, 51:54, 101:104), ], Species)
  as_hux(iris_grp, groups_to_headers = TRUE)
}

==as_Workbook==
  Convert a huxtable for Excel

Description

If the openxlsx package is installed, Huxtables can be converted to openxlsx::openxlsx() Workbook objects, for use in Excel documents.

Usage

as_Workbook(ht, ...)

## S3 method for class 'huxtable'

as_Workbook(
    ht,
    Workbook = NULL,
    sheet = "Sheet 1",
    write_caption = TRUE,
    start_row = 1,
    start_col = 1,
    ... )
as_Workbook

Arguments

ht A huxtable.
...
Workbook An existing Workbook object. By default, a new workbook will be created.
sheet Name for the worksheet where the huxtable will be created.
write_caption If TRUE, print any caption in the row above or below the table.
start_row, start_col Number. Write data starting at the given row and column.

Details

Use openxlsx::saveWorkbook() to save the resulting object to an Excel file. Properties are supported with the following exceptions:

- Non-numeric column widths and row heights, table width and height.
- Decimal padding.
- Cell padding.
- Table position.
- Caption width.

Huxtable tries to guess appropriate widths and height for rows and columns; numeric width() and height() are treated as scaling factors.

Contents are only stored as numbers if a whole column is "numeric", i.e. can be converted by as.numeric()). Otherwise, they are stored as text.

Value

An object of class Workbook.

Examples

wb <- as_Workbook(jams)

## Not run:
  openxlsx::saveWorkbook(wb, "my-excel-file.xlsx")

## End(Not run)

# multiple sheets in a single workbook:
wb <- openxlsx::createWorkbook()
w <- as_Workbook(jams,
  Workbook = wb, sheet = "sheet1")
w <- as_Workbook(
  hux("Another", "huxtable"),
  Workbook = wb,
  sheet = "sheet2")
background_color

Description

Colors can be in any format understood by R:

- A color name like "darkred"
- A HTML string like "#FF0000"
- The result of a function like rgb(1, 0, 0) or grey(0.5)

Usage

background_color(ht)
background_color(ht) <- value
set_background_color(ht, row, col, value )
map_background_color(ht, row, col, fn)

Arguments

ht A huxtable.
row A row specifier. See rowspecs for details.
col An optional column specifier.
fn A mapping function. See mapping-functions for details.
value A character vector or matrix.

Details

Transparent colors are not guaranteed to work at present.

Value

background_color() returns the background_color property. set_background_color() returns the modified huxtable.

See Also

Other formatting functions: bold(), font_size(), font(), na_string(), number_format(), text_color()
**bold**

Examples

```r
background_color(jams) <- grey(0.7)
background_color(jams)

set_background_color(jams, "yellow")
set_background_color(jams, 2:3, 1, "yellow")
map_background_color(jams, by_rows("yellow", grey(0.7)))
```

---

**bold**

*Make cell text bold or italic*

Description

Make cell text bold or italic

Usage

```r
bold(ht)
bold(ht) <- value
set_bold(ht, row, col, value = TRUE)
map_bold(ht, row, col, fn)

italic(ht)
italic(ht) <- value
set_italic(ht, row, col, value = TRUE)
map_italic(ht, row, col, fn)
```

Arguments

- `ht`: A huxtable.
- `row`: A row specifier. See `rowspecs` for details.
- `col`: An optional column specifier.
- `fn`: A mapping function. See `mapping-functions` for details.
- `value`: A logical vector or matrix. Set to `NA` to reset to the default, which is `FALSE`.

Value

`bold()` returns the `bold` property. `set_bold()` returns the modified huxtable.

See Also

Other formatting functions: `background_color()`, `font_size()`, `font()`, `na_string()`, `number_format()`, `text_color()`
Examples

```r
bold(jams) <- TRUE
bold(jams)

set_bold(jams, FALSE)
set_bold(jams, 2:3, 1, FALSE)
map_bold(jams, by_rows(FALSE, TRUE))
```

---

**border-colors**

*Set border colors*

### Description

These functions set border colors.

### Usage

```r
left_border_color(ht)
left_border_color(ht) <- value
set_left_border_color(ht, row, col, value)
map_left_border_color(ht, row, col, fn)

right_border_color(ht)
right_border_color(ht) <- value
set_right_border_color(ht, row, col, value)
map_right_border_color(ht, row, col, fn)

top_border_color(ht)
top_border_color(ht) <- value
set_top_border_color(ht, row, col, value)
map_top_border_color(ht, row, col, fn)

bottom_border_color(ht)
bottom_border_color(ht) <- value
set_bottom_border_color(ht, row, col, value)
map_bottom_border_color(ht, row, col, fn)
```

### Arguments

- **ht** A huxtable.
- **row** A row specifier. See `rowspecs` for details.
- **col** An optional column specifier.
- **fn** A mapping function. See `mapping-functions` for details.
- **value** A valid R color, e.g. "red", "#FF0000".
Details

Borders are always "collapsed": right_border_color(ht)[,1] is the same as left_border_color(ht)[, 2], and setting one sets the other.

Limitations

- Transparent borders with the alpha channel set are not guaranteed to work.

See Also

set-multiple, brdr()

Other border properties: border-styles, borders

Examples

jams <- set_all_borders(jams)
bottom_border_color(jams)[1,] <- "red"
jams

set_bottom_border_color(jams, "blue")

Description

These functions set border styles.

Usage

left_border_style(ht)
left_border_style(ht) <- value
set_left_border_style(ht, row, col, value)
map_left_border_style(ht, row, col, fn)

right_border_style(ht)
right_border_style(ht) <- value
set_right_border_style(ht, row, col, value)
map_right_border_style(ht, row, col, fn)

top_border_style(ht)
top_border_style(ht) <- value
set_top_border_style(ht, row, col, value)
map_top_border_style(ht, row, col, fn)
bottom_border_style(ht)
bottom_border_style(ht) <- value
set_bottom_border_style(ht, row, col, value )
map_bottom_border_style(ht, row, col, fn)

Arguments

ht          A huxtable.
row         A row specifier. See rowspecs for details.
col         An optional column specifier.
fn           A mapping function. See mapping-functions for details.
value       One of "solid", "double", "dashed" or "dotted".

Details

Borders are always "collapsed": right_border_style(ht)[, 1] is the same as left_border_style(ht)[, 2], and setting one sets the other.

Limitations

- In HTML, you will need to set a width of at least 3 to get a double border.
- Only "solid" and "double" styles are currently implemented in LaTeX.

See Also

set-multiple, brdr()

Other border properties: border-colors, borders

Examples

jams <- set_allBorders(jams)
bottom_border_style(jams)[1, ] <- "dotted"
jams

set_bottom_border_style(jams, "double")

<table>
<thead>
<tr>
<th>borders</th>
<th>Set borders</th>
</tr>
</thead>
</table>

Description

These functions set borders between cells.
Usage

```r
left_border(ht)
left_border(ht) <- value
set_left_border(ht, row, col, value = 0.4)
map_left_border(ht, row, col, fn)

right_border(ht)
right_border(ht) <- value
set_right_border(ht, row, col, value = 0.4)
map_right_border(ht, row, col, fn)

top_border(ht)
top_border(ht) <- value
set_top_border(ht, row, col, value = 0.4)
map_top_border(ht, row, col, fn)

bottom_border(ht)
bottom_border(ht) <- value
set_bottom_border(ht, row, col, value = 0.4)
map_bottom_border(ht, row, col, fn)

## S3 replacement method for class 'huxtable'
left_border(ht) <- value

## S3 replacement method for class 'huxtable'
right_border(ht) <- value

## S3 replacement method for class 'huxtable'
top_border(ht) <- value

## S3 replacement method for class 'huxtable'
bottom_border(ht) <- value
```

Arguments

- **ht**: A huxtable.
- **value**: A numeric thickness or a `brdr()` object.
- **row**: A row specifier. See `rowspecs` for details.
- **col**: An optional column specifier.
- **fn**: A mapping function. See `mapping-functions` for details.

Details

Borders are always "collapsed": `right_border(ht)[, 1]` is the same as `left_border(ht)[, 2]`, and setting one sets the other.

Setting `left_border(ht) <- number` sets the border thickness. You can set multiple properties at once by using `brdr()`. 
Currently in LaTeX, all non-zero border widths on a given line must be the same.

Limitations

- In HTML, you will need to set a width of at least 3 to get a double border.
- Only "solid" and "double" styles are currently implemented in LaTeX, and all non-zero horizontal border widths on a given line must be the same.

See Also

set-multiple

Other border properties: border-colors, border-styles

Examples

```r
bottom_border(jams)[1, ] <- 0.4
jams

bottom_border(jams)[1, ] <- brdr(0.4, "solid", "blue")
jams

set_bottom_border(jams, brdr(0.4, "solid", "green"))
```

---

**brdr**  
*Create a border object*

**Description**

`brdr()` objects can be passed into `set_top_border()` and friends. They set multiple border properties simultaneously.

**Usage**

```r
brdr(thickness = 0.4, style = "solid", color = NA_character_)
```

**Arguments**

- `thickness`  
  Thickness of the border in points.
- `style`  
  "solid" (the default), "double", "dashed" or "dotted".
- `color`  
  String representing a valid color (either a color name or a hexadecimal string like "#00FF00").

**Value**

An object of class "brdr".
**brdr_thickness**

Examples

```r
set_bottom_border(jams, brdr(1, "solid", "red"))
```

| brdr_thickness | Get thickness of a `brdr()` object |

Description

Get thickness of a `brdr()` object

Usage

```r
brdr_thickness(x)
```

Arguments

- `x` A `brdr()` object.

Value

A number or numeric matrix.

Examples

```r
brdr_thickness(left_border(jams))
brdr_thickness(brdr(1, "solid", "red"))
```

| by_cases | Map cell contents to properties using `case_when` |

Description

This function uses `dplyr::case_when()` to set cell properties.

Usage

```r
by_cases(..., ignore_na = TRUE)
```

Arguments

- `...` A list of two-sided formulas interpreted by `case_when`.  
- `ignore_na` If `TRUE`, NA values in the result will be left unchanged from their previous values. Otherwise, NA normally resets to the default.
Details

Within the formulas, the variable . will refer to the content of ht[rows, cols], after conversion to a vector.

case_when returns NA when no formula LHS is matched. To avoid this, set a default in the last formula: TRUE ~ default.

case_when can’t deal with brdr() objects, so you cannot use these in by_cases().

Value

A function for use in map_*** functions.

See Also

mapping-functions

Other mapping functions: by_colorscape(), by_function(), by_quantiles(), by_ranges(), by_regex(), by_rows(), by_values()

Examples

```r
if (! requireNamespace("dplyr")) {
  stop("Please install the 'dplyr' package to run this example")
}

ht <- hux(runif(5), letters[1:5])

map_background_color(ht, by_cases(
  . == "a" ~ "red",
  . %in% letters ~ "green",
  . < 0.5 ~ "pink"
))
```

by_colorscape

Map numeric cell contents smoothly to colors

Description

by_colorscape() can be used to set background, border or text colors, visually differentiating high or low values.

Usage

```r
by_colorspace(
  ..., 
  range = NULL, 
  na_color = NA, 
  ignore_na = TRUE, 
  colwise = FALSE 
)
```
**by_function**

**Map cell contents to cell properties using a function or scale**

**Description**

This creates a simple wrapper around a function for use in map.xxx. Useful functions include scales and palettes from the scales package.

**Usage**

by_function(inner_fn, ignore_na = TRUE)
by_quantiles

Map numeric quantiles to cell properties

Description

These functions split cell values by quantiles. Non-numeric cells are ignored.

Usage

by_quantiles(
  quantiles,
  values,
  right = FALSE,
  extend = TRUE,
by_quantiles

    ignore_na = TRUE,
    colwise = FALSE
  )

by_equal_groups(n, values, ignore_na = TRUE, colwise = FALSE)

Arguments

quantiles  Vector of quantiles.
values     Vector of values. length(values) should be one greater than length(quantiles),
or one less if extend = FALSE.
right      If TRUE, intervals are closed on the right, i.e. if values are exactly equal to a
break, they go in the lower group. Otherwise, intervals are closed on the left,
so equal values go in the higher group. FALSE by default.
extend     Extend breaks to c(-Inf, breaks, Inf). i.e. include numbers below and
above the outermost breaks. TRUE by default.
ignore_na  If TRUE, NA values in the result will be left unchanged from their previous values.
Otherwise, NA normally resets to the default.
colwise    Logical. Calculate breaks separately within each column?
n          Number of equal-sized groups. length(values) should equal n.

Details

by_equal_groups(n, values) splits the data into n equal-sized groups (i.e. it is a shortcut for
by_quantiles(seq(1/n, 1 - 1/n, 1/n), values)).

Value

A function for use in map_*** functions.

See Also

mapping-functions

Other mapping functions: by_cases(), by_colorspace(), by_function(), by_ranges(), by_regex(),
by_rows(), by_values()

Examples

ht <- hux(rnorm(5), rnorm(5))

map_background_color(ht,
  by_quantiles(
    c(0.2, 0.8),
    c("red", "yellow", "green")
  ))

map_background_color(ht,
  by_quantiles(
by_ranges

Map numeric ranges to cell properties

Description
by_ranges() sets property values for cells falling within different numeric ranges.

Usage
by_ranges(breaks, values, right = FALSE, extend = TRUE, ignore_na = TRUE)

Arguments
- breaks: A vector of numbers in increasing order.
- values: A vector of property values. length(values) should be one greater than length(breaks) if extend = TRUE, or one less if extend = FALSE.
- right: If TRUE, intervals are closed on the right, i.e. if values are exactly equal to a break, they go in the lower group. Otherwise, intervals are closed on the left, so equal values go in the higher group. FALSE by default.
- extend: Extend breaks to c(-Inf, breaks, Inf), i.e. include numbers below and above the outermost breaks. TRUE by default.
- ignore_na: If TRUE, NA values in the result will be left unchanged from their previous values. Otherwise, NA normally resets to the default.

Details
Non-numeric cells return NA. The effects of this depend on ignore_na.

Value
A function for use in map_*** functions.

See Also
mapping-functions
Other mapping functions: by_cases(), by_colors(), by_function(), by_quantiles(), by_regex(), by_rows(), by_values()
Examples
ht <- huxtable(c(1, 3, 5))
map_background_color(ht,
  by_ranges(
    c(2, 4),
    c("red", "yellow", "blue")
  ))

map_background_color(ht,
  by_ranges(
    c(2, 4),
    "pink",
    extend = FALSE
  ))

map_background_color(ht,
  by_ranges(
    c(1, 5),
    c("red", "yellow", "green"),
    right = TRUE
  ))

map_background_color(ht,
  by_ranges(
    c(1, 5),
    c("red", "yellow", "green"),
    right = FALSE
  ))

by_regex

Map cells matching a string or regex to cell properties

Description
by_regex() sets properties on cells which match a regular expression.

Usage
by_regex(..., .grepl_args = list(), ignore_na = TRUE)

Arguments
...
  A list of name-value pairs. The names are regular expressions. If there is a
  single unnamed argument, this is the default value for unmatched cells. More
  than one unnamed argument is an error.
.grepl_args
  A list of arguments to pass to grepl(). Useful options include fixed, perl
  and ignore.case.
ignore_na
  If TRUE, NA values in the result will be left unchanged from their previous values.
  Otherwise, NA normally resets to the default.
by_rows

Value

A function for use in map_*** functions.

See Also

mapping-functions

Other mapping functions: by_cases(), by_colorspace(), by_function(), by_quantiles(), by_ranges(), by_rows(), by_values()

Examples

ht <- hux(c("The cat sat", "on the", "mat"))

map_bold(ht, by_regex("at" = TRUE))
map_bold(ht, by_regex("a.*a" = TRUE))

map_bold(ht, by_regex(
  "the" = TRUE,
  .grepl_args = list(
    ignore.case = TRUE
  )
))
See Also

mapping-functions

Other mapping functions: \texttt{by\_cases()}, \texttt{by\_colorspace()}, \texttt{by\_function()}, \texttt{by\_quantiles()}, \texttt{by\_ranges()}, \texttt{by\_regex()}, \texttt{by\_values()}

Examples

ht <- as_hux(matrix(rnorm(25), 5, 5))
map\_background\_color(ht,
  by\_rows("green", "grey"))
map\_background\_color(ht,
  by\_cols("green", "grey"))
Examples

```r
t <- hux(letters[1:3])
map_background_color(t, 
  by_values(a = "red", c = "yellow"))
map_background_color(t, 
  by_values(a = "red", c = "yellow", "green"))
```

caption

Set the table caption

Description

By default, captions are displayed above the table. You can change this with `caption_pos()`.

Usage

```
caption(ht)
caption(ht) <- value
set_caption(ht, value)
```

Arguments

- `ht`: A huxtable.
- `value`: A string. Set to `NA` to reset to the default, which is "NA".

Details

Captions are not escaped. See the example for a workaround.

Value

`caption()` returns the caption property. `set_caption()` returns the modified huxtable.

See Also

Other caption properties: `caption_pos()`, `caption_width()`

Examples

```r
set_caption(jams, "Pots of jam for sale")
# escape caption characters:
caption(jams) <- sanitize(
  "Make $$$ with jam",
  type = "latex")
```
caption_pos

| caption_pos | Position the table's caption |

Description

If caption_pos is "top" or "bottom", then the horizontal position ("left", "center" or "right") will be determined by the huxtable's position().

Usage

caption_pos(ht)
caption_pos(ht) <- value
set_caption_pos(ht, value)

Arguments

ht A huxtable.
value String: "top", "bottom", "topleft", "topcenter", "topright", "bottomleft", "bottomcenter" or "bottomright". Set to NA to reset to the default, which is "top".

Value

caption_pos() returns the caption_pos property. set_caption_pos() returns the modified huxtable.

See Also

Other caption properties: caption_width(), caption()

Examples

caption_pos(jams) <- "topleft"
caption_pos(jams)
caption(jams) <- "Jam for sale"
jams
set_caption_pos(jams, "bottom")
caption_width

Set the width of the table caption

Description

A numeric widths is interpreted as a proportion of text width in LaTeX, or of width of the containing element in HTML. A character width must be a valid LaTeX or CSS dimension. The default, NA, makes the caption the same width as the table.

Usage

caption_width(ht)
caption_width(ht) <- value
set_caption_width(ht, value)

Arguments

ht A huxtable.
value Number or string. Set to NA to reset to the default, which is NA.

Value

caption_width() returns the caption_width property. set_caption_width() returns the modified huxtable.

See Also

Other caption properties: caption_pos(), caption()

Examples

caption_width(jams) <- 0.5
caption_width(jams)

cbind.huxtable

Combine rows or columns

Description

These methods are called when one argument to cbind/rbind is a huxtable. As well as combining cell contents, they copy table, row, column and/or cell properties into the returned result.
Usage

```r
## S3 method for class 'huxtable'
cbind(..., deparse.level = 1, copy_cell_props = TRUE)
```

```r
## S3 method for class 'huxtable'
rbind(..., deparse.level = 1, copy_cell_props = TRUE)
```

Arguments

- `...` Vectors, matrices, or huxtables.
- `deparse.level` Unused.
- `copy_cell_props` Cell properties to copy from neighbours (see below).

Details

Table properties will be taken from the first argument which is a huxtable. So will row properties (for `cbind`) and column properties (for `rbind`).

If some of the inputs are not huxtables, and `copy_cell_props` is `TRUE`, then cell properties will be copied to non-huxtables. Objects on the left or above get priority over those on the right or below.

If `copy_cell_props` is `FALSE`, cells from non-huxtable objects will get the default properties.

You cannot bind huxtables with data frames, since the R method dispatch will always call the data frame method instead of the huxtable-specific code. For a solution, see `add_columns()`.

Value

A huxtable.

Examples

```r
sugar <- c("Sugar", "40\%", "35\%", "50\%")
jams <- set_bold(jams, 1, everywhere)
cbind(jams, sugar)

# copy_cell_props = FALSE

jams <- set_text_color(jams,
 everywhere, 1, "red")
rbind(jams, c("Damson", 2.30))
rbind(jams, c("Damson", 2.30),
 copy_cell_props = FALSE)
```
column_to_header

Convert a column to header rows

Description

Convert a column to header rows

Usage

column_to_header(
  ht,
  col,
  ...,
  glue = "{value}",
  start_col = 1,
  ignore_headers = TRUE,
  set_headers = TRUE
)

Arguments

ht      A huxtable.
col     A column specifier for a single column.
...     Properties to set on new rows
glue    Glue string. "{value}" will be replaced by the column value.
start_col    Integer. New header text will start at this column.
ignore_headers Logical. Ignore existing headers?
set_headers    Logical. Set new rows as headers?

Examples

column_to_header(jams, "Type")
column_to_header(jams, "Type", text_color = "red")
column_to_header(jams, "Price",
  number_format = 2,
  italic = TRUE,
  glue = "Price: {value}")

iris_hux <- as_hux(iris[c(1:4, 51:54, 101:104), ])
column_to_header(iris_hux, "Species",
  markdown = TRUE,
  glue = "Species: **{value}**"
col_width

Set the width of table columns

Description

Numeric column widths are treated as proportions of the table width. Character widths must be
valid CSS or LaTeX dimensions.

Usage

\begin{itemize}
  \item \texttt{col_width(ht)}
  \item \texttt{col_width(ht) <- value}
  \item \texttt{set_col_width(ht, col, value)}
\end{itemize}

Arguments

\begin{itemize}
  \item \texttt{ht} \hspace{1cm} A huxtable.
  \item \texttt{col} \hspace{1cm} A col specifier. See \texttt{rowspecs} for details.
  \item \texttt{value} \hspace{1cm} Numeric or character vector. Set to \texttt{NA} to reset to the default, which is \texttt{NA}.
\end{itemize}

Details

In LaTeX, if you specify a column width, but set \texttt{wrap} to \texttt{FALSE} and have cells which overrun,
then you may have problems with table position and with background colours in other cells. The
workaround is to adjust the width, so that your cells no longer overrun.

Value

\texttt{col_width()} returns the \texttt{col_width} property. \texttt{set_col_width()} returns the modified huxtable.

See Also

Other table measurements: \texttt{height()}, \texttt{row_height()}, \texttt{width()}

Examples

\begin{verbatim}
col_width(jams) <- c(.2, .8)
col_width(jams)
jams$Notes <- c("Notes",
                "This year's finest", ",", ")
jams
set_col_width(jams, c(.4, .5, .1))
\end{verbatim}
### escape_contents

**Escape or unescape text in cells**

#### Description

Setting `escape_contents` to `FALSE` allows you to include raw HTML or TeX code in your cells.

#### Usage

```r
escape_contents(ht)
escape_contents(ht) <- value
set_escape_contents(ht, row, col, value)
map_escape_contents(ht, row, col, fn)
```

#### Arguments

- `ht`: A huxtable.
- `row`: A row specifier. See `rowspecs` for details.
- `col`: An optional column specifier.
- `fn`: A mapping function. See `mapping-functions` for details.
- `value`: A logical vector or matrix. Set to NA to reset to the default, which is `TRUE`.

#### Details

If `markdown()` is `TRUE` for a cell, the `escape_contents` property will be ignored.

#### Value

- `escape_contents()` returns the `escape_contents` property. `set_escape_contents()` returns the modified huxtable.

#### See Also

`sanitize()` for escaping text manually.

#### Examples

```r
ht <- huxtable(
  Text  = "x squared",
  Maths = "$x^2$"
)
ht <- set_escape_contents(ht, FALSE)
## Not run:
quick_pdf(ht)
```
### final

Return the last \( n \) rows or columns

#### Description

This is a convenience function to use in row and column specifications. In that context, it returns the last \( n \) row or column numbers of the huxtable.

#### Usage

```r
final(n = 1)
```

#### Arguments

- **n**: Number of rows to return.

#### Details

Technically, `final` returns a two-argument function - see `rowspecs` for more details.

#### Examples

```r
set_bold(jams, final(2), final(1), TRUE)
```

### fmt_percent

Format numbers as percent

#### Description

`fmt_` functions are designed to work with `number_format()`.

#### Usage

```r
fmt_percent(digits = 1, format = "f", ...)
```

#### Arguments

- **digits**: How many digits to print.
- **format**, ...: Passed into `formatC()`.

#### Value

An object you can pass into `number_format()`.
See Also

Other format functions: `fmt_pretty()`

Examples

```r
jams$Sugar <- c("Sugar content",
0.4, 0.35, 0.45)
set_number_format(jams, -1, "Sugar",
fmt_percent(1))
```

```r
fmt_pretty
Use prettyNum() to format numbers
```

Description

Use prettyNum() to format numbers

Usage

```r
fmt_pretty(big.mark = ",", ..., scientific = FALSE)
```

Arguments

- `big.mark`, `scientific`, ...
  - Passed to `prettyNum()`.

Value

An object you can pass into `number_format()`.

See Also

Other format functions: `fmt_percent()`

Examples

```r
jams$Sales <- c("Sales", 35000,
55500, 20000)
set_number_format(jams, -1, "Sales",
fmt_pretty())
```
font

Set the font for cell text

Description

Set the font for cell text

Usage

font(ht)
font(ht) <- value
set_font(ht, row, col, value)
map_font(ht, row, col, fn)

Arguments

ht A huxtable.
row A row specifier. See rowspecs for details.
col An optional column specifier.
fn A mapping function. See mapping-functions for details.
value A character vector or matrix.
Set to NA to reset to the default, which is "NA".

Details

To find out what fonts are on your system, systemfonts::match_font() is useful.

For HTML, you can use comma-separated lists of font names like "Times New Roman, Times, Serif". This is not portable, though.

LaTeX and HTML use different font names. To use the same font names across document formats, see options("huxtable.latex_use_fontspec") in huxtable-options.

Value

font() returns the font property. set_font() returns the modified huxtable.

See Also

Other formatting functions: background_color(), bold(), font_size(), na_string(), number_format(), text_color()
Examples

```r
font(jams) <- "times"
font(jams)

jams2 <- set_font(jams, "arial")
font(jams2)

jams3 <- set_font(jams, 2:3, 1, "arial")
font(jams3)

jams4 <- map_font(jams, by_rows("arial", "times")
font(jams4)
```

---

font_size

**Make text larger or smaller**

Description

Font size is in points.

Usage

```r
font_size(ht)
font_size(ht) <- value
set_font_size(ht, row, col, value )
map_font_size(ht, row, col, fn)
```

Arguments

- `ht` A huxtable.
- `row` A row specifier. See `rowspecs` for details.
- `col` An optional column specifier.
- `fn` A mapping function. See `mapping-functions` for details.
- `value` A numeric vector.
  Set to NA to reset to the default, which is NA.

Value

`font_size()` returns the `font_size` property. `set_font_size()` returns the modified huxtable.
guess_knitr_output_format

See Also

Other formatting functions: background_color(), bold(), font(), na_string(), number_format(), text_color()

Examples

```r
font_size(jams) <- 14
font_size(jams)

jams2 <- set_font_size(jams, 12)
font_size(jams2)

jams3 <- set_font_size(jams, 2:3, 1, 12)
font_size(jams3)

jams4 <- map_font_size(jams, by_rows(12, 14))
font_size(jams4)
```

guess_knitr_output_format

Guess knitr output format

Description

Convenience function which tries to guess the ultimate output from knitr and rmarkdown.

Usage

```r
guess_knitr_output_format()
```

Value

"html", "latex", or something else. If we are not in a knitr document, returns an empty string.

Examples

```r
## Not run:
# in a knitr document
guess_knitr_output_format()

## End(Not run)
```
header_cols

Mark rows or columns as headers

Description
Arbitrary rows and columns can be headers: they do not have to be at the top or left of the table.

Usage

header_cols(ht)
header_cols(ht) <- value
set_header_cols(ht, col, value)

header_rows(ht)
header_rows(ht) <- value
set_header_rows(ht, row, value)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ht</td>
<td>A huxtable.</td>
</tr>
<tr>
<td>col</td>
<td>A col specifier. See rowspecs for details.</td>
</tr>
<tr>
<td>value</td>
<td>Logical vector. Set to NA to reset to the default, which is FALSE.</td>
</tr>
<tr>
<td>row</td>
<td>A row specifier. See rowspecs for details.</td>
</tr>
</tbody>
</table>

Details
By default header rows and columns are not shown differently from other rows, but you can change this with style_headers(). Various themes may set properties on headers. Lastly, headers are treated differently when restacking.

Value

header_cols() returns the header_cols property. set_header_cols() returns the modified huxtable.

Examples

jams <- set_header_rows(jams, 1, TRUE)
jams <- set_header_cols(jams, 1, TRUE)
style_headers(jams,
    bold = TRUE,
    text_color = "purple"
)
**Description**

`height()` sets the height of the entire table, while `[row_height()]` sets the height of individual rows. A character height must be a valid CSS or LaTeX dimension.

**Usage**

```r
height(ht) <- value
set_height(ht, value)
```

**Arguments**

- `ht`: A huxtable.
- `value`: A number or string. Set to `NA` to reset to the default, which is `NA`.

**Value**

`height()` returns the height property. `set_height()` returns the modified huxtable.

**See Also**

Other table measurements: `col_width()`, `row_height()`, `width()`

**Examples**

```r
height(jams) <- 0.4
height(jams)
```

---

**huxreg**

Create a huxtable to display model output

**Description**

Create a huxtable to display model output
Usage

huxreg(
  ..., 
  error_format = "({std.error})",
  error_pos = c("below", "same", "right"),
  number_format = "%.3f",
  align = ",",
  ci_level = NULL,
  tidy_args = NULL,
  glance_args = NULL,
  stars = c(`***` = 0.001, `**` = 0.01, `*` = 0.05),
  bold_signif = NULL,
  borders = 0.4,
  outer_borders = 0.8,
  note = if (is.null(stars)) NULL else "{stars}",
  statistics = c(N = "nobs", R2 = "r.squared", "logLik", "AIC"),
  coefs = NULL,
  omit_coefs = NULL
)

Arguments

... Models, or a single list of models. Names will be used as column headings.
error_format How to display uncertainty in estimates. See below.
error_pos Display uncertainty "below", to the "right" of, or in the "same" cell as estimates.
number_format Format for numbering. See number_format() for details.
align Alignment for table cells. Set to a single character to align on this character.
ci_level Confidence level for intervals. Set to NULL to not calculate confidence intervals.
tidy_args List of arguments to pass to generics::tidy(). A list without names will be treated as a list of argument lists, one for each model.
glance_args List of arguments to pass to generics::glance(). A list without names will be treated as a list of argument lists, one for each model.
stars Levels for p value stars. Names of stars are symbols to use. Set to NULL to not show stars.
bold_signif Where p values are below this number, cells will be displayed in bold. Use NULL to turn off this behaviour.
borders Thickness of inner horizontal borders. Set to 0 for no borders.
outer_borders Thickness of outer (top and bottom) horizontal borders. Set to 0 for no borders.
note Footnote for bottom cell, which spans all columns. {stars} will be replaced by a note about significance stars. Set to NULL for no footnote.
statistics A vector of summary statistics to display. Set to NULL to show all available statistics. To change display names, name the statistics vector: c("Displayed title" = "statistic_name", ...)

**huxreg**

```r
coops
coefs
A vector of coefficients to display. Overrules `omit_coefs`. To change display names, name the `coef` vector: `c("Displayed title" = "coefficient_name", ...)

omit_coefs
Omit these coefficients.

Details
Models must have a `generics::tidy()` method defined, which should return "term", "estimate", "std.error", "statistic" and "p.value". The "broom" package provides methods for many model objects. If the `tidy` method does not have a `conf.int` option, `huxreg` will calculate confidence intervals itself, using a normal approximation.

If `...` has names or contains a single named list, the names will be used for column headings. Otherwise column headings will be automatically created.

If the `coef` and/or `statistics` vectors have names, these will be used for row headings. If different values of `coef` have the same name, the corresponding rows will be merged in the output.

`statistics` should be column names from `generics::glance()`. You can also use "nobs" for the number of observations. If `statistics` is `NULL` then all columns from `glance` will be used. To use no columns, set `statistics = character(0)`.

`error_format` is a string to be interpreted by `glue::glue()`. Terms in parentheses will be replaced by computed values. You can use any columns returned by `tidy`: typical columns include `statistic`, `p.value`, `std.error`, as well as `conf.low` and `conf.high` if you have set `ci_level`. For example, to show confidence intervals, you could write `error_format = "{conf.low} to {conf.high}"`.

Value
A huxtable object.

Fixing p values manually
If you wish to use e.g. robust standard errors, you can pass results from e.g. `lmtest::coeftest()` into `huxreg`, since these objects have `tidy` methods. Alternatively, to manually insert your own statistics, see `tidy_override()`.

Examples
```r
if (! requireNamespace("broom"){  
  stop("Please install 'broom' to run this example.")  
}

lm1 <- lm(mpg ~ cyl, mtcars)
lm2 <- lm(mpg ~ cyl + hp, mtcars)
glm1 <- glm(I(mpg > 20) ~ cyl, mtcars,
           family = binomial)

huxreg(lm1, lm2, glm1)

if (requireNamespace("sandwich") &&
    requireNamespace("lmtest"){
lm_robust <- lmtest::coeftest(lm1, 
vcov = sandwich::vcovHC)
# coeftest() has no "glance" method:
huxreg(lm_robust, 
statistics = character(0))
}

huxtable

Create a huxtable

Description

huxtable, or hux, creates a huxtable object.

Usage

huxtable(
...,
add_colnames = getOption("huxtable.add_colnames", TRUE),
add_rownames = FALSE,
autoformat = getOption("huxtable.autoformat", TRUE)
)

hux(
...,
add_colnames = getOption("huxtable.add_colnames", TRUE),
add_rownames = FALSE,
autoformat = getOption("huxtable.autoformat", TRUE)
)

tribble_hux(
...;
add_colnames = getOption("huxtable.add_colnames", TRUE),
autoformat = getOption("huxtable.autoformat", TRUE)
)

Arguments

... For huxtable, named list of values as in data.frame(). For tribble_hux, data values as in tibble::tribble().
add_colnames If TRUE, add a first row of column names to the huxtable.
add_rownames If TRUE or a character string, add a first column of row names to the huxtable. The string gives the name for the new column (or "rownames" for TRUE).
autoformat If TRUE, automatically format columns by type. See below.
Details

If you use `add_colnames` or `add_rownames`, be aware that these will shift your rows and columns along by one: your old row/column 1 will now be row/column 2, etc.

`add_colnames` defaults to `TRUE`. You can set the default globally by setting `options("huxtable.add_colnames")` to `TRUE` or `FALSE`.

`tribble_hux` is a simple wrapper around `tibble::tribble()` which lets you create data in a readable format. It requires the "tibble" package to be installed.

Value

An object of class `huxtable`.

Automatic formatting

If `autoformat` is `TRUE`, then columns will have `number_format()` and `align()` properties set automatically, as follows:

- Integer columns will have `number_format` set to 0.
- Other numeric columns will have `number_format` set to "%.3g".
- All other columns will have `number_format` set to `NA` (no formatting).
- Integer, `Date` and date-time (i.e. `POSIXct` and `POSIXlt`) columns will be right-aligned.
- Other numeric columns will be aligned on `options("OutDec")`, usually ".".
- Other columns will be left aligned.

You can change these defaults by editing `options("huxtable.autoformat_number_format")` and `options("huxtable.autoformat_align")`. See `huxtable-package` for more details.

Automatic alignment also applies to column headers if `add_colnames` is `TRUE`; headers of columns aligned on a decimal point will be right-aligned. Automatic number formatting does not apply to column headers.

`huxtable-options`

Examples

```r
ht <- huxtable(
  column1 = 1:5,
  column2 = letters[1:5]
)
ht
tribble_hux(
  ~ Name, ~ Salary,
  "John Smith", 50000,
  "Jane Doe", 50000,
  "David Hugh-Jones", 50000,
  add_colnames = TRUE
)
```

Frequently Asked Questions, including how to get help

Description

A FAQ of common issues.

Details

- I get a LaTeX error when I try to compile my document!
  Have you installed the LaTeX packages you need? LaTeX packages are different from R packages. Run `check_latex_dependencies()` to find out if you are missing any. Then install them using your system’s LaTeX management application. Or you can try `install_latex_dependencies()`.
  In some rmarkdown and LaTeX formats, you also need to add LaTeX dependencies manually. Run `report_latex_dependencies()` and add the output to your LaTeX preamble, or in Rmarkdown formats, add it to the rmarkdown header like this:

```
header-includes:
  - \usepackage{array}
  - \usepackage{caption}
  ... et cetera
```

- Huxtable isn’t working in my Rmarkdown beamer_presentation slides.
  You may need to set the beamer "fragile" option, like this:

```
# Slide title {.fragile}
```

- Numbers in my cells look weird!
  You can change numeric formatting using `number_format()`. Base R options like `scipen` usually have no effect.

- How can I use HTML, TeX etc. in my table?
  Use `escape_contents()`:

```
jams |> add_footnote("These jams are <i>tasty</i>!") |> set_escape_contents(final(1), everywhere, FALSE) |> quick_html()
```

Alternatively you might consider using markdown in cells, with `set_markdown_contents()`.

- I ran caption(ht) <- "Something" and got an error message:
  
  Error in UseMethod("caption<-") : no applicable method for 'caption<-' applied to an object of class "c('huxtable', 'data.frame')"

  You may have loaded another package with a caption method, e.g. "xtable". Try loading huxtable after xtable.

- How can I get line breaks in my cells?
  Just insert a line break "\n" in the cell contents. Then make sure that `width()` is set and `wrap()` is TRUE (it is by default).
• How can I change the font size, font etc. of captions?
There are no direct commands for this. You have to use raw HTML/TeX/other commands within the caption itself. For example to have a bold caption in HTML, you might do something like:

```r
caption(jams) <- "<b>Jam Prices</b>"
```

• How do I refer to tables in bookdown?
As of version 4.3.0, this is handled automatically for you. Just set the label using `label()`, then in markdown text do e.g.:

```r
@ref(tab:my-table-label).
```

• How do I refer to tables in quarto?
In quarto versions up to 1.3, or when compiling to HTML and other formats, simply use quarto cell labels like `label: tbl-foo` and refer to them via `@tbl-foo`.

In quarto versions 1.4 and above, when compiling to PDF, quarto cross-referencing no longer works, and labels starting with `tbl-` will cause an error. (This is a quarto issue.) Instead, set labels within huxtable using `label()` or `set_label()` and refer to them with TeX-only referencing using `\ref{label}`. You must also set a caption, either via quarto or via huxtable.

Here’s an example:

```r
A reference to Table \ref{tab:jams}.
```

If you really need cross-referencing for both PDF and other output formats, either downgrade to quarto 1.3, use a different package, or write code to emit appropriate references.

• I called `library(huxtable)` and now my `data.table` objects are getting printed!
Set `options(huxtable.knit_print_df = FALSE)`.

• How can I set a property on an arbitrary group of cells?
If you can’t use the `mapping-functions` interface, and you want to set a property for multiple cells that aren’t all in the same rows and/or columns, you could use a little-known fact about R subsetting. If you subset `ht[x]` where `x` is two-column numeric matrix, then each row of `x` indexes a single `(row, column)` cell. So, for example, here’s how to set the background color of cells (2,1), (1, 3) and (4, 2) of a huxtable:

```r
indices <- matrix(c(2, 1, 1, 3, 4, 2), ncol = 2, byrow = TRUE)
background_color(jams)[indices] <- "orange"
```

Another useful trick sets properties on the diagonal, using `diag()`:

```r
diag(background_color(jams)) <- "grey"
```
• I have another problem.
  If you have a bug - i.e. there is something wrong with the software - or a feature request,
  please report it to https://github.com/hughjonesd/huxtable/issues. Otherwise, ask a
  question on StackOverflow or https://community.rstudio.com. That way, other people
  will benefit from the answers you get.

• Can I email you directly?
  I’d rather you asked on a public website. If you then email me a link, I may be able to help.

---

**huxtable-news  Changes to the huxtable package**

**Description**

This help page simply gives the contents of NEWS.md.

**huxtable 5.5.6**

  • Bugfix: quarto cross-referencing was giving too many warnings.

**huxtable 5.5.5**

  • Bugfix: quarto cross-referencing doesn’t work for PDF with quarto version 1.4. See ?huxtable-FAQ
    for workarounds.
  • Bugfix: by_cases() wasn’t picking up variables from the caller environment.
  • huxtable 5.5.4 was never released due to failing a reverse dependency check.

**huxtable 5.5.3**

  • Bugfix: disable quarto styling on HTML tables. You can reenable quarto processing with
    options(huxtable.quarto_process = TRUE).
  • Bugfix: borders weren’t working with merged cells in Word documents.

**huxtable 5.5.2**

  • Update by_cases() to work with dplyr 1.1.0. Within by_cases() formulas, . is now vector
    rather than matrix when dplyr version 1.1.0 is detected. Thanks @DavisVaughan.
  • Add package checks in quick_* functions. Thanks @reuning.

**huxtable 5.5.1**

  • CSS borders are now set explicitly even if they are all set to 0.
  • Bugfix: shell-quote files in quick_* functions. Thanks to @cereseck.
  • Bugfix: cope with adjustbox version “1.3a” among latex dependencies.
**huxtable 5.5.0**

- Huxtable should work with Quarto documents.
  - Quarto labels and captions will override huxtable-provided ones.
  - Quarto style references like `@table-label` only work with quarto labels.
  - Please report any bugs!
- New `column_to_header()` function converts a column to header rows. New `as_hux()` method for `grouped_df` objects optionally converts groups to header rows.
- New convenience functions `stripe_rows()` and `stripe_columns()`.
- Add `format` and `...` options to `fmt_percent()` to allow flexible formatting via `formatC()`.
- `add_footnote()` gets an explicit `number_format` argument which is `NA` by default.
- Bugfix: infinite loop with wide characters in `to_screen()`.
- Bugfix: duplicate colnames when exporting `huxreg(..., error_pos = "right")` to `flextable`.
- Bugfix: bookdown-style references weren’t working in `blogdown`.

**huxtable 5.4.0**

- New behaviour: setting `colspan()` or `rowspan()` overwrites the content of cells that have been shadowed.

```r
ht <- hux(c(1, 1), c(2, 2), c(3, 3))
ht <- set_all_borders(ht)
colspan(ht)[1, 1] <- 3

# old behaviour
ht[, c(2, 1, 3)]
## +--------------------------+
## | 2 |                   |
## +--------+--------+--------+
## | 2 | 1 | 3 |
## +--------+--------+--------+

# new behaviour
ht[, c(2, 1, 3)]
## +--------------------------+
## | 1 |                   |
## +--------+--------+--------+
## | 2 | 1 | 3 |
## +--------+--------+--------+
```

- New option `huxtable.latex_siunitx_align` allows you to use the LaTeX `siunitx` package to handle decimal point alignment. This is `FALSE` by default.
- Bugfix: centre alignment was not working in `print_screen()`.
- Bugfix: failure in `to_md()` with recent versions of `stringi` package.
- Bugfix: repeating a single row in a subset, like `ht[c(1, 1, 2, 3),]`, was setting `colspan = 2` on the repeated row.
- Bugfix: zero-argument subset replacement like `ht[] <- ...` wasn’t working.
huxtable 5.3.0

- Improve decimal alignment in LaTeX when `align(ht) == "."`. This may change the appearance of some documents.
- Allow `tidy_override()` to extend columns of `tidy` and `glance`.
- Bugfix: #196 * was giving errors in LaTeX.

huxtable 5.2.0

- Add `table_environment` property so you can use e.g. "table*" in TeX.
- Bugfix: `print_screen(h, colnames = FALSE)` didn’t print a final newline.
- Bugfix: italic from markdown was being printed as underlined in TeX.
- Minor test update for markdown was being printed as underlined in TeX.

huxtable 5.1.1

- Minor test update for compatibility with broom.
- Fixes for R 4.1.0.

huxtable 5.1.0

- `as_flextable()` now exports markdown in cells to RTF, and to Word with the help of the optional `ftExtra` package. Thanks @atusy for adding this feature.
- Improvements to markdown screen export. This now uses the optional `fansi` package.
- New feature: `as_Workbook()` gains `start_row` and `start_col` arguments, to write a huxtable into an Excel worksheet starting at a particular row or column.
- New feature: `huxreg()` gains a `glance_args` argument to pass arguments to `glance()`.
- New feature: `options(huxtable.long_minus = TRUE)` will try to use long minus signs before numbers. The default is `FALSE`. It will probably become `TRUE` in a future version.
- Bugfix: `insert_row/column(..., after = 0)` was unsetting table properties.
- Bugfix: unicode characters above 32767 were incorrectly represented in RTF. Thanks @kaigu1990.
- Bugfix: columns were being collapsed in `as_Workbook()`.
- Bugfix: `style_cells` didn’t work unless huxtable was on the search path.
- Bugfix: `merge_repeated_rows` merged NA rows incorrectly.
- Bugfix: number format was not set correctly in `huxreg()`’s note.
- Bugfix: in `huxreg()`, `tidy_args` threw an error if the first argument to `tidy()` was a named list.
- Bugfix: `tidy_replace()` was broken.
- Clearer error messages for `tidy_override()` when `extend = FALSE`. In future, `extend` will probably default to `TRUE`.

Other news::

- Huxtable received its first Patreon sponsor! Thanks to Ross Mattheis.
huxtable 5.0.0

Huxtable 5.0.0 brings numerous changes. For a more user-friendly introduction, see https://hughjonesd.github.io/whats-new-in-huxtable-5.0.0.html.

Breaking changes:

• There are changes to LaTeX output.
  – LaTeX \tabcolsep is now set to 0 within huxtable tables, while left and right padding should now take effect even when wrap is FALSE.
  – The default LaTeX table environment is now “tabular” unless width is set. If width is set, it is “tabularx”.
  – wrap only matters if width is set. Otherwise, cell wrapping is off.
  – the \centerbox macro from the LaTeX “adjustbox” package is used to centre tables. This should improve centring when tables are too wide. You may need to update the LaTeX “adjustbox” package to a recent version. check_latex_dependencies() can inform you about this.
• As previously signalled, add_colnames has now become TRUE by default in huxtable() and as_huxtable(). Set options(huxtable.add_colnames = FALSE) to go back to the old behaviour.
• Newlines in cell contents are now respected (in LaTeX, so long as wrap = TRUE and width has been set).
• Huxtable borders have been reworked, fixing some longstanding bugs and adding new features.
  – Borders are now automatically collapsed. For example:

    jams %>%
    set_right_border(everywhere, 1, 1) %>%
    set_left_border(everywhere, 2, 0.4)

    will set the border in between the columns of jams to 0.4, overwriting the previous value. This is more in line with what you would expect. For example, the following code now does what you probably want:

    jams %>%
    set_rowspan(2, 1, 3) %>%
    set_bottom_border(4, everywhere, 1)

    ## Type Price
    ## Strawberry 1.90
    ## 2.10
    ## 1.80
    ## ---------------------------

    instead of the old behaviour:

    jams %>%
    set_rowspan(2, 1, 3) %>%
    set_bottom_border(4, everywhere, 1)

    ## Type Price
    ## Strawberry 1.90
    ## 2.10
    ## 1.80
    ## -----------
- `set_left_border()`, `set_allBorders()` and friends all use a default value of 0.4. So to set a default border, write e.g.

```r
as_hux(head(iris)) %>%
  set_bottom_border(1, everywhere)
```

- A new `brdr()` class encapsulates border thickness, style and colour. You can set all properties at once by writing, e.g.:

```r
as_hux(jams) %>%
  set_bottom_border(1, everywhere, brdr(1, "dotted", "darkgreen"))
```

`left_border(ht)` and friends return a `brdr` object. To access the border thickness, write `brdr_thickness(left_border(ht))`.

- Various deprecated items have been removed:
  - The 3-argument form of `set_*`. Instead, use `map_*`.
  - The `byrow` argument to `set_*`. Instead, use `map_*` and `by_cols()`.
  - `error_style` and `pad_decimal` arguments in `huxreg`. Use `error_format` and `align(hx) <- "."`.
  - The `where()`, `is_a_number()` and `pad_decimal()` functions. Use `map_*` functions, i.e. `is.na(as.numeric(x))`, and `align(ht) <- "."`.

- Default padding has been increased to 6 points.
- By default, `width()` is now unset.
- By default, `wrap()` is now `TRUE`.
- `every()` has been renamed to `stripe()`, to avoid a clash with `purrr::every()`. `everywhere`, `evens` and `odds` are still the same.
- The little-used ability to set `copy_cell_props` to a character vector in `rbind.huxtable` and `cbind.huxtable` has been removed. You can still set it to `FALSE`.
- `add_rows()` and `add_columns()` now always call `rbind.huxtable()` or `cbind.huxtable()` and return a huxtable.
- Huxtable no longer supports dplyr versions less than 0.7.0 (released mid-2017).
- `set_cell_properties()` has been renamed `style_cells()`. It is retained as a soft-deprecated alias.
- Various themes have been tweaked:
  - `theme_basic()` now has bold headers and no header column by default.
  - `theme_plain()` defaults to `position = "centre"`.
  - `theme_striped()` uses grey stripes, a white border, and subtler headers.
  - `theme_article()` has thinner borders.

**Other changes:**

- You can now use `markdown` within table cells.
  - Use `set_markdown(ht, rows, cols)` to turn this on.
  - Or use the convenience function `set_markdown_contents()` to set cell contents that will be interpreted as markdown.
  - Markdown works for HTML and LaTeX. There’s basic support for on-screen display.
- Huxtable now has the concept of header row and columns.
  - By default, data frame column names will be headers.
To set other rows to be headers, use `set_header_rows(ht, row_numbers, TRUE)`. For columns, use `header_cols()` or `set_header_cols()`.

New functions `style_headers()`, `style_header_cols()`, and `style_header_rows()` to set multiple properties on headers.

In themes, `header_row/col = TRUE` set the first row/col to a header, and style all header rows/cols.

- `set_bold()` and `set_italic()` now use a default value of `TRUE`. So you can write e.g.
  ```r
  as_hux(head(iris)) %>%
  set_bold(1, everywhere)
  ```

- Console output in R now shows table position and caption position.

- By default, huxtable now sets labels from the current knitr chunk label, if there is one. This is consistent with `kable()`. In bookdown, you can then do e.g.
  ```r
  Some iris species are shown in `@ref(tab:mytable)`:
  ```

Set options(huxtable.autolabel = FALSE) to turn off this behaviour.

- The one-argument form of `[` now works for huxtables just as it does for data frames. For example, `ht[2:3]` selects columns 2 and 3.

- New functions `fmt_percent()` and `fmt_pretty()` for passing into `number_format()`:
  ```r
  jams$Sugar <- c("Sugar content", 0.4, 0.35, 0.45)
  set_number_format(jams, -1, "Sugar", fmt_percent(1))
  ```

- `split_across()` and `split_down()` split a huxtable into a list of sub-tables. Headers can be automatically included.

- `restack_across()` and `restack_down()` split a huxtable, then join it back up. This is useful for making a table fit on a page.

- `merge_across()` and `merge_down()` merge an area of cells horizontally across rows, or vertically down columns.

- New functions `set_lr_borders()/_border_colors()/_border_styles()/_padding()` set left and right borders and padding simultaneously. New functions `set_TB_borders()` etc. set top and bottom properties simultaneously. There are `map_` equivalents of all of these.

- `set_outer_padding()` sets padding around a range of cells, similarly to `set_outer_borders()`.

- A new table-level property, `caption_width()`, allows you to set the width of the caption. The default, `NA`, sets the width equal to the table width.

- There are two new themes: `theme_compact()` and `theme_bright()`.

- For `huxreg()`, a new function `tidy_replace()` allows you to replace the output of `tidy(x)` entirely.

- huxtable now only sets options(huxtable.knit_print_df = TRUE) if it is attached, not if it is loaded.

- huxtable supports `dplyr::relocate()`, new in dplyr 1.0.0.

- Improvements to `as_flextable()`.

- Improvements to `quick_pptx()` (thanks @davidgohel).

- Bug fixes for options(huxtable.use_fontspec = TRUE).
• Bugfix: `add_rownames = "string"` now works as promised.
• Bugfix: non-ASCII characters are now supported in RTF.

Other news:
• New versions of the `gtsummary` package will have an `as_huxtable()` method.
• Package `texreg` on CRAN includes a `huxtablereg()` function for creating a table of regression outputs.

huxtable 4.7.1
• The `expss` package now supports export to huxtables.
• `by_quantiles()`, `by_equal_groups()` and `by_colorspace()` have gained a `colwise` argument, which calculates quantiles or colors separately for each column.
• Add caption support for `as_flextable()` (thanks @sjewo).

huxtable 4.7.0
• Better error messages.
• New `merge_repeated_rows()` function: merge repeated rows into a single cell.
• New `fill` and `colspan/rowspan` arguments for `insert_row()/insert_column()`:
  – `insert_row(ht, "blah", "", "", "", "", ...)` can be written `insert_row(ht, "blah", fill = "")`.
  – `colspan/rowspan` set `colspan/rowspan` of the first cell in the inserted row/column.

huxtable 4.6.1
• Bugfix: right borders in wrong place when cells were merged.
• Bugfix: Chinese characters were displaying wrongly in `to_screen()`.

huxtable 4.6.0
• Set `options('huxtable.latex_use_fontspec')` to TRUE to use portable font names in TeX documents, with the LaTeX “fontspec” package.
• Bugfix: attributes were being copied wrongly in subset assignment of huxtables.
• Bugfix: text colors in `hux_logo()`.
• Bugfix: `rbind` of `huxtable` and matrix wasn’t setting `row_height` correctly.

huxtable 4.5.0
• Add `quick_latex()` function.
• The `texreg` package now includes a `huxtablereg` function, analogous to `huxreg`, which outputs a `huxtable` from a list of regressions. This will be available from the next version of `texreg`. 
**huxtable 4.4.0**

- Huxtables can now be printed directly in Word documents and Powerpoint presentations, thanks to the flextable package and recent versions of Pandoc. (Powerpoint printing requires Pandoc >= 2.4.0.)
- New “wrapleft” and “wrapright” options to position() allow text wrapping around tables.
- New set_outer_border_colors() and set_outer_border_styles() functions, like set_outer_borders().
- Huxtable no longer requires the broom package, instead using the generics package. If you use huxreg(), you will still need e.g. broom or broom.mixed to provide tidy() and glance() methods for specific models.
- Bugfix: tidy.tidy_override() and glance.tidy_override() should work even if underlying object has no tidy() or glance() method.
- Bugfix: huxtables had option clash when echo = TRUE in Rmd pdf_document format.
- Bugfix: caption() and height() weren’t playing nicely.
- Bugfix: mutate(…, copy_cell_props = FALSE) was adding a column named copy_cell_props.
- Bugfix: check_latex_dependencies and install_latex_dependencies gave misleading errors.
- Enhancement: when stars is NULL in huxreg, don’t print a note by default.
- Enhancement: use tinytex when available, allowing autoinstallation of latex packages.

**huxtable 4.3.0**

- More work on TeX. Tables *should* now compile when raw_attributes is not set.
- New map_xxx functions to set properties variably by cell values.
- Functions for mapping properties variably: by_rows, by_values, by_ranges, by_quantiles etc.
- Correct bookdown labels are now automatically created.
- New grey, blue, green and orange themes.
- New “themes” vignette.
- New tidy_override function to override p values etc. in huxreg.
- New set_contents function to change huxtable contents within dplyr pipes.
- Enhancement: left- and right-aligned captions are now set above the table in LaTeX, using the “threeparttable” package. You will need to install this using e.g. install_latex_dependencies() or tlmgr if it is not already on your system.
- Enhancement: in huxtable() and friends, add_rownames = "Colname" now sets the name for the new column.
- Improvements to the vignettes and help files.
- Bugfix: to_md could hang with bold/italic cells.

**Deprecated:**

- The 3 argument form of set_xxx functions is deprecated, as is the where function. Use map_xxx instead.
- Argument byrow is soft-deprecated. Use cols() instead.
huxtable 4.2.1

• Bugfix: wrap=TRUE caused squeezed text in RTF.

Important:

• TeX code was getting escaped by pandoc. To avoid this, if possible, huxtable now adds fenced code blocks round latex tables (see https://pandoc.org/MANUAL.html#extension-raw_attribute). You must add md_extensions: +raw_attribute to your YAML header for this to work, and you will need a recent (> 2.0.0) version of Pandoc.

huxtable 4.2.0

• More speedups: LaTeX 2-3x faster, as_Workbook 2-3x faster.
• Simplify LaTeX output using our own LaTeX commands.
• RTF support: new print_rtf, to_rtf and quick_rtf functions.
• New border_style properties to set “solid”, “double”, “dotted” or “dashed” borders. (At present, LaTeX only allows “solid” or “double”.)
• New merge_cells function, an alternative interface to colspan and rowspan.
• New quick_pptx function to print data frames and huxtables into Powerpoint.
• New install_latex_dependencies and check_latex_dependencies utility functions.
• add_rows and add_columns now accept data frames as arguments.
• New theme_mondrian theme :-D
• Enhancement: print_md now handles bold and italic cells.
• Enhancement: quick_pdf has new width and height options to change paper size.
• Use CSS writing-mode where possible for text rotation. Note that this may break on non-LTR languages. If this affects you, please file an issue.
• Bugfix: LaTeX didn’t compile when height and caption were both set.
• Bugfix: print_screen and print_md would hang with a wide huxtable.
• Tweaks to documentation.

huxtable 4.1.0

• dplyr, knitr, rmarkdown and some other packages have moved to “Suggests:”, lowering the dependency load considerably. All the functionality is still present. huxtable gives an informative warning if a needed package is not installed.
• Code rewrites for better performance and maintainability: HTML is up to 10x faster, LaTeX is up to 4x faster.
• Documentation improvements.
• New tribble_hux function wrapping tibble::tribble() for readable data input.
• New add_rows and add_columns functions to insert one or more rows into the middle of a huxtable.
• New option “huxtable.knitr_output_format” to override the default output format in knitr documents.
• Numeric row heights and column widths are rescaled to 1 when huxtables are cbinded/rbinded.
• LaTeX: at points where borders cross, priority is given to the horizontal border color.
• Bugfix: property accessors had the wrong environment. Thanks to Iñaki Úcar.
• Bugfix: row heights and column widths weren’t being copied with cbind/rbind.
• Bugfixes for 0-row or 0-column huxtables:
  – Output works, usually with a warning.
  – cbind and rbind work.
• Bugfix: HTML cols were printed with ‘width: NA’.
• Bugfix: width, col_width etc. can be reset to a number after setting them to a string.
  – The (undocumented) ability to mix numeric and non-numeric values for padding and/border
    widths has been removed. If you want a number, set a number and not a string.
• Bugfix: HTML tables with position “right” weren’t right-aligned.
• Nicer error messages when rbinding objects with different numbers of rows.
• Vignette improvements.
• is_a_number is deprecated.
• ... and a cool new randomized hux_logo() :-)

huxtable 4.0.1

• Improved formatting in Excel output.
• New format method which returns the result of to_html, to_latex etc. as appropriate.
• Bugfix: to_html printing e.g. “left-border: NA;” in cell CSS.
• Bugfix: set_all_* not working when huxtable is not attached.
• Bugfix: as_Workbook failing with non-numeric width.
• Bugfix: hux_logo was using multiple fonts, fails with Excel output.
• Bugfix: as_flextable borders not working in cells with colspan > 1.
• Documentation bugfixes.
• Compatibility with broom 5.0.0 - thanks @alexphayes

huxtable 4.0.0

• New theme_plain theme.
• The default value for add_colnames is going to become TRUE. At present it remains FALSE. Set
  options("huxtable.add_colnames") to TRUE or FALSE to set the default and avoid warn-
  ings in future.
• quick_* functions now automatically open documents if used interactively. Use open = FALSE
  to avoid.
• Tweak top and bottom margins for HTML tables.
• pad_decimal is deprecated in favour of align(ht) <- ".".
• huxreg continues with a warning if statistics are unavailable for some models.
Breaking changes:

- huxtable now provides knit_print.data.frame methods. This means that bare data frames will be pretty-printed via huxtable if the package is loaded.
  - Set options("huxtable.knit_print_df") to FALSE if you don’t want this.
  - By default data frames are printed using the theme_plain theme. Set options("huxtable.knit_print_df_theme") to a different one-argument function if you want to use a different theme.
- The new autoformat argument lets huxtable() and as_huxtable() automatically choose alignment and number format based on column type. Set options("huxtable.autoformat") to FALSE to turn off this feature by default.
- The default value of number_format has changed from “%.5.3g” to “%.3g”, which no longer space-pads numbers.
- as_flextable now does not print column names in the header. This matches the standard huxtable behaviour whereby headers are “just another row/column”. To get the old behaviour, use colnames_to_header = TRUE.

Bugfixes:

- Bugfix: Date and datetime columns were converted to numbers by add_colnames.
- LaTeX bugfix: background colors were printing an extra space.
- huxreg was never using built-in confidence intervals.
- Screen bugfixes:
  - set max_width to screen width (thanks @jacob-long)
  - misaligned decimal points
- Various bugfixes for number_format, huxreg, as_hux.table, as_flextable.

huxtable 3.0.0

- Output to Excel workbooks using the openxlsx package.
- New quick_xlsx function.
- dplyr select helpers now work inside set_* column specifications: e.g. set_bold(ht, 1:3, matches("ab"), TRUE)
- Column names can now be used for the after argument to insert_column.
- quick_* functions: when the file argument is not explicitly specified, confirm overwrites manually, or fail if called non-interactively.
- Add pointless quote marks in Description and Title… I don’t make the rules.
- Don’t apply number_format to negative exponents (e.g. 1.12e-3).
- New tidy_args argument to huxreg allows per-model customization of the call to tidy.

Breaking changes:

- quick_xxx functions without an explicit file argument throw an error if called non-interactively, and prompt before overwriting files if called interactively.

huxtable 2.0.2

- Don’t apply number_format to exponents in scientific notation.
- Turn off some tests on CRAN, as they fail there but not elsewhere.
huxtable 2.0.1

• Fix quick_pdf error when moving output across filesystems.

huxtable 2.0.0

• New quick_html, quick_pdf and quick_docx functions to print table-like objects to a new document.

• to_screen only shows colnames if there are any non-zero-length column names.

Breaking changes:

• number_format now applies to any number-like substrings in cells. This means you can include e.g. significance stars in a cell and still use number_format to format the content.

• If number_format is NA, numbers are unchanged.

• Default value of number_format has changed from “%5.2f” to “%5.3g”, which plays nicer with integers but may surprise you by using scientific format for large numbers.

huxtable 1.2.0

• New outer_borders argument for huxreg. This changes default behaviour slightly.

• New border argument for add_footnote to choose width of footnote’s top border.

• Added guard assertions to many exported functions.

• Bugfix: captions and colnames are wrapped in to_screen to respect max_width.

huxtable 1.1.0

• No more ugly autocreated column names.

• Allow huxtable to have invalid or empty column names in general.

• LaTeX should now be much faster on large tables.

• set_outer_borders now accepts the same row/column arguments as other set_* functions.

• Better handling in LaTeX of horizontal borders which don’t cross the entire table. (But not varying positive border widths…)

• Bugfix: flextable didn’t like huxreg’s syntactically invalid column names.

• Accept, but silently change, English spelling of ‘centre’ in align, position and caption_pos.

huxtable 1.0.0

• LaTeX implements different thicknesses for vertical and horizontal borders (but only one horizontal thickness per row).

• LaTeX border colors now collapse nicely: set colors override unset ones.

• React gracefully to lack of p values in huxreg.

• New set_outer_borders function to set borders round a rectangle of cells.

• to_screen and to_md now respect wrap and col_widths properties.

• Screen and markdown wrap respect word boundaries.
• to_screen and to_md gain a min_width argument; to_md gains a logical header argument; to_screen gains a compact argument replacing blank = NULL.

• On screen colour and bold support, if the crayon package is installed. New huxtable.color_screen option.

• Move from ReporteRs to officer and flextable. No more RJava horror.

• New error_format argument to huxreg for flexible control over uncertainty estimates.

• Infrastructure improvements: slightly less ugly code in screen.R and LaTeX.R.

Breaking changes:

• Removed options collapse, borders, blank and colname_color from to_screen/print_screen.

• as_FlexTable is deprecated and calls as_flextable with a warning. header_rows and footer_rows arguments are ignored. If you need this feature, tell me.

• HTML border sizes are now set in points, not pixels.

• In huxreg:
  – ci_level is NULL by default. Set it to a number to calculate confidence intervals.
  – error_style is deprecated with a warning in favour of error_format.
  – Use {stars} not %stars% to display significance levels in the note argument.
  – borders becomes a number specifying border width. Set to 0 for no borders.

huxtable 0.3.1

• New convenience functions insert_row and insert_column.

• latex_float property allows you to change positioning in LaTeX.

• (Semantic versioning fail: this should have been 0.4.0.)

huxtable 0.3.0

• New borders argument for huxreg, gives borders in sensible places.

• Allow more flexible caption positioning with caption_pos.

• New set_default_properties function to set default properties for new huxtables.

• Fix compatibility with dplyr 0.6.0.

huxtable 0.2.2

• Fix a bug that could lead to wrong significance stars in huxreg.

huxtable 0.2.1

• Compatibility with dplyr 0.6.0.

• Use ~ for decimal padding in LaTeX.
**huxtable 0.2.0**

- New huxreg function to convert a list of models to a huxtable.
- New set_* interface allowing column ranges, expressions a la subset, and filling in values by row.
- Replacement methods $<-$, [<- and [[<- now work better.
- New function set_cell_properties to set multiple properties on cells.
- evens, odds, everywhere, every(n, from), final(n), where(cond): convenience functions to select rows, columns and cells.
- Export to Word/Powerpoint via ReporteRs.
- Huxtable now supports dplyr verbs like filter and select.
- Exported function guess_knitr_output_format.
- Ability to set border colors.
- Prevent overlapping row/colspans.
- Expanded introduction and new vignette for huxreg.
- Numerous bugs have been fixed and replaced with new, more advanced bugs.

**Breaking changes:**

- theme_minimal has been renamed theme_basic to avoid a name clash with ggplot2.

**huxtable 0.1.0**

- Added a NEWS.md file to track changes to the package.
- First CRAN release.

---

**huxtable-options**

**Package options**

**Description**

Huxtable has several options.

**Details**

- options("huxtable.add_colnames") sets the default value for add_colnames in huxtable() and as_huxtable(). As of version 5.0.0, this defaults to TRUE.
- options("huxtable.print") sets the print method for huxtable objects. See print.huxtable().
- options("huxtable.knitr_output_format") overrides the default output format when huxtable objects are printed by knitr. Set to "html", "latex", "md" or "screen". If NULL (the default), huxtable guesses the format using guess_knitr_output_format().
- options("huxtable.autolabel"). If TRUE, (the default) automatically sets label() from the knitr chunk label, if there is one.
• options("huxtable.color_screen"). If TRUE and package crayon is available, huxtables will be printed in color on screen.

• options("huxtable.bookdown"). Set to TRUE within a bookdown document to automatically print bookdown-style labels. If unset, huxtable will try to guess if we are in a bookdown document.

• options("huxtable.knit_print_df"). If TRUE, data frames in knitr will be pretty-printed using huxtable. This option defaults to TRUE only if huxtable is attached to the search path using library(); not if huxtable is merely loaded (e.g. imported by another package).

• options("huxtable.knit_print_df_theme"). A function applied to data frames before printing in knitr. The function should take one argument (a data frame) and return a huxtable. Defaults to theme_plain().

• options("huxtable.autoformat") sets the default value for autoformat in huxtable() and as_huxtable(). It defaults to TRUE.

• options("huxtable.latex_use_fontspec"). If TRUE, use the "fontspec" package, which allows you to use the same font names in TeX and HTML. This requires the the xetex or xelatex engine, which can be set using an .rmd header option. Note that quick_pdf() may use pdflatex. The default is FALSE.

• options("huxtable.long_minus"). If TRUE, prints long minus signs for numbers. The default is FALSE. In LaTeX output, this option is overridden by options("huxtable.latex_siunitx_align").

• options("huxtable.latex_siunitx_align"). If TRUE, uses the \tablenum macro from the "siunitx" package to align numbers when align(ht) is "." or similar. See align() for details. The default is FALSE.

• options("huxtable.quarto_process"). If TRUE, enables quarto processing of HTML tables. This overrides some huxtable styles, but may allow quarto to do other things, e.g. process citations correctly. The default is FALSE.

• options("huxtable.autoformat_number_format") and options("huxtable.autoformat_align") are lists. The list names are base R classes. huxtable() with autoformat = TRUE will set number_format() and align() for data columns according to the corresponding list values. For example, to center-align Date objects you could set "huxtable.autoformat_align" to something like list(..., Date = "center", ...).

---

hux_logo

**Huxtable logo**

Description

Returns a randomized huxtable logo, inspired by Mondrian.

Usage

hux_logo(latex = FALSE, html = FALSE)

Arguments

<table>
<thead>
<tr>
<th>latex</th>
<th>Style for LaTeX.</th>
</tr>
</thead>
<tbody>
<tr>
<td>html</td>
<td>Style for HTML.</td>
</tr>
</tbody>
</table>
Value

The huxtable logo.

Examples

print_screen(hux_logo())

---

**insert_column**

*Insert a row or column*

Description

These convenience functions wrap `cbind` or `rbind` for huxtables, to insert a single row or column.

Usage

```r
insert_column(
  ht,
  ..., 
  after = 0,
  fill = NULL,
  colspan = 1,
  copy_cell_props = TRUE
)
```

```r
insert_row(
  ht,
  ..., 
  after = 0,
  fill = NULL,
  colspan = 1,
  copy_cell_props = TRUE
)
```

Arguments

- `ht` A huxtable.
- `...` Cell contents.
- `after` Insert the row/column after this position. 0 (the default) inserts as the first row/column.
- `fill` String. If ... contains fewer elements than there are columns/rows to fill, the remaining cells will be filled with this.
- `rowspan, colspan` Scalar integer. Sets the `rowspan` or `colspan` of the first cell only. The default `NULL` throws an error if there are too few elements.
- `copy_cell_props` Copy cell properties from the previous row or column (if `after` > 0). See `cbind.huxtable()`.
Details

In `insert_column` only, you can use a column name for `after`.
Even if `colspan` or `rowspan` are greater than 1, you must still provide values for the hidden cells.
Use `fill = ""` for this.

Value

The modified huxtable

See Also

`add_rows()` and `add_columns()`, which insert multiple rows/columns at once.

Examples

```r
insert_row(jams, c("Gooseberry", 2.15), after = 1)

insert_column(jams, c("Sugar", "50%", "60%", "40%") , after = "Price")

insert_column(jams, "Sugar", after = "Price", fill = "50%")

# don't forget to use `fill`:
insert_row(jams, "Jams and prices", fill = "", colspan = 2)
```

<table>
<thead>
<tr>
<th>jams</th>
<th>Prices of 3 jams</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Description

A huxtable of jams.

Usage

jams
Format

A huxtable with 4 rows and 2 columns ("Type" and "Price").

Description

Print data frames in knitr using huxtable

Usage

knit_print.data.frame(x, options, ...)

Arguments

x A huxtable.
options Not used.
... Not used.

Details

huxtable defines a knit_print method for data.frames. This converts the data frame to a huxtable, with add_colnames = TRUE, themes it using theme_plain() and prints it. It also tries to set a few intelligent defaults, e.g. wrapping long columns and setting an appropriate width. To turn this behaviour off, set options(huxtable.knit_print_df = FALSE). To change the theme, set options("huxtable.knit_print_df_theme") to a one-argument function which should return the huxtable.

See Also

huxtable-options

Other knit_print: knit_print.huxtable()

Examples

## Not run:
# in your knitr document
mytheme <- function (ht) {
  ht <- set_allBorders(ht, 0.4)
  ht <- set_allBorderColors(ht, "darkgreen")
  ht <- set_background_color(ht,
    evens, odds, "salmon")
  ht
}

knit_print.data.frame  Print data frames in knitr using huxtable
options(huxtable.knit_print_df_theme
   = mytheme)
# groovy!
data.frame(
   a = 1:5,
   b = 1:5
)
## End(Not run)

knit_print.huxtable   Print a huxtable within knitr

Description

Print a huxtable within knitr

Usage

knit_print.huxtable(x, options, ...)

Arguments

x A huxtable.
options Not used.
... Not used.

Details

knitr calls knitr::knit_print() on objects when they are printed in a knitr (or RMarkdown) document. The method for huxtable objects guesses the appropriate output format and prints itself out appropriately. You can override the output format by setting options("huxtable.knitr_output_format").

See Also

huxtable-options

Other knit_print: knit_print.data.frame()
**label**

*Set a table label for external referencing*

**Description**

The label is used as the table's label in LaTeX, and as the "id" property of the table element in HTML.

**Usage**

```r
label(ht)
label(ht) <- value
set_label(ht, value)
```

**Arguments**

- **ht**: A huxtable.
- **value**: A string. Set to `NA` to reset to the default, which is "NA".

**Details**

LaTeX table labels typically start with "tab:".

Within knitr, huxtable labels will default to the same as the knitr chunk label. To turn off this behaviour, set `options(huxtable.autolabel = FALSE)`.

If you use bookdown, and set a label on your table, the table `caption()` will automatically be prefixed with `(#label)`. You can then refer to the table using `@ref(label)`. `label` needs to start with "tab:"; if it doesn't, the "tab:" prefix will be added automatically. To turn off this behaviour, set `options(huxtable.bookdown = FALSE)`.

**Value**

`label()` returns the `label` property. `set_label()` returns the modified huxtable.

**See Also**

huxtable-options

**Examples**

```r
label(jams) <- "tab:mytable"
label(jams)
```
latex_float

Set the position of the table float in LaTeX

Description

Possible values include:

- "h": here
- "h!": definitely here
- "t": top of page
- "ht": here or at top of page
- "b": bottom of page
- "p": page of floats

Usage

latex_float(ht)
latex_float(ht) <- value
set_latex_float(ht, value)

Arguments

ht A huxtable.
value A string. Set to NA to reset to the default, which is "ht".

Details

See LaTeX documentation for more details.

Value

latex_float() returns the latex_float property. set_latex_float() returns the modified huxtable.

Examples

latex_float(jams) <- "b"
latex_float(jams)
How to set cell properties variably by cell contents

Description

This help page explains how to set properties differently for cells, depending on their contents. For example, in a table of p-values, you could bold cells where \( p < 0.05 \):

\[
\text{map\_bold}(\text{pval\_hux}, \text{by\_ranges}(0.05, \text{c(TRUE, FALSE)}))
\]

Or you can use red text for a particular value:

\[
\text{hxtbl} \%\% \text{map\_text\_color(by\_values("Warning" = "red"))}
\]

There is a map\_... function for each huxtable cell property. The syntax is:

\[
\text{map\_property}(\text{ht}, \text{row}, \text{col}, \text{fn})
\]

where property is the property name.

row and col specify ranges of rows and columns. See rowspecs for details. To set properties for the whole table, omit row and col:

\[
\text{map\_property}(\text{ht}, \text{fn})
\]

The fn argument is a mapping function which maps cell contents to property values.

- To set property values in "stripes" by rows or by columns, use \text{by\_rows()} and \text{by\_cols()}.  
- To set property values for cells with specific contents, use \text{by\_values()}.  
- To set property values for cells within a numeric range, use \text{by\_ranges()}.  
- To set property values for cells by quantiles, use \text{by\_quantiles()} or \text{by\_equal\_groups()}.  
- To set property values for cells that match a string or regular expression, use \text{by\_regex()}.  
- To map numeric values to a colorspace, use \text{by\_colorspace()}.  
- For a more general solution, use \text{by\_function()} or \text{by\_cases()}.  

Caveat

Most functions convert the huxtable to a matrix using \text{as\_matrix()}. This can have unexpected results if you mix character and numeric data. See the example.

Technical details

fn takes four arguments: the entire original huxtable \text{ht}, a numeric vector of rows, a numeric vector of cols, and the current property values for \text{ht[rows, cols]}, as a matrix. It should return the new property values for \text{ht[rows, cols]}, as a matrix.
Examples

```r
ht <- hux(Condition = c("OK", "Warning", "Error"))
ht <- map_text_color(ht, by_values(
    OK = "green",
    Warning = "orange",
    Error = "red"
))
ht

# Leaving NA values alone:
map_text_color(ht, by_values(
    "OK" = "blue", NA, ignore_na = TRUE))

# Resetting values:
map_text_color(ht, by_values(
    "OK" = "blue", NA, ignore_na = FALSE))

ht <- as_hux(matrix(rnorm(15), 5, 3))
map_background_color(ht, by_ranges(
    c(-1, 1),
    c("blue", "yellow", "red")
))
map_background_color(ht,
    by_equal_groups(2, c("red", "green")))

ht <- hux(
    Coef = c(3.5, 2.4, 1.3),
    Pval = c(0.04, 0.01, 0.07),
    add_colnames = TRUE
)
map_bold(ht, everywhere, "Pval",
    by_ranges(0.05, c(TRUE, FALSE)))

# Problems with as.matrix:
ht <- hux(c(-1, 1, 2), letters[1:3])
as.matrix(ht) # look at the spaces...
as.matrix(ht) > 0 # uh oh
map_text_color(ht,
    by_cases(. < 0 ~ "red", TRUE ~ "blue"))

# To avoid this, only look at the truly numeric columns:
map_text_color(ht, row = 1:3, col = 1,
    by_cases(. < 0 ~ "red", TRUE ~ "blue"))
```

markdown

Interpret cell content as markdown

Description

Cells where the markdown property is TRUE will be interpreted as markdown.
markdown

Usage

markdown(ht)
markdown(ht) <- value
set_markdown(ht, row, col, value = TRUE)
map_markdown(ht, row, col, fn)

Arguments

ht A huxtable.
row A row specifier. See rowspecs for details.
col An optional column specifier.
fn A mapping function. See mapping-functions for details.
value A logical vector or matrix.
  Set to NA to reset to the default, which is FALSE.

Details

Markdown is currently implemented for HTML, Word, PowerPoint, RTF, LaTeX and on-screen display. Word requires the ftExtra package.

Most formats use commonmark, with the "strikethrough" extension enabled.

The following features are intended to work:

• bold and italic text
• strikethrough (write ~text~ to strike through text).
• hyperlinks

There are some quirks:

• Paragraph-level properties (e.g. lists) won’t work in Word.
• Strikethrough will probably not work in Word.
• To make lists work in LaTeX, set width() and ensure wrap() is TRUE.
• Inline images in RTF work using the INCLUDEPICTURE field type.

If you try to use markdown tables within a table cell, then seek psychiatric help.

Value

markdown() returns the markdown property. set_markdown() returns the modified huxtable.

Note

Markdown content in cells is completely separate from printing the whole table as markdown using print_md(). When you set markdown to TRUE, huxtable itself interprets the cell contents as markdown, and spits out HTML, TeX or whatever.

See Also

set_markdown_contents(), a shortcut function.
merge_across

Examples

```r
ejams[3, 2] <- "~2.10~ **Sale!** 1.50"
set_markdown(jams, 3, 2)
```

merge_across Merge cells across rows or down columns

Description
merge_across() creates multicolumn cells within each row. merge_down() creates multirow cells within each column.

Usage
```r
merge_across(ht, row, col)
merge_down(ht, row, col)
```

Arguments

- `ht` A huxtable.
- `row` A row specifier. See rowspecs for details.
- `col` An optional column specifier.

Value
The `ht` object.

Cell content
In merged cell ranges, only the top left cell’s content is displayed. In addition, when you merge cells (either by setting `colspan()` or `rowspan()`, or using `merge_cells()` and friends) the content of the top left cell is copied to other cells. This prevents unexpected changes to content if you reorder or subset rows and columns.

See Also
Other cell merging: `merge_cells()`, `merge_repeated_rows()`

Examples

```r
ht <- as_hux(matrix(1:12, 4, 3, byrow = TRUE))
ht <- set_all_borders(ht, 1)
merge_across(ht, 2:4, 2:3)
merge_down(ht, 2:4, 2:3)
```
merge_cells

Merge a range of cells

Description

merge_cells() merges a rectangle of cells into a single displayed cell, by setting colspan() and rowspan().

Usage

merge_cells(ht, row, col)

Arguments

ht A huxtable.
row A row specifier. See rowspecs for details.
col An optional column specifier.

Details

merge_cells(ht, c(min_row, max_row), c(min_col, max_col)) is equivalent to

colspan(ht)[min_row, min_col] <- max_col - min_col + 1
rowspan(ht)[min_row, min_col] <- max_row - min_row + 1

Value

The ht object.

Cell content

In merged cell ranges, only the top left cell’s content is displayed. In addition, when you merge cells (either by setting colspan() or rowspan(), or using merge_cells() and friends) the content of the top left cell is copied to other cells. This prevents unexpected changes to content if you reorder or subset rows and columns.

See Also

Other cell merging: merge_across(), merge_repeated_rows()

Examples

ht <- hux(a = 1:3, b = 1:3)
ht <- set_allBorders(ht, 1)
merge_cells(ht, 2:3, 1:2)
merge_repeated_rows

Merge repeated rows into multirow cells

Description
merge_repeated_rows() looks within each column for contiguous groups of identical cells. These are merged by setting `rowspan()`. Doing this helps remove redundant information from the table.

Usage
merge_repeated_rows(ht, row, col)

Arguments
- `ht`: A huxtable.
- `row`: A row specifier. See `rowspecs` for details.
- `col`: An optional column specifier.

Details
If `row` contains gaps, results may be unexpected (and a warning is given).

Value
The `ht` object.

Cell content
In merged cell ranges, only the top left cell’s content is displayed. In addition, when you merge cells (either by setting `colspan()` or `rowspan()`, or using `merge_cells()` and friends) the content of the top left cell is copied to other cells. This prevents unexpected changes to content if you reorder or subset rows and columns.

See Also
Other cell merging: `merge_across()`, `merge_cells()`

Examples
```r
everywhere
merge_repeated_rows(ht, everywhere, "Type")
```

Use `dplyr` verbs with `huxtable` objects

Description

Huxtable can be used with `dplyr` verbs `dplyr::select()`, `dplyr::rename()`, `dplyr::relocate()`, `dplyr::slice()`, `dplyr::arrange()`, `dplyr::mutate()` and `dplyr::transmute()`. These will return huxtables. Other verbs like `dplyr::summarise()` will simply return data frames as normal; `dplyr::pull()` will return a vector. `mutate` has an extra option, detailed below.

Usage

```r
## S3 method for class 'huxtable'
mutate(.data, ..., copy_cell_props = TRUE)
```

Arguments

- `.data`: A huxtable.
- `...`: Arguments passed to `dplyr::mutate()`.
- `copy_cell_props`: Logical: copy cell and column properties from existing columns.

Details

If `mutate` creates new columns, and the argument `copy_cell_props` is missing or `TRUE`, then cell and column properties will be copied from existing columns to their left, if there are any. Otherwise, they will be the standard defaults. Row and table properties, and properties of cells in existing columns, remain unchanged.

Examples

```r
ht <- hux(a = 1:5, b = 1:5, c = 1:5, d = 1:5, add_colnames = FALSE)
bold(ht)[c(1, 3), ] <- TRUE
bold(ht)[, 1] <- TRUE
ht2 <- dplyr::select(ht, b:c)
ht2
bold(ht2)
ht3 <- dplyr::mutate(ht, x = a + b)
ht3
bold(ht3)
ht4 <- dplyr::mutate(ht, x = a + b, copy_cell_props = FALSE)
bold(ht4)
```
na_string

Change how NA values are printed

Description

NA values in the huxtable are printed as the value of na_string.

Usage

na_string(ht)
na_string(ht) <- value
set_na_string(ht, row, col, value )
map_na_string(ht, row, col, fn)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ht</td>
<td>A huxtable.</td>
</tr>
<tr>
<td>row</td>
<td>A row specifier. See rowspecs for details.</td>
</tr>
<tr>
<td>col</td>
<td>An optional column specifier.</td>
</tr>
<tr>
<td>fn</td>
<td>A mapping function. See mapping-functions for details.</td>
</tr>
<tr>
<td>value</td>
<td>A character vector or matrix. Set to NA to reset to the default, which is &quot;&quot;.</td>
</tr>
</tbody>
</table>

Value

na_string() returns the na_string property. set_na_string() returns the modified huxtable.

See Also

Other formatting functions: background_color(), bold(), font_size(), font(), number_format(), text_color()

Examples

jams[3, 2] <- NA
jams
set_na_string(jams, "---")
**number_format**  
*Set how numbers are formatted in cells*

**Description**

If `number_format` is:

- numeric, numbers will be rounded to that many decimal places;
- character, it will be used as an argument to `sprintf()`;
- a function, the function will be applied to the numbers;
- NA, then numbers will not be formatted (except by conversion with `as.character`).

**Usage**

```r
number_format(ht)  
number_format(ht) <- value
set_number_format(ht, row, col, value )  
map_number_format(ht, row, col, fn)
```

**Arguments**

- `ht` A huxtable.
- `row` A row specifier. See `rowspecs` for details.
- `col` An optional column specifier.
- `fn` A mapping function. See `mapping-functions` for details.
- `value` A character or integer vector,
  Note that setting to NA does not reset to the default.

**Details**

Number formatting is applied to any parts of cells that look like numbers. The exception is exponents in scientific notation; huxtable attempts to detect and ignore these.

The default value is "%.3g", which rounds numbers if they have more than 3 significant digits, and which may use scientific notation for large numbers.

Note that if your cells are of type numeric, a number format of NA doesn’t guarantee you get back what you typed in, since R’s default conversion may apply scientific notation and rounding.

To set `number_format` to a function, enclose the function in `list`. The function should take one argument and return a string. `fmt_pretty()` and `fmt_percent()` are useful shortcuts for common formatting functions.

**Value**

`number_format()` returns the `number_format` property. `set_number_format()` returns the modified huxtable.
See Also

fmt_pretty() and fmt_percent().options("huxtable.long_minus") in huxtable-options for pretty-printing minus signs.

Other formatting functions: background_color(), bold(), font_size(), font(), na_string(), text_color()

Examples

ht <- huxtable(
  number_format = c(
    "Default",
    "NA",
    "2",
    "\%5.2f",
    "Pretty",
    "Sign"
  ),
  a = rep(1000, 6),
  b = rep(1000.005, 6),
  c = rep(0.0001, 6),
  d = rep(-1, 6),
  e = rep("3.2 (s.e. 1.4)", 6)
)

number_format(ht)[3, -1] <- NA
number_format(ht)[4, -1] <- 2
number_format(ht)[5, -1] <- "\%5.2f"

number_format(ht)[6, -1] <- fmt_pretty()

number_format(ht)[7, -1] <- list(
  function(x) if (x > 0) "+" else "-
)

right_border(ht) <- 1
bottom_border(ht)[1, ] <- 1

ht

ht_bands <- huxtable("10000 Maniacs", autoformat = FALSE)
# probably not what you want:
ht_bands
# fixed:
set_number_format(ht_bands, NA)
padding

Description

These functions set the space around the edges of cells, within the borders.

Usage

\[
\begin{align*}
\text{left_padding(ht)} \\
\text{left_padding(ht) <- value} \\
\text{set_left_padding(ht, row, col, value)} \\
\text{map_left_padding(ht, row, col, fn)} \\
\text{right_padding(ht)} \\
\text{right_padding(ht) <- value} \\
\text{set_right_padding(ht, row, col, value)} \\
\text{map_right_padding(ht, row, col, fn)} \\
\text{top_padding(ht)} \\
\text{top_padding(ht) <- value} \\
\text{set_top_padding(ht, row, col, value)} \\
\text{map_top_padding(ht, row, col, fn)} \\
\text{bottom_padding(ht)} \\
\text{bottom_padding(ht) <- value} \\
\text{set_bottom_padding(ht, row, col, value)} \\
\text{map_bottom_padding(ht, row, col, fn)}
\end{align*}
\]

Arguments

- **ht**: A huxtable.
- **row**: A row specifier. See `rowspecs` for details.
- **col**: An optional column specifier.
- **fn**: A mapping function. See `mapping-functions` for details.
- **value**: Numeric: padding width/height in points.

See Also

- `set-multiple`, `set-outer`.

Examples

\[
\begin{align*}
\text{left_padding(jams) <- 2} \\
\text{left_padding(jams)} \\
\text{jams <- set_left_padding(jams, 2)} \\
\text{left_padding(jams)}
\end{align*}
\]
position

Set the table’s position with respect to surrounding content

Description

Table position may be "left", "right" or "center". If you want text to wrap around the table, use "wrapleft" or "wrapright".

Usage

position(ht)
position(ht) <- value
set_position(ht, value)

Arguments

ht            A huxtable.
value         String. "left", "center", "right", "wrapleft" or "wrapright". Set to NA to reset to the default, which is "center".

Details

"wrapleft" and "wrapright" position the table to the left or right, and allow text to wrap around the table.

Value

position() returns the position property. set_position() returns the modified huxtable.

Examples

position(jams) <- "right"
position(jams)

set_position(jams, "left")
set_position(jams, "right")
set_position(jams, "center")
By default huxtables are printed using `print_screen()`. In certain cases, for example in Sweave documents, it may be useful to change this. You can do so by setting `options("huxtable.print").`

## S3 method for class 'huxtable'

```r
print(x, ...)
```

## S3 method for class 'huxtable'

```r
format(x, ..., output = c("latex", "html", "md", "screen", "rtf"))
```

### Arguments

- `x` A huxtable.
- `...` Options passed to other methods.
- `output` Output format. One of "html", "latex", "md", "screen" or "rtf".

### Value

- `print` prints the huxtable and returns `NULL` invisibly.
- `format` returns a string representation from `to_latex()`, `to_html()` etc.

### See Also

To change how huxtables are printed within knitr, see `options("huxtable.knitr_output_format")` in `huxtable-options`.

### Examples

```r
## Not run:
# to print LaTeX output:
options(huxtable.print = print_latex)

## End(Not run)

format(jams, output = "screen")
format(jams, output = "md")
```
print_html | Create HTML representing a huxtable

Description

These functions print or return an HTML table.

Usage

print_html(ht, ...)
to_html(ht, ...)
print_notebook(ht, ...)

## S3 method for class 'huxtable'
to_html(ht, ...)

Arguments

ht A huxtable.
...
Arguments to pass to methods. Not currently used.

Value

to_html returns an HTML string. print_html prints the string and returns NULL.
print_notebook prints HTML output suitable for use in an RStudio interactive notebook.

See Also

Other printing functions: print_latex(), print_md(), print_rtf(), print_screen()

Examples

ht <- hux(a = 1:3, b = letters[1:3])
to_html(ht)
print_latex

Create LaTeX representing a huxtable

Description

Create LaTeX representing a huxtable

Usage

print_latex(ht, ...)

to_latex(ht, ...)

## S3 method for class 'huxtable'
to_latex(ht, tabular_only = FALSE, ...)

Arguments

ht            A huxtable.
...
Arguments to pass to methods.
tabular_only  Return only the LaTeX tabular, not the surrounding float.

Details

If we appear to be in a rmarkdown document with the Pandoc markdown +raw_attribute extension available, to_latex will return LaTeX surrounded by a "raw attribute code block" (see https://pandoc.org/MANUAL.html#extension-raw_attribute). This helps protect against pandoc accidentally escaping the TeX code.

Value

to_latex returns a string. print_latex prints the string and returns NULL.

See Also

Other printing functions: print_html(), print_md(), print_rtf(), print_screen()

Examples

ht <- huxtable(
    a = 1:3,
    b = letters[1:3]
)
print_latex(ht)
Create Markdown representing a huxtable

## S3 method for class 'huxtable'
```
print_md(ht, ...)  
to_md(ht, ...)  
```

### Arguments

- **ht**: A huxtable.
- **...**: Arguments passed to methods.
- **header**: Logical. Print the first row as a header?
- **min_width**: Minimum width in on-screen characters of the result.
- **max_width**: Maximum width in on-screen characters of the result. Overrides `min_width`.

### Details

Only `align` and `caption` properties are used. The markdown format is `multiline_tables`, see the [pandoc documentation](http://pandoc.org/).

### Value

- `to_md()` returns a string. `print_md()` prints the string and returns `NULL`.

### See Also

Other printing functions: `print_html()`, `print_latex()`, `print_rtf()`, `print_screen()`

### Examples

```
print_md(jams)
```
Description

These functions print or return an RTF character string.

Usage

```r
print_rtf(ht, fc_tables = rtf_fc_tables(ht), ...)

to_rtf(ht, ...)
```

```r
## S3 method for class 'huxtable'
to_rtf(ht, fc_tables = rtf_fc_tables(ht), ...)
```

Arguments

- `ht` A huxtable.
- `fc_tables` See `rtf_fc_tables()`.
- `...` Arguments to pass to methods.

Details

RTF files use a single per-document table for colors, and one for fonts. If you are printing multiple huxtables in a document, you need to make sure that the font and color table is set up correctly and that the RTF tables refer back to them. See `rtf_fc_tables()`.

1. Prepare all the huxtables;
2. Call `rtf_fc_tables()`, passing in all the huxtables;
3. Print the `rtfFCTables` object in the RTF document header;
4. Pass in the `rtfFCTables` object to each call to `print_rtf`.

Value

`to_rtf` returns a string representing an RTF table. The `fc_tables` attribute of the returned string will contain the `fc_tables` object that was passed in (or autocreated). `print_rtf` prints the string and returns NULL.

Limitations

- rmarkdown’s `rtf_document` can’t yet print out customized color tables, so custom fonts and colors won’t work in this context.
- `col_width()` and `width()` can only be numeric or "pt".
- `wrap()` has no effect: cell contents always wrap.
- `rotation()` can only be 90 or 270, i.e. text going up or down.
See Also

Other printing functions: `print_html()`, `print_latex()`, `print_md()`, `print_screen()`

Examples

```r
print_rtf(jams)
```

---

**print_screen**

*Print a huxtable on screen*

**Description**

Print a huxtable on screen

**Usage**

```r
print_screen(ht, ...

to_screen(ht, ...)

## S3 method for class 'huxtable'
to_screen(
  ht,
  min_width = ceiling(getOption("width")/6),
  max_width = getOption("width", Inf),
  compact = TRUE,
  colnames = TRUE,
  color = getOption("huxtable.color_screen", default = TRUE),
  ...
)
```

**Arguments**

- `ht` A huxtable.
- `...` Passed on to `to_screen`.
- `min_width` Minimum width in on-screen characters of the result.
- `max_width` Maximum width in on-screen characters of the result. Overrides `min_width`.
- `compact` Logical. To save space, don’t print lines for empty horizontal borders.
- `colnames` Logical. Whether or not to print column names.
- `color` Logical. Whether to print the huxtable in color (requires the `crayon` package).
Details

Screen display shows the following features:

- Table and caption positioning
- Merged cells
- Cell alignment
- Borders
- Cell background and border color (if the "crayon" package is installed)
- Text color, bold and italic (if the "crayon" package is installed)

Cell padding, widths and heights are not shown, nor are border styles.

Value

to_screen returns a string. print_screen prints the string and returns NULL.

See Also

Other printing functions: print_html(), print_latex(), print_md(), print_rtf()

Examples

```r
bottom_border(jams)[1, 1:2] <- 1
bold(jams)[1, 1:2] <- TRUE
jams <- map_text_color(jams,
    by_regex("berry" = "red"))

print_screen(jams)
```

Description

These functions use huxtable to print objects to an output document. They are useful as one-liners for data reporting.

Usage

```r
quick_latex(
    ...,
    file = confirm("huxtable-output.tex"),
    borders = 0.4,
    open = interactive()
)
```
quick_pdf(
  ..., 
  file = confirm("huxtable-output.pdf"),
  borders = 0.4,
  open = interactive(),
  width = NULL,
  height = NULL
)

quick_html(
  ..., 
  file = confirm("huxtable-output.html"),
  borders = 0.4,
  open = interactive()
)

quick_docx(
  ..., 
  file = confirm("huxtable-output.docx"),
  borders = 0.4,
  open = interactive()
)

quick_pptx(
  ..., 
  file = confirm("huxtable-output.pptx"),
  borders = 0.4,
  open = interactive()
)

quick_xlsx(
  ..., 
  file = confirm("huxtable-output.xlsx"),
  borders = 0.4,
  open = interactive()
)

quick_rtf(
  ..., 
  file = confirm("huxtable-output.rtf"),
  borders = 0.4,
  open = interactive()
)

Arguments

... One or more huxtables or R objects with an as_huxtable method.

file File path for the output.
**report_latex_dependencies**

```
borders      Border width for members of ... that are not huxtables.
open         Logical. Automatically open the resulting file?
width        String passed to the LaTeX geometry package's paperwidth option. Use NULL for the default width.
height       String passed to geometry's paperheight option. Use NULL for the default height.
```

**Details**

Objects in ... will be converted to huxtables, with borders added.

If ‘file’ is not specified, the command will fail in non-interactive sessions. In interactive sessions, the default file path is "huxtable-output.xxx" in the working directory; if this already exists, you will be asked to confirm manually before proceeding.

To create docx and pptx files flextable and officer must be installed, while xlsx needs openxlsx.

**Value**

Invisible NULL.

**Examples**

```
## Not run:
m <- matrix(1:4, 2, 2)
quick_pdf(m, jams)
quick_latex(m, jams)
quick_html(m, jams)
quick_docx(m, jams)
quick_xlsx(m, jams)
quick_pptx(m, jams)
quick_rtf(m, jams)
## End(Not run)
```

---

**report_latex_dependencies**

*Manage LaTeX dependencies for huxtables*

**Description**

`report_latex_dependencies` prints out and/or returns a list of LaTeX dependencies for adding to a LaTeX preamble.

`check_latex_dependencies` checks whether the required LaTeX packages are installed.

`install_latex_dependencies` is a utility function to install and/or update the LaTeX packages that huxtable requires. It calls `tinytex::tlmgr_install()` if possible, or `tlmgr install` directly.
Usage

```r
report_latex_dependencies(quiet = FALSE, as_string = FALSE)
check_latex_dependencies(quiet = FALSE)
install_latex_dependencies()
```

Arguments

- **quiet**: Logical. For `report_latex_dependencies`, suppress printing of dependencies. For `check_latex_dependencies`, suppress messages.
- **as_string**: Logical: return dependencies as a string.

Value

If `as_string` is `TRUE`, `report_latex_dependencies` returns a string of `"\\usepackage\{...\}"` statements; otherwise it returns a list of `rmarkdown::latex_dependency` objects, invisibly.

- `check_latex_dependencies()` returns `TRUE` or `FALSE`.
- `install_latex_dependencies()` returns `TRUE` if `tlmgr` returns 0.

Examples

```r
report_latex_dependencies()

## Not run:
check_latex_dependencies()

## End(Not run)

## Not run:
install_latex_dependencies()

## End(Not run)
```

---

**Description**

- `restack_across()` splits a huxtable horizontally, then joins the parts up side by side.
- `restack_down()` splits a huxtable vertically, then joins the parts up top to bottom.
restack-across-down

Usage

restack_across(
  ht,
  rows,
  headers = TRUE,
  on_remainder = c("warn", "stop", "fill")
)

restack_down(
  ht,
  cols,
  headers = TRUE,
  on_remainder = c("warn", "stop", "fill")
)

Arguments

ht              A huxtable
rows, cols      How many rows/columns the new result should have.
headers         Logical. Take account of header rows/columns?
on_remainder    String. "warn", "stop" or "fill". See below.

Details

If headers is TRUE, header rows/columns will be repeated across/down the restacked huxtable as necessary.

on_remainder determines what happens if the huxtable could not be evenly divided for restacking:

- "stop": stop with an error.
- "fill": fill the remainder with empty cells.
- "warn" (the default): issue a warning, then fill the remainder with empty cells.

Value

A new huxtable.

See Also

split-across-down

Examples

ht <- as_hux(matrix(LETTERS[1:4], 2, 2))
ht <- set_all_borders(ht)
ht
restack_down(ht, 1)
restack_across(ht, 1)

# headers:
restack_across(jams, 2)
restack_across(jams, 2,
               headers = FALSE)

# on_remainder:
restack_across(jams, 3,
               on_remainder = "fill")

---

<table>
<thead>
<tr>
<th>rotation</th>
<th>Rotate text within cells</th>
</tr>
</thead>
</table>

**Description**

Numbers represent degrees to rotate text anti-clockwise:

**Usage**

```
rotation(ht)
rotation(ht) <- value
set_rotation(ht, row, col, value)
map_rotation(ht, row, col, fn)
```

**Arguments**

- **ht**: A huxtable.
- **row**: A row specifier. See `rowspecs` for details.
- **col**: An optional column specifier.
- **fn**: A mapping function. See `mapping-functions` for details.
- **value**: A numeric vector or matrix.
  Set to NA to reset to the default, which is 0.

**Details**

- 0 is the default;
- 90 is going upwards, for left-to-right languages;
- 270 is going downwards.

You will probably need to set `col_width()` and `row_height()` explicitly to achieve a nice result, in both HTML and LaTeX.

**Value**

`rotation()` returns the rotation property. `set_rotation()` returns the modified huxtable.
Examples

```r
rotation(jams) <- 90
rotation(jams)

jams2 <- set_rotation(jams, 
270)
rotation(jams2)

jams3 <- set_rotation(jams, 
2:3, 1, 270)
rotation(jams3)

jams4 <- map_rotation(jams, 
by_rows(
  270,
  90)
)
rotation(jams4)
```

rowspecs

**Different ways to select rows and columns**

Description

This help page describes how to use the row and col arguments in set_* functions.

The basics

The set_* functions for cell properties all have arguments like this: set_property(ht, row, col, value).

You can treat row and col arguments like arguments for data frame subsetting. For example, you can use row = 1:3 to get the first three rows, col = "salary" to specify the column named "salary", or row = ht$salary >= 50000 to specify rows where a condition is true.

There are also a few extra tricks you can use:

- Write set_property(ht, x), omitting row and col, to set the property to x for all cells.
- Use everywhere to refer to all rows or all columns.
- Use final(n) to refer to the last n rows or columns.
- Use evens to get only even rows/columns and odds for only odd ones.
- Use {dplyr} functions like starts_with, contains and matches to specify columns (but not rows). See tidyselect::language for a full list.
The gory details

How the row and col arguments are parsed depends on the number of arguments passed to the set_*
function.

- If there are two arguments then the second argument is taken as the value and is set for all
  rows and columns.
- If there are four arguments:
  - If row or col is numeric, character or logical, it is evaluated just as in standard subsetting.
    col will be evaluated in a special context provided by tidyselect::with_vars() to
    allow the use of dplyr functions.
  - If row or col is a function, it is called with two arguments: the huxtable, and the dimension
    number being evaluated, i.e. 1 for rows, 2 for columns. It must return a vector of column
    indices. evens(), odds(), stripe() and final() return functions for this purpose.

Examples

set_bold(jams, 2:4, 1:2, TRUE)
set_background_color(jams, evens, everywhere, "grey95")
set_bold(jams, everywhere,
tidyselect::matches("yp"), TRUE)
set_text_color(jams, 2:4, 1:2,
c("red", "violetred", "purple"))

row_height

Set the height of table rows

Description

Numeric heights are scaled to 1 and treated as proportions of the table height in HTML, or of the text
height (\textheight) in LaTeX. Character row heights must be valid CSS or LaTeX dimensions.

Usage

row_height(ht)
row_height(ht) <- value
set_row_height(ht, row, value)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ht</td>
<td>A huxtable.</td>
</tr>
<tr>
<td>row</td>
<td>A row specifier. See rowspecs for details.</td>
</tr>
<tr>
<td>value</td>
<td>Numeric or character vector. Set to NA to reset to the default, which is NA.</td>
</tr>
</tbody>
</table>
Value

`row_height()` returns the `row_height` property. `set_row_height()` returns the modified `huxtable`.

See Also

Other table measurements: `col_width()`, `height()`, `width()`

Examples

```r
row_height(jams) <- c(.4, .2, .2, .2)
row_height(jams)
```

---

**rtf_fc_tables**

Create RTF font and color tables

Description

Create RTF font and color tables

Usage

```r
rtf_fc_tables(..., extra_fonts = "Times", extra_colors = character(0))
```

Arguments

- `...` One or more objects of class `huxtable`.
- `extra_fonts` Extra fonts to include. These will be first in the fonts table.
- `extra_colors` Extra colors to include, as R color names.

Details

RTF documents have a single table of fonts, and a table of colors, in the RTF header. To create font and color tables for multiple `huxtable`s, use this command. You can print the returned object in the RTF header. Pass it to `print_rtf()` or `to_rtf()` to ensure that `huxtable`s print out the correct colour references.

Value

An object of class `rtfFCTables`. This is a list containing two items: "fonts" is a character vector of unique font names; "colors" is a character vector of unique color names.
Examples

# Printing multiple huxtables:

ht <- huxtable("Blue with red border")
ht <- set_all_borders(ht, 1)
ht <- set_all_border_colors(ht, "red")
background_color(ht) <- "blue"

ht2 <- huxtable("Dark green text")
text_color(ht2) <- "darkgreen"

fc_tbls <- rtf_fc_tables(ht, ht2)

# In the document header:
print(fc_tbls)

# In the document body:
print_rtf(ht, fc_tables = fc_tbls)
print_rtf(ht2, fc_tables = fc_tbls)

sanitize

Escape text for various formats

Description

This escapes a string for LaTeX, HTML or RTF.

Usage

sanitize(str, type = c("latex", "html", "rtf"))

Arguments

str       A character object.
type      "latex", "html" or "rtf".

Details

HTML and LaTeX code was copied over from xtable::sanitize().

Value

The sanitized character object.

Examples

txt <- "Make $$$ with us"
sanitize(txt, type = "latex")
Description

These functions set left, right, top and/or bottom properties simultaneously for the specified cells.

Usage

```python
set_allBorders(ht, row, col, value = 0.4)
map_allBorders(ht, row, col, fn)
set_allBorderColors(ht, row, col, value)
map_allBorderColors(ht, row, col, fn)
set_allBorderStyle(ht, row, col, value)
map_allBorderStyle(ht, row, col, fn)
set_allPadding(ht, row, col, value)
map_allPadding(ht, row, col, fn)
set_tbPadding(ht, row, col, value)
map_tbPadding(ht, row, col, fn)
set_lrPadding(ht, row, col, value)
map_lrPadding(ht, row, col, fn)
set_tbBorders(ht, row, col, value)
map_tbBorders(ht, row, col, fn)
set_lrBorders(ht, row, col, value)
map_lrBorders(ht, row, col, fn)
set_tbBorderColor(ht, row, col, value)
map_tbBorderColor(ht, row, col, fn)
set_lrBorderColor(ht, row, col, value)
```
map_lr_border_colors(ht, row, col, fn)
set_tb_border_styles(ht, row, col, value)
map_tb_border_styles(ht, row, col, fn)
set_lr_border_styles(ht, row, col, value)
map_lr_border_styles(ht, row, col, fn)

Arguments

ht
A huxtable.
row
A row specifier. See rowspecs for details.
col
An optional column specifier.
value
Value(s) to set. Set to NA to reset to the default.
fn
A mapping function. See mapping-functions for details.

Details

- set_all_* functions set top, bottom, left and right properties.
- set_tb_* functions set top and bottom properties.
- set_lr_* functions set left and right properties.

Value

The modified huxtable.

See Also

borders, border-colors, border-styles, padding.

Examples

ht <- as_hux(jams)
ht <- set_allBorders(ht)
ht
ht <- set_all_border_colors(ht, "red")
ht
ht <- set_all_border_styles(ht, "double")
ht <- set_all_padding(ht, 1:3, 1:2, "20px")
ht <- set_tb_padding(ht, 10)
ht <- set_tbBorders(ht)
set_tb_border_colors(ht, "red")
set_tb_border_styles(ht, "double")
**Description**

Set borders and padding around a rectangle of cells

**Usage**

```
set_outer_borders(ht, row, col, value = 0.4)
set_outer_border_colors(ht, row, col, value)
set_outer_border_styles(ht, row, col, value)
set_outer_padding(ht, row, col, value)
```

**Arguments**

- `ht` A huxtable.
- `row` A row specifier. See `rowspecs` for details.
- `col` An optional column specifier.
- `value` Border width, color, style or a `brdr()` object. See `borders`. For padding, padding width in points.

**Details**

`set_outer_borders` sets borders round the top, bottom, left and right of a group of cells. Behaviour is undefined unless `row` and `col` specify contiguous sequences. `set_outer_border_colors` and `set_outer_border_styles` set border colors and styles. `set_outer_padding` sets padding, i.e. top padding on the top row of cells, etc.

**Examples**

```
ht2 <- huxtable(a = 1:3, b = 1:3)
set_outer_borders(ht2)
set_outer_borders(ht2, 2:3, 1:2)
```
set_contents

**Set cell contents**

**Description**

`set_contents()` is a convenience function to change the cell contents of a huxtable within a dplyr chain. `set_contents(ht, x, y, foo)` just calls `ht[x, y] <- foo` and returns `ht`.

**Usage**

```r
contents(ht)
contents(ht) <- value
set_contents(ht, row, col, value)
map_contents(ht, row, col, fn)
```

**Arguments**

- `ht` A huxtable.
- `row` A row specifier. See `rowspecs` for details.
- `col` An optional column specifier.
- `fn` A mapping function. See `mapping-functions` for details.
- `value` Cell contents.

**Examples**

```r
set_contents(jams, 2, 1, "Blackcurrant")
map_contents(jams, by_regex(".*berry" = "Snodberry"))
```

set_default_properties

**Default huxtable properties**

**Description**

Defaults are used for new huxtables, and also when a property is set to `NA`.

**Usage**

```r
set_default_properties(...)
get_default_properties(names = NULL)
```
Arguments

... Properties specified by name, or a single named list.

names Vector of property names. If NULL, all properties are returned.

Details

Note that autoformat = TRUE in huxtable() overrides some defaults.
To set default border styles, use the pseudo-properties border/border_style/border_color. You cannot set defaults separately for different sides.

Value

For set_default_properties, a list of the previous property values, invisibly.
For get_default_properties, a list of the current defaults.

See Also

Options for autoformat in huxtable-options.

Examples

old <- set_default_properties(
  text_color = "red",
  border    = 0.4
)
hux(a = 1:2, b = 1:2)
set_default_properties(old)
get_default_properties("bold")
spans

Value

The modified huxtable.

Note

Markdown content in cells is completely separate from printing the whole table as markdown using `print_md()`. When you set `markdown` to `TRUE`, huxtable itself interprets the cell contents as markdown, and spits out HTML, TeX or whatever.

See Also

`markdown()`.

Examples

```r
set_markdown_contents(jams, 1, 1,
  "**Type** of jam")
```

---

spans  

Extend cells over multiple rows and/or columns

Description

A cell with `rowspan` of 2 covers the cell directly below it. A cell with `colspan` of 2 covers the cell directly to its right. A cell with `rowspan` of 2 and `colspan` of 2 covers a 2 x 2 square, hiding three other cells.

Usage

```r
rowspan(ht)
rowspan(ht) <- value
set_rowspan(ht, row, col, value )
map_rowspan(ht, row, col, fn)
```

```r
colspan(ht)
colspan(ht) <- value
set_colspan(ht, row, col, value )
map_colspan(ht, row, col, fn)
```

Arguments

- `ht` A huxtable.
- `row` A row specifier. See rowspecs for details.
- `col` An optional column specifier.
- `fn` A mapping function. See mapping-functions for details.
- `value` An integer vector or matrix.
Cell content

In merged cell ranges, only the top left cell’s content is displayed. In addition, when you merge cells (either by setting colspan() or rowspan(), or using merge_cells() and friends) the content of the top left cell is copied to other cells. This prevents unexpected changes to content if you reorder or subset rows and columns.

See Also

merge_cells(), merge_across() and merge_down() for a higher-level interface.

Examples

letter_hux <- as_hux(matrix(LETTERS[1:9], 3, 3))
letter_hux <- set_all_borders(letter_hux)
letter_hux
set_rowspan(letter_hux, 1, 1, 2)
set_colspan(letter_hux, 1, 1, 2)

split_across_down

Description

These functions split a huxtable horizontally or vertically, and return the new sub-tables in a list.

Usage

split_across(ht, after, height, headers = TRUE)

split_down(ht, after, width, headers = TRUE)

Arguments

ht A huxtable.

after Rows/columns after which to split. See rowsspecs for details. Note that tidyselect semantics are allowed in split_down() but not split_across().

height, width Maximum height/width for the result.

headers Logical. Take account of header rows/columns?

Details

Only one of after and width or height must be given. If width or height is given, the huxtable will be split by col_width() or row_height(), which must be numeric with no NA values.

If headers is TRUE, all previous headers will be added to each new table.
stripe

Value

A list of huxtables.

See Also

restack-across-down

Examples

```r
ht <- as_hux(matrix(LETTERS[1:16], 4, 4))
ht <- set_allBorders(ht)
split_across(ht, after = 2)
split_down(ht, after = c(1, 3))

col_width(ht) <- c(0.15, 0.1, 0.25, 0.3)
split_down(ht, width = 0.3)

# split by column name:
split_down(jams, "Type")

# headers are repeated:
split_across(jams, 3)
```

---

**Description**

This is a convenience function to use in row or column specifications. In this context, `stripe(n, from)` will return `from, from + n, ...`, up to the number of rows or columns of the huxtable. `evens` and `odds` return even and odd numbers, i.e. they are equivalent to `stripe(2, 2)` and `stripe(2, 1)` respectively. `everywhere` returns all rows or columns, equivalently to `stripe(1)`.

**Usage**

```r
stripe(n = 1, from = n)

everywhere(ht, dimension)

evens(ht, dimension)

odds(ht, dimension)
```
**stripes**

**_set background color stripes_

**Description**

These convenience functions call `map_background_color` with `by_rows` or `by_cols`.

**Usage**

```r
stripe_rows(ht, stripe1 = "white", stripe2 = "grey90")

stripe_columns(ht, stripe1 = "white", stripe2 = "grey90")
```

**Arguments**

- `ht` A huxtable.
- `stripe1` Color for rows/columns 1, 3, 5, ...
- `stripe2` Color for rows/columns 2, 4, 6, ...
Examples

```r
stripe_rows(jams)
stripe_columns(jams)
stripe_rows(jams, "red", "blue")
```
Examples

```
style_headers(jams, text_color = "red")
jams <- set_header_cols(jams, 1, TRUE)
style_header_cols(jams,
   text_color = c(NA, "red",
      "darkred", "purple")
)

style_cells(jams, everywhere, 2, bold = TRUE)
```

---

**t.huxtable**  
*Transpose a huxtable*

---

**Description**

`t()` switches a huxtable so rows become columns and columns become rows.

**Usage**

```r
# S3 method for class 'huxtable'
t(x)
```

**Arguments**

- `x`  
  A huxtable.

**Details**

Row and column spans of `x` will be swapped, as will column widths and row heights, table width and height, and cell borders (bottom becomes right, etc.). Other properties - in particular, alignment, vertical alignment and rotation - will be preserved.

**Value**

The transposed huxtable.

**Examples**

```
ht <- huxtable(
   a = 1:3,
   b = letters[1:3],
   autoformat = FALSE
)
bottom_border(ht)[3,] <- 1
ht
ht <- t(ht)
t(ht)
```
Description

By default this is "table".

Usage

table_environment(ht)
table_environment(ht) <- value
set_table_environment(ht, value)

Arguments

ht A huxtable.
value A string. Set to NA to reset to the default, which is "table".

Details

No features are guaranteed to work if you set this to a non-default value. Use at your own risk! In particular, you may need to set latex_float() to a non-default value.

If position() is set to "wrapleft" or "wrapright", this value is overridden.

Value

table_environment() returns the table_environment property. set_table_environment() returns the modified huxtable.

Examples

    table_environment(jams) <- "table*
    table_environment(jams)

Description

By default this is either "tabular" or "tabularx".

Usage

tabular_environment(ht)
tabular_environment(ht) <- value
set_tabular_environment(ht, value)
text_color

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ht</code></td>
<td>A huxtable.</td>
</tr>
<tr>
<td><code>value</code></td>
<td>A string. Set to <code>NA</code> to reset to the default, which is &quot;NA&quot;.</td>
</tr>
</tbody>
</table>

Details

No features are guaranteed to work if you set this to a non-default value. Use at your own risk!

Value

tabular_environment() returns the tabular_environment property. set_tabular_environment() returns the modified huxtable.

Examples

```r
tabular_environment(jams) <- "longtable"
tabular_environment(jams)
```

Description

Colors can be in any format understood by R:

- A color name like "darkred"
- A HTML string like "#FF0000"
- The result of a function like `rgb(1, 0, 0)` or `grey(0.5)`

Usage

```r
text_color(ht)
text_color(ht) <- value
set_text_color(ht, row, col, value )
map_text_color(ht, row, col, fn)
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ht</code></td>
<td>A huxtable.</td>
</tr>
<tr>
<td><code>row</code></td>
<td>A row specifier. See <code>rowspecs</code> for details.</td>
</tr>
<tr>
<td><code>col</code></td>
<td>An optional column specifier.</td>
</tr>
<tr>
<td><code>fn</code></td>
<td>A mapping function. See <code>mapping-functions</code> for details.</td>
</tr>
<tr>
<td><code>value</code></td>
<td>A character vector or matrix. Set to <code>NA</code> to reset to the default, which is &quot;NA&quot;.</td>
</tr>
</tbody>
</table>
Value

`text_color()` returns the `text_color` property. `set_text_color()` returns the modified huxtable.

See Also

Other formatting functions: `background_color()`, `bold()`, `font_size()`, `font()`, `na_string()`, `number_format()`

Examples

```r

text_color(jams) <- "blue"
text_color(jams)

set_text_color(jams, "red")
set_text_color(jams, 2:3, 1, "red")
map_text_color(jams, by_rows("red", "blue"))
```

---

**themes**

*Theme a huxtable*

Description

These functions quickly set default styles for a huxtable.

Usage

```r
theme_plain(ht, header_rows = TRUE, position = "center")
theme_bright(
  ht,
  header_rows = TRUE,
  header_cols = FALSE,
  colors = c("#7eabf2", "#e376e3", "#fcbb03", "#7aba59", "#fc0356")
)
theme_basic(ht, header_rows = TRUE, header_cols = FALSE)
theme_compact(ht, header_rows = TRUE, header_cols = FALSE)
theme_striped(
  ht,
  stripe = "grey90",
  stripe2 = "grey95",
  header_rows = TRUE,
  header_cols = TRUE
)```
themes

)

theme_grey(ht, header_rows = TRUE, header_cols = TRUE)
theme_blue(ht, header_rows = TRUE, header_cols = TRUE)
theme_orange(ht, header_rows = TRUE, header_cols = TRUE)
theme_green(ht, header_rows = TRUE, header_cols = TRUE)
theme_article(ht, header_rows = TRUE, header_cols = TRUE)
theme_mondrian(ht, prop_colored = 0.1, font = NULL)

Arguments

ht A huxtable object.
header_rows Logical: style header rows?
position "left", "center" or "right"
header_cols Logical: style header columns?
colors Colors for header rows. Can also be a palette function.
stripe Background colour for odd rows
stripe2 Background colour for even rows
prop_colored Roughly what proportion of cells should have a primary-color background?
font Font to use. For LaTeX, try "cmss".

Details

• theme_plain is a simple theme with a bold header, a grey striped background, and an outer border.
• theme_basic sets header rows/columns to bold, and adds a border beneath them.
• theme_compact is like theme_basic but with minimal padding.
• theme_striped uses different backgrounds for alternate rows, and for headers.
• theme_article is similar to the style of many scientific journals. It sets horizontal lines above and below the table.
• theme_bright uses thick white borders and a colourful header. It works nicely with sans-serif fonts.
• theme_grey, theme_blue, theme_orange and theme_green use white borders and subtle horizontal stripes.
• theme_mondrian mimics the style of a Mondrian painting, with thick black borders and randomized colors.

Value

The huxtable object, appropriately styled.
Examples

```r
tidy_override(jams)
```

## Not run:
```
quick_pdf(
  theme_plain(jams),
  theme_basic(jams),
  theme_compact(jams),
  theme_striped(jams),
  theme_article(jams),
  theme_bright(jams),
  theme_grey(jams),
  theme_blue(jams),
  theme_orange(jams),
  theme_green(jams),
  theme_mondrian(jams)
)
```

## End(Not run)

### tidy_override

<table>
<thead>
<tr>
<th>tidy_override</th>
<th>Change a model’s tidy output</th>
</tr>
</thead>
</table>

**Description**

Use `tidy_override` and `tidy_replace` to provide your own p values, confidence intervals etc. for a model.

**Usage**

```r
 tidy_override(x, ..., glance = list(), extend = FALSE)
 tidy_replace(x, tidied, glance = list())
```
tidy_override

glance(x, ...)

## S3 method for class 'tidy_override'
nobs(object, ...)

### Arguments

- **x**
  
  A model with methods defined for `generics::tidy()` and/or `generics::glance()`.

- **...**
  
  In `tidy_override`, columns of statistics to replace tidy output. In tidy and glance methods, arguments passed on to the underlying model.

- **glance**
  
  A list of summary statistics for glance.

- **extend**
  
  Logical: allow adding new columns to `tidy(x)` and `glance(x)`?

- **tidied**
  
  Data frame to replace the result of `tidy(x)`.

- **object**
  
  A `tidy_override` object.

### Details

`tidy_override` allows you to replace some columns of `tidy(x)` with your own data.

`tidy_replace` allows you to replace the result of `tidy(x)` entirely.

### Value

An object that can be passed in to `huxreg`.

### Examples

```r
if (!requireNamespace("broom", quietly = TRUE)) {
  stop("Please install 'broom' to run this example.")
}

lm1 <- lm(mpg ~ cyl, mtcars)
fixed_lm1 <- tidy_override(lm1, 
p.value = c(.04, .12),
  glance = list(r.squared = 0.99))
huxreg(lm1, fixed_lm1)

if (requireNamespace("nnet", quietly = TRUE)) {
  mnl <- nnet::multinom(gear ~ mpg, mtcars)
tidied <- broom::tidy(mnl)
mnl4 <- tidy_replace(mnl, tidied[tidied$y.level == 4, ])
mnl5 <- tidy_replace(mnl, tidied[tidied$y.level == 5, ])
huxreg(mnl4, mnl5, statistics = "nobs")
}
```
valign

Set the vertical alignment of cell content

Description

Allowed values are "top", "middle", "bottom" or NA.

Usage

valign(ht)
valign(ht) <- value
set_valign(ht, row, col, value )
map_valign(ht, row, col, fn)

Arguments

ht A huxtable.
row A row specifier. See rowspecs for details.
col An optional column specifier.
fn A mapping function. See mapping-functions for details.
value A character vector or matrix.
Set to NA to reset to the default, which is "top".

Details

Vertical alignment may not work for short text in LaTeX. Defining row heights with row_height() may help.

Value

valign() returns the valign property. set_valign() returns the modified huxtable.

Examples

```r
valign(jams) <- "top"
valign(jams)

jams2 <- set_valign(jams, "bottom")
valign(jams2)

jams3 <- set_valign(jams, 2:3, 1, "bottom")
valign(jams3)

jams4 <- map_valign(jams, 
```
**width**

by_rows(
  "bottom",
  "top"
)
valign(jams4)

---

<table>
<thead>
<tr>
<th>width</th>
<th>Set the table width</th>
</tr>
</thead>
</table>

**Description**

`width()` sets the width of the entire table, while `col_width()` sets the width of individual columns. A numeric width is treated as a proportion of the surrounding block width (HTML) or text width (LaTeX). A character width must be a valid CSS or LaTeX dimension.

**Usage**

```r
width(ht)
width(ht) <- value
set_width(ht, value)
```

**Arguments**

- `ht` A huxtable.
- `value` A number or string. Set to `NA` to reset to the default, which is `NA`.

**Value**

`width()` returns the `width` property. `set_width()` returns the modified huxtable.

**See Also**

Other table measurements: `col_width()`, `height()`, `row_height()`

**Examples**

```r
width(jams) <- 0.8
width(jams)
```
wrap

Wrap cell content over multiple lines

Description

Text wrapping only works when the table `width()` has been set. In particular, if you want to insert newlines in cells, then you should set a value for `width()` and set `wrap` to `TRUE`.

Usage

```r
wrap(ht)
warp(ht) <- value
set_wrap(ht, row, col, value)
map_wrap(ht, row, col, fn)
```

Arguments

- `ht`: A huxtable.
- `row`: A row specifier. See `rowspecs` for details.
- `col`: An optional column specifier.
- `fn`: A mapping function. See `mapping-functions` for details.
- `value`: A logical vector or matrix.
  Set to `NA` to reset to the default, which is `TRUE`.

Value

`wrap()` returns the `wrap` property. `set_wrap()` returns the modified huxtable.

Examples

```r
long_text <- paste(
  rep("Some long text.", 10),
  collapse = " ");
ht <- huxtable(Long = long_text)
width(ht) <- 0.2
wrap(ht) <- TRUE

## Not run:
quick_html(ht)

## End(Not run)
```
Description

Subset a huxtable

Usage

```r
## S3 method for class 'huxtable'
x[i, j, drop = FALSE]
## S3 replacement method for class 'huxtable'
x[i, j] <- value
## S3 replacement method for class 'huxtable'
x$name <- value
## S3 replacement method for class 'huxtable'
x[[i, j]] <- value
```

Arguments

- **x**: A huxtable.
- **i**: Rows to select.
- **j, name**: Columns to select.
- **drop**: Only included for compatibility with `r[, ]`. Do not use.
- **value**: A matrix, data frame, huxtable or similar object.

Value

- `[` returns a huxtable. `$` and `[[` return data from the underlying data frame.

Replacing existing rows and columns

For the replacement function `<-`, if `value` is a huxtable, then its properties will be copied into `x`. Replacement functions `$<-` and `[<-` replace existing data without affecting any properties.

Adding new rows and columns

If new columns or rows are created, then properties will be copied from the last column or row of `x`, or from `value` if `value` is a huxtable.

These methods are stricter than their data frame equivalents in some places. You can’t add new rows or columns at a numeric location without specifying all intervening rows/columns. New values must have the appropriate dimensions (vectors will be interpreted appropriately).
Examples

jams[1:3, ]
class(jams[1:3, ])
jams[, 1]
jams$Type
prices <- huxtable(c("Price", 1.70, 2.00, 2.20))
number_format(prices) <- 2
bold(prices) <- TRUE
jams[, 2] <- prices
jams

data(jams)
jams$price <- c("Price", 1.70, 2.00, 2.20)
jams
