Package ‘lax’

December 5, 2019

Title Loglikelihood Adjustment for Extreme Value Models
Version 1.1.0
Date 2019-12-05

Description Performs adjusted inferences based on model objects fitted, using maximum likelihood estimation, by the extreme value analysis packages 'evd' <https://cran.r-project.org/package=evd>, 'evir' <https://cran.r-project.org/package=evir>, 'extRemes' <https://cran.r-project.org/package=extRemes>, 'fExtremes' <https://cran.r-project.org/package=fExtremes>, 'ismev' <https://cran.r-project.org/package=ismev>, 'mev' <https://cran.r-project.org/package=mev>, 'POT' <https://cran.r-project.org/package=POT> and 'texmex' <https://cran.r-project.org/package=texmex>. Adjusted standard errors and an adjusted loglikelihood are provided, using the 'chandwich' package <https://cran.r-project.org/package=chandwich> and the object-oriented features of the 'sandwich' package <https://cran.r-project.org/package=sandwich>. The adjustment is based on a robust sandwich estimator of the parameter covariance matrix, based on the methodology in Chandler and Bate (2007) <doi:10.1093/biomet/asm015>. This can be used for cluster correlated data when interest lies in the parameters of the marginal distributions, or for performing inferences that are robust to certain types of model misspecification. Univariate extreme value models, including regression models, are supported.

alogLik

Loglikelihood adjustment for model fits

Description

This function is generic. It performs adjustment of the loglikelihood associated with fitted model objects, following Chandler and Bate (2007). Certain classes of extreme value model objects are supported automatically. For details see the alogLik help pages for the packages: evd, evir, extRemes, fExtremes, ismev, mev, POT, texmex. User-supplied objects can also be supported: the requirements for these objects are explained in Details.
alogLik

Usage

alogLik(x, cluster = NULL, use_vcov = TRUE, ...)

Arguments

x A fitted model object with certain associated S3 methods. See Details.

cluster A vector or factor indicating from which cluster the respective loglikelihood contributions from loglik originate. This must have the same length as the vector returned by the logLikVec method for an object like x. If cluster is not supplied (i.e. is NULL) then it is assumed that each observation forms its own cluster. See Details.

use_vcov A logical scalar. Should we use the vcov S3 method for x (if this exists) to estimate the Hessian of the independence loglikelihood to be passed as the argument H to adjust_loglik? Otherwise, H is estimated inside adjust_loglik using optimHess.

... Further arguments to be passed to the functions in the sandwich package meat (if cluster = NULL), or meatCL (if cluster is not NULL).

Details

Object x must have the following S3 methods:

- logLikVec: returns a vector of the contributions to the independence loglikelihood from individual observations;
- coef: returns a vector of model coefficients, see coef;
- nobs: returns the number of (non-missing) observations used in a model fit, see nobs;

and may have the following S3 methods

- vcov: returns the estimated variance-covariance matrix of the (main) parameters of a fitted model, see vcov;
- estfun: returns an nxk matrix, in which each column gives the derivative of the loglikelihood at each of n observation with respect to the k parameters of the model, see estfun.

Loglikelihood adjustment is performed using the adjust_loglik function in the sandwich package. The relevant arguments to adjust_loglik, namely loglik,mle,H and V, are created based on the class of the object x.

If a vcov method is not available, or if use_vcov = FALSE, then the variance-covariance matrix of the MLE (from which H is calculated) is estimated inside adjust_loglik using optimHess.

The sandwich package is used to estimate the variance matrix V of the score vector: meat is used if cluster = NULL; meatCL is used if cluster is not NULL. If cluster is NULL then any arguments of meatCL present in ... will be ignored. Similarly, if cluster is not NULL then any arguments of meat present in ... will be ignored. meat and meatCL require an estfun method to be available, which, in the current context, provides matrix of score contributions. If a bespoke estfun method is not provided then this is constructed by estimating the score contributions using jacobian.
Value

An object inheriting from class "chandwich". See adjust_loglik.

If x is one of the supported models then class(x) is a vector of length 5. The first 3 components are c("lax","chandwich","name_of_package"), where "name_of_package" is the name of the package from which the input object x originated. The remaining 2 components depend on the model that was fitted. See the documentation of the relevant package for details: evd, evir, extRemes, fExtremes, ismev, mev, POT, texmex.

Otherwise, class(x) is c("lax","chandwich",class(x)).

Examples

See the (package-specific) examples in evd, evir, extRemes,fExtremes, ismev, mev, POT and texmex.

anova.lax

Comparison of nested models

Description

anova method for objects of class "lax". Compares two or more nested models using the adjusted likelihood ratio test statistic (ALRTS) described in Section 3.5 of Chandler and Bate (2007). The nesting must result from the simple constraint that a subset of the parameters of the larger model is held fixed.

Usage

```r
## S3 method for class 'lax'
anova(object, object2, ...)
```
Arguments

object An object of class "lax", returned by alogLik.
object2 An object of class "chandwich", returned by alogLik.
... Further objects of class "lax" and/or arguments to be passed to anova.chandwich, and then on to compare_models, in particular type, which chooses the type of adjustment.

Details

The objects of class "lax" need not be provided in nested order: they will be ordered inside anova.lax based on the values of attr(.,"p_current").

Value

An object of class "anova" inheriting from class "data.frame", with four columns:

- **Model.Df** The number of parameters in the model
- **Df** The decrease in the number of parameter compared the model in the previous row
- **ALRTS** The adjusted likelihood ratio test statistic
- **Pr(>ALRTS)** The p-value associated with the test that the model is a valid simplification of the model in the previous row.

The row names are the names of the model objects.

**evd**

*Loglikelihood adjustment for evd fits*

**Description**

S3 `alogLik` method to perform loglikelihood adjustment for fitted extreme value model objects returned from the functions `fgev` and `fpot` in the evd package. If `x` is returned from `fgev` then the call must have used `prob = NULL`.

**Usage**

```r
## S3 method for class 'evd'
alogLik(x, cluster = NULL, use_vcov = TRUE, ...)
```

**Arguments**

- `x` A fitted model object with certain associated S3 methods. See **Details**.
- `cluster` A vector or factor indicating from which cluster the respective loglikelihood contributions from `loglik` originate. This must have the same length as the vector returned by the `logLikVec` method for an object like `x`. If `cluster` is not supplied (i.e., `is NULL`) then it is assumed that each observation forms its own cluster. See **Details**.
- `use_vcov` A logical scalar. Should we use the vcov S3 method for `x` (if this exists) to estimate the Hessian of the independence loglikelihood to be passed as the argument `H` to `adjust_loglik`? Otherwise, `H` is estimated inside `adjust_loglik` using `optimHess`.
- `...` Further arguments to be passed to the functions in the sandwich package `meat` (if `cluster = NULL`), or `meatCL` (if `cluster` is not NULL).
Details

See `aLogLik` for details.

Value

An object inheriting from class "chandwich". See `adjust_loglik`. `class(x)` is a vector of length 5. The first 3 components are c("lax","chandwich","evd"). The remaining 2 components depend on the model that was fitted. If `fgev` was used then these components are c("gev","stat") if `nsloc` was NULL and c("gev","nonstat") if `nsloc` was not NULL. If `fpot` was used then these components are c("pot","gpd") if `model` was "gpd" and c("pot","pp") if `model` was "pp".

Examples

```r
# We need the evd package
got_evd <- requireNamespace("evd", quietly = TRUE)

if (got_evd) {
  library(evd)
  # An example from the evd::fgev documentation
  set.seed(3082019)
  uvdata <- evd::rgev(100, loc = 0.13, scale = 1.1, shape = 0.2)
  M1 <- evd::fgev(uvdata, nsloc = (-49:50)/100)
  adj_fgev <- aLogLik(M1)
  summary(adj_fgev)

  # An example from Chandler and Bate (2007)
  owfit <- fgev(ow$temp, nsloc = ow$loc)
  adj_owfit <- aLogLik(owfit, cluster = ow$year)
  summary(adj_owfit)

  # An example from the evd::fpot documentation
  set.seed(3082019)
  uvdata <- evd::rgpd(100, loc = 0, scale = 1.1, shape = 0.2)
  M1 <- fpot(uvdata, model = "gpd")
  adj_fpot <- aLogLik(M1)
  summary(adj_fpot)

  # Fit using the pp model, rather than the gpd
  M1 <- fpot(uvdata, model = "pp", npp = 365)
  adj_fpot <- aLogLik(M1)
  summary(adj_fpot)

if (!got_evd) {
  suggestion <- "Install the evd package with: install.packages("evd")"
  message(suggestion)
}
```

S3 `alogLik` method to perform loglikelihood adjustment for fitted extreme value model objects returned from the functions `gev`, `gpd` and `pot` in the `evir` package. If `x` was returned from `pot` then the model will need to be re-fitted using `pot_refit`.

**Usage**

```r
## S3 method for class 'gev'
alogLik(x, cluster = NULL, use_vcov = TRUE, ...)
## S3 method for class 'gpd'
alogLik(x, cluster = NULL, use_vcov = TRUE, ...)
## S3 method for class 'potd'
alogLik(x, cluster = NULL, use_vcov = TRUE, ...)
```

**Arguments**

- `x` A fitted model object with certain associated S3 methods. See Details.
- `cluster` A vector or factor indicating from which cluster the respective loglikelihood contributions from `loglik` originate. This must have the same length as the vector returned by the `logLikVec` method for an object like `x`. If `cluster` is not supplied (i.e. is `NULL`) then it is assumed that each observation forms its own cluster. See Details.
- `use_vcov` A logical scalar. Should we use the `vcov` S3 method for `x` (if this exists) to estimate the Hessian of the independence loglikelihood to be passed as the argument `H` to `adjust_loglik`? Otherwise, `H` is estimated inside `adjust_loglik` using `optimHess`.
- `...` Further arguments to be passed to the functions in the sandwich package `meat` (if `cluster = NULL`), or `meatCL` (if `cluster` is not `NULL`).

**Details**

See `alogLik` for details.

If `pot` was used then `x` does not contain the raw data that `alogLik` needs. The model will need to be re-fitted using `pot_refit` and the user will be prompted to do this by an error message produced by `alogLik`. 
Value

An object inheriting from class "chandwich". See `adjust_loglik`. `class(x)` is a vector of length 5. The first 3 components are c("lax","chandwich","evir"). The remaining 2 components depend on the model that was fitted. If `gev` was used then these components are c("gev","stat"). If `gpd` was used then these components are c("gpd","stat"). If `pot_refit` was used then these components are c("potd","stat").

Examples

```r
# We need the evir package
got_evir <- requireNamespace("evir", quietly = TRUE)
if (got_evir) {
  library(evir)
  # An example from the evir::gev documentation
  data(bmw)
  out <- gev(bmw, "month")
  adj_out <- alogLik(out)
  summary(adj_out)

  # An example from the evir::gpd documentation
  data(danish)
  out <- gpd(danish, 10)
  adj_out <- alogLik(out)
  summary(adj_out)

  # An example from the evir::pot documentation
  # We use lax::pot_refit() to return the input data
  out <- pot_refit(danish, 10)
  adj_out <- alogLik(out)
  summary(adj_out)
}
```
**Description**

S3 alogLik method to perform loglikelihood adjustment for fitted extreme value model objects returned from the function `fevd` in the `extRemes` package. The model must have been fitted using maximum likelihood estimation.

**Usage**

```r
# S3 method for class 'fevd'
alogLik(x, cluster = NULL, use_vcov = TRUE, ...)
```

**Arguments**

- `x`: A fitted model object with certain associated S3 methods. See Details.
- `cluster`: A vector or factor indicating from which cluster the respective loglikelihood contributions from loglik originate. This must have the same length as the vector returned by the logLikVec method for an object like `x`. If `cluster` is not supplied (i.e. is NULL) then it is assumed that each observation forms its own cluster. See Details.
- `use_vcov`: A logical scalar. Should we use the vcov S3 method for `x` (if this exists) to estimate the Hessian of the independence loglikelihood to be passed as the argument `H` to adjust_loglik? Otherwise, `H` is estimated inside adjust_loglik using optimHess.
- `...`: Further arguments to be passed to the functions in the sandwich package `meat` (if `cluster = NULL`), or `meatCL` (if `cluster` is not NULL).

**Details**

See `alogLik` for details.

**Value**

An object inheriting from class "chandwich". See adjust_loglik. `class(x)` is a vector of length 5. The first 3 components are c("lax","chandwich","extRemes"). The remaining 2 components depend on the model that was fitted. The 4th component is:  "gev" if x$type = "GEV" or x$type = "Gumbel"; "gp" if x$type = "GP" or x$type = "Exponential"; "pp" if x$type = "PP". The 5th component is "stat" if `is.fixedfevd = TRUE` and "nonstat" if `is.fixedfevd = FALSE`.

}

---

fExtremes

Loglikelihood adjustment for fExtremes fits

Description

S3 alogLik method to perform loglikelihood adjustment for fitted extreme value model objects returned from the functions gevFit, gumbelFit and gpdFit in the fExtremes package. The model must have been fitted using maximum likelihood estimation.

Usage

```r
## S3 method for class 'fGEVFIT'
alogLik(x, cluster = NULL, use_vcov = TRUE, ...)

## S3 method for class 'fGPDFIT'
alogLik(x, cluster = NULL, use_vcov = TRUE, ...)
```

Arguments

- **x**
  - A fitted model object with certain associated S3 methods. See Details.

- **cluster**
  - A vector or factor indicating from which cluster the respective loglikelihood contributions from loglik originate. This must have the same length as the vector returned by the logLikVec method for an object like x. If cluster is not supplied (i.e. is NULL) then it is assumed that each observation forms its own cluster. See Details.
A logical scalar. Should we use the vcov S3 method for `x` (if this exists) to estimate the Hessian of the independence loglikelihood to be passed as the argument `H` to `adjust_loglik`? Otherwise, `H` is estimated inside `adjust_loglik` using `optimHess`. Further arguments to be passed to the functions in the sandwich package `meat` (if `cluster = NULL`), or `meatCL` (if `cluster` is not `NULL`).

Details

See `aLogLik` for details.

Value

An object inheriting from class "chandwich". See `adjust_loglik`. `class(x)` is a vector of length 5. The first 3 components are `c("lax","chandwich","fExtremes")`. The remaining 2 components depend on the model that was fitted. If `gevFit` or `gumbelFit` was used then these components are `c("gev","stat")`. If `gpdFit` was used then these components are `c("gpd","stat")`.

Examples

```r
# We need the fExtremes package
got_fExtremes <- requireNamespace("fExtremes", quietly = TRUE)
if (got_fExtremes) {
  library(fExtremes)

  # GEV
  # An example from the fExtremes::gevFit documentation
  set.seed(4082019)
  x <- gevSim(model = list(xi=0.25, mu=0, beta=1), n = 1000)
  # Fit GEV distribution by maximum likelihood estimation
  fit <- gevFit(x)
  adj_fit <- alogLik(fit)
  summary(adj_fit)

  # GP
  # An example from the fExtremes::gpdFit documentation
  x <- gpdSim(model = list(xi = 0.25, mu = 0, beta = 1), n = 1000)
  # Simulate GP data
  # Fit GP distribution by maximum likelihood estimation
  fit <- gpdFit(x, u = min(x))
```
adj_fit <- alogLik(fit)
summary(adj_fit)

---

**ismo**

**Loglikelihood adjustment for ismo fits**

**Description**

S3 `alogLik` method to perform loglikelihood adjustment for fitted extreme value model objects returned from the functions `gev.fit`, `gpd.fit`, `pp.fit` and `rlarg.fit` in the `ismo` package. If regression modelling is used then the model will need to be re-fitted, see `ismo_refits`.

**Usage**

```r
## S3 method for class 'gev.fit'
alogLik(x, cluster = NULL, use_vcov = TRUE, ...)

## S3 method for class 'pp.fit'
alogLik(x, cluster = NULL, use_vcov = TRUE, ...)

## S3 method for class 'gpd.fit'
alogLik(x, cluster = NULL, use_vcov = TRUE, ...)

## S3 method for class 'rlarg.fit'
alogLik(x, cluster = NULL, use_vcov = TRUE, ...)
```

**Arguments**

- `x`: A fitted model object with certain associated S3 methods. See Details.
- `cluster`: A vector or factor indicating from which cluster the respective loglikelihood contributions from loglik originate. This must have the same length as the vector returned by the logLikVec method for an object like x. If cluster is not supplied (i.e. is NULL) then it is assumed that each observation forms its own cluster. See Details.
- `use_vcov`: A logical scalar. Should we use the vcov S3 method for x (if this exists) to estimate the Hessian of the independence loglikelihood to be passed as the argument H to `adjust_loglik`? Otherwise, H is estimated inside `adjust_loglik` using `optimHess`.
- `...`: Further arguments to be passed to the functions in the sandwich package `meat` (if cluster = NULL), or `meatCL` (if cluster is not NULL).
Details

See **alogLik** for details.

If regression modelling is used then the ismev functions `gev.fit`, `gpd.fit`, `pp.fit` and `rlarg.fit` return residuals but `alogLik` needs the raw data. The model will need to be re-fitted, using one of the functions in **isme_refits**, and the user will be prompted to do this by an error message produced by `alogLik`.

Value

An object inheriting from class "chandwich". See **adjust_loglik**. class(x) is a vector of length 5. The first 3 components are c("lax","chandwich","isme"). The remaining 2 components depend on the model that was fitted. The 4th component is: "gev" if `gev.fit` (or `gev_refit`) was used; "gpd" if `gpd.fit` (or `gpd_refit`) was used; "pp" `pp.fit` (or `pp_refit`) was used; "rlarg" `rlarg.fit` (or `rlarg_refit`) was used. The 5th component is "stat" if x$trans = FALSE and "nonstat" if x$trans = TRUE.

Description

These are a slightly modified versions of the \texttt{gev.fit}, \texttt{gpd.fit}, \texttt{pp.fit} and \texttt{rlarg.fit} functions in the \texttt{ismev} package. The modification is to add to the returned object regression design matrices for the parameters of the model. That is, \texttt{xdat}, \texttt{ydat}, \texttt{mulink}, \texttt{siglink}, \texttt{shlink} and matrices \texttt{mumat}, \texttt{sigmat}, \texttt{shmat} for the location, scale and shape parameters \texttt{gev.fit}, \texttt{pp.fit} and \texttt{rlarg.fit}, and \texttt{xdat}, \texttt{ydat}, \texttt{siglink}, \texttt{shlink} and matrices \texttt{sigmat}, \texttt{shmat} for the scale and shape parameters for \texttt{gpd.fit}.

Usage

\begin{verbatim}
geom_refit(
  xdat,
  ydat = NULL,
\end{verbatim}
mul = NULL,
sigl = NULL,
shl = NULL,
mulink = identity,
siglink = identity,
shlink = identity,
muinit = NULL,
siginit = NULL,
shinit = NULL,
show = TRUE,
method = "Nelder-Mead",
maxit = 10000,
)

gpd_refit(
  xdat,
threshold,
npy = 365,
ydat = NULL,
sigl = NULL,
shl = NULL,
siglink = identity,
shlink = identity,
siginit = NULL,
shinit = NULL,
show = TRUE,
method = "Nelder-Mead",
maxit = 10000,
)

pp_refit(
  xdat,
threshold,
npy = 365,
ydat = NULL,
mul = NULL,
sigl = NULL,
shl = NULL,
mulink = identity,
siglink = identity,
shlink = identity,
muinit = NULL,
siginit = NULL,
shinit = NULL,
show = TRUE,
method = "Nelder-Mead",

maxit = 10000,
...
)

rlarg_refit(
xdat,
r = dim(xdat)[2],
ydat = NULL,
mul = NULL,
sigl = NULL,
shl = NULL,
mulink = identity,
siglink = identity,
shlink = identity,
muint = NULL,
siginit = NULL,
shinit = NULL,
show = TRUE,
method = "Nelder-Mead",
maxit = 10000,
...)

Arguments

xdat       A numeric vector of data to be fitted.
ydat       A matrix of covariates for generalized linear modelling of the parameters (or
            NULL (the default) for stationary fitting). The number of rows should be the
            same as the length of xdat.
mul        Numeric vectors of integers, giving the columns of ydat that contain covari-
            ates for generalized linear modelling of the location, scale and shape parameters
            respectively (or NULL (the default) if the corresponding parameter is stationary).
sigl       Numeric vectors of integers, giving the columns of ydat that contain covari-
            ates for generalized linear modelling of the location, scale and shape parameters
            respectively (or NULL (the default) if the corresponding parameter is stationary).
shl        Numeric vectors of integers, giving the columns of ydat that contain covari-
            ates for generalized linear modelling of the location, scale and shape parameters
            respectively (or NULL (the default) if the corresponding parameter is stationary).
mulink     Inverse link functions for generalized linear modelling of the location, scale and
            shape parameters respectively.
siglink    Inverse link functions for generalized linear modelling of the location, scale and
            shape parameters respectively.
shlink     Inverse link functions for generalized linear modelling of the location, scale and
            shape parameters respectively.
muint      numeric of length equal to total number of parameters used to model the location, scale or shape parameter(s), resp. See Details section for default (NULL) initial values.
siginit numeric of length equal to total number of parameters used to model the location, scale or shape parameter(s), resp. See Details section for default (NULL) initial values.

shinit numeric of length equal to total number of parameters used to model the location, scale or shape parameter(s), resp. See Details section for default (NULL) initial values.

show Logical; if TRUE (the default), print details of the fit.

method The optimization method (see optim for details).

maxit The maximum number of iterations.

... Other control parameters for the optimization. These are passed to components of the control argument of optim.

threshold The threshold; a single number or a numeric vector of the same length as xdat.

npy The number of observations per year/block.

r The largest r order statistics are used for the fitted model.

                      shinit = -0.1129, show = FALSE)
  ls(fit2)
}

Description

Performs adjusted inferences based on model objects fitted, using maximum likelihood estimation, by the extreme value analysis packages `evd`, `evir`, `extRemes`, `fExtremes`, `ismeV`, `mev`, `POT` and `texmex`. Univariate extreme value models, including regression models, are supported. Adjusted standard errors and an adjusted loglikelihood are provided, using the `chandwich` package and the object-oriented features of the `sandwich` package. The adjustment is based on a robust sandwich estimator of the parameter covariance matrix, based on the methodology in Chandler and Bate (2007). This can be used for cluster correlated data when interest lies in the parameters of the marginal distributions, or for performing inferences that are robust to certain types of model misspecification. Univariate extreme value models, including regression models, are supported.

Details

Main function is `alogLik`, which works in an object-oriented way, operating on fitted model objects. This function performs the loglikelihood adjustments using `adjust_loglik`. See the following package-specific help pages for details and examples: `evd`, `evir`, `extRemes`, `fExtremes`, `ismeV`, `mev`, `POT`, `texmex`.

See `vignette("lax-vignette",package = "lax")` for an overview of the package.

### logLik.logLikVec

**Description**

S3 logLik method for logLikVec objects

**Usage**

```r
## S3 method for class 'logLikVec'
logLik(object, ...)
```

**Arguments**

- `object` An object of class "logLikVec" return from a logLikVec method.
- `...` Further arguments.

---

### logLikVec

**Description**

Generic function for calculating loglikelihood contributions from individual observations for a fitted model.

**Usage**

```r
logLikVec(object, ...)
```

**Arguments**

- `object` A fitted model object.
- `...` Further arguments.

---
Description

S3 alogLik method to perform loglikelihood adjustment for fitted extreme value model objects returned from the functions fit.gev, fit.gpd, and fit.pp and fit.rlarg in the mev package.

Usage

## S3 method for class 'mev_gev'
alogLik(x, cluster = NULL, use_vcov = TRUE, ...)

## S3 method for class 'mev_pp'
alogLik(x, cluster = NULL, use_vcov = TRUE, ...)

## S3 method for class 'mev_gpd'
alogLik(x, cluster = NULL, use_vcov = TRUE, ...)

## S3 method for class 'mev_rlarg'
alogLik(x, cluster = NULL, use_vcov = TRUE, ...)

## S3 method for class 'mev_egp'
alogLik(x, cluster = NULL, use_vcov = TRUE, ...)

Arguments

x  A fitted model object with certain associated S3 methods. See Details.
cluster  A vector or factor indicating from which cluster the respective loglikelihood contributions from loglik originate. This must have the same length as the vector returned by the logLikVec method for an object like x. If cluster is not supplied (i.e. is NULL) then it is assumed that each observation forms its own cluster. See Details.
use_vcov  A logical scalar. Should we use the vcov S3 method for x (if this exists) to estimate the Hessian of the independence loglikelihood to be passed as the argument H to adjust_loglik? Otherwise, H is estimated inside adjust_loglik using optimHess.
...  Further arguments to be passed to the functions in the sandwich package meat (if cluster = NULL), or meatCL (if cluster is not NULL).

Details

See alogLik for details.

If x was returned from fit.pp then the data xdat supplied to fit.pp must contain all the data, both threshold exceedances and non-exceedances.
Value

An object inheriting from class "chandwich". See adjust_loglik. class(x) is a vector of length 5. The first 3 components are c("lax","chandwich","mev"). The 4th component depends on which model was fitted. "gev" if fit.gev was used; "gpd" if fit.gpd was used; "pp" fit.pp was used; "egp" fit.egp was used; "rlarg" fit.rlarg was used; The 5th component is "stat" (for stationary).

---

**Oxford and Worthing annual maximum temperatures**

**Description**

Annual maximum temperatures at Oxford and Worthing (England), for the period 1901 to 1980.

**Usage**

```r
ow
```

**Format**

A dataframe with 80 rows and 4 columns.

- Column 1, temp: annual maximum temperatures in degrees Fahrenheit.
- Column 2, year: year in which the maximum was recorded.
- Column 3, name: name of location, "oxford" or "worthing"
- Column 4, loc: location: 1 for "oxford", -1 for "worthing"

plot.retlev

Plot diagnostics for a retlev object

Description

plot method for an objects of class c("retlev","lax").

Usage

## S3 method for class 'retlev'
plot(x, y = NULL, level = NULL, legend = TRUE, digits = 3, plot = TRUE, ...)

Arguments

x an object of class c("retlev","lax"), a result of a call to return_level, using prof = TRUE.

y Not used.

level A numeric scalar in (0, 1). The confidence level required for the confidence interval for the m-year return level. If level is not supplied then x$level is used. level must be no larger than x$level.

legend A logical scalar. Should we add a legend (in the top right of the plot) that gives the approximate values of the MLE and 100 level% confidence limits?

digits An integer. Passed to signif to round the values in the legend.

plot A logical scalar. If TRUE then the plot is produced. Otherwise, it is not, but the MLE and confidence limits are returned.

... Further arguments to be passed to plot.

Details

Plots the profile loglikelihood for a return level, provided that x returned by a call to return_level using prof = TRUE. Horizontal lines indicate the values of the maximised loglikelihood and the critical level used to calculate the confidence limits. If level is smaller than x$level then approximate 100 level% confidence limits are recalculated based on the information contained in x$for_plot.

Value

A numeric vector of length 3 containing the lower 100 level% confidence limit, the MLE and the upper 100 level% confidence limit.

Examples

See the examples in return_level.

See Also

return_level to perform inferences about return levels.
Loglikelihood adjustment for POT fits

Description

S3 alogLik method to perform loglikelihood adjustment for fitted extreme value model objects returned from fitGPD function in the POT package. The model must have been fitted using maximum likelihood estimation.

Usage

```r
## S3 method for class 'uvpot'
alogLik(x, cluster = NULL, use_vcov = TRUE, ...)
```

Arguments

- `x` A fitted model object with certain associated S3 methods. See Details.
- `cluster` A vector or factor indicating from which cluster the respective loglikelihood contributions from loglik originate. This must have the same length as the vector returned by the logLikVec method for an object like x. If cluster is not supplied (i.e. is NULL) then it is assumed that each observation forms its own cluster. See Details.
- `use_vcov` A logical scalar. Should we use the vcov S3 method for x (if this exists) to estimate the Hessian of the independence loglikelihood to be passed as the argument H to adjust_loglik? Otherwise, H is estimated inside adjust_loglik using optimHess.
- `...` Further arguments to be passed to the functions in the sandwich package `meat` (if cluster = NULL), or `meatCL` (if cluster is not NULL).

Details

See alogLik for details.

Value

An object inheriting from class "chandwich". See adjust_loglik.

class(x) is c("lax","chandwich","POT","pot","gpd").

References

See Also

talogLik: loglikelihood adjustment for model fits.

Examples

# We need the POT package
got_POT <- requireNamespace("POT", quietly = TRUE)
if (got_POT) {
  library(POT)
  # An example from the POT::fitgpd documentation.
  set.seed(4082019)
  x <- POT::rgpd(200, 1, 2, 0.25)
  fit <- fitgpd(x, 1, "mle")
  adj_fit <- alogLik(fit)
}

pot_refit

Fits a Poisson point process to the data, an approach sometimes known as peaks over thresholds (POT), and returns an object of class "potd".

Description

This is a slightly modified versions of the pot function in the evir package. The main modification is to add to the returned object the argument data supplied by the user. This is added to the returned (list) object with the name input_data.

Usage

pot_refit(data, threshold = NA, nextremes = NA, run = NA, picture = TRUE, ...)

Arguments

data numeric vector of data, which may have a times attribute containing (in an object of class "POSIXct", or an object that can be converted to that class; see as.POSIXct) the times/dates of each observation. If no times attribute exists, the data are assumed to be equally spaced.

threshold a threshold value (either this or nextremes must be given but not both).

nextremes the number of upper extremes to be used (either this or threshold must be given but not both).

run if the data are to be declustered the run length parameter for the runs method (see decluster) should be entered here.

picture whether or not a picture should be drawn if declustering is performed.

... arguments passed to optim.
print.retlev

References

Examples

# We need the evir package
got_evir <- requireNamespace("evir", quietly = TRUE)
if (got_evir) {
  library(evir)
data(danish)
  out <- pot(danish, 10)
  ls(out)
  out <- pot_refit(danish, 10)
  ls(out)
}

print.retlev

Print method for retlev object

Description

print method for an objects of class c("retlev","lax").

Usage

## S3 method for class 'retlev'
print(x, digits = max(3L, getOption("digits") - 3L), ...)

Arguments

x an object of class c("retlev","lax"). a result of a call to return_level.
digits The argument digits to print.default.
... Additional arguments. None are used in this function.

Details

Prints the call to return_level and the estimates and 100x$level% confidence limits for the x$m-
observation return level.

Value

The argument x, invisibly, as for all print methods.

Examples

See the examples in return_level.
**Description**

print method for an object x of class "summary.retlev".

**Usage**

```r
## S3 method for class 'summary.retlev'
print(x, ...)
```

**Arguments**

- `x`  
  An object of class "summary.retlev", a result of a call to `summary.retlev`.

- `...`  
  Additional arguments passed on to `print.default`.

**Details**

Prints the call and the numeric matrix x$matrix returned from `summary.retlev`.

**Value**

The argument x, invisibly, as for all `print` methods.

**Examples**

See the examples in `return_level`.

**See Also**

`return_level` to perform inferences about return levels.
return_level

Description

Calculates point estimates and confidence intervals for \( m \)-observation return levels for stationary extreme value fitted model objects returned from \texttt{alogLik}. Two types of interval may be returned: (a) intervals based on approximate large-sample normality of the maximum likelihood estimator for return level, which are symmetric about the point estimate, and (b) profile likelihood-based intervals based on an (adjusted) loglikelihood.

Usage

\begin{verbatim}
return_level(
  x,  
  m = 100,  
  level = 0.95,  
  npy = 1,  
  prof = TRUE,  
  inc = NULL,  
  type = c("vertical", "cholesky", "spectral", "none")
)
\end{verbatim}

Arguments

\begin{description}
\item[x] An object inheriting from class \texttt{"lax"} returned from \texttt{alogLik}.
\item[m] A numeric scalar. The return period, in units of the number of observations. See \texttt{Details} for information.
\item[level] A numeric scalar in \((0, 1)\). The confidence level required for confidence interval for the \( m \)-observation return level.
\item[npy] A numeric scalar. The
\item[prof] A logical scalar. Should we calculate intervals based on profile loglikelihood?
\item[inc] A numeric scalar. Only relevant if \texttt{prof = TRUE}. The increment in return level by which we move upwards and downwards from the MLE for the return level in the search for the lower and upper confidence limits. If this is not supplied then \texttt{inc} is set to one hundredth of the length of the symmetric confidence interval for return level.
\item[type] A character scalar. The argument \texttt{type} to the function returned by \texttt{adjust_loglik}, that is, the type of adjustment made to the independence loglikelihood function in creating an adjusted loglikelihood function. See \texttt{Details} and \texttt{Value} in \texttt{adjust_loglik}.
\end{description}
Details

At present `return_level` only supports GEV models.

Care must be taken in specifying the input value of `m`, taking into account the parameterisation of the original fit.

For GEV models it is common for each observation to relate to a year. In this event the `m`-observation return level is an `m`-year return level.

For details about the definition and estimation of return levels see Chapter 3 and 4 of Coles (2001).

The profile likelihood-based intervals are calculated by reparameterising in terms of the `m`-year return level and estimating the values at which the (adjusted) profile loglikelihood reaches the critical value `logLik(x) - 0.5 * stats::qchisq(level, 1)`. This is achieved by calculating the profile loglikelihood for a sequence of values of this return level as governed by `inc`. Once the profile loglikelihood drops below the critical value the lower and upper limits are estimated by interpolating linearly between the cases lying either side of the critical value. The smaller `inc` the more accurate (but slower) the calculation will be.

Value

A object (a list) of class "retlev", "lax" with the components

- `rl_sym, rl_prof`
  Named numeric vectors containing the respective lower 100 level% limit, the MLE and the upper 100 level% limit for the return level. If `prof = FALSE` then `rl_prof` will be missing.

- `rl_se`
  Estimated standard error of the return level.

- `max_loglik, crit, for_plot`
  If `prof = TRUE` then these components will be present, containing respectively: the maximised loglikelihood; the critical value and a matrix with return levels in the first column (`ret_levs`) and the corresponding values of the (adjusted) profile loglikelihood (`prof_loglik`).

- `m, level`
  The input values of `m` and `level`.

- `call`
  The call to `return_level`.

References

See Also

- `plot.retlev` for plotting the profile loglikelihood for a return level.

Examples

```r
got_evd <- requireNamespace("evd", quietly = TRUE)
if (got_evd) {
  library(evd)
```
# An example from the `evd::fgev` documentation

set.seed(4082019)
uvdata <- evd::rgev(100, loc = 0.13, scale = 1.1, shape = 0.2)
M1 <- fgev(uvdata)
adj_fgev <- alogLik(M1)
# Large inc set here for speed, sacrificing accuracy
rl <- return_level(adj_fgev, inc = 0.5)
summary(rl)
plot(rl)

} got_ismev <- requireNamespace("isme", quietly = TRUE)

if (got_ismev) {

library(isme)
# An example from the `isme::geom.fit` documentation
geom_fit <- geom.fit(revdbayes::portpirie, show = FALSE)
adj_geom_fit <- alogLik(geom_fit)
# Large inc set here for speed, sacrificing accuracy
rl <- return_level(adj_geom_fit, inc = 0.05)
summary(rl)
plot(rl)
}

---

**summary.retlev**

Summary method for a "retlev" object

### Description

summary method for an objects of class c("retlev","lax").

### Usage

```r
## S3 method for class 'retlev'
summary(object, digits, ...)
```

### Arguments

- **object**
  
an object of class c("retlev","lax"), a result of a call to `return_level`.

- **digits**
  
  An integer. Used for number formatting with `signif`. If digits is not specified (i.e. `missing`) then `signif()` will not be called (i.e. no rounding will be performed).

- **...**
  
  Additional arguments. None are used in this function.

### Value

Returns a list containing the list element `object$call` and a numeric matrix `matrix` containing the MLE and estimated SE of the return level.
Examples

See the examples in return_level.

See Also

return_level.

texmex  

Loglikelihood adjustment of texmex fits

Description

S3 alogLik method to perform loglikelihood adjustment of fitted extreme value model objects returned from the evm function in the texmex package. The model must have been fitted using maximum likelihood estimation.

Usage

## S3 method for class 'evmOpt'
alogLik(x, cluster = NULL, use_vcov = TRUE, ...)

Arguments

x  
A fitted model object with certain associated S3 methods. See Details.

cluster  
A vector or factor indicating from which cluster the respective loglikelihood contributions from loglik originate. This must have the same length as the vector returned by the logLikVec method for an object like x. If cluster is not supplied (i.e. is NULL) then it is assumed that each observation forms its own cluster. See Details.

use_vcov  
A logical scalar. Should we use the vcov S3 method for x (if this exists) to estimate the Hessian of the independence loglikelihood to be passed as the argument H to adjust_loglik? Otherwise, H is estimated inside adjust_loglik using optimHess.

...  
Further arguments to be passed to the functions in the sandwich package meat (if cluster = NULL), or meatCL (if cluster is not NULL).

Details

See alogLik for details.

Value

An object inheriting from class "chandwich". See adjust_loglik. class(x) is a vector of length 5. The first 3 components are c("lax","chandwich","texmex"). The remaining 2 components depend on the model that was fitted. The 4th component is: "gev" if x$family$name = "GEV"; "gpd" if x$family$name = "GPD"; "egp3" if x$family$name = "EGP3". The 5th component is "stat" if there are no covariates in the mode and "nonstat" otherwise.
