Package ‘iNZightPlots’

October 14, 2023

Type Package

Title Graphical Tools for Exploring Data with 'iNZight'

Version 2.15.3

Description Simple plotting function(s) for exploratory data analysis with flexible options allowing for easy plot customisation. The goal is to make it easy for beginners to start exploring a dataset through simple R function calls, as well as provide a similar interface to summary statistics and inference information. Includes functionality to generate interactive HTML-driven graphs. Used by 'iNZight', a graphical user interface providing easy exploration and visualisation of data for students of statistics, available in both desktop and online versions.

BugReports https://github.com/iNZightVIT/iNZightPlots/issues

Contact inzight_support@stat.auckland.ac.nz

URL https://inzight.nz

Depends R (>= 4.0)

Imports boot, chron, colorspace, dichromat, emmeans, expss, grDevices, grid, hexbin, hms, iNZightMR (>= 2.2.7), iNZightTools (>= 1.9), lubridate, magrittr, quantreg, rlang, scales, stats, stringr, units, survey, utils

Suggests covr, forcats, DBI, dplyr, dbplyr, ggbeswarm, ggmosaic, ggplot2, ggridges, ggtext, ggthemes, gridSVG (>= 1.7-2), hextri, jsonlite, kableExtra, knitr, plotly, RColorBrewer, RSQLite, testthat, tidby, tidyr, viridis, waffle

License GPL-3

**can.interact**

**Identify if a plot can be interactive**

**Description**

Several iNZightPlots graphs have been enabled with custom interaction, while others make use of the automatic output of `plotly`. This function returns 'TRUE' if the provided plot has interaction (as determined by iNZight), and 'FALSE' otherwise.

**Usage**

```r
can.interact(x)
```

```r
## Default S3 method:
can.interact(x)
```

```r
## S3 method for class 'inzplotoutput'
```
can.interact(x)

## S3 method for class 'ggplot'
can.interact(x)

**Arguments**

- **x** a plot object returned from a plotting function

**Details**

Not that, while most ‘ggplot2’ graphs can be passed to ‘plotly’, and even though we are using plotly directly for some of our ggplot2 graphs, we still only return ‘TRUE’ if the graph was created by one of the packages in the iNZight collection.

**Value**

Logical to identify if there is an interactive version

**Methods (by class)**

- can.interact(default): Default interaction helper (always returns ‘FALSE’)
- can.interact(inzplotoutput): Graphs from ‘iNZightPlot()’, many of which have interaction enabled, but some do not (for example, hex plots)
- can.interact(ggplot): Those ‘iNZight*’ plotting functions which return a ‘ggplot2’ object and have been tested to work with plotly will be tagged as such; this is just a helper to check for the necessary attribute.

**Author(s)**

Tom Elliott, Yu Han Soh

**Examples**

```r
can.interact(iNZightPlot(Sepal.Length, data = iris))
```

**Description**

Construct plot call from settings list
**Usage**

custom_call(
    settings,
    vartypes,
    data = quote(.dataset),
    design = quote(.design),
    what = c("plot", "summary", "inference")
)

**Arguments**

- **settings**: a list of plot settings, similar to inzpar()
- **vartypes**: a list of variables types (numeric, factor)
- **data**: a data set to pass to the call
- **design**: a survey design (can be NULL)
- **what**: the type of call to produce

**Value**

a plot/summary/inference call

**Description**

This function was misspelled in earlier versions and has been corrected to cont_palette_names, which should be used instead.

**Usage**

custom_palette_names()

**Value**

a list of continuous colour palettes

**See Also**

- cont_palette_names
convert.to.factor  

Convert to Factor

Description
Convert a numeric variable into a factor with four levels.

Usage
convert.to.factor(x)

Arguments
x
a numeric vector

Value
a factor variable

Author(s)
Tom Elliott

Examples
f <- convert.to.factor(runif(100, 0, 10))
levels(f)

create  

Create plots for iNZight

Description
Create a Plot Object

Usage
create(obj, ...)

Arguments
obj
an object
...  
additional arguments
emphasize_pal_colour

Details
This create method is to be used by packages extending 'iNZightPlots', and should not be used by users. The resulting object should have an associated plot method.

Value
an iNZight plot object with class determined by data type

Author(s)
Tom Elliott

description
Emphasize a level or interval of a colour palette

Usage
emphasize_pal_colour(n, k, cat = TRUE, ncat = 5, fn)

Arguments
- n: the number of colours to draw from the palette
- k: the index of the colour to emphasize
- cat: logical indicator if palette is categorical or numeric
- ncat: the number of intervals to use for continuous palettes
- fn: the colour palette function to use

Value
a colour palette, with one level emphasized (or range for numeric)

Author(s)
Tom Elliott

Examples
pal <- inzpalette("bright")
plot(1:5, pch = 19, col = emphasize_pal_colour(5, 2, fn = pal))
exploreAllPlots

exploreAllPlots  Explore all Univariate Plots

Description
Allows easy viewing of every variable in the data set. The user will be prompted to see the next variable.

Usage
exploreAllPlots(data)

Arguments
- data: a data frame

Author(s)
Tom Elliott

Examples
if (interactive())
    exploreAllPlots(iris)

exploreAllSummaries

exploreAllSummaries  Explore all Univariate Summaries

Description
Allows easy access to a summary for every variable in the data set.

Usage
exploreAllSummaries(data, ...)

# S3 method for class 'allSummaries'
print(x, ...)

Arguments
- data: a data set
- ...: additional arguments passed to getPlotSummary()
- x: an allSummaries object
Value

allSummaries object, a concatenation of summaries from all variables

Functions

• print(allSummaries): print method for allSummaries object

Author(s)

Tom Elliott

Examples

exploreAllSummaries(iris)

Description

exportHTML is designed to export the iNZight plot as a dynamic, interactive HTML page. Currently only handles single panel plots. Coloured hex plots are currently not available yet.

Usage

exportHTML(
  x,
  file = file.path(dir, "index.html"),
  data,
  local = FALSE,
  dir = tempdir(),
  extra.vars,
  ...
)

## S3 method for class `function`
exportHTML(
  x,
  file = file.path(dir, "index.html"),
  data = NULL,
  local = FALSE,
  dir = tempdir(),
  extra.vars = NULL,
  width = dev.size()[1],
  height = dev.size()[2],
  ...
)
exportHTML

## S3 method for class 'ggplot'
exportHTML(
  x,
  file = file.path(dir, "index.html"),
  data = NULL,
  local = FALSE,
  dir = tempdir(),
  extra.vars = NULL,
  mapObj,
  ...
)

## S3 method for class 'inzplotoutput'
exportHTML(
  x,
  file = file.path(dir, "index.html"),
  data = NULL,
  local = FALSE,
  dir = tempdir(),
  extra.vars = NULL,
  ...
)

### Arguments

- **x**: An iNZight plot object that captures iNZight environment
- **file**: Name of temporary HTML file generated (defaults to 'index.html' in a temporary directory, or other as specified using 'dir')
- **data**: dataset/dataframe that you wish to investigate and export more variables from
- **local**: Logical for creating local files for offline use (default to false)
- **dir**: A directory to store the file and output
- **extra.vars**: extra variables specified by the user to be exported
- **...**: extra arguments
- **width**: the desired width of the SVG plot
- **height**: the desired height of the SVG plot
- **mapObj**: iNZightMap object (from iNZightMaps)

### Value

An inzHTML object consisting of a link to an HTML rendering of x with filename file, which can be loaded in the browser (for example using browseURL, or calling the print() method of the returned object.
Methods (by class)

• `exportHTML('function')`: method for an iNZightPlot-generating function
• `exportHTML(ggplot)`: method for iNZightMaps or other supported ggplot graphs
• `exportHTML(inzplotoutput)`: method for output from iNZightPlot

Author(s)

Yu Han Soh

Examples

```r
## Not run:
x <- iNZightPlot(Petal.Width, Petal.Length, data = iris, colby = Species)
exportHTML(x, "index.html")

# to export more variables for scatterplots:
exportHTML(x, "index.html", data = iris, extra.vars = c("Sepal.Length", "Sepal.Width"))

## End(Not run)
```

---

### exportSVG

**Export iNZightPlots as an SVG**

**Description**

`exportSVG` is designed to export the iNZight plot as a temporary SVG that is opened in a web browser. The iNZightPlot must be drawn to a graphics device before exporting can occur.

**Usage**

```r
exportSVG(x, file = tempfile(fileext = ".svg"), ...)
```

---

## S3 method for class 'function'

```r
exportSVG(
  x,
  file = tempfile(fileext = ".svg"),
  width = dev.size()[1],
  height = dev.size()[2],
  ...
)
```

## S3 method for class 'inzplotoutput'

```r
exportSVG(x, file = tempfile(fileext = "svg"), ...)```
getPlotSummary

Arguments

x   iNZight plot object or function that captures iNZight environment
file Name of temporary svg file generated (by default: 'inzightplot.svg')
... additional arguments
width the width of the plot device
height the height of the plot device

Value

Opens up an SVG file of x with filename file in a web browser

Methods (by class)

• exportSVG('function'): method for functions
• exportSVG(inzplotoutput): method for an existing plot object

Author(s)

Yu Han Soh

Description

Generate summary or inference information for an iNZight plot

Usage

getPlotSummary(
  x,
  y = NULL,
  g1 = NULL,
  g1.level = NULL,
  g2 = NULL,
  g2.level = NULL,
  varnames = list(),
  colby = NULL,
  sizeby = NULL,
  data = NULL,
  design = NULL,
  freq = NULL,
  missing.info = TRUE,
  inzpars = inzpar(),
  summary.type = "summary",
)
Arguments

- **x**
  - a vector (numeric or factor), or the name of a column in the supplied data or design object

- **y**
  - a vector (numeric or factor), or the name of a column in the supplied data or design object

- **g1**
  - a vector (numeric or factor), or the name of a column in the supplied data or design object. This variable acts as a subsetting variable.

- **g1.level**
  - the name (or numeric position) of the level of g1 that will be used instead of the entire data set

- **g2**
  - a vector (numeric or factor), or the name of a column in the supplied data or design object. This variable acts as a subsetting variable, similar to g1

- **g2.level**
  - same as g1.level, however takes the additional value "_MULTI", which produces a matrix of g1 by g2

- **varnames**
  - a list of variable names, with the list named using the appropriate arguments (i.e., list(x = "height", g1 = "gender"))

- **colby**
  - the name of a variable (numeric or factor) to colour points by. In the case of a numeric variable, a continuous colour scale is used, otherwise each level of the factor is assigned a colour

- **sizeby**
  - the name of a (numeric) variable, which controls the size of points

- **data**
  - the name of a data set

- **design**
  - the name of a survey object, obtained from the survey package

- **freq**
  - the name of a frequency variable if the data are frequencies

- **missing.info**
  - logical, if TRUE, information regarding missingness is displayed in the plot

- **inzpars**
  - allows specification of iNZight plotting parameters over multiple plots

- **summary.type**
  - one of "summary" or "inference"
getPlotSummary

```
table.direction
  one of 'horizontal' (default) or 'vertical' (useful for many categories)
hypothesis.value
  H0 value for hypothesis test
hypothesis.alt
  alternative hypothesis (!=, <, >)
hypothesis.var.equal
  use equal variance assumption for t-test?
hypothesis.use.exact
  logical, if TRUE the exact p-value will be calculated (if applicable)
hypothesis.test
  in some cases (currently just two-samples) can perform multiple tests (t-test or ANOVA)
hypothesis.simulated.p.value
  also calculate (where available) the simulated p-value
hypothesis
  either NULL for no test, or missing (in which case above arguments are used)
survey.options
  additional options passed to survey methods
width
  width for the output, default is 100 characters
epi.out
  logical, if TRUE, then odds/rate ratios and rate differences are printed when appropriate (y with 2 levels)
privacy_controls
  optional, pass in confidentialisation and privacy controls (e.g., random rounding, suppression) for microdata
html
  logical, if TRUE output will be returned as an HTML page (if supported)
...
env
  compatibility argument

Details

Works much the same as iNZightPlot

Value

an inzight.plotsummary object with a print method

Author(s)

Tom Elliott

Examples

getPlotSummary(Species, data = iris)
getPlotSummary(Species, data = iris, summary.type = "inference", inference.type = "conf")

# perform hypothesis testing
getPlotSummary(Sepal.Length, data = iris, summary.type = "inference", inference.type = "conf")
summary.type = "inference", inference.type = "conf",
  hypothesis.value = 5)

# if you prefer a formula interface
inzsummary(Sepal.Length ~ Species, data = iris)
inzinference(Sepal.Length ~ Species, data = iris)

## confidentialisation and privacy controls
# random rounding and suppression:
HairEyeColor_df <- as.data.frame(HairEyeColor)
inzsummary(Hair ~ Eye, data = HairEyeColor_df, freq = Freq)
inzsummary(Hair ~ Eye, data = HairEyeColor_df, freq = Freq,
  privacy_controls = list(
    rounding = "RR3",
    suppression = 10
  )
)

---

**iNZightPlot**  

**iNZight Plot**

**Description**

A general plotting function that automatically detects variable type and draws the appropriate plot. It also provides facilities to add inference information to plots, colour- and size-by variables, and can handle survey data.

**Usage**

iNZightPlot(
  x,
  y = NULL,
  g1 = NULL,
  g1.level = NULL,
  g2 = NULL,
  g2.level = NULL,
  varnames = list(),
  colby = NULL,
  sizeby = NULL,
  symbolby = NULL,
  extra.vars,
  locate = NULL,
  locate.id = NULL,
  locate.col = NULL,
  locate.extreme = NULL,
  locate.same.level = NULL,
  highlight = NULL,
  data = NULL,
Arguments

x  a vector (numeric or factor), or the name of a column in the supplied data or 
   design object

y  a vector (numeric or factor), or the name of a column in the supplied data or 
   design object

g1 a vector (numeric or factor), or the name of a column in the supplied data or 
   design object. This variable acts as a subsetting variable.

g1.level the name (or numeric position) of the level of g1 that will be used instead of the 
   entire data set

g2 a vector (numeric or factor), or the name of a column in the supplied data or 
   design object. This variable acts as a subsetting variable, similar to g1

g2.level same as g1.level, however takes the additional value "_MULTI", which pro-
   duces a matrix of g1 by g2

varnames a list of variable names, with the list named using the appropriate arguments 
   (i.e., list(x = "height", g1 = "gender"))

colby the name of a variable (numeric or factor) to colour points by. In the case of a 
   numeric variable, a continuous colour scale is used, otherwise each level of the 
   factor is assigned a colour

sizeby the name of a (numeric) variable, which controls the size of points

symbolby the name of a factor variable to code point symbols

extra.vars the names of any additional variables to be passed through the internal functions 
   to the create and plot methods.

locate variable to label points
locate.id  id of points (row numbers) to label, or an expression that evaluates as a logical vector (e.g., \( x > 5 \))
locate.col  the colour to locate points if a variable is not specified
locate.extreme numeric, the number of extreme points to label (using Mahalanobis’ distance)
locate.same.level name of a variable to label points with same level of as those specified with ‘locate.id’
highlight numeric vector consisting of the row numbers/IDs of points to highlight
data  the name of a data set
design  the name of a survey object, obtained from the survey package
cfreq  the name of a frequency variable if the data are frequencies
missing.info logical, if TRUE, information regarding missingness is displayed in the plot
xlab  the text for the x-label
ylab  the text for the y-label
show_units logical, if ‘TRUE’ (default) units will be shown beside axes and legend variable labels
new  logical, used for compatibility
inzpars  allows specification of iNZight plotting parameters over multiple plots
layout.only logical, if TRUE, only the layout is drawn (useful if a custom plot is to be drawn)
plot  logical, if FALSE, the plot is not drawn (used by summary)
xaxis  logical, whether or not to draw the x-axis
yaxis  logical, whether or not to draw the y-axis
xlim  specify the x limits of the plot
ylim  specify the y limits of the plot
zoombars numeric, length 2; when drawing a bar plot, if the number of bars is too large, the user can specify a subset. The first value is the starting point (1 is the first bar, etc), while the second number is the number of bars to show.
hide.legend logical, if TRUE, the legend will not be drawn
df  compatibility argument
env  compatibility argument
...  additional arguments, see inzpar

Details
The main goal of 'iNZightPlots' is to make it easy to beginners to explore a dataset graphically, using a suite of simple arguments to add features to their graph.
The second use of this function is within the companion software 'iNZight', providing a single function call with arguments controlled by the user through a GUI.

Value
An inzightplotoutput object, which contains the information displayed in the plot
inzinference

**Author(s)**

Tom Elliott

**Examples**

```r
inzighPlot(Species, data = iris)
inzighPlot(Petal.Width, g1 = Species, data = iris)

inzighPlot(Sepal.Length, Sepal.Width, data = iris, colby = Species)
inzighPlot(Sepal.Length, Sepal.Width, data = iris, colby = Species, trend = c("linear", "quadratic"), trend.by = TRUE, trend.parallel = FALSE)

# add inference information
inzighPlot(Petal.Width, data = iris, inference.type = "conf", inference.par = "mean")
inzighPlot(Petal.Width, data = iris, inference.type = "conf", inference.par = "mean", bootstrap = TRUE)

# alternatively, use the formula interface
inzplot(Sepal.Length ~ Sepal.Width | Species, data = iris)
```

---

**inzinference**  
*iNZight Inference Method*

**Description**

A generic function used to generate inferential information for objects within the iNZight ecosystem.

**Usage**

```r
inzinference(x, ..., env = parent.frame())
```

## S3 method for class 'formula'

```r
inzinference(
  x,
  data = NULL,
  design = NULL,
  type = c("conf", "comp"),
  ..., 
  env = parent.frame()
)
```
Arguments

- `x`: An object
- `...`: additional arguments for methods
- `env`: an environment to evaluate things
- `data`: Dataset to plot
- `design`: A survey design to use
- `type`: Type type of inference to obtain, one of 'conf' or 'comp' for confidence intervals and comparison intervals, respectively (currently ignored).

Value

The output depends on the type of input, and consists of an inference object with a `print` method.

Methods (by class)

- `inzinference(formula)`: Wrapper for `getPlotSummary` to obtain inference information about a plot

inzpalette `iNZight colour palette`

Description

Used to obtain a colour palette of a given name. A list of available palettes can be obtained by `cat_palette_names()` and `cont_palette_names()`.

Usage

```r
inzpalette(palette)
cat_palette_names()
cont_palette_names()
```

Arguments

- `palette`: the name of a palette

Value

a colour palette function with single argument ‘n’

Functions

- `cat_palette_names()`: List of categorical colour palettes
- `cont_palette_names()`: List of continuous colour palettes
inzpar

Author(s)
Tom Elliott

Examples

```r
plot(1:5, pch = 19, col = inzpalette("bright")(5))
```

# for a list of palette names
cat_palette_names()
cont_palette_names()

inzpar iNZight Plotting Parameters

Description

Plotting parameters for iNZight Plots

Usage

```r
inzpar(..., .viridis = requireNamespace("viridis", quietly = TRUE))
```

Arguments

... If arguments are supplied, then these values are set. If left empty, then

`.viridis` checks if the viridis package is installed; or can be turned off the default list is returned.

Details

A whole suite of parameters that can be used to fine-tune plots obtained from the iNZightPlot function. The parameters include both plot type, style, and appearance.

'pch' the plotting symbol to be used; default is '21' (circle with fill)

'col.pt' the colour of points. this can either be a single value, or a vector of colours if colby is specified

'col.fun' a function to use for colouring points, etc., or the name of a palette, see inzpalette

'col.emph', 'col.emphn' emphasize the chosen level of a colour by variable. For numeric colour by, col.emphn specifies the number of quantiles to use.

'emph.on.top' if TRUE, emphasised points will be positioned on top

'col.default' the default colour functions, containing a list with entries for 'cat' and 'cont' variables

'col.missing' the colour for missing values; default is a light grey

'reverse.palette' logical, if TRUE the palette will be reversed

'col.method' the method to use for colouring by a variable, one of 'linear' or 'rank'
'cex' the overall scaling for the entire plot; values less than 1 will make the text and points smaller, while values larger than 1 will magnify everything

'cex.pt' the scaling value for points

'cex.dotpt' the scaling value for points in a dotplot. Note, this is not multiplicative with 'cex.pt'

'cex.lab' the scaling value for the plot labels

'cex.axis' the scaling value for the axis labels

'cex.main' the scaling value for the main plot title

'cex.text' the scaling value for text on the plot

'resize.method' one of 'proportional' (default) or 'emphasize'

'alpha' transparency setting for points; default is 1, 0 is fully transparent

'bg' the background colour for the plot

'grid.lines' logical to control drawing of axis grid lines

'col.grid' if 'grid.lines' is TRUE, this controls the colour of them. The default is 'default', which will choose a colour based on the value of 'bg')

'fill.pt' the fill colour for points; default is "transparent"

'lwd' the line width of lines (for joining points)

'lt' the line type of lines (for joining points)

'lwd.pt' the line width used for points; default is 2

'col.line' the colour of lines used to join points

'col.sub' vector of up to two colours for the background of subplot labels. If only one specified, it is used for both.

'locate.col.def' the default colour for locating points

'highlight.col' colour to use for highlighting points

'jitter' the axes to add jitter to. Takes values "x", "y", or "xy" (default is an empty string, "")

'rugs' the axes to add rugs to. Takes same values as jitter

'trend' a vector containing the trend lines to add to the plot. Possible values are c("linear", "quadratic", "cubic")

'smooth' the smoothing (lowess) for the points. Takes a value between 0 and 1 (the default, 0, draws no smoother)

'smoothby.lty' the line type used for smoothers if trend.by = TRUE

'quant.smooth' if quantile smoothers are desired, they can be specified here as either the quantiles to smooth over (e.g., c(0.25, 0.5, 0.75)), or "default", which uses the sample size to decide on an appropriate set of quantile smoothers

'LOE' logical, if TRUE, then a 1-1 line of equality is drawn

'join' logical, if TRUE, then points are joined by lines

'lines.by' logical, if join = TRUE and colby is specified, points are joined by the specified variable

'col.trend' a named list of colours to be used for drawing the lines. The default is list(linear = "blue", quadratic = "red", cubic = "green4")

'lty.trend' a named list of line types for various types of trend lines. The default is list(linear = 1, quadratic = 2, cubic = 3)
'trend.by' logical, if TRUE, then trend lines are drawn separately for each group specified by \code{col} by
'trend.parallel' logical, if TRUE, the trend lines by group are given the same slope; otherwise they are fit independently
'\code{col.smooth}' the colour of the smoother
'\code{col.LOE}' the colour of the line of equality
'\code{lt吕.LOE}' the line type of the line of equality
'\code{boxplot}' logical, if TRUE, a boxplot is drawn with dotplots and histograms
'\code{box.lwd}', '\code{box.col}', '\code{box.fill}' the line width, colour, and fill colour for the box plot drawn
'\code{bar.lwd}', '\code{bar.col}', '\code{bar.fill}' the line width, colour, and fill colour of bars in a bar plot
'\code{bar.counts}' logical, if TRUE bar graphs will display counts instead of percentages (the default)
'\code{full.height}' may no longer be necessary ...
'\code{inf.lwd.comp}', '\code{inf.lwd.conf}' the line width of comparison and confidence intervals, respectively
'\code{inf.col.comp}', '\code{inf.col.conf}' the colour of comparison and confidence intervals, respectively. These take a length 2 vector, where the first element is used for normal inference, while the second is used for bootstrap intervals
'\code{inference.type}' the type of inference added to the plot. Possible values are c("comp", "conf")
'\code{inference.par}' the parameter which we obtain intervals for. For a dotplot or histogram, this can be either "mean" or "median"; for bar plots it can be "proportion"
'\code{ci.width}' the width of confidence intervals, default 0.95 for a 95% confidence interval
'\code{bs.inference}' logical, if TRUE, then nonparametric bootstrap simulation is used to obtain the intervals
'\code{min.count}' the min count for barplots inference; counts less than this are ignored
'\code{n.boot}' the number of bootstrap simulations to perform
'\code{large.sample.size}' sample sizes over this value will use a large-sample plot variant (i.e., scatter plots will become hex plots, dot plots become histograms)
'\code{largesample}' logical, if TRUE, then the large-sample plot variance is used
'\code{scatter.grid.bins}' the number, N, of bins to use for the scatter-grid plot, producing an N x N matrix
'\code{hex.bins}' the number of bins to use for hexagonal binning
'\code{hex.style}' the style of the hexagons, one of "size" or "alpha"
'\code{hex.diffuse}' logical, Pass on rounding error to nearest not-yet-drawn hexes so that rare classes get represented
'\code{hist.bins}' the number of bins to use for the histogram (The default NULL uses point size to approximate dot plot)
'\code{quant.cutoff}' if \code{quant.smooth} = "default", these sample size values are used to determine which quantiles are drawn
'\code{plottype}' used to override the default plot type. Possible values, depending on data type, include c("scatter"|"grid"|"hex"|"dot"|"hist")
'\code{matchplots}' logical, if TRUE, then the type of plot is kept consistent between different subsets
'\code{match.limits}' a vector of two values used to decide whether to use all small-sample or all large-sample plots
'xlim' a vector defining the x axis limits (default NULL will use the data)
'ylim' a vector defining the y axis limits (default NULL will use the data)
'transform' a list of variable transformations (e.g., list(x = 'log'))
'plot.features' a list containing any additional features for new plots (e.g., maptype)
'round' integer specifying optional rounding of numerical output, default NA (ignored)
'round_percent' integer specifying rounding for percentages (default 2)
'signif' integer specifying number of significant figured in numeric output (default 2). Ignored if round is not NA.

Value

an object of class inzpar.list

Examples

# arguments can be passed directly to \code{iNZightPlot}
\footnotesize{
\begin{verbatim}

}

inzplot iNZight Plot Method

Description

A generic function used to plot objects within the iNZight ecosystem.

Usage

\footnotesize{
\begin{verbatim}
inzplot(x, ..., env = parent.frame())
\end{verbatim}
}

## S3 method for class 'formula'
\footnotesize{
\begin{verbatim}
inzplot(x, data = NULL, design = NULL, ..., env = parent.frame())
\end{verbatim}
}
Arguments

x  A formula in the form of y ~ x | g. See Details.

... Any arguments to pass to \texttt{iNZightPlot}

env  the parent environment to pass to the plot function
data  Dataset to plot

design  A survey design to use

Details

\texttt{inzplot} is a simple wrapper around the \texttt{iNZightPlot} function.

There are four options for the formula passed in:
y will produce a plot of the single variable y.
y ~ x will produce a plot of y against x.
y ~ x | g1 will produce a plot of y against x subset by g1.
y ~ x | g1 + g2 will produce a plot of y against x subset by g1 and g2.

Value

The output depends on the type of input, but is usually called for the side-effect of producing a plot.

An \texttt{inzightplotoutput} object, which contains the information displayed in the plot

See Also

\texttt{iNZightPlot}

Examples

data("CO2")
inzplot(~uptake, data = CO2)
inzplot(uptake ~ Treatment, data = CO2)
inzplot(uptake ~ Treatment | Type, data = CO2)
inzplot(uptake ~ Treatment | Type,
        data = CO2, g1.level = "Quebec")

inzsummary

inzsummary  \textit{iNZight Summary Method}

Description

A generic function used to summarize objects within the iNZight ecosystem.
Usage

inzsummary(x, ..., env = parent.frame())

## S3 method for class 'formula'
inzsummary(x, data = NULL, design = NULL, ..., env = parent.frame())

Arguments

x An object
... additional arguments for methods
env an environment to evaluate things
data Dataset to plotq
design A survey design to use

Value

The output depends on the type of input, and consists of a summary object with a print method.

Methods (by class)

• inzsummary(formula): Wrapper for getPlotSummary to obtain summary information about a plot

mend_call
Mend a plot call based on valid parameters

Description

Mend a plot call based on valid parameters

Usage

mend_call(call, data, design_name, plot)

Arguments

call a plot call string, or expression
data the dataset
design_name name of the design, if any
plot the result of inzplot, inzsummary, or inzinfence

Value

a plot call with extraneous arguments removed
print.inzHTML

Print method for 'inzHTML' object

Description
The default action is for the URL to be 'printed' (opened) in the browser, unless 'viewer' is specified as something else. If 'viewer = NULL', then the URL is printed as a character string.

Usage
### S3 method for class 'inzHTML'
print(x, viewer = getOption("viewer", utils::browseURL), ...)

Arguments
- **x**: a URL that will be printed
- **viewer**: the viewing function to use to display the URL
- **...**: additional arguments

Value
NULL (it's a print function, after all)

snz_privacy_controls Statistics New Zealand Privacy Controls

Description
Based off Microdata Output Guide 2020 v5-1

Usage
snz_privacy_controls(type = c("survey"), weighted = type == "survey", ...)

Arguments
- **type**: the type of data, used to specify the correct rules. Currently only survey (4.0.1) data is supported.
- **weighted**: logical indicating if the results are a weighted survey design or not.
- **...**: additional arguments, used to override defaults

Value
a list of privacy control rules
