Package ‘libcoin’

September 27, 2021

Title  Linear Test Statistics for Permutation Inference
Date   2021-09-27
Version 1.0-9

Description  Basic infrastructure for linear test statistics and permutation inference in
This package must not be used by end-users. CRAN package 'coin' implements all user
interfaces and is ready to be used by anyone.

Depends  R (>= 3.4.0)
Suggests coin
Imports  stats, mvtnorm
LinkingTo  mvtnorm

License  GPL-2
Author  Torsten Hothorn [aut, cre]
Maintainer  Torsten Hothorn <Torsten.Hothorn@R-project.org>
Repository  CRAN
Date/Publication 2021-09-27 09:50:07 UTC

R topics documented:

LinStatExpCov ......................................... 3

Index 6
**ctabs**

*Cross Tabulation*

**Description**

Efficient weighted cross tabulation of two factors and a block

**Usage**

```r
ctabs(ix, iy = integer(0), block = integer(0), weights = integer(0),
      subset = integer(0), checkNAs = TRUE)
```

**Arguments**

- `ix`: a integer of positive values with zero indicating a missing.
- `iy`: an optional integer of positive values with zero indicating a missing.
- `block`: an optional blocking factor without missings.
- `weights`: an optional vector of weights, integer or double.
- `subset`: an optional integer vector indicating a subset.
- `checkNAs`: a logical for switching off missing value checks.

**Details**

A faster version of `xtabs(weights ~ ix + iy + block,subset)`.

**Value**

If `block` is present, a three-way table. Otherwise, a one- or two-dimensional table.

**Examples**

```r
ctabs(ix = 1:5, iy = 1:5, weights = 1:5 / 5)
```

---

**doTest**

*Permutation Test*

**Description**

Perform permutation test for a linear statistic

**Usage**

```r
doTest(object, teststat = c("maximum", "quadratic", "scalar"),
       alternative = c("two.sided", "less", "greater"), pvalue = TRUE,
       lower = FALSE, log = FALSE, PermuttedStatistics = FALSE,
       minbucket = 10L, ordered = TRUE, maxselect = object$Xfactor,
       pargs = GenzBretz())
```
Arguments

object  an object returned by LinStatExpCov.
teststat  type of test statistic to use.
alternative  alternative for scalar or maximum-type statistics.
pvalue  a logical indicating if a p-value shall be computed.
lower  a logical indicating if a p-value (lower is FALSE) or 1 - p-value (lower is TRUE) shall be returned.
log  a logical, if TRUE probabilities are log-probabilities.
PermutedStatistics  a logical, return permuted test statistics.
minbucket  minimum weight in either of two groups for maximally selected statistics.
ordered  a logical, if TRUE maximally selected statistics assume that the cutpoints are ordered.
maxselect  a logical, if TRUE maximally selected statistics are computed. This requires that X was an implicitly defined design matrix in LinStatExpCov.
pargs  arguments as in GenzBretz.

Details

Computes a test statistic, a corresponding p-value and, optionally, cutpoints for maximally selected statistics.

Value

A list.

LinStatExpCov  Linear Statistics with Expectation and Covariance

Description

Strasser-Weber type linear statistics and their expectation and covariance under the independence hypothesis

Usage

LinStatExpCov(X, Y, ix = NULL, iy = NULL, weights = integer(0),
  subset = integer(0), block = integer(0), checkNAs = TRUE,
  varonly = FALSE, nresample = 0, standardise = FALSE,
  tol = sqrt(.Machine$double.eps))
lmult(x, object)
Arguments

X numeric matrix of transformations.
Y numeric matrix of influence functions.
ix an optional integer vector expanding X.
iy an optional integer vector expanding Y.
weights an optional integer vector of non-negative case weights.
subset an optional integer vector defining a subset of observations.
block an optional factor defining independent blocks of observations.
checkNAs a logical for switching off missing value checks. This included switching off checks for suitable values of subset. Use at your own risk.
varonly a logical asking for variances only.
nresample an integer defining the number of permuted statistics to draw.
standardise a logical asking to standardise the permuted statistics.
tol tolerance for zero variances.
x a contrast matrix to be left-multiplied in case X was a factor.
object an object of class LinStatExpCov.

Details

The function, after minimal preprocessing, calls the underlying C code and computes the linear statistic, its expectation and covariance and, optionally, nresample samples from its permutation distribution.

When both ix and iy are missing, the number of rows of X and Y is the same, ie the number of observations.

When X is missing and ix a factor, the code proceeds as if X were a dummy matrix of ix without explicitly computing this matrix.

Both ix and iy being present means the code treats them as subsetting vectors for X and Y. Note that ix = 0 or iy = 0 means that the corresponding observation is missing and the first row or X and Y must be zero.

lmult allows left-multiplication of a contrast matrix when X was (equivalent to) a factor.

Value

A list.

References

Examples

wilcox.test(Ozone ~ Month, data = airquality, subset = Month %in% c(5, 8))

aq <- subset(airquality, Month %in% c(5, 8))
X <- as.double(aq$Month == 5)
Y <- as.double(rank(aq$Ozone))
doTest(LinStatExpCov(X, Y))
