Package ‘lintr’

July 19, 2023

Title  A ‘Linter’ for R Code

Version  3.1.0

Description  Checks adherence to a given style, syntax errors and possible semantic issues. Supports on the fly checking of R code edited with 'RStudio IDE', 'Emacs', 'Vim', 'Sublime Text', 'Atom' and 'Visual Studio Code'.

License  MIT + file LICENSE

BugReports  https://github.com/r-lib/lintr/issues

Depends  R (>= 3.5)

Imports  backports,
codetools,
cyclocomp,
digest,
glue,
knitr,
rex,
stats,
utils,
xml2 (>= 1.0.0),
xmlparsedata (>= 1.0.5)

Suggests  bookdown,
crayon,
httr (>= 1.2.1),
jsonlite,
mockery,
patrick,
rlang,
rmockdown,
rstudioapi (>= 0.2),
testthat (>= 3.1.5),
tibble,
tufte,
withr (>= 2.5.0)

Enhances  data.table

VignetteBuilder  knitr

**absolute_path_linter**

---

**Absolute path linter**

**Description**

Check that no absolute paths are used (e.g. "/var", "C:\System", "~/docs").

**Usage**

```r
absolute_path_linter(lax = TRUE)
```

**Arguments**

- **lax**: Less stringent linting, leading to fewer false positives. If `TRUE`, only lint path strings, which
  - contain at least two path elements, with one having at least two characters and
  - contain only alphanumeric chars (including UTF-8), spaces, and win32-allowed punctuation

**Tags**

- `best_practices`, `configurable`, `robustness`

**See Also**

- `linters` for a complete list of linters available in lintr.
- `nonportable_path_linter()`

**Examples**

# Following examples use raw character constant syntax introduced in R 4.0.

# will produce lints
```r
lint(
  text = 'R"-[/blah/file.txt]-"',
  linters = absolute_path_linter()
)
```

# okay
```r
lint(
  text = 'R"./blah"',
  linters = absolute_path_linter()
)
```
all_linters

Create a linter configuration based on all available linters

Description

Create a linter configuration based on all available linters

Usage

all_linters(packages = "lintr", ...)

Arguments

packages

A character vector of packages to search for linters.

...

Arguments of elements to change. If unnamed, the argument is automatically named. If the named argument already exists in the list of linters, it is replaced by the new element. If it does not exist, it is added. If the value is NULL, the linter is removed.

See Also

- linters_with_defaults for basing off lintr’s set of default linters.
- linters_with_tags for basing off tags attached to linters, possibly across multiple packages.
- available_linters to get a data frame of available linters.
- linters for a complete list of linters available in lintr.

Examples

names(all_linters())

all_undesirable_functions

Default undesirable functions and operators

Description

Lists of function names and operators for undesirable_function_linter() and undesirable_operator_linter(). There is a list for the default elements and another that contains all available elements. Use modify_defaults() to produce a custom list.

Usage

all_undesirable_functions

default_undesirable_functions

all_undesirable_operators

default_undesirable_operators
Format

A named list of character strings.

Details

The following functions are sometimes regarded as undesirable:

- `attach()` modifies the global search path. Use roxygen2’s `@importFrom` statement in packages, or :: in scripts.
- `browser()` pauses execution when run and is likely a leftover from debugging. It should be removed.
- `debug()` traps a function and causes execution to pause when that function is run. It should be removed.
- `debugcall()` works similarly to `debug()`, causing execution to pause. It should be removed.
- `debugonce()` is only useful for interactive debugging. It should be removed.
- `detach()` modifies the global search path. Detaching environments from the search path is rarely necessary in production code.
- `ifelse()` isn't type stable. Use an if/else block for scalar logic, or use `dplyr::if_else()`/`data.table::ifelse()` for type stable vectorized logic.
- `.libPaths()` permanently modifies the library location. Use `withr::with_libpaths()` for a temporary change instead.
- `library()` modifies the global search path. Use roxygen2’s `@importFrom` statement in packages, or :: in scripts.
- `loadNamespace()` doesn’t provide an easy way to signal failures. Use the return value of `requireNamespace()` instead.
- `mapply()` isn’t type stable. Use `Map()` to guarantee a list is returned and simplify accordingly.
- `options()` permanently modifies the session options. Use `withr::with_options()` for a temporary change instead.
- `par()` permanently modifies the graphics device parameters. Use `withr::with_par()` for a temporary change instead.
- `require()` modifies the global search path. Use roxygen2’s `@importFrom` statement in packages, and `library()` or :: in scripts.
- `sapply()` isn’t type stable. Use `vapply()` with an appropriate `FUN.VALUE=` argument to obtain type stable simplification.
- `setwd()` modifies the global working directory. Use `withr::with_dir()` for a temporary change instead.
- `sink()` permanently redirects output. Use `withr::with_sink()` for a temporary redirection instead.
- `source()` loads code into the global environment unless `local = TRUE` is used, which can cause unexpected behavior.
- `substring()` should be replaced by `substr()` with appropriate `stop=` value.
- `Sys.setenv()` permanently modifies the global environment variables. Use `withr::with_envvar()` for a temporary change instead.
- `Sys.setlocale()` permanently modifies the session locale. Use `withr::with_locale()` for a temporary change instead.
The following operators are sometimes regarded as undesirable:

- `:::` accesses non-exported functions inside packages. Code relying on these is likely to break in future versions of the package because the functions are not part of the public interface and may be changed or removed by the maintainers without notice. Use public functions via `::` instead.
- `<<-` and `->>` assign outside the current environment in a way that can be hard to reason about. Prefer fully-encapsulated functions wherever possible, or, if necessary, assign to a specific environment with `assign()`. Recall that you can create an environment at the desired scope with `new.env()`.

---

**any_duplicated_linter**

*Require usage of `anyDuplicated(x) > 0` over `any(duplicated(x))`*

**Description**

`anyDuplicated()` exists as a replacement for `any(duplicated(.))`, which is more efficient for simple objects, and is at worst equally efficient. Therefore, it should be used in all situations instead of the latter.

**Usage**

```r
any_duplicated_linter()
```

**Details**

Also match usage like `length(unique(x$col)) == nrow(x)`, which can be replaced by `anyDuplicated(x$col) == 0L`.

**Tags**

`best_practices`, `efficiency`

**See Also**

`linters` for a complete list of linters available in lintr.

**Examples**

```r
# will produce lints
lint(
  text = "any(duplicated(x), na.rm = TRUE)",
  linters = any_duplicated_linter()
)

lint(
  text = "length(unique(x)) == length(x)",
```
any_is_na_linter

```r
linters = any_duplicated_linter()

# okay
lint(
  text = "anyDuplicated(x)",
  linters = any_duplicated_linter()
)

lint(
  text = "anyDuplicated(x) == 0L",
  linters = any_duplicated_linter()
)
```

---

**any_is_na_linter**  
**Require usage of anyNA(x) over any(is.na(x))**

**Description**

*anyNA()* exists as a replacement for *any(is.na(x))* which is more efficient for simple objects, and is at worst equally efficient. Therefore, it should be used in all situations instead of the latter.

**Usage**

`any_is_na_linter()`

**Tags**

`best_practices, efficiency`

**See Also**

`linters` for a complete list of linters available in lintr.

**Examples**

```r
# will produce lints
lint(
  text = "any(is.na(x), na.rm = TRUE)",
  linters = any_is_na_linter()
)

lint(
  text = "any(is.na(foo(x)))",
  linters = any_is_na_linter()
)

# okay
lint(
  text = "anyNA(x)",
  linters = any_is_na_linter()
)
```
assignment_linter

Description

Check that <- is always used for assignment.

Usage

assignment_linter(
  allow_cascading_assign = TRUE,
  allow_right_assign = FALSE,
  allow_trailing = TRUE
)

Arguments

allow_cascading_assign
  Logical, default TRUE. If FALSE, <<- and ->> are not allowed.
allow_right_assign
  Logical, default FALSE. If TRUE, -> and <<- are allowed.
allow_trailing
  Logical, default TRUE. If FALSE then assignments aren’t allowed at end of lines.

Tags

configurable, consistency, default, style

See Also

• linters for a complete list of linters available in lintr.
• https://style.tidyverse.org/syntax.html#assignment-1

Examples

# will produce lints
lint(
  text = "x = mean(x)",
  linters = assignment_linter()
)

code_lines <- "1 -> x
2 ->> y"
writeLines(code_lines)
lint(
  text = code_lines,
  linters = assignment_linter()
)

# okay
lint(
  text = "x <- mean(x)",
  linters = assignment_linter()
)

code_lines <- "x <- 1\ny <<- 2"
writeLines(code_lines)
lint(
  text = code_lines,
  linters = assignment_linter()
)

# customizing using arguments
code_lines <- "1 -> x\n2 ->> y"
writeLines(code_lines)
lint(
  text = code_lines,
  linters = assignment_linter(allow_right_assign = TRUE)
)

lint(
  text = "x <<- 1",
  linters = assignment_linter(allow_cascading_assign = FALSE)
)

writeLines("foo(bar = \n 1)")
lint(
  text = "foo(bar = \n 1)",
  linters = assignment_linter(allow_trailing = FALSE)
)

### available_linters

Get Linter metadata from a package

**Description**

available_linters() obtains a tagged list of all Linters available in a package.
available_tags() searches for available tags.

**Usage**

available_linters(packages = "lintr", tags = NULL, exclude_tags = "deprecated")

available_tags(packages = "lintr")
available_linters

Arguments

- **packages**: A character vector of packages to search for linters.
- **tags**: Optional character vector of tags to search. Only linters with at least one matching tag will be returned. If tags is NULL, all linters will be returned. See available_tags("lintr") to find out what tags are already used by lintr.
- **exclude_tags**: Tags to exclude from the results. Linters with at least one matching tag will not be returned. If except_tags is NULL, no linters will be excluded. Note that tags takes priority, meaning that any tag found in both tags and exclude_tags will be included, not excluded.

Value

available_linters returns a data frame with columns 'linter', 'package' and 'tags':

- **linter**: A character column naming the function associated with the linter.
- **package**: A character column containing the name of the package providing the linter.
- **tags**: A list column containing tags associated with the linter.

available_tags returns a character vector of linter tags used by the packages.

Package Authors

To implement available_linters() for your package, include a file inst/lintr/linters.csv in your package. The CSV file must contain the columns 'linter' and 'tags', and be UTF-8 encoded. Additional columns will be silently ignored if present and the columns are identified by name. Each row describes a linter by

1. its function name (e.g. "assignment_linter") in the column 'linter'.
2. space-separated tags associated with the linter (e.g. "style consistency default") in the column 'tags'.

Tags should be snake_case.

See available_tags("lintr") to find out what tags are already used by lintr.

See Also

- **linters** for a complete list of linters available in lintr.
- **available_tags()** to retrieve the set of valid tags.

Examples

```r
lintr_linters <- available_linters()

# If the package doesn't exist or isn't installed, an empty data frame will be returned
available_linters("does-not-exist")

lintr_linters2 <- available_linters(c("lintr", "does-not-exist"))
identical(lintr_linters, lintr_linters2)
available_tags()
```
Description

Check for usage of unavailable functions. Not reliable for testing r-devel dependencies.

Usage

backport_linter(r_version = getRversion(), except = character())

Arguments

r_version  Minimum R version to test for compatibility
except     Character vector of functions to be excluded from linting. Use this to list explicitly defined backports, e.g. those imported from the backports package or manually defined in your package.

Tags

configurable, package_development, robustness

See Also

linters for a complete list of linters available in lintr.

Examples

# will produce lints
lint(
  text = "trimws(x)",
  linters = backport_linter("3.0.0")
)

lint(
  text = "str2lang(x)",
  linters = backport_linter("3.2.0")
)

# okay
lint(
  text = "trimws(x)",
  linters = backport_linter("3.6.0")
)

lint(
  text = "str2lang(x)",
  linters = backport_linter("4.0.0")
)
**best_practices_linters**

*Best practices linters*

**Description**

Linters checking the use of coding best practices, such as explicit typing of numeric constants.

**Linters**

The following linters are tagged with 'best_practices':

- `absolute_path_linter`
- `any_duplicated_linter`
- `any_is_na_linter`
- `boolean_arithmetic_linter`
- `class_equals_linter`
- `commented_code_linter`

See Also

linters for a complete list of linters available in lintr.

---

boolean_arithmetic_linter

Require usage of boolean operators over equivalent arithmetic

Description

\[ \text{length}(\text{which}(x == y)) == 0 \] is the same as \( \neg \text{any}(x == y) \), but the latter is more readable and more efficient.

Usage

boolean_arithmetic_linter()

Tags

best_practices, efficiency, readability

See Also

linters for a complete list of linters available in lintr.
Examples

```r
# will produce lints
lint(
  text = "length(which(x == y)) == 0L",
  linters = boolean_arithmetic_linter()
)

lint(
  text = "sum(grepl(pattern, x)) == 0",
  linters = boolean_arithmetic_linter()
)

# okay
lint(
  text = "!any(x == y)",
  linters = boolean_arithmetic_linter()
)

lint(
  text = "!any(grepl(pattern, x))",
  linters = boolean_arithmetic_linter()
)
```

bracket_linter

Description

Perform various style checks related to placement and spacing of curly braces:

Usage

```r
brace_linter(allow_single_line = FALSE)
```

Arguments

allow_single_line

- if `TRUE`, allow an open and closed curly pair on the same line.

Details

- Opening curly braces are never on their own line and are always followed by a newline.
- Opening curly braces have a space before them.
- Closing curly braces are on their own line unless they are followed by an else.
- Closing curly braces in if conditions are on the same line as the corresponding else.
- Either both or neither branch in if/else use curly braces, i.e., either both branches use {...} or neither does.
- Functions spanning multiple lines use curly braces.

  linters = brace_linter()
)

writeLines("if (TRUE) { \n  return(1) \n}\n")
lint(
  text = "if (TRUE) { \n  return(1) \n}\n",
  linters = brace_linter()
)

# customizing using arguments
writeLines("if (TRUE) { return(1) }")
lint(
  text = "if (TRUE) { return(1) }",
  linters = brace_linter(allow_single_line = TRUE)
)

Description

Generate a report of the linting results using the Checkstyle XML format.

Usage

checkstyle_output(lints, filename = "lintr_results.xml")
class_equals_linter

Arguments

- lints: the linting results.
- filename: the name of the output report

class_equals_linter  Block comparison of class with ==

Description

Usage like `class(x) == "character"` is prone to error since class in R is in general a vector. The correct version for S3 classes is `inherits()`: `inherits(x, "character")`. Often, `class k` will have an `is` equivalent, for example `is.character()` or `is.data.frame()`.

Usage

class_equals_linter()

Details

Similar reasoning applies for `class(x) %in% "character"`.

Tags

- best_practices, consistency, robustness

See Also

- `linters` for a complete list of linters available in lintr.

Examples

# will produce lints
lint(
  text = 'is_lm <- class(x) == "lm"',
  linters = class_equals_linter()
)

lint(
  text = 'if ("lm" %in% class(x)) is_lm <- TRUE',
  linters = class_equals_linter()
)

# okay
lint(
  text = 'is_lm <- inherits(x, "lm")',
  linters = class_equals_linter()
)

lint(
  text = 'if (inherits(x, "lm")) is_lm <- TRUE',
  linters = class_equals_linter()
)
clear_cache

Clear the lintr cache

Description
Clear the lintr cache

Usage
```
clear_cache(file = NULL, path = NULL)
```

Arguments
- file: filename whose cache to clear. If you pass NULL, it will delete all of the caches.
- path: directory to store caches. Reads option 'lintr.cache_directory' as the default.

Value
0 for success, 1 for failure, invisibly.

commas_linter

Commas linter

Description
Check that all commas are followed by spaces, but do not have spaces before them.

Usage
```
commas_linter()
```

Tags
default, readability, style

See Also
- linters for a complete list of linters available in lintr.
- https://style.tidyverse.org/syntax.html#commas
commented_code_linter

Examples

# will produce lints
lint(
  text = "switch(op, x = foo, y = bar)",
  linters = commas_linter()
)

lint(
  text = "mean(x, trim = 0.2, na.rm = TRUE)",
  linters = commas_linter()
)

lint(
  text = "x[, , drop=TRUE]",
  linters = commas_linter()
)

# okay
lint(
  text = "switch(op, x = foo, y = bar)",
  linters = commas_linter()
)

lint(
  text = "switch(op, x = , y = bar)",
  linters = commas_linter()
)

lint(
  text = "mean(x, trim = 0.2, na.rm = TRUE)",
  linters = commas_linter()
)

lint(
  text = "a[1, , 2, , 3]",
  linters = commas_linter()
)

commented_code_linter Commented code linter

Description

Check that there is no commented code outside roxygen blocks.

Usage

commented_code_linter()

Tags

best_practices, default, readability, style
### common_mistakes_linters

**Common mistake linters**

#### Description

Linters highlighting common mistakes, such as duplicate arguments.

#### Linters

The following linters are tagged with 'common_mistakes':

- `duplicate_argument_linter`
- `equals_na_linter`
- `missing_argument_linter`
- `missing_package_linter`
- `redundant_equals_linter`
- `sprintf_linter`
- `unused_import_linter`

---

**See Also**

linters for a complete list of linters available in lintr.

**Examples**

```r
# will produce lints
lint(
  text = "# x <- 1",
  linters = commented_code_linter()
)

lint(
  text = "x <- f() # g()",
  linters = commented_code_linter()
)

lint(
  text = "x + y # + z[1, 2]",
  linters = commented_code_linter()
)

# okay
lint(
  text = "x <- 1; x <- f(); x + y",
  linters = commented_code_linter()
)

lint(
  text = "# x <- 1",
  linters = commented_code_linter()
)
```
See Also

`linters` for a complete list of linters available in lintr.

---

`condition_message_linter`

Block usage of `paste()` and `paste0()` with messaging functions using ... 

Description

This linter discourages combining condition functions like `stop()` with string concatenation functions `paste()` and `paste0()`. This is because

Usage

`condition_message_linter()`

Details

- `stop(paste0(...))` is redundant as it is exactly equivalent to `stop(...)`
- `stop(paste(...))` is similarly equivalent to `stop(...)` with separators (see examples)

The same applies to the other default condition functions as well, i.e., `warning()`, `message()`, and `packageStartupMessage()`.

Tags

`best_practices`, `consistency`

See Also

`linters` for a complete list of linters available in lintr.

Examples

```r
# will produce lints
lint(
  text = 'stop(paste("a string", "another"))',
  linters = condition_message_linter()
)

lint(
  text = 'warning(paste0("a string", " another"))',
  linters = condition_message_linter()
)

# okay
lint(
  text = 'stop("a string", " another")',
  linters = condition_message_linter()
)
```

configurable_linters

Description

Generic linters which support custom configuration to your needs.

Linters

The following linters are tagged with ‘configurable’:

• absolute_path_linter
• assignment_linter
• backport_linter
• brace_linter
• conjunct_test_linter
• cyclocomp_linter
• duplicate_argument_linter
• implicit_assignment_linter
• implicit_integer_linter
• indentation_linter
• infix_spaces_linter
• line_length_linter
• missing_argument_linter
• namespace_linter
• nonportable_path_linter
• object_length_linter
• object_name_linter
• object_usage_linter
• paste_linter
• quotes_linter
• redundant_ifelse_linter
• semicolon_linter
• string_boundary_linter
• todo_comment_linter
• trailing_whitespace_linter
• undesirable_function_linter
• undesirable_operator_linter
• unnecessary_concatenation_linter
• unused_import_linter

See Also

linters for a complete list of linters available in lintr.

### conjunct_test_linter

*Force && conditions in expect_true() and expect_false() to be written separately*

#### Description

For readability of test outputs, testing only one thing per call to testthat::expect_true() is preferable, i.e., expect_true(A); expect_true(B) is better than expect_true(A && B), and expect_false(A); expect_false(B) is better than expect_false(A || B).

#### Usage

```r
conjunct_test_linter(allow_named_stopifnot = TRUE)
```

#### Arguments

- **allow_named_stopifnot**
  
  Logical, TRUE by default. If FALSE, “named” calls to stopifnot(), available since R 4.0.0 to provide helpful messages for test failures, are also linted.

#### Details

Similar reasoning applies to && usage inside stopifnot() and assertthat::assert_that() calls.

#### Tags

- best_practices, configurable, package_development, readability

See Also

- linters for a complete list of linters available in lintr.

#### Examples

```r
# will produce lints
lint(
  text = "expect_true(x && y)",
  linters = conjunct_test_linter()
)

lint(
  text = "expect_false(x || (y && z))",
```
linters = conjunct_test_linter()

lint(
    text = "stopifnot('x must be a logical scalar' = length(x) == 1 && is.logical(x) && !is.na(x))",
    linters = conjunct_test_linter(allow_named_stopifnot = FALSE)
)

# okay
lint(  
    text = "expect_true(x || (y && z))",
    linters = conjunct_test_linter()
)

lint(  
    text = 'stopifnot("x must be a logical scalar" = length(x) == 1 && is.logical(x) && !is.na(x))',
    linters = conjunct_test_linter(allow_named_stopifnot = TRUE)
)

---

consecutive_assertion_linter

*Force consecutive calls to assertions into just one when possible*

**Description**

`stopifnot()` accepts any number of tests, so sequences like `stopifnot(x); stopifnot(y)` are redundant. Ditto for tests using `assertthat::assert_that()` without specifying `msg=`.

**Usage**

`consecutive_assertion_linter()`

**Tags**

`consistency, readability, style`

**See Also**

`linters` for a complete list of linters available in lintr.

**Examples**

# will produce lints
lint(  
    text = "stopifnot(x); stopifnot(y)",
    linters = consecutive_assertion_linter()
)

lint(  
    text = "assert_that(x); assert_that(y)",
    linters = consecutive_assertion_linter()
)
# consistency_linters

Linters checking enforcing a consistent alternative if there are multiple syntactically valid ways to write something.

## Linters

The following linters are tagged with `consistency`:

- `assignment_linter`
- `class_equals_linter`
- `condition_message_linter`
- `consecutive_assertion_linter`
- `function_argument_linter`
- `implicit_integer_linter`
- `inner_combine_linter`
- `is_numeric_linter`
- `literal_coercion_linter`
- `numeric_leading_zero_linter`
- `object_name_linter`
- `paste_linter`
- `quotes_linter`
- `redundant_ifelse_linter`
- `seq_linter`
- `system_file_linter`
- `T_and_F_symbol_linter`
- `whitespace_linter`

## See Also

`linters` for a complete list of linters available in lintr.
**Correctness linters**

**Description**

Linters highlighting possible programming mistakes, such as unused variables.

**Linters**

The following linters are tagged with 'correctness':

- duplicate_argument_linter
- equals_na_linter
- missing_argument_linter
- namespace_linter
- object_usage_linter
- package_hooks_linter
- sprintf_linter

**See Also**

[linters](#) for a complete list of linters available in lintr.

---

**Cyclomatic complexity linter**

**Description**

Check for overly complicated expressions. See `cyclocomp::cyclocomp()`.

**Usage**

```r
cyclocomp_linter(complexity_limit = 15L)
```

**Arguments**

- `complexity_limit`
  
  Maximum cyclomatic complexity, default 15. Expressions more complex than this are linted. See `cyclocomp::cyclocomp()`.

**Tags**

- `best_practices`, `configurable`, `default`, `readability`, `style`

**See Also**

[linters](#) for a complete list of linters available in lintr.
Examples

# will produce lints
lint(
  text = "if (TRUE) 1 else 2",
  linters = cyclocomp_linter(complexity_limit = 1L)
)

# okay
lint(
  text = "if (TRUE) 1 else 2",
  linters = cyclocomp_linter(complexity_limit = 2L)
)

---

default_linters  

Default linters

Description

List of default linters for `lint()`. Use `linters_with_defaults()` to customize it. Most of the default linters are based on the tidyverse style guide.

The set of default linters is as follows (any parameterized linters, e.g., `line_length_linter` use their default argument(s), see `?<linter_name>` for details):

Usage

default_linters

Format

An object of class `list` of length 25.

Linters

The following linters are tagged with 'default':

- `assignment_linter`
- `brace_linter`
- `commas_linter`
- `commented_code_linter`
- `cyclocomp_linter`
- `equals_na_linter`
- `function_left_parentheses_linter`
- `indentation_linter`
- `infix_spaces_linter`
- `line_length_linter`
- `object_length_linter`
- `object_name_linter`
See Also

linters for a complete list of linters available in lintr.

---

<table>
<thead>
<tr>
<th>default_settings</th>
<th>Default lintr settings</th>
</tr>
</thead>
</table>

**Description**

The default settings consist of

- linters: a list of default linters (see default_linters())
- encoding: the character encoding assumed for the file
- exclude: pattern used to exclude a line of code
- exclude_start, exclude_end: patterns used to mark start and end of the code block to exclude
- exclude_linter, exclude_linter_sep: patterns used to exclude linters
- exclusions: a list of files to exclude
- cache_directory: location of cache directory
- comment_token: a GitHub token character
- comment_bot: decides if lintr comment bot on GitHub can comment on commits
- error_on_lint: decides if error should be produced when any lints are found

**Usage**

default_settings

**Format**

An object of class list of length 12.
See Also

read_settings(), default_linters

Examples

# available settings
names(default_settings)

# linters included by default
names(default_settings$linters)

# default values for a few of the other settings
default_settings[<c(  
  "encoding",
  "exclude",
  "exclude_start",
  "exclude_end",
  "exclude_linter",
  "exclude_linter_sep",
  "exclusions",
  "error_on_lint"
)]

---

deprecated_linters

Description

Linters that are deprecated and provided for backwards compatibility only. These linters will be excluded from linters_with_tags() by default.

Linters

The following linters are tagged with 'deprecated':

- closed_curly_linter
- consecutive_stopifnot_linter
- no_tab_linter
- open_curly_linter
- paren_brace_linter
-semicolon_terminator_linter
- single_quotes_linter
- unneeded_concatenation_linter

See Also

linters for a complete list of linters available in lintr.
**duplicate_argument_linter**

*Duplicate argument linter*

**Description**

Check for duplicate arguments in function calls. Some cases are run-time errors (e.g. `mean(x = 1:5, x = 2:3)`), otherwise this linter is used to discourage explicitly providing duplicate names to objects (e.g. `c(a = 1, a = 2)`). Duplicate-named objects are hard to work with programmatically and should typically be avoided.

**Usage**

```r
duplicate_argument_linter(except = c("mutate", "transmute"))
```

**Arguments**

- `except` A character vector of function names as exceptions. Defaults to functions that allow sequential updates to variables, currently `dplyr::mutate()` and `dplyr::transmute()`.

**Tags**

- common_mistakes, configurable, correctness

**See Also**

- `linters` for a complete list of linters available in lintr.

**Examples**

```r
# will produce lints
lint(
  text = "list(x = 1, x = 2)",
  linters = duplicate_argument_linter()
)

lint(
  text = "fun(arg = 1, arg = 2)",
  linters = duplicate_argument_linter()
)

# okay
lint(
  text = "list(x = 1, x = 2)",
  linters = duplicate_argument_linter(except = "list")
)

lint(
  text = "df %>% dplyr::mutate(x = a + b, x = x + d)",
  linters = duplicate_argument_linter()
)
```
Efficiency linters

Description

Linters highlighting code efficiency problems, such as unnecessary function calls.

Linters

The following linters are tagged with `efficiency`:

- `any_duplicated_linter`
- `any_is_na_linter`
- `boolean_arithmetic_linter`
- `fixed_regex_linter`
- `ifelse_censor_linter`
- `inner_combine_linter`
- `lengths_linter`
- `literal_coercion_linter`
- `matrix_apply_linter`
- `nested_ifelse_linter`
- `outer_negation_linter`
- `redundant_equals_linter`
- `redundant_ifelse_linter`
- `regex_subset_linter`
- `routine_registration_linter`
- `seq_linter`
- `sort_linter`
- `string_boundary_linter`
- `undesirable_function_linter`
- `undesirable_operator_linter`
- `unnecessary_concatenation_linter`
- `unnecessary_lambda_linter`
- `vector_logic_linter`

See Also

`linters` for a complete list of linters available in lintr.
empty_assignment_linter

Block assignment of {}

Description

Assignment of {} is the same as assignment of NULL; use the latter for clarity. Closely related: unnecessary_concatenation_linter().

Usage

empty_assignment_linter()

Tags

best_practices, readability

See Also

linters for a complete list of linters available in lintr.

Examples

# will produce lints
lint(
  text = "x <- {}",
  linters = empty_assignment_linter()
)

writeLines("x = {
")
lint(
  text = "x = {
",  
  linters = empty_assignment_linter()
)

# okay
lint(
  text = "x <- { 3 + 4 }",
  linters = empty_assignment_linter()
)

lint(
  text = "x <- NULL",
  linters = empty_assignment_linter()
)
equals_na_linter  

Equality check with NA linter

Description

Check for `x == NA` and `x != NA`. Such usage is almost surely incorrect – checks for missing values should be done with `is.na()`.

Usage

```r
equals_na_linter()
```

Tags

- common_mistakes
- correctness
- default
- robustness

See Also

- `linters` for a complete list of linters available in lintr.

Examples

```r
# will produce lints
lint(
  text = "x == NA",
  linters = equals_na_linter()
)
lint(
  text = "x != NA",
  linters = equals_na_linter()
)

# okay
lint(
  text = "is.na(x)",
  linters = equals_na_linter()
)
lint(
  text = "!is.na(x)",
  linters = equals_na_linter()
)
```
exclude  Exclude lines or files from linting

Description
Exclude lines or files from linting

Usage
exclude(lints, exclusions = settings$exclusions, linter_names = NULL, ...)

Arguments

- **lints**: that need to be filtered.
- **exclusions**: manually specified exclusions
- **linter_names**: character vector of names of the active linters, used for parsing inline exclusions.
- **...**: additional arguments passed to `parse_exclusions()`

Details
Exclusions can be specified in three different ways.

1. single line in the source file. default: `# nolint`, possibly followed by a listing of linters to exclude. If the listing is missing, all linters are excluded on that line. The default listing format is `# nolint: linter_name, linter2_name`. There may not be anything between the colon and the line exclusion tag and the listing must be terminated with a full stop (.) for the linter list to be respected.
2. line range in the source file. default: `# nolint start`, `# nolint end`. `# nolint start` accepts linter lists in the same form as `# nolint`.
3. exclusions parameter, a named list of files with named lists of linters and lines to exclude them on, a named list of the files and lines to exclude, or just the filenames if you want to exclude the entire file, or the directory names if you want to exclude all files in a directory.

executing_linters  Code executing linters

Description
Linters that evaluate parts of the linted code, such as loading referenced packages. These linters should not be used with untrusted code, and may need dependencies of the linted package or project to be available in order to function correctly.

Linters
The following linters are tagged with `executing`:

- `namespace_linter`
- `object_length_linter`
- `object_name_linter`
- `object_usage_linter`
- `unused_import_linter`
See Also

`linters` for a complete list of linters available in lintr.

---

**expect_comparison_linter**

*Require usage of `expect_gt(x, y)` over `expect_true(x > y)` (and similar)*

---

**Description**

`testthat::expect_gt()`, `testthat::expect_gte()`, `testthat::expect_lt()`, `testthat::expect_lte()`, and `testthat::expect_equal()` exist specifically for testing comparisons between two objects. `testthat::expect_true()` can also be used for such tests, but it is better to use the tailored function instead.

**Usage**

```r
expect_comparison_linter()
```

**Tags**

`best_practices`, `package_development`

See Also

`linters` for a complete list of linters available in lintr.

**Examples**

```r
# will produce lints
lint(
  text = "expect_true(x > y)",
  linters = expect_comparison_linter()
)

lint(
  text = "expect_true(x <= y)",
  linters = expect_comparison_linter()
)

lint(
  text = "expect_true(x == (y == 2))",
  linters = expect_comparison_linter()
)

# okay
lint(
  text = "expect_gt(x, y)",
  linters = expect_comparison_linter()
)

lint(
  text = "expect_lte(x, y)",
  linters = expect_comparison_linter()
)
```
expect_identical_linter

Require usage of expect_identical(x, y) where appropriate

Description

This linter enforces the usage of `testthat::expect_identical()` as the default expectation for comparisons in a testthat suite. `expect_true(identical(x, y))` is an equivalent but unadvised method of the same test. Further, `testthat::expect_equal()` should only be used when `expect_identical()` is inappropriate, i.e., when x and y need only be numerically equivalent instead of fully identical (in which case, provide the `tolerance` argument to `expect_equal()` explicitly). This also applies when it's inconvenient to check full equality (e.g., names can be ignored, in which case `ignore_attr = "names"` should be supplied to `expect_equal()` (or, for 2nd edition, `check.attributes = FALSE`).

Usage

`expect_identical_linter()`

Exceptions

The linter allows `expect_equal()` in three circumstances:

1. A named argument is set (e.g. `ignore_attr` or `tolerance`)
2. Comparison is made to an explicit decimal, e.g. `expect_equal(x, 1.0)` (implicitly setting `tolerance`)
3. ... is passed (wrapper functions which might set arguments such as `ignore_attr` or `tolerance`)

Tags

`package_development`

See Also

`linters` for a complete list of linters available in lintr.
expect_length_linter

Examples

# will produce lints
lint(
  text = "expect_equal(x, y)",
  linters = expect_identical_linter()
)

lint(
  text = "expect_true(identical(x, y))",
  linters = expect_identical_linter()
)

# okay
lint(
  text = "expect_identical(x, y)",
  linters = expect_identical_linter()
)

lint(
  text = "expect_equal(x, y, check.attributes = FALSE)",
  linters = expect_identical_linter()
)

lint(
  text = "expect_equal(x, y, tolerance = 1e-6)",
  linters = expect_identical_linter()
)

expect_length_linter

Require usage of expect_length(x, n) over expect_equal(length(x), n)

Description

\[\text{\texttt{testthat::expect_length()}\texttt{\textbackslash ;} exists specifically for testing the length() of an object. }\text{\texttt{testthat::expect_equal()}\texttt{\textbackslash ; can also be used for such tests, but it is better to use the tailored function instead.}}\]

Usage

expect_length_linter()

Tags

best_practices, package_development, readability

See Also

lintr for a complete list of linters available in lintr.
**Example**

```r
# will produce lints
lint(
  text = "expect_equal(length(x), 2L)",
  linters = expect_length_linter()
)

# okay
lint(
  text = "expect_length(x, 2L)",
  linters = expect_length_linter()
)
```

---

### expect_lint

**Lint expectation**

#### Description

This is an expectation function to test that the lints produced by `lint` satisfy a number of checks.

#### Usage

```r
expect_lint(content, checks, ..., file = NULL, language = "en")
```

#### Arguments

- **content**: a character vector for the file content to be linted, each vector element representing a line of text.
- **checks**: checks to be performed:
  - `NULL`: check that no lints are returned.
  - **single string or regex object**: check that the single lint returned has a matching message.
  - **named list**: check that the single lint returned has fields that match. Accepted fields are the same as those taken by `Lint()`.
  - **list of named lists**: for each of the multiple lints returned, check that it matches the checks in the corresponding named list (as described in the point above).
  
  Named vectors are also accepted instead of named lists, but this is a compatibility feature that is not recommended for new code.

- **...**: arguments passed to `lint()`, e.g. the linters or cache to use.
- **file**: if not `NULL`, read content from the specified file rather than from `content`.
- **language**: temporarily override Rs `LANGUAGE` envvar, controlling localization of base R error messages. This makes testing them reproducible on all systems irrespective of their native R language setting.

#### Value

`NULL`, invisibly.
Examples

# no expected lint
expect_lint("a", NULL, trailing_blank_lines_linter())

# one expected lint
expect_lint("a\n", "superfluous", trailing_blank_lines_linter())
expect_lint("a\n", list(message = "superfluous", line_number = 2), trailing_blank_lines_linter())

# several expected lints
expect_lint("a\n\n", list("superfluous", "superfluous"), trailing_blank_lines_linter())
expect_lint("a\n\n", list(list(message = "superfluous", line_number = 2), list(message = "superfluous", line_number = 3)), trailing_blank_lines_linter())

expect_lint_free

Test that the package is lint free

Description

This function is a thin wrapper around lint_package that simply tests there are no lints in the package. It can be used to ensure that your tests fail if the package contains lints.

Usage

expect_lint_free(...)

Arguments

... arguments passed to lint_package()

expect_named_linter

Require usage of expect_named(x, n) over expect_equal(names(x), n)

Description

testthat::expect_named() exists specifically for testing the names() of an object. testthat::expect_equal() can also be used for such tests, but it is better to use the tailored function instead.

Usage

expect_named_linter()

Tags

best_practices, package_development, readability
See Also

`linters` for a complete list of linters available in lintr.

Examples

```r
# will produce lints
lint(
  text = 'expect_equal(names(x), "a")',
  linters = expect_named_linter()
)

# okay
lint(
  text = 'expect_named(x, "a")',
  linters = expect_named_linter()
)

lint(
  text = 'expect_equal(colnames(x), "a")',
  linters = expect_named_linter()
)

lint(
  text = 'expect_equal(dimnames(x), "a")',
  linters = expect_named_linter()
)
```

Description

`testthat::expect_false()` exists specifically for testing that an output is FALSE. `testthat::expect_true()` can also be used for such tests by negating the output, but it is better to use the tailored function instead. The reverse is also true – use `expect_false(A)` instead of `expect_true(!A)`.

Usage

`expect_not_linter()`

Tags

`best_practices, package_development, readability`

expect_null_linter

Examples

# will produce lints
lint(
    text = "expect_true(!x)",
    linters = expect_not_linter()
)

# okay
lint(
    text = "expect_false(x)",
    linters = expect_not_linter()
)

require(expect_null)

Description

Require usage of expect_null(x) over expect_equal(x, NULL) and similar usages.

Usage

expect_null_linter()

Details

testthat::expect_null() exists specifically for testing for NULL objects. testthat::expect_equal(), testthat::expect_identical(), and testthat::expect_true() can also be used for such tests, but it is better to use the tailored function instead.

Tags

best_practices, package_development

See Also

linters for a complete list of linters available in lintr.

Examples

# will produce lints
lint(
    text = "expect_equal(x, NULL)",
    linters = expect_null_linter()
)

lint(
    text = "expect_identical(x, NULL)",
    linters = expect_null_linter()
)

lint("
require(testthat, quietly = TRUE)

testthat::expect_s3_class() exists specifically for testing the class of S3 objects. testthat::expect_equal(), testthat::expect_identical(), and testthat::expect_true() can also be used for such tests, but it is better to use the tailored function instead.

Usage

expect_s3_class_linter()

Tags

best_practices, package_development

See Also

• linters for a complete list of linters available in lintr.

Examples

# will produce lints
lint(

)

lint(
  text = ‘expect_equal(class(x), “numeric”),
  linters = expect_s3_class_linter()
)

# okay
lint(
  text = ‘expect_s3_class(x, “data.frame”),
  linters = expect_s3_class_linter()
)
lint(
    text = 'expect_type(x, "double")',
    linters = expect_s3_class_linter()
)

expect_s4_class_linter

Require usage of `expect_s4_class(x, k)` over `expect_true(is(x, k))`

Description

`testthat::expect_s4_class()` exists specifically for testing the class of S4 objects. `testthat::expect_true()` can also be used for such tests, but it is better to use the tailored function instead.

Usage

`expect_s4_class_linter()`

Tags

`best_practices`, `package_development`

See Also

- linters for a complete list of linters available in lintr.
- `expect_s3_class_linter()`

Examples

```r
# will produce lints
lint(
    text = 'expect_true(is(x, "Matrix"))',
    linters = expect_s4_class_linter()
)

# okay
lint(
    text = 'expect_s4_class(x, "Matrix")',
    linters = expect_s4_class_linter()
)
```
Description

testthat::expect_true() and testthat::expect_false() exist specifically for testing the TRUE/FALSE value of an object. testthat::expect_equal() and testthat::expect_identical() can also be used for such tests, but it is better to use the tailored function instead.

Usage

expect_true_false_linter()

Tags

best_practices, package_development, readability

  text = 'expect_identical(typeof(x), "double")',
  linters = expect_type_linter()
)

# okay
lint(
  text = 'expect_type(x, "double")',
  linters = expect_type_linter()
)
```

---

**extraction_operator_linter**

*Extraction operator linter*

Description

Check that the `[]` operator is used when extracting a single element from an object, not `[]` (subsetting) nor `$` (interactive use).
extraction_operator_linter

Usage

extraction_operator_linter()

Details

There are three subsetting operators in R ([[], [ and $) and they interact differently with different data structures (atomic vector, list, data frame, etc.).

Here are a few reasons to prefer the [[ operator over [ or $ when you want to extract an element from a data frame or a list:

• Subsetting a list with [ always returns a smaller list, while [[ returns the list element.
• Subsetting a named atomic vector with [ returns a named vector, while [[ returns the vector element.
• Subsetting a data frame (but not tibble) with [ is type unstable; it can return a vector or a data frame. [[, on the other hand, always returns a vector.
• For a data frame (but not tibble), $ does partial matching (e.g. df$a will subset df$abc), which can be a source of bugs. [[ doesn’t do partial matching.

For data frames (and tibbles), irrespective of the size, the [[ operator is slower than $. For lists, however, the reverse is true.

linters for a complete list of linters available in lintr.

Examples

# will produce lints
lint(
  text = 'iris["Species"]',
  linters = extraction_operator_linter()
)

lint(
  text = "iris$Species",
  linters = extraction_operator_linter()
)

# okay
lint(
  text = 'iris[["Species"]]',
  linters = extraction_operator_linter()
)
fixed_regex_linter

Description

Invoking a regular expression engine is overkill for cases when the search pattern only involves static patterns.

Usage

fixed_regex_linter()

Details

NB: for stringr functions, that means wrapping the pattern in stringr::fixed().
NB: this linter is likely not able to distinguish every possible case when a fixed regular expression is preferable, rather it seeks to identify likely cases. It should never report false positives, however; please report false positives as an error.

best_practices, efficiency, readability

See Also

linters for a complete list of linters available in lintr.

Examples

# will produce lints
code_lines <- 'gsub("\\\.", ",", x)'
writelnLines(code_lines)
lint(
  text = code_lines,
  linters = fixed_regex_linter()
)

tlint(
  text = 'grepl("a[x]b", x)',
  linters = fixed_regex_linter()
)

code_lines <- 'stringr::str_subset(x, "\\\$")'
writelnLines(code_lines)
lint(
  text = code_lines,
  linters = fixed_regex_linter()
)

tlint(
  text = 'grepl("Munich", address)',
  linters = fixed_regex_linter()
for_loop_index_linter

Block usage of for loops directly overwriting the indexing variable

Description

for (x in x) is a poor choice of indexing variable. This overwrites x in the calling scope and is confusing to read.

Usage

for_loop_index_linter()

Tags

best_practices, readability, robustness

See Also

linters for a complete list of linters available in lintr.

Examples

# will produce lints
lint(
  text = "for (x in x) { TRUE }",
  linters = for_loop_index_linter()
)
function_argument_linter

Function argument linter

Description

Check that arguments with defaults come last in all function declarations, as per the tidyverse design guide.

Changing the argument order can be a breaking change. An alternative to changing the argument order is to instead set the default for such arguments to NULL.

Usage

function_argument_linter()

Tags

best_practices, consistency, style

See Also

- linters for a complete list of linters available in lintr.

Examples

# will produce lints
lint(
    text = "function(y = 1, z = 2, x) {}",
    linters = function_argument_linter()
)

lint(
    text = "function(x, y, z = 1, ..., w) {}",
    linters = function_argument_linter()
)
# okay
lint(
  text = "function(x, y = 1, z = 2) {}",
  linters = function_argument_linter()
)

lint(
  text = "function(x, y, w, z = 1, ...) {}",
  linters = function_argument_linter()
)

lint(
  text = "function(y = 1, z = 2, x = NULL) {}",
  linters = function_argument_linter()
)

lint(
  text = "function(x, y, z = 1, ..., w = NULL) {}",
  linters = function_argument_linter()
)

---

**function_left_parentheses_linter**

*Function left parentheses linter*

**Description**

Check that all left parentheses in a function call do not have spaces before them (e.g. `mean (1:3)`). Although this is syntactically valid, it makes the code difficult to read.

**Usage**

`function_left_parentheses_linter()`

**Details**

Exceptions are made for control flow functions (`if`, `for`, etc.).

**Tags**

default, readability, style

**See Also**

- [lintr](https://style.tidyverse.org/syntax.html#parentheses)
- `spaces_left_parentheses_linter()`
Examples

# will produce lints
lint(
  text = "mean (x)",
  linters = function_left_parentheses_linter()
)

lint(
  text = "stats::sd(c (x, y, z))",
  linters = function_left_parentheses_linter()
)

# okay
lint(
  text = "mean(x)",
  linters = function_left_parentheses_linter()
)

lint(
  text = "stats::sd(c(x, y, z))",
  linters = function_left_parentheses_linter()
)

lint(
  text = "foo <- function(x) (x + 1)",
  linters = function_left_parentheses_linter()
)

---

**function_return_linter**

*Lint common mistakes/style issues cropping up from return statements*

**Description**

`return(x <- ...)` is either distracting (because `x` is ignored), or confusing (because assigning to `x` has some side effect that is muddled by the dual-purpose expression).

**Usage**

`function_return_linter()`

**Tags**

`best_practices, readability`

**See Also**

`linters` for a complete list of linters available in lintr.
Examples

# will produce lints
lint(
  text = "foo <- function(x) return(y <- x + 1)",
  linters = function_return_linter()
)

lint(
  text = "foo <- function(x) return(x <<- x + 1)",
  linters = function_return_linter()
)

writeLines("e <- new.env() \nfoo <- function(x) return(e$val <- x + 1)"
lint(
  text = "e <- new.env() \nfoo <- function(x) return(e$val <- x + 1)",
  linters = function_return_linter()
)

# okay
lint(
  text = "foo <- function(x) return(x + 1)",
  linters = function_return_linter()
)

code_lines <- "
foo <- function(x) {
  x <<- x + 1
  return(x)
}
"
lint(
  text = code_lines,
  linters = function_return_linter()
)

code_lines <- "
e <- new.env()
foo <- function(x) {
  e$val <- x + 1
  return(e$val)
}
"
writeLines(code_lines)
lint(
  text = code_lines,
  linters = function_return_linter()
)
Description

Convert STR_CONST text() values into R strings. This is useful to account for arbitrary character literals valid since R 4.0, e.g. `R"------[hello]------"`, which is parsed in R as "hello". It is quite cumbersome to write XPaths allowing for strings like this, so whenever your linter logic requires testing a STR_CONST node’s value, use this function. NB: this is also properly vectorized on s, and accepts a variety of inputs. Empty inputs will become NA outputs, which helps ensure that length(get_r_string(s)) == length(s).

Usage

get_r_string(s, xpath = NULL)

Arguments

s An input string or strings. If s is an xml_node or xml_nodeset and xpath is NULL, extract its string value with `xml2::xml_text()`. If s is an xml_node or xml_nodeset and xpath is specified, it is extracted with `xml2::xml_find_chr()`.

xpath An XPath, passed on to `xml2::xml_find_chr()` after wrapping with `string()`.

Examples

tmp <- withr::local_tempfile(lines = "c('a', 'b')")
expr_as_xml <- get_source_expressions(tmp)$expressions[[1L]]$xml_parsed_content
writelines(as.character(expr_as_xml))
get_r_string(expr_as_xml, "expr[2]") # "a"
get_r_string(expr_as_xml, "expr[3]") # "b"

# more importantly, extract strings under R>=4 raw strings

tmp4.0 <- withr::local_tempfile(lines = "c(R'(a\b)', R'--[a\"\'\"\b]--')")
expr_as_xml4.0 <- get_source_expressions(tmp4.0)$expressions[[1L]]$xml_parsed_content
writelines(as.character(expr_as_xml4.0))
get_r_string(expr_as_xml4.0, "expr[2]") # "a\b"
get_r_string(expr_as_xml4.0, "expr[3]") # "a\"\'\"\b"

get_source_expressions

Parsed sourced file from a filename

Description

This object is given as input to each linter.

Usage

get_source_expressions(filename, lines = NULL)

Arguments

filename the file to be parsed.
lines a character vector of lines. If NULL, then filename will be read.
Details

The file is read using the encoding setting. This setting is found by taking the first valid result from the following locations

1. The encoding key from the usual lintr configuration settings.
2. The Encoding field from a Package DESCRIPTION file in a parent directory.
3. The Encoding field from an R Project .Rproj file in a parent directory.
4. "UTF-8" as a fallback.

Value

A list with three components:

expressions a list of n+1 objects. The first n elements correspond to each expression in filename, and consist of a list of 9 elements:

• filename (character)
• line (integer) the line in filename where this expression begins
• column (integer) the column in filename where this expression begins
• lines (named character) vector of all lines spanned by this expression, named with the line number corresponding to filename
• parsed_content (data.frame) as given by utils::getParseData() for this expression
• xml_parsed_content (xml_document) the XML parse tree of this expression as given by xmlparsedata::xml_parse_data()
• content (character) the same as lines as a single string (not split across lines)
• (Deprecated) find_line (function) a function for returning lines in this expression
• (Deprecated) find_column (function) a similar function for columns

The final element of expressions is a list corresponding to the full file consisting of 6 elements:

• filename (character)
• file_lines (character) the readLines() output for this file
• content (character) for .R files, the same as file_lines; for .Rmd or .qmd scripts, this is the extracted R source code (as text)
• full_parsed_content (data.frame) as given by utils::getParseData() for the full content
• full_xml_parsed_content (xml_document) the XML parse tree of all expressions as given by xmlparsedata::xml_parse_data()
• terminal_newline (logical) records whether filename has a terminal newline (as determined by readLines() producing a corresponding warning)

error A Lint object describing any parsing error.

lines The readLines() output for this file.

Examples

```r
tmp <- withr::local_tempfile(lines = c(“x <- 1”, ”y <- x + 1”))
get_source_expressions(tmp)
```
Description

Gets the source IDs (row indices) corresponding to given token.

Usage

```r
ids_with_token(source_expression, value, fun = `==`, source_file = NULL)

with_id(source_expression, id, source_file)
```

Arguments

- **source_expression**: A list of source expressions, the result of a call to `get_source_expressions()`, for the desired filename.
- **value**: Character. String corresponding to the token to search for. For example:
  - "SYMBOL"
  - "FUNCTION"
  - "EQ_FORMALS"
  - "$"
  - "(" 
- **fun**: For additional flexibility, a function to search for in the token column of parsed_content. Typically `==` or `%in%`.
- **source_file**: (DEPRECATED) Same as `source_expression`. Will be removed.
- **id**: Integer. The index corresponding to the desired row of parsed_content.

Value

- **ids_with_token**: The indices of the parsed_content data frame entry of the list of source expressions. Indices correspond to the rows where `fun` evaluates to `TRUE` for the `value` in the `token` column.
- **with_id**: A data frame corresponding to the row(s) specified in `id`.

Functions

- **with_id()**: Return the row of the parsed_content entry of the `get_source_expressions()` object. Typically used in conjunction with `ids_with_token` to iterate over rows containing desired tokens.

Examples

```r
tmp <- withr::local_tempfile(lines = c("x <- 1", "y <- x + 1"))
source_exprs <- get_source_expressions(tmp)
ids_with_token(source_exprs$expressions[[1L]], value = "SYMBOL")
with_id(source_exprs$expressions[[1L]], 2L)
```
ifelse_censor_linter

Block usage of ifelse() where pmin() or pmax() is more appropriate

Description

ifelse(x > M, M, x) is the same as pmin(x, M), but harder to read and requires several passes over the vector.

Usage

ifelse_censor_linter()

Details

The same goes for other similar ways to censor a vector, e.g. ifelse(x <= M, x, M) is pmin(x, M), ifelse(x < m, m, x) is pmax(x, m), and ifelse(x >= m, x, m) is pmax(x, m).

Tags

best_practices, efficiency

See Also

linters for a complete list of linters available in lintr.

Examples

# will produce lints
lint(
  text = "ifelse(5:1 < pi, 5:1, pi)",
  linters = ifelse_censor_linter()
)

lint(
  text = "ifelse(x > 0, x, 0)",
  linters = ifelse_censor_linter()
)

# okay
lint(
  text = "pmin(5:1, pi)",
  linters = ifelse_censor_linter()
)

lint(
  text = "pmax(x, 0)",
  linters = ifelse_censor_linter()
)
**implicit_assignment_linter**

Avoid implicit assignment in function calls

**Description**

Assigning inside function calls makes the code difficult to read, and should be avoided, except for functions that capture side-effects (e.g. `capture.output()`).

**Usage**

```r
implicit_assignment_linter(
  except = c("bquote", "expression", "expr", "quo", "quos", "quote")
)
```

**Arguments**

- **except** A character vector of functions to be excluded from linting.

**Tags**

- best_practices, configurable, readability, style

**See Also**

- [lintr](https://style.tidyverse.org/syntax.html#assignment)

**Examples**

```r
# will produce lints
lint(
  text = "if (x <- 1L) TRUE",
  linters = implicit_assignment_linter()
)

lint(
  text = "mean(x <- 1:4)",
  linters = implicit_assignment_linter()
)

# okay
writeLines("x <- 1L\nif (x) TRUE")
lint(
  text = "x <- 1L\nif (x) TRUE",
  linters = implicit_assignment_linter()
)

writeLines("x <- 1:4\nmean(x)"
)
lint(
  text = "x <- 1:4\nmean(x)",
  linters = implicit_assignment_linter()
)
```
**implicit_integer_linter**

*Implicit integer linter*

**Description**

Check that integers are explicitly typed using the form `1L` instead of `1`.

**Usage**

```r
implicit_integer_linter(allow_colon = FALSE)
```

**Arguments**

- `allow_colon` Logical, default `FALSE`. If `TRUE`, expressions involving `:` won’t throw a lint regardless of whether the inputs are implicitly integers.

**Tags**

`best_practices, configurable, consistency, style`

**See Also**

`linters` for a complete list of linters available in lintr.

**Examples**

```r
# will produce lints
lint(
  text = "x <- 1",
  linters = implicit_integer_linter()
)

# okay
lint(
  text = "x <- 1.0",
  linters = implicit_integer_linter()
)
```

```r
# okay
lint(
  text = "x <- 1L",
  linters = implicit_integer_linter()
)
```
lint(
    text = "x[2L]",
    linters = implicit_integer_linter()
)

lint(
    text = "1:10",
    linters = implicit_integer_linter(allow_colon = TRUE)
)

indentation_linter  

Check that indentation is consistent

Description

Check that indentation is consistent

Usage

indentation_linter(
    indent = 2L,
    hanging_indent_style = c("tidy", "always", "never"),
    assignment_as_infix = TRUE
)

Arguments

indent  Number of spaces, that a code block should be indented by relative to its parent code block. Used for multi-line code blocks (\{ ... \}), function calls (\( ... \)) and extractions ([ ... ], [[ ... ]]). Defaults to 2.

hanging_indent_style  Indentation style for multi-line function calls with arguments in their first line. Defaults to tidyverse style, i.e. a block indent is used if the function call terminates with ) on a separate line and a hanging indent if not. Note that function multi-line function calls without arguments on their first line will always be expected to have block-indented arguments. If hanging_indent_style is "tidy", multi-line function definitions are expected to be double-indented if the first line of the function definition contains no arguments and the closing parenthesis is not on its own line.

# complies to any style
map(
    x,
    f,
    additional_arg = 42
)

# complies to "tidy" and "never"
map(x, f,
    additional_arg = 42
)
# complies to "always"
map(x, f,
   additional_arg = 42
)

# complies to "tidy" and "always"
map(x, f,
   additional_arg = 42)

# complies to "never"
map(x, f,
   additional_arg = 42)

# complies to "tidy"
function(
   a,
   b) {
   # body
}

assignment_as_infix
Treat <- as a regular (i.e. left-associative) infix operator? This means, that infix operators on the right hand side of an assignment do not trigger a second level of indentation:

# complies to any style
variable <- a %+% b %+% c

# complies to assignment_as_infix = TRUE
variable <-
   a %+% b %+% c

# complies to assignment_as_infix = FALSE
variable <-
   a %+% b %+% c

lint(
  text = code_lines,
  linters = indentation_linter()
)

code_lines <- "if (TRUE) {
1 + 1
}"writeLines(code_lines)
lint(
  text = code_lines,
  linters = indentation_linter(indent = 4)
)
```

---

**infix_spaces_linter**  
Infix spaces linter

**Description**

Check that infix operators are surrounded by spaces. Enforces the corresponding Tidyverse style guide rule; see [https://style.tidyverse.org/syntax.html#infix-operators](https://style.tidyverse.org/syntax.html#infix-operators).
Usage

infix_spaces_linter(exclude_operators = NULL, allow_multiple_spaces = TRUE)

Arguments

exclude_operators
Character vector of operators to exclude from consideration for linting. Default is to include the following "low-precedence" operators: +, -, ~, >, >=, <, <=, ==, !=, &., &&, |., ||, <, :=, <<=, -=, ->, ->>, =, /, *, and any infix operator (exclude infixes by passing "%%"). Note that <-, :=, and <<- are included/excluded as a group (indicated by passing "<-"), as are -> and ->>(viz. "->"), and that = for assignment and for setting arguments in calls are treated the same.

allow_multiple_spaces
Logical, default TRUE. If FALSE, usage like x = 2 will also be linted; excluded by default because such usage can sometimes be used for better code alignment, as is allowed by the style guide.

Tags

)

lint(
  text = "1:4 %>%sum()",
  linters = infix_spaces_linter()
)

# okay
lint(
  text = "x <- 1L",
  linters = infix_spaces_linter()
)

lint(
  text = "1:4 %>% sum()",
  linters = infix_spaces_linter()
)

code_lines <- "
  ab <- 1L
  abcdef <- 2L
"
writeLines(code_lines)
inner_combine_linter

Description

as.Date(c(a, b)) is logically equivalent to c(as.Date(a), as.Date(b)). The same equivalence holds for several other vectorized functions like as.POSIXct() and math functions like sin(). The former is to be preferred so that the most expensive part of the operation (as.Date()) is applied only once.

Usage

inner_combine_linter()

Tags

consistency, efficiency, readability

See Also

linters for a complete list of linters available in lintr.

Examples

# will produce lints
lint(
  text = "c(log10(x), log10(y), log10(z))",
  linters = inner_combine_linter()
)

# okay
lint(
  text = "log10(c(x, y, z))",
  linters = inner_combine_linter()
)

lint(
  text = "c(log(x, base = 10), log10(x, base = 2))",
  linters = inner_combine_linter()
)
is_lint_level

Is this an expression- or a file-level source object?

Description
Helper for determining whether the current source_expression contains all expressions in the current file, or just a single expression.

Usage
is_lint_level(source_expression, level = c("expression", "file"))

Arguments
source_expression
A parsed expression object, i.e., an element of the object returned by get_source_expressions().
level
Which level of expression is being tested? "expression" means an individual expression, while "file" means all expressions in the current file are available.

Examples
tmp <- withr::local_tempfile(lines = c("x <- 1", "y <- x + 1"))
source_exprs <- get_source_expressions(tmp)
is_lint_level(source_exprs$expressions[[1L]], level = "expression")
is_lint_level(source_exprs$expressions[[1L]], level = "file")
is_lint_level(source_exprs$expressions[[3L]], level = "expression")
is_lint_level(source_exprs$expressions[[3L]], level = "file")

is_numeric_linter
Redirect is.numeric(x) || is.integer(x) to just use is.numeric(x)

Description
is.numeric() returns TRUE when typeof(x) is double or integer – testing is.numeric(x) || is.integer(x) is thus redundant.

Usage
is_numeric_linter()

Details
NB: This linter plays well with class_equals_linter(), which can help avoid further is.numeric() equivalents like any(class(x) == c("numeric", "integer")).

Tags
best_practices, consistency, readability
See Also

`linters` for a complete list of linters available in lintr.

Examples

```r
# will produce lints
lint(
  text = "is.numeric(y) || is.integer(y)",
  linters = is_numeric_linter()
)

lint(
  text = 'class(z) %in% c("numeric", "integer")',
  linters = is_numeric_linter()
)

# okay
lint(
  text = "is.numeric(y) || is.factor(y)",
  linters = is_numeric_linter()
)

lint(
  text = 'class(z) %in% c("numeric", "integer", "factor")',
  linters = is_numeric_linter()
)
```

---

`lengths_linter`  
*Require usage of `lengths()` where possible*

Description

`lengths()` is a function that was added to base R in version 3.2.0 to get the length of each element of a list. It is equivalent to `sapply(x, length)`, but faster and more readable.

Usage

`lengths_linter()`

Tags

`best_practices`, `efficiency`, `readability`

See Also

`linters` for a complete list of linters available in lintr.
Examples

```r
# will produce lints
lint(
  text = "sapply(x, length)",
  linters = lengths_linter()
)

lint(
  text = "vapply(x, length, integer(1L))",
  linters = lengths_linter()
)

lint(
  text = "purrr::map_int(x, length)",
  linters = lengths_linter()
)

# okay
lint(
  text = "lengths(x)",
  linters = lengths_linter()
)
```

Description

Check that the line length of both comments and code is less than `length`.

Usage

```r
line_length_linter(length = 80L)
```

Arguments

- `length`: maximum line length allowed. Default is 80L (Hollerith limit).

Tags

- configurable, default, readability, style

See Also

- `lintr` for a complete list of linters available in lintr.
- `https://style.tidyverse.org/syntax.html#long-lines`
Examples

```r
# will produce lints
lint(
  text = strrep("x", 23L),
  linters = line_length_linter(length = 20L)
)

# okay
lint(
  text = strrep("x", 21L),
  linters = line_length_linter(length = 40L)
)
```

lint

Lint a file, directory, or package

Description

- `lint()` lints a single file.
- `lint_dir()` lints all files in a directory.
- `lint_package()` lints all likely locations for R files in a package, i.e. `R/`, `tests/`, `inst/`, `vignettes/`, `data-raw/`, `demo/`, and `exec/`.

Usage

```r
lint(
  filename,
  linters = NULL,
  ..., 
  cache = FALSE,
  parse_settings = TRUE,
  text = NULL
)
```

```r
lint_dir(
  path = ".",
  ..., 
  relative_path = TRUE,
  exclusions = list("renv", "packrat"),
  pattern = rex::rex(". ", one_of("Rr"), or("", "html", "md", "nw", "rst", "tex", "txt"),
  end),
  parse_settings = TRUE
)
```

```r
lint_package(
  path = ".",
  ..., 
  relative_path = TRUE,
  exclusions = list("R/RcppExports.R"),
  parse_settings = TRUE
)
```
Arguments

filename  either the filename for a file to lint, or a character string of inline R code for linting. The latter (inline data) applies whenever filename has a newline character (\n).

linters  a named list of linter functions to apply. See linters for a full list of default and available linters.

...  Provide additional arguments to be passed to:

• exclude() (in case of lint(); e.g. lints or exclusions)
• lint() (in case of lint_dir() and lint_package(); e.g. linters or cache)

cache  given a logical, toggle caching of lint results. If passed a character string, store the cache in this directory.

parse_settings  whether to try and parse the settings.

text  Optional argument for supplying a string or lines directly, e.g. if the file is already in memory or linting is being done ad hoc.

path  For the base directory of the project (for lint_dir()) or package (for lint_package()).

relative_path  if TRUE, file paths are printed using their path relative to the base directory. If FALSE, use the full absolute path.

exclusions  exclusions for exclude(), relative to the package path.

Details

Read vignette("lintr") to learn how to configure which linters are run by default. Note that if files contain unparsable encoding problems, only the encoding problem will be linted to avoid unintelligible error messages from other linters.

Value

An object of class c("lints", "list"), each element of which is a "list" object.

Examples

f <- withr::local_tempfile(lines = "a=1", fileext = "R")
lint(f)  # linting a file
lint("a = 123\n")  # linting inline-code
lint(text = "a = 123")  # linting inline-code

if (FALSE) {
  lint_dir()
  lint_dir(
    linters = list(semicolon_linter()),
    exclusions = list(
      "inst/doc/creating_linters.R" = 1,
      "inst/example/bad.R",
      "renv"
    )
  )
}

if (FALSE) {
    lint_package()

    lint_package(
        linters = linters_with_defaults(semicolon_linter = semicolon_linter()),
        exclusions = list("inst/doc/creating_linters.R" = 1, "inst/example/bad.R")
    )
}

---

## lint-s3

Create a lint object

### Description

Create a lint object

### Usage

```r
Lint(
    filename,
    line_number = 1L, # line number where the lint occurred.
    column_number = 1L,
    type = c("style", "warning", "error"),
    message = "",
    line = "",
    ranges = NULL,
    linter = ""
)
```

### Arguments

- `filename`: path to the source file that was linted.
- `line_number`: line number where the lint occurred.
- `column_number`: column number where the lint occurred.
- `type`: type of lint.
- `message`: message used to describe the lint error
- `line`: code source where the lint occurred
- `ranges`: a list of ranges on the line that should be emphasized.
- `linter`: deprecated. No longer used.

### Value

an object of class `c("lint", "list")`. 
Create a linter closure

Usage

```r
Linter(fun, name = linter_auto_name())
```

Arguments

- **fun**: A function that takes a source file and returns lint objects.
- **name**: Default name of the Linter. Lints produced by the linter will be labelled with name by default.

Value

The same function with its class set to 'linter'.

Available linters

A variety of linters are available in lintr. The most popular ones are readily accessible through `default_linters()`. Within a `lint()` function call, the linters in use are initialized with the provided arguments and fed with the source file (provided by `get_source_expressions()`).

A data frame of all available linters can be retrieved using `available_linters()`. Documentation for linters is structured into tags to allow for easier discovery; see also `available_tags()`.

---

**linters_with_defaults**  
*Create a linter configuration based on defaults*

**Description**

Make a new list based on `lintr`’s default linters. The result of this function is meant to be passed to the `linters` argument of `lint()`, or to be put in your configuration file.

**Usage**

```r
linters_with_defaults(..., defaults = default_linters)
```

```r
with_defaults(..., default = default_linters)
```

**Arguments**

...  
Arguments of elements to change. If unnamed, the argument is automatically named. If the named argument already exists in the list of linters, it is replaced by the new element. If it does not exist, it is added. If the value is `NULL`, the linter is removed.

defaults, default

Default list of linters to modify. Must be named.

**See Also**

• **linters_with_tags** for basing off tags attached to linters, possibly across multiple packages.
• **all_linters** for basing off all available linters in `lintr`.
• **available_linters** to get a data frame of available linters.
• **linters** for a complete list of linters available in `lintr`.

---
Examples

# When using interactively you will usually pass the result onto `lint` or `lint_package()`
f <- withr::local_tempfile(lines = "my_slightly_long_variable_name <- 2.3", fileext = "R")
lint(f, linters = linters_with_defaults(line_length_linter = line_length_linter(120)))

# the default linter list with a different line length cutoff
my_linters <- linters_with_defaults(line_length_linter = line_length_linter(120))

# omit the argument name if you are just using different arguments
my_linters <- linters_with_defaults(defaults = my_linters, object_name_linter("camelCase"))

# remove assignment checks (with NULL), add absolute path checks
my_linters <- linters_with_defaults(
  defaults = my_linters,
  assignment_linter = NULL,
  absolute_path_linter()
)

# checking the included linters
names(my_linters)

linters_with_tags

Create a tag-based linter configuration

Description

Make a new list based on all linters provided by packages and tagged with tags. The result of this function is meant to be passed to the `linters` argument of `lint()`, or to be put in your configuration file.

Usage

linters_with_tags(tags, ..., packages = "lintr", exclude_tags = "deprecated")

Arguments

tags
Optional character vector of tags to search. Only linters with at least one matching tag will be returned. If `tags` is `NULL`, all linters will be returned. See `available_tags("lintr")` to find out what tags are already used by lintr.

... Arguments of elements to change. If unnamed, the argument is automatically named. If the named argument already exists in the list of linters, it is replaced by the new element. If it does not exist, it is added. If the value is `NULL`, the linter is removed.

packages
A character vector of packages to search for linters.

exclude_tags
Tags to exclude from the results. Linters with at least one matching tag will not be returned. If `exclude_tags` is `NULL`, no linters will be excluded. Note that `tags` takes priority, meaning that any tag found in both `tags` and `exclude_tags` will be included, not excluded.
A modified list of linters.

See Also

- `linters_with_defaults` for basing off lintr’s set of default linters.
- `all_linters` for basing off all available linters in lintr.
- `available_linters` to get a data frame of available linters.
- `linters` for a complete list of linters available in lintr.

Examples

```r
# `linters_with_defaults()` and `linters_with_tags("default")` are the same:
all.equal(linters_with_defaults(), linters_with_tags("default"))

# Get all linters useful for package development
linters <- linters_with_tags(tags = c("package_development", "style"))
names(linters)

# Get all linters tagged as "default" from lintr and mypkg
if (FALSE) {
  linters_with_tags("default", packages = c("lintr", "mypkg"))
}
```

---

### literal_coercion_linter

Require usage of correctly-typed literals over literal coercions

Description

as.integer(1) (or rlang::int(1)) is the same as 1L but the latter is more concise and gets typed correctly at compilation.

Usage

```r
literal_coercion_linter()
```

Details

The same applies to missing sentinels like NA – typically, it is not necessary to specify the storage type of NA, but when it is, prefer using the typed version (e.g. NA_real_) instead of a coercion (like as.numeric(NA)).

Tags

- best_practices, consistency, efficiency

See Also

- `linters` for a complete list of linters available in lintr.
matrix_apply_linter

Examples

# will produce lints
lint(
  text = "int()",
  linters = literal_coercion_linter()
)

lint(
  text = "as.character(NA)",
  linters = literal_coercion_linter()
)

lint(
  text = "rlang::lgl(1L)",
  linters = literal_coercion_linter()
)

# okay
lint(
  text = "1L",
  linters = literal_coercion_linter()
)

lint(
  text = "NA_character_",
  linters = literal_coercion_linter()
)

lint(
  text = "TRUE",
  linters = literal_coercion_linter()
)

Description

colSums() and rowSums() are clearer and more performant alternatives to apply(x, 2, sum) and apply(x, 1, sum) respectively in the case of 2D arrays, or matrices

Usage

matrix_apply_linter()

Tags

efficiency, readability

See Also

linters for a complete list of linters available in lintr.
Examples

# will produce lints
lint(
  text = "apply(x, 1, sum)",
  linters = matrix_apply_linter()
)
lint(
  text = "apply(x, 2, sum)",
  linters = matrix_apply_linter()
)
lint(
  text = "apply(x, 2, sum, na.rm = TRUE)",
  linters = matrix_apply_linter()
)
lint(
  text = "apply(x, 2:4, sum)",
  linters = matrix_apply_linter()
)

missing_argument_linter

Missing argument linter

Description

Check for missing arguments in function calls (e.g. stats::median(1:10, )).

Usage

missing_argument_linter(
  except = c("alist", "quote", "switch"),
  allow_trailing = FALSE
)

Arguments

except a character vector of function names as exceptions.
allow_trailing always allow trailing empty arguments?

Tags

common_mistakes, configurable, correctness

See Also

linters for a complete list of linters available in lintr.
Examples

# will produce lints
lint(
    text = 'tibble(x = "a", )',
    linters = missing_argument_linter()
)

# okay
lint(
    text = 'tibble(x = "a")',
    linters = missing_argument_linter()
)

lint(
    text = 'tibble(x = "a", )',
    linters = missing_argument_linter(except = "tibble")
)

lint(
    text = 'tibble(x = "a", )',
    linters = missing_argument_linter(allow_trailing = TRUE)
)

missing_package_linter

Missing package linter

Description

Check for missing packages in `library()`, `require()`, `loadNamespace()`, and `requireNamespace()` calls.

Usage

`missing_package_linter()`

Tags

`common_mistakes`, `robustness`

See Also

`linters` for a complete list of linters available in `lintr`.

Examples

# will produce lints
lint(
    text = "library(xyzxyz)",
    linters = missing_package_linter()
)
modify_defaults

Modify lintr defaults

Description

Modify a list of defaults by name, allowing for replacement, deletion and addition of new elements.

Usage

```r
modify_defaults(defaults, ...)```

Arguments

- `defaults` named list of elements to modify.
- `...` arguments of elements to change. If unnamed, the argument is automatically named. If the named argument already exists in `defaults`, it is replaced by the new element. If it does not exist, it is added. If the value is `NULL`, the element is removed.

Value

A modified list of elements, sorted by name. To achieve this sort in a platform-independent way, two transformations are applied to the names: (1) replace `_` with `0` and (2) convert `tolower()`.

See Also

- `lintr_with_defaults` for basing off lintr’s set of default linters.
- `all_linters` for basing off all available linters in lintr.
- `lintr_with_tags` for basing off tags attached to linters, possibly across multiple packages.
- `available_linters` to get a data frame of available linters.
- `lintr` for a complete list of linters available in lintr.

Examples

```r
# custom list of undesirable functions:
# remove `sapply` (using `NULL`)
# add `cat` (with an accompanying message),
# add `print` (unnamed, i.e. with no accompanying message)
# add `source` (as taken from `all_undesirable_functions`)
my_undesirable_functions <- modify_defaults(
  defaults = default_undesirable_functions,
  sapply = NULL, "cat" = "No cat allowed", "print", all_undesirable_functions[["source"]]
)

# list names of functions specified as undesirable
names(my_undesirable_functions)
```
namespace_linter

Namespace linter

Description

Check for missing packages and symbols in namespace calls. Note that using check_exports=TRUE or check_nonexports=TRUE will load packages used in user code so it could potentially change the global state.

Usage

namespace_linter(check_exports = TRUE, check_nonexports = TRUE)

Arguments

check_exports  Check if symbol is exported from namespace in namespace::symbol calls.
check_nonexports  Check if symbol exists in namespace in namespace:::symbol calls.

Tags

configurable, correctness, executing, robustness

See Also

linters for a complete list of linters available in lintr.

Examples

# will produce lints
lint(
  text = "xyzxyz::sd(c(1, 2, 3))",
  linters = namespace_linter()
)

lint(
  text = "stats::ssd(c(1, 2, 3))",
  linters = namespace_linter()
)

# okay
lint(
  text = "stats::sd(c(1, 2, 3))",
  linters = namespace_linter()
)

lint(
  text = "stats::ssd(c(1, 2, 3))",
  linters = namespace_linter(check_exports = FALSE)
)

lint(
  text = "stats::ssd(c(1, 2, 3))",
  linters = namespace_linter(check_nonexports = FALSE)
)
nested_ifelse_linter

Block usage of nested ifelse() calls

Description
Calling `ifelse()` in nested calls is problematic for two main reasons:

1. It can be hard to read – mapping the code to the expected output for such code can be a messy task/require a lot of mental bandwidth, especially for code that nests more than once
2. It is inefficient – `ifelse()` can evaluate all of its arguments at both yes and no (see https://stackoverflow.com/q/16275149); this issue is exacerbated for nested calls

Usage
`nested_ifelse_linter()`

Details
Users can instead rely on a more readable alternative modeled after SQL CASE WHEN statements, such as `data.table::fcase()` or `dplyr::case_when()`. or use a look-up-and-merge approach (build a mapping table between values and outputs and merge this to the input).

Tags
`efficiency, readability`

See Also
`linters` for a complete list of linters available in lintr.

Examples
```
# will produce lints
lint(  
  text = 'ifelse(x == "a", 1L, ifelse(x == "b", 2L, 3L))',  
  linters = nested_ifelse_linter()  
)

# okay
lint(  
  text = 'dplyr::case_when(x == "a" ~ 1L, x == "b" ~ 2L, TRUE ~ 3L)',  
  linters = nested_ifelse_linter()  
)
lint(  
  text = 'data.table::fcase(x == "a", 1L, x == "b", 2L, default = 3L)',  
  linters = nested_ifelse_linter()  
)
```
**nonportable_path_linter**

*Non-portable path linter*

Description

Check that `file.path()` is used to construct safe and portable paths.

Usage

```r
nonportable_path_linter(lax = TRUE)
```

Arguments

- `lax`  
  Less stringent linting, leading to fewer false positives. If `TRUE`, only lint path strings, which
  - contain at least two path elements, with one having at least two characters and
  - contain only alphanumeric chars (including UTF-8), spaces, and win32-allowed punctuation

Tags

- best_practices, configurable, robustness

See Also

- `linters` for a complete list of linters available in lintr.
- `absolute_path_linter()`

**numeric_leading_zero_linter**

*Require usage of a leading zero in all fractional numerics*

Description

While .1 and 0.1 mean the same thing, the latter is easier to read due to the small size of the `'` glyph.

Usage

```r
numeric_leading_zero_linter()
```

Tags

- consistency, readability, style

See Also

- `linters` for a complete list of linters available in lintr.
Examples

```r
# will produce lints
lint(
  text = "x <- .1",
  linters = numeric_leading_zero_linter()
)
lint(
  text = "x <- -.1",
  linters = numeric_leading_zero_linter()
)

# okay
lint(
  text = "x <- 0.1",
  linters = numeric_leading_zero_linter()
)
lint(
  text = "x <- -0.1",
  linters = numeric_leading_zero_linter()
)
```

---

**object_length_linter**  
*Object length linter*

Description

Check that object names are not too long. The length of an object name is defined as the length in characters, after removing extraneous parts:

Usage

```r
object_length_linter(length = 30L)
```

Arguments

- **length** maximum variable name length allowed.

Details

- generic prefixes for implementations of S3 generics, e.g. `as.data.frame.my_class` has length 8.
- leading `.`, e.g. `my_hidden_function` has length 18.
- `"\%\%"` for infix operators, e.g. `%%my_op%%` has length 5.
- trailing `<-` for assignment functions, e.g. `my_attr<-` has length 7.

Note that this behavior relies in part on having packages in your Imports available; see the detailed note in `object_name_linter()` for more details.
object_name_linter

Tags

configurable, default, executing, readability, style

See Also

linters for a complete list of linters available in lintr.

Examples

# will produce lints
lint(
  text = "very_very_long_variable_name <- 1L",
  linters = object_length_linter(length = 10L)
)

# okay
lint(
  text = "very_very_long_variable_name <- 1L",
  linters = object_length_linter(length = 30L)
)

lint(
  text = "var <- 1L",
  linters = object_length_linter(length = 10L)
)

---

object_name_linter  Object name linter

Description

Check that object names conform to a naming style. The default naming styles are "snake_case" and "symbols".

Usage

object_name_linter(styles = c("snake_case", "symbols"), regexes = character())

Arguments

styles  A subset of 'symbols', 'CamelCase', 'camelCase', 'snake_case', 'SNAKE_CASE', 'dotted_case', 'lowercase', 'UPPERCASE'. A name should match at least one of these styles. The "symbols" style refers to names containing only non-alphanumeric characters; e.g., defining %+% from ggplot2 or `%>%` from magrittr would not generate lint markers, whereas `%m%` from lubridate (containing both alphanumeric and non-alphanumeric characters) would.

regexes  A (possibly named) character vector specifying a custom naming convention. If named, the names will be used in the lint message. Otherwise, the regexes enclosed by / will be used in the lint message. Note that specifying regexes overrides the default styles. So if you want to combine regexes and styles, both need to be explicitly specified.
Details

Quotes ("'"') and specials (% and trailing <-) are not considered part of the object name.

Note when used in a package, in order to ignore objects imported from other namespaces, this linter will attempt `getNamespaceExports()` whenever an `import(PKG)` or `importFrom(PKG, ...)` statement is found in your NAMESPACE file. If `requireNamespace()` fails (e.g., the package is not yet installed), the linter won’t be able to ignore some usages that would otherwise be allowed.

Suppose, for example, you have `import(upstream)` in your NAMESPACE, which makes available its exported S3 generic function `a_really_quite_long_function_name` that you then extend in your package by defining a corresponding method for your class `my_class`. Then, if `upstream` is not installed when this linter runs, a lint will be thrown on this object (even though you don’t “own” its full name).

The best way to get lintr to work correctly is to install the package so that it’s available in the session where this linter is running.

`linters` for a complete list of linters available in lintr.

Examples

```r
# will produce lints
lint(
  text = "my_var <- 1L",
  linters = object_name_linter(styles = "CamelCase")
)

lint(
  text = "xYz <- 1L",
  linters = object_name_linter(styles = c("UPPERCASE", "lowercase"))
)

lint(
  text = "MyVar <- 1L",
  linters = object_name_linter(styles = "dotted.case")
)

lint(
  text = "asd <- 1L",
  linters = object_name_linter(regexes = c(my_style = "F$", "f$"))
)

# okay
lint(
  text = "my_var <- 1L",
  linters = object_name_linter(styles = "snake_case")
)

lint(
  text = "xyz <- 1L",
  linters = object_name_linter(styles = "lowercase")
)
```
object_usage_linter

)  

lint(
    text = "my.var <- 1L; myvar <- 2L",
    linters = object_name_linter(styles = c("dotted.case", "lowercase"))
)  

lint(
    text = "asdf <- 1L; asdF <- 1L",
    linters = object_name_linter(regexes = c(my_style = "F$", "f$"))
)

---

object_usage_linter  Object usage linter

Description

Check that closures have the proper usage using `codetools::checkUsage()`. Note that this runs `base::eval()` on the code, so **do not use with untrusted code**.

Usage

`object_usage_linter(interpret_glue = TRUE, skip_with = TRUE)`

Arguments

- `interpret_glue` If TRUE, interpret `glue::glue()` calls to avoid false positives caused by local variables which are only used in a glue expression.
- `skip_with` A logical. If TRUE (default), code in `with()` expressions will be skipped. This argument will be passed to `skipWith` argument of `codetools::checkUsage()`.

Linters

The following linters are tagged with `package_development`:

- `backport_linter`
- `conjunct_test_linter`
- `expect_comparison_linter`
- `expect_identical_linter`

linters for a complete list of linters available in lintr.

Examples

# will produce lints
lint(
  text = "foo <- function() { x <- 1 }",
  linters = object_usage_linter()
)

# okay
lint(
  text = "foo <- function(x) { x <- 1 }",
  linters = object_usage_linter()
)

lint(
  text = "foo <- function() { x <- 1; return(x) }",
  linters = object_usage_linter()
)

outer_negation_linter

Require usage of !any(x) over all(!x), !all(x) over any(!x)

Description

any(!x) is logically equivalent to !any(x); ditto for the equivalence of all(!x) and !any(x).
Negating after aggregation only requires inverting one logical value, and is typically more readable.

Usage

outer_negation_linter()

Tags

best_practices, efficiency, readability

See Also

linters for a complete list of linters available in lintr.

Examples

# will produce lints
lint(
  text = "all(!x)",
  linters = outer_negation_linter()
)

lint(
  text = "any(!x)",
  linters = outer_negation_linter()
# okay
lint(
    text = "!any(x)",
    linters = outer_negation_linter()
)

lint(
    text = "!all(x)",
    linters = outer_negation_linter()
)

---

## Description

Linters useful to package developers, for example for writing consistent tests.

## Linters

The following linters are tagged with 'package_development':

- backport_linter
- conjunct_test_linter
- expect_comparison_linter
- expect_identical_linter
- expect_length_linter
- expect_named_linter
- expect_not_linter
- expect_null_linter
- expect_s3_class_linter
- expect_s4_class_linter
- expect_true_false_linter

- package_hooks_linter
- yoda_test_linter

## See Also

[lintr](https://example.com/lintr) for a complete list of linters available in lintr.
package_hooks_linter  Package hooks linter

Description

Check various common "gotchas" in `.onLoad()`, `.onAttach()`, `.Last.lib()`, and `.onDetach()` namespace hooks that will cause `R CMD check` issues. See Writing R Extensions for details.

Usage

```r
package_hooks_linter()
```

Details

1. `.onLoad()` shouldn’t call `cat()`, `message()`, `print()`, `writeLines()`, `packageStartupMessage()`, `require()`, `library()`, or `installed.packages()`.
2. `.onAttach()` shouldn’t call `cat()`, `message()`, `print()`, `writeLines()`, `library.dynam()`, `require()`, `library()`, or `installed.packages()`.
3. `.Last.lib()` and `.onDetach()` shouldn’t call `library.dynam.unload()`.
4. `.onLoad()` and `.onAttach()` should take two arguments, with names matching `^lib` and `^pkg`. `.Last.lib()` and `.onDetach()` should take one argument with name matching `^lib`.

Tags

correctness, package_development, style

See Also

`linters` for a complete list of linters available in lintr.

Examples

```r
# will produce lints
lint(
  text = "onLoad <- function(lib, ...) { }",
  linters = package_hooks_linter()
)

lint(
  text = "onAttach <- function(lib, pkg) { require(foo) }",
  linters = package_hooks_linter()
)

lint(
  text = "onDetach <- function(pkg) { }",
  linters = package_hooks_linter()
)

# okay
lint(
  text = "onLoad <- function(lib, pkg) { }",
  linters = package_hooks_linter()
)```
paren_body_linter

Parenthesis before body linter

Description

Check that there is a space between right parenthesis and a body expression.

Usage

paren_body_linter()

Tags

default, readability, style

See Also

• linters for a complete list of linters available in lintr.

• https://style.tidyverse.org/syntax.html#parentheses

Examples

# will produce lints
lint(
    text = "function(x)x + 1",
    linters = paren_body_linter()
)

# okay
lint(
    text = "function(x) x + 1",
    linters = paren_body_linter()
)
parse_exclusions  
read a source file and parse all the excluded lines from it

Description
read a source file and parse all the excluded lines from it

Usage
parse_exclusions(  
  file,  
  exclude = settings$exclude,  
  exclude_start = settings$exclude_start,  
  exclude_end = settings$exclude_end,  
  exclude_linter = settings$exclude_linter,  
  exclude_linter_sep = settings$exclude_linter_sep,  
  lines = NULL,  
  linter_names = NULL  
)

Arguments

- **file**: R source file
- **exclude**: regular expression used to mark lines to exclude
- **exclude_start**: regular expression used to mark the start of an excluded range
- **exclude_end**: regular expression used to mark the end of an excluded range
- **exclude_linter**: regular expression used to capture a list of to-be-excluded linters immediately following a exclude or exclude_start marker.
- **exclude_linter_sep**: regular expression used to split a linter list into individual linter names for exclusion.
- **lines**: a character vector of the content lines of file
- **linter_names**: Names of active linters

Value
A possibly named list of excluded lines, possibly for specific linters.

paste_linter  
Raise lints for several common poor usages of paste()

Description
The following issues are linted by default by this linter (see arguments for which can be de-activated optionally):
### Usage

```r
paste_linter(allow_empty_sep = FALSE, allow_to_string = FALSE)
```

### Arguments

- **allow_empty_sep**: Logical, default FALSE. If TRUE, usage of `paste()` with `sep = ""` is not linted.
- **allow_to_string**: Logical, default FALSE. If TRUE, usage of `paste()` and `paste0()` with `collapse = "", " "` is not linted.

### Details

1. Block usage of `paste()` with `sep = ""`. `paste0()` is a faster, more concise alternative.
2. Block usage of `paste()` or `paste0()` with `collapse = "", " "`. `toString()` is a direct wrapper for this, and alternatives like `glue::glueCollapse()` might give better messages for humans.
3. Block usage of `paste0()` that supplies `sep=` -- this is not a formal argument to `paste0`, and is likely to be a mistake.
4. Block usage of `paste()` / `paste0()` combined with `rep()` that could be replaced by `strrep()`. `strrep()` can handle the task of building a block of repeated strings (e.g. often used to build "horizontal lines" for messages). This is both more readable and skips the (likely small) overhead of putting two strings into the global string cache when only one is needed.

Only target scalar usages -- `strrep` can handle more complicated cases (e.g. `strrep(letters, 26:1)`, but those aren’t as easily translated from a `paste(collapse=)` call.

### Tags

- `best_practices`, `configurable`, `consistency`

### See Also

- `linters` for a complete list of linters available in lintr.

### Examples

```r
# will produce lints
lint(
  text = 'paste("a", "b", sep = "")',
  linters = paste_linter()
)

lint(
  text = 'paste(c("a", "b"), collapse = ", ", "")',
  linters = paste_linter()
)

lint(
  text = 'paste0(c("a", "b"), sep = " ")',
  linters = paste_linter()
)

lint(
```
text = `paste0(rep("*", 10L), collapse = ""')
  linters = paste_linter()
)

# okay
lint(
  text = `paste0("a", "b")',
  linters = paste_linter()
)

lint(
  text = `paste("a", "b", sep = "")',
  linters = paste_linter(allow_empty_sep = TRUE)
)

lint(
  text = `toString(c("a", "b"))',
  linters = paste_linter()
)

lint(
  text = `paste(c("a", "b"), collapse = ", ")',
  linters = paste_linter(allow_to_string = TRUE)
)

lint(
  text = `paste(c("a", "b"))',
  linters = paste_linter()
)

lint(
  text = `strrep("*", 10L)' ,
  linters = paste_linter()
)

---

### pipe_call_linter

**Pipe call linter**

#### Description

Force explicit calls in magrittr pipes, e.g., `1:3 %>% sum()` instead of `1:3 %>% sum`. Note that native pipe always requires a function call, i.e. `1:3 |> sum` will produce an error.

#### Usage

`pipe_call_linter()`

#### Tags

readability, style

#### See Also

`lintr` for a complete list of linters available in lintr.
Examples

```r
# will produce lints
lint(
  text = "1:3 %>% mean() %>% as.character()",
  linters = pipe_call_linter()
)

# okay
lint(
  text = "1:3 %>% mean() %>% as.character()",
  linters = pipe_call_linter()
)
```

**Description**

Check that each step in a pipeline is on a new line, or the entire pipe fits on one line.

**Usage**

```r
pipe_continuation_linter()
```

**Tags**

- default, readability, style

**See Also**

- `linters` for a complete list of linters available in lintr.
- [https://style.tidyverse.org/pipes.html#long-lines-2](https://style.tidyverse.org/pipes.html#long-lines-2)

**Examples**

```r
# will produce lints
code_lines <- "1:3 \n mean() \n as.character()"
writeLines(code_lines)
lint(
  text = code_lines,
  linters = pipe_continuation_linter()
)

code_lines <- "1:3 |> mean() |>\n as.character()"
writeLines(code_lines)
lint(
  text = code_lines,
  linters = pipe_continuation_linter()
)

# okay
```
quotes_linter

Description

Check that the desired quote delimiter is used for string constants.

Usage

quotes_linter(delimiter = c("\"", "\""))

Arguments

delimiter Which quote delimiter to accept. Defaults to the tidyverse default of " (double-quoted strings).

Tags

configurable, consistency, default, readability, style

See Also

- linters for a complete list of linters available in lintr.
- https://style.tidyverse.org/syntax.html#character-vectors
Examples

```r
# will produce lints
lint(
  text = "c('a', 'b')",
  linters = quotes_linter()
)

# okay
lint(
  text = 'c("a", "b")',
  linters = quotes_linter()
)

code_lines <- "paste0(x, '\"this is fine\")"
writeLines(code_lines)
lint(
  text = code_lines,
  linters = quotes_linter()
)

# okay
lint(
  text = "c('a', 'b')",
  linters = quotes_linter(delimiter = ""))
```

---

**readability_linters**  
**Readability linters**

**Description**

Linters highlighting readability issues, such as missing whitespace.

**Linters**

The following linters are tagged with `readability`:

See Also

linters for a complete list of linters available in lintr.
**read_settings**

*Read lintr settings*

**Description**

Lintr searches for settings for a given source file in the following order.

1. options defined as `linter.setting`
2. `linter_file` in the same directory
3. `linter_file` in the project directory
4. `linter_file` in the user home directory
5. `default_settings()`

**Usage**

`read_settings(filename)`

**Arguments**

- `filename` source file to be linted

**Details**

The default `linter_file` name is `.lintr` but it can be changed with option `lintr.linter_file` or the environment variable `R_LINTR_LINTER_FILE`. This file is a dcf file, see `base::read.dcf()` for details.

**redundant_equals_linter**

*Block usage of ==, != on logical vectors*

**Description**

Testing `x == TRUE` is redundant if `x` is a logical vector. Wherever this is used to improve readability, the solution should instead be to improve the naming of the object to better indicate that its contents are logical. This can be done using prefixes (is, has, can, etc.). For example, `is_child`, `has_parent_supervision`, `can_watch_horror_movie` clarify their logical nature, while `child`, `parent_supervision`, `watch_horror_movie` don't.

**Usage**

`redundant_equals_linter()`

**Tags**

*best_practices, common_mistakes, efficiency, readability*
See Also

- linters for a complete list of linters available in lintr.
- outer_negation_linter()

Examples

```r
# will produce lints
lint(
  text = "if (any(x == TRUE)) 1",
  linters = redundant_equals_linter()
)
lint(
  text = "if (any(x != FALSE)) 0",
  linters = redundant_equals_linter()
)

# okay
lint(
  text = "if (any(x)) 1",
  linters = redundant_equals_linter()
)
lint(
  text = "if (!all(x)) 0",
  linters = redundant_equals_linter()
)
```

redundant_ifelse_linter

Prevent ifelse() from being used to produce TRUE/FALSE or 1/0

Description

Expressions like ifelse(x, TRUE, FALSE) and ifelse(x, FALSE, TRUE) are redundant: just x or !x suffice in R code where logical vectors are a core data structure. ifelse(x, 1, 0) is also as.numeric(x), but even this should be needed only rarely.

Usage

```r
redundant_ifelse_linter(allow10 = FALSE)
```

Arguments

- **allow10** Logical, default FALSE. If TRUE, usage like ifelse(x, 1, 0) is allowed, i.e., only usage like ifelse(x, TRUE, FALSE) is linted.

Tags

- best_practices, configurable, consistency, efficiency
See Also

linter for a complete list of linters available in lintr.

Examples

# will produce lints
lint(
  text = "ifelse(x >= 2.5, TRUE, FALSE)",
  linters = redundant_ifelse_linter()
)

lint(
  text = "ifelse(x < 2.5, 1L, 0L)",
  linters = redundant_ifelse_linter()
)

# okay
lint(
  text = "x >= 2.5",
  linters = redundant_ifelse_linter()
)

# Note that this is just to show the strict equivalent of the example above;
# converting to integer is often unnecessary and the logical vector itself
# should suffice.
lint(
  text = "as.integer(x < 2.5)",
  linters = redundant_ifelse_linter()
)

lint(
  text = "ifelse(x < 2.5, 1L, 0L)",
  linters = redundant_ifelse_linter(allow10 = TRUE)
)

regex_subset_linter

Description

Using value = TRUE in grep() returns the subset of the input that matches the pattern, e.g. grep("[a-m]", letters, value = TRUE) will return the first 13 elements (a through m).

Usage

regex_subset_linter()

Details

letters[grepl("[a-m]", letters)] and letters[grepl("[a-m]", letters)] both return the same thing, but more circuitously and more verbosely.

The stringr package also provides an even more readable alternative, namely str_subset(), which should be preferred to versions using str_detect() and str_which().
robustness_linters

Exceptions

Note that `x[grep(pattern, x)]` and `grep(pattern, x, value = TRUE)` are not completely interchangeable when `x` is not character (most commonly, when `x` is a factor), because the output of the latter will be a character vector while the former remains a factor. It still may be preferable to refactor such code, as it may be faster to match the pattern on `levels(x)` and use that to subset instead.

Tags

`best_practices`, `efficiency`

See Also

`linters` for a complete list of linters available in lintr.

Examples

```r
# will produce lints
lint(
  text = "x[grep(pattern, x)]",
  linters = regex_subset_linter()
)

lint(
  text = "x[stringr::str_which(x, pattern)]",
  linters = regex_subset_linter()
)

# okay
lint(
  text = "grep(pattern, x, value = TRUE)",
  linters = regex_subset_linter()
)

lint(
  text = "stringr::str_subset(x, pattern)",
  linters = regex_subset_linter()
)
```

---

robustness_linters  Robustness linters

Description

Linters highlighting code robustness issues, such as possibly wrong edge case behavior.

Linters

The following linters are tagged with 'robustness':

- `absolute_path_linter`
- `backport_linter`
routine_registration_linter

Identify unregistered native routines

Description

It is preferable to register routines for efficiency and safety.

Usage

routine_registration_linter()

Tags

best_practices, efficiency, robustness

See Also

• linters for a complete list of linters available in lintr.

Examples

# will produce lints
lint(
  text = '.Call("cpp_routine", PACKAGE = "mypkg")',
  linters = routine_registration_linter()
)

lint(
  text = '.Fortran("f_routine", PACKAGE = "mypkg")',
  linters = routine_registration_linter()
)
# okay
lint(
    text = `.Call(cpp_routine)`,
    linters = routine_registration_linter()
)

lint(
    text = `.Fortran(f_routine)`,
    linters = routine_registration_linter()
)

**sarif_output**  
*SARIF Report for lint results*

**Description**
Generate a report of the linting results using the **SARIF** format.

**Usage**
```
sarif_output(lints, filename = "lintr_results.sarif")
```

**Arguments**
- `lints`: the linting results.
- `filename`: the name of the output report

**semicolon_linter**  
*Semicolon linter*

**Description**
Check that no semicolons terminate expressions.

**Usage**
```
semicolon_linter(allow_compound = FALSE, allow_trailing = FALSE)
```

**Arguments**
- `allow_compound`: Logical, default FALSE. If TRUE, "compound" semicolons (e.g. as in x; y, i.e., on the same line of code) are allowed.
- `allow_trailing`: Logical, default FALSE. If TRUE, "trailing" semicolons (i.e., those that terminate lines of code) are allowed.

**Tags**
- configurable
- default
- readability
- style
semicolon_linter

See Also

- linters for a complete list of linters available in lintr.
- https://style.tidyverse.org/syntax.html#semicolons

Examples

```r
# will produce lints
lint(
  text = "a <- 1;",
  linters = semicolon_linter()
)

lint(
  text = "a <- 1; b <- 1",
  linters = semicolon_linter()
)

lint(
  text = "function() { a <- 1; b <- 1 }",
  linters = semicolon_linter()
)

# okay
lint(
  text = "a <- 1",
  linters = semicolon_linter()
)

lint(
  text = "a <- 1;",
  linters = semicolon_linter(allow_trailing = TRUE)
)

code_lines <- "a <- \nb <- 1"
writeLines(code_lines)
lint(
  text = code_lines,
  linters = semicolon_linter()
)

lint(
  text = "a <- 1; b <- 1",
  linters = semicolon_linter(allow_compound = TRUE)
)

code_lines <- "function() { \n    a <- \n    b <- \n  }"
writeLines(code_lines)
lint(
  text = code_lines,
  linters = semicolon_linter()
)
```
seq_linter

**Sequence linter**

**Description**

This linter checks for `1:length(...)`, `1:nrow(...)`, `1:ncol(...)`, `1:NROW(...)`, and `1:NCOL(...)` expressions in base-R, or their usage in conjunction with `seq()` (e.g., `seq(length(...))`, `seq(nrow(...))`, etc.).

**Usage**

```r
seq_linter()
```

**Details**

Additionally, it checks for `1:n()` (from dplyr) and `1:.N` (from data.table).

These often cause bugs when the right-hand side is zero. It is safer to use `base::seq_len()` or `base::seq_along()` instead.

**Tags**

- best_practices
- consistency
- default
- efficiency
- robustness

**See Also**

- linters for a complete list of linters available in lintr.

**Examples**

```r
# will produce lints
lint(
  text = "seq(length(x))",
  linters = seq_linter()
)

lint(
  text = "1:nrow(x)",
  linters = seq_linter()
)

lint(
  text = "dplyr::mutate(x, .id = 1:n())",
  linters = seq_linter()
)

# okay
lint(
  text = "seq_along(x)",
  linters = seq_linter()
)

lint(
  text = "seq_len(nrow(x))",
  linters = seq_linter()
)
```
linters = seq_linter()
)

lint(
    text = "dplyr::mutate(x, .id = seq_len(n()))",
    linters = seq_linter()
    )

---

**sort_linter**

*Require usage of `sort()` over `.[order(.)]`*

**Description**

`sort()` is the dedicated option to sort a list or vector. It is more legible and around twice as fast as `.[order(.)]`, with the gap in performance growing with the vector size.

**Usage**

`sort_linter()`

**Tags**

`best_practices, efficiency, readability`

**See Also**

`linters` for a complete list of linters available in lintr.

**Examples**

```r
# will produce lints
lint(
    text = "x[order(x)]",
    linters = sort_linter()
)

lint(
    text = "x[order(x, decreasing = TRUE)]",
    linters = sort_linter()
)

# okay
lint(
    text = "x[sample(order(x))]",
    linters = sort_linter()
)

lint(
    text = "y[order(x)]",
    linters = sort_linter()
)

# If you are sorting several objects based on the order of one of them, such
```
# spaces_inside_linter

## Description

Check that parentheses and square brackets do not have spaces directly inside them, i.e., directly following an opening delimiter or directly preceding a closing delimiter.

## Usage

```r
spaces_inside_linter()
```

## Tags

default, readability, style

## See Also

- `linters` for a complete list of linters available in lintr.
- [https://style.tidyverse.org/syntax.html#parentheses](https://style.tidyverse.org/syntax.html#parentheses)

## Examples

```r
# will produce lints
lint(
  text = "c( TRUE, FALSE )",
  linters = spaces_inside_linter()
)

lint(
  text = "x[ 1L ]",
  linters = spaces_inside_linter()
)

# okay
lint(
  text = "c(TRUE, FALSE)",
  linters = spaces_inside_linter()
)

lint(
  text = "c(TRUE, FALSE)",
  linters = spaces_inside_linter()
)
```
spaces_left_parentheses_linter

Spaces before parentheses linter

Description

Check that all left parentheses have a space before them unless they are in a function call.

Usage

spaces_left_parentheses_linter()

Tags

default, readability, style

See Also

- linters for a complete list of linters available in lintr.
- https://style.tidyverse.org/syntax.html#parentheses
- function_left_parentheses_linter()

Examples

# will produce lints
lint(
    text = "if(TRUE) x else y",
    linters = spaces_left_parentheses_linter()
)

# okay
lint(
    text = "if (TRUE) x else y",
    linters = spaces_left_parentheses_linter()
)
Description

Check for an inconsistent number of arguments or arguments with incompatible types (for literal arguments) in `sprintf()` calls.

Usage

```r
sprintf_linter()
```

Details

`gettextf()` calls are also included, since `gettextf()` is a thin wrapper around `sprintf()`.

Tags

`common_mistakes, correctness`

See Also

`linters` for a complete list of linters available in lintr.

Examples

```r
# will produce lints
lint(
  text = 'sprintf("hello %s %s %d", x, y)',
  linters = sprintf_linter()
)

# okay
lint(
  text = 'sprintf("hello %s %s %d", x, y, z)',
  linters = sprintf_linter()
)

lint(
  text = 'sprintf("hello %s %s %d", x, y, ...)',
  linters = sprintf_linter()
)
```
Identify cases where `stringsAsFactors` should be supplied explicitly

Description

Designed for code bases written for versions of R before 4.0 seeking to upgrade to R >= 4.0, where one of the biggest pain points will surely be the flipping of the default value of `stringsAsFactors` from `TRUE` to `FALSE`.

Usage

`strings_as_factors_linter()`

Details

It’s not always possible to tell statically whether the change will break existing code because R is dynamically typed — e.g. in `data.frame(x)` if `x` is a string, this code will be affected, but if `x` is a number, this code will be unaffected. However, in `data.frame(x = "a")`, the output will unambiguously be affected. We can instead supply `stringsAsFactors = TRUE`, which will make this code backwards-compatible.

See https://developer.r-project.org/Blog/public/2020/02/16/stringsasfactors/.

Tags

robustness

See Also

`linters` for a complete list of linters available in lintr.

Examples

```r
# will produce lints
lint(
  text = 'data.frame(x = "a")',
  linters = strings_as_factors_linter()
)

# okay
lint(
  text = 'data.frame(x = "a", stringsAsFactors = TRUE)',
  linters = strings_as_factors_linter()
)

lint(
  text = 'data.frame(x = "a", stringsAsFactors = FALSE)',
  linters = strings_as_factors_linter()
)
```

```r
lint(
  text = "data.frame(x = 1.2)",
  linters = strings_as_factors_linter()
)```
string_boundary_linter

Description

`startsWith()` is used to detect fixed initial substrings; it is more readable and more efficient than equivalents using `grepl()` or `substr()`. c.f. `startsWith(x, "abc"), grepl("abc", x), substr(x, 1L, 3L) == "abc".`

Usage

`string_boundary_linter(allow_grepl = FALSE)`

Arguments

`allow_grepl` Logical, default FALSE. If TRUE, usages with `grepl()` are ignored. Some authors may prefer the conciseness offered by `grepl()` whereby NA input maps to FALSE output, which doesn’t have a direct equivalent with `startsWith()` or `endsWith()`.

Details

Ditto for using `endsWith()` to detect fixed terminal substrings.

Note that there is a difference in behavior between how `grepl()` and `startsWith()` (and `endsWith()`) handle missing values. In particular, for `grepl()`, NA inputs are considered FALSE, while for `startsWith()`, NA inputs have NA outputs. That means the strict equivalent of `grepl("^abc", x)` is `!is.na(x) & startsWith(x, "abc")`.

We lint `grepl()` usages by default because the `!is.na()` version is more explicit with respect to NA handling – though documented, the way `grepl()` handles missing inputs may be surprising to some users.

Tags

configurable, efficiency, readability

See Also

`linters` for a complete list of linters available in lintr.

Examples

```r
# will produce lints
lint(
  text = 'grepl("^a", x)',
  linters = string_boundary_linter()
)
```
```r
lint(
  text = 'grepl("$", x)',
  linters = string_boundary_linter()
)
# okay
lint(
  text = 'startsWith(x, "a")',
  linters = string_boundary_linter()
)
lint(
  text = 'endsWith(x, "z")',
  linters = string_boundary_linter()
)
# If missing values are present, the suggested alternative wouldn't be strictly
# equivalent, so this linter can also be turned off in such cases.
lint(
  text = 'grepl("$", x)',
  linters = string_boundary_linter(allow_grepl = TRUE)
)
```

---

**style_linters**

**Style linters**

- **Description**
  - Linters highlighting code style issues.

- **Linters**
  - The following linters are tagged with `style`:
    - assignment_linter
    - brace_linter

---

system_file_linter  Block usage of file.path() with system.file()

Description

system.file() has a ... argument which, internally, is passed to file.path(), so including it in user code is repetitive.

Usage

system_file_linter()

Tags

best_practices, consistency, readability

See Also

linters for a complete list of linters available in lintr.
 todo_comment_linter

**Examples**

```r
# will produce lints
lint(
  text = 'system.file(file.path("path", "to", "data"), package = "foo"),
         linters = system_file_linter()
)

lint(
  text = 'file.path(system.file(package = "foo"), "path", "to", "data"),
         linters = system_file_linter()
)

# okay
lint(
  text = 'system.file("path", "to", "data", package = "foo"),
         linters = system_file_linter()
)
```

---

todo_comment_linter  TODO comment linter

**Description**

Check that the source contains no TODO comments (case-insensitive).

**Usage**

```r
todo_comment_linter(todo = c("todo", "fixme"))
```

**Arguments**

- **todo**: Vector of strings that identify TODO comments.

**Tags**

configurable, style

**See Also**

linters for a complete list of linters available in lintr.

**Examples**

```r
# will produce lints
lint(
  text = "x + y # TODO",
  linters = todo_comment_linter()
)

lint(
  text = "pi <- 1.0 # FIXME",
  linters = todo_comment_linter()
)
```
lint(
    text = "x <- TRUE # hack",
    linters = todo_comment_linter(todo = c("todo", "fixme", "hack"))
)

# okay
lint(
    text = "x + y # my informative comment",
    linters = todo_comment_linter()
)

lint(
    text = "pi <- 3.14",
    linters = todo_comment_linter()
)

lint(
    text = "x <- TRUE",
    linters = todo_comment_linter()
)

---

trailing_blank_lines_linter

*Trailing blank lines linter*

**Description**

Check that there are no trailing blank lines in source code.

**Usage**

`trailing_blank_lines_linter()`

**Tags**

`default, style`

**See Also**

`linters` for a complete list of linters available in lintr.

**Examples**

# will produce lints
f <- withr::local_tempfile(lines = "x <- 1
"
readLines(f)
lint(
    filename = f,
    linters = trailing_blank_lines_linter()
)

# okay
trailing_whitespace_linter

Trailing whitespace linter

Description
Check that there are no space characters at the end of source lines.

Usage
trailing_whitespace_linter(allow_empty_lines = FALSE, allow_in_strings = TRUE)

Arguments
allow_empty_lines
Suppress lints for lines that contain only whitespace.
allow_in_strings
Suppress lints for trailing whitespace in string constants.

Tags
configurable, default, style

See Also
lintr for a complete list of linters available in lintr.

Examples
# will produce lints
lint(
  text = "x <- 1.2 ",
  linters = trailing_whitespace_linter()
)

code_lines <- "a <- TRUE
\nb <- FALSE"
writeLines(code_lines)
lint(
  text = code_lines,
  linters = trailing_whitespace_linter()
)

# okay
lint(
  text = "x <- 1.2",
  linters = trailing_whitespace_linter()
T_and_F_symbol_linter

Description

Avoid the symbols T and F, and use TRUE and FALSE instead.

Usage

T_and_F_symbol_linter()

Tags

best_practices, consistency, default, readability, robustness, style

See Also

- linters for a complete list of linters available in lintr.
- https://style.tidyverse.org/syntax.html#logical-vectors

Examples

# will produce lints
lint("x <- T; y <- F",
linters = T_and_F_symbol_linter())

lint("T = 1.2; F = 2.4",
linters = T_and_F_symbol_linter())

# okay
lint("x <- c(TRUE, FALSE)",
linters = T_and_F_symbol_linter())
**undesirable_function_linter**

Undesirable function linter

### Description

Report the use of undesirable functions (e.g. `base::return()`, `base::options()`, or `base::sapply()`) and suggest an alternative.

### Usage

```r
undesirable_function_linter(
  fun = default_undesirable_functions,
  symbol_is_undesirable = TRUE
)
```

### Arguments

- **fun**: Named character vector. names(fun) correspond to undesirable functions, while the values give a description of why the function is undesirable. If NA, no additional information is given in the lint message. Defaults to default_undesirable_functions. To make small customizations to this list, use `modify_defaults()`.
- **symbol_is_undesirable**: Whether to consider the use of an undesirable function name as a symbol undesirable or not.

### Tags

- best_practices, configurable, efficiency, robustness, style

### See Also

- `linters` for a complete list of linters available in lintr.

### Examples

```r
# defaults for which functions are considered undesirable names(default_undesirable_functions)

# will produce lints
lint(
  text = "sapply(x, mean)",
  linters = undesirable_function_linter()
)

lint(
  text = "log10(x)",
  linters = undesirable_function_linter()
)
```
Undesirable operator linter

**Description**

Report the use of undesirable operators, e.g. `:::` or `<<-` and suggest an alternative.

**Usage**

```r
undesirable_operator_linter(op = default_undesirable_operators)
```

**Arguments**

- `op` Named character vector. `names(op)` correspond to undesirable operators, while the values give a description of why the operator is undesirable. If NA, no additional information is given in the lint message. Defaults to `default_undesirable_operators`. To make small customizations to this list, use `modify_defaults()`.

**Tags**

- best_practices, configurable, efficiency, robustness, style
See Also

`linters` for a complete list of linters available in lintr.

Examples

```r
# defaults for which functions are considered undesirable
names(default_undesirable_operators)

# will produce lints
lint(
  text = "a <<- log(10)",
  linters = undesirable_operator_linter()
)
lint(
  text = "mtcars$wt",
  linters = undesirable_operator_linter(op = c("$" = "As an alternative, use the `\[\[` accessor."))
)

# okay
lint(
  text = "a <- log(10)",
  linters = undesirable_operator_linter()
)
lint(
  text = 'mtcars["wt"]',
  linters = undesirable_operator_linter(op = c("$" = NA))
)
lint(
  text = 'mtcars["wt"]',
  linters = undesirable_operator_linter(op = c("$" = "As an alternative, use the `\[\[` accessor."))
)
```

unnecessary_concatenation_linter

*Unneeded concatenation linter*

Description

Check that the `c()` function is not used without arguments nor with a single constant.

Usage

```r
unnecessary_concatenation_linter(allow_single_expression = TRUE)
```

Arguments

allow_single_expression

Logical, default `TRUE`. If `FALSE`, one-expression usages of `c()` are always linted, e.g. `c(x)` and `c(matrix(...))`. In some such cases, `c()` is being used for its side-effect of stripping non-name attributes; it is usually preferable to use the
unnecessary_concatenation_linter

more readable `as.vector()` instead. `as.vector()` is not always preferable, for example with environments (especially, R6 objects), in which case `list()` is the better alternative.

**Tags**

configurable, efficiency, readability, style

**See Also**

`linters` for a complete list of linters available in lintr.

**Examples**

```r
# will produce lints
lint(
  text = "x <- c()",
  linters = unnecessary_concatenation_linter()
)

lint(
  text = "x <- c(TRUE)",
  linters = unnecessary_concatenation_linter()
)

lint(
  text = "x <- c(1.5 + 2.5)",
  linters = unnecessary_concatenation_linter(allow_single_expression = FALSE)
)

# okay
lint(
  text = "x <- NULL",
  linters = unnecessary_concatenation_linter()
)

# In case the intent here was to seed a vector of known size
lint(
  text = "x <- integer(4L)",
  linters = unnecessary_concatenation_linter()
)

lint(
  text = "x <- TRUE",
  linters = unnecessary_concatenation_linter()
)

lint(
  text = "x <- c(1.5 + 2.5)",
  linters = unnecessary_concatenation_linter(allow_single_expression = TRUE)
)
```
unnecessary_lambda_linter

Block usage of anonymous functions in iteration functions when unnecessary

Description

Using an anonymous function in, e.g., \texttt{lapply()} is not always necessary, e.g. \texttt{lapply(DF, sum)} is the same as \texttt{lapply(DF, function(x) sum(x))} and the former is more readable.

Usage

\texttt{unnecessary_lambda_linter()}

Tags

\texttt{best_practices, efficiency, readability}

See Also

\texttt{linters} for a complete list of linters available in lintr.

Examples

# will produce lints
\texttt{lint(text = "lapply(list(1:3, 2:4), function(xi) sum(xi))", linters = unnecessary_lambda_linter() )}

# okay
\texttt{lint(text = "lapply(list(1:3, 2:4), sum)", linters = unnecessary_lambda_linter() )}

\texttt{lint(text = 'lapply(x, function(xi) grep("ptn", xi)' , linters = unnecessary_lambda_linter() )}

\texttt{lint(text = "lapply(x, function(xi) data.frame(col = xi))", linters = unnecessary_lambda_linter() )}
unnecessary_nested_if_linter

Avoid unnecessary nested if conditional statements

Description

Avoid unnecessary nested if conditional statements

Usage

unnecessary_nested_if_linter()

Tags

best_practices, readability

See Also

linters for a complete list of linters available in lintr.

Examples

```r
# will produce lints
writeLines("if (x) { \n if (y) { \n return(1L) \n } \n}\n")
lint(
  text = "if (x) { \n if (y) { \n return(1L) \n } \n}\n",
  linters = unnecessary_nested_if_linter()
)

# okay
writeLines("if (x && y) { \n return(1L) \n}\n")
lint(
  text = "if (x && y) { \n return(1L) \n}\n",
  linters = unnecessary_nested_if_linter()
)

writeLines("if (x) { \n y <- x + 1L\n if (y) { \n return(1L) \n } \n}\n")
lint(
  text = "if (x) { \n y <- x + 1L\n if (y) { \n return(1L) \n } \n}\n",
  linters = unnecessary_nested_if_linter()
)
```

unnecessary_placeholder_linter

Block usage of pipeline placeholders if unnecessary

Description

The argument placeholder . in magrittr pipelines is unnecessary if passed as the first positional argument; using it can cause confusion and impacts readability.
Usage

unnecessary_placeholder_linter()

Details

This is true for forward (%>%), assignment (%<%>, and tee (%T>%) operators.

Tags

best_practices, readability

See Also

linters for a complete list of linters available in lintr.

Examples

# will produce lints
lint(
  text = "x %>% sum(., na.rm = TRUE)",
  linters = unnecessary_placeholder_linter()
)

# okay
lint(
  text = "x %>% sum(na.rm = TRUE)",
  linters = unnecessary_placeholder_linter()
)

lint(
  text = "x %>% lm(data = ., y ~ z)",
  linters = unnecessary_placeholder_linter()
)

lint(
  text = "x %>% outer(., .)",
  linters = unnecessary_placeholder_linter()
)

unreachable_code_linter

Block unreachable code and comments following return statements

Description

Code after a top-level return() or stop() can’t be reached; typically this is vestigial code left after refactoring or sandboxing code, which is fine for exploration, but shouldn’t ultimately be checked in. Comments meant for posterity should be placed before the final return().

Usage

unreachable_code_linter()
Tags

best_practices, readability

See Also

linters for a complete list of linters available in lintr.

Examples

# will produce lints
code_lines <- "f <- function() {
  return(1 + 1)
  2 + 2"
writeLines(code_lines)
lint(
  text = code_lines,
  linters = unreachable_code_linter()
)

# okay
code_lines <- "f <- function() {
  return(1 + 1)"
writeLines(code_lines)
lint(
  text = code_lines,
  linters = unreachable_code_linter()
)

unused_import_linter  Check that imported packages are actually used

Description

Check that imported packages are actually used

Usage

unused_import_linter(
  allow_ns_usage = FALSE,
  except_packages = c("bit64", "data.table", "tidyverse")
)

Arguments

allow_ns_usage  Suppress lints for packages only used via namespace. This is FALSE by de-

fault because pkg::fun() doesn’t require library(pkg). You can use require-

Namespace("pkg") to ensure a package is installed without loading it.

except_packages  Character vector of packages that are ignored. These are usually attached for

their side effects.

Tags

  linters = unused_import_linter()
)

code_lines <- "library(dplyr)\ndplyr::tibble(a = 1)"
writeLines(code_lines)
lint(
  text = code_lines,
  linters = unused_import_linter(allow_ns_usage = TRUE)
)
```

Description

Create a minimal lintr config file as a starting point for customization

Usage

`use_lintr(path = ".", type = c("tidyverse", "full"))`

Arguments

- `path` Path to project root, where a `.lintr` file should be created. If the `.lintr` file already exists, an error will be thrown.
- `type` What kind of configuration to create?
vector_logic_linter

- tidyverse creates a minimal lintr config, based on the default linters (`linters_with_defaults()`). These are suitable for following the tidyverse style guide.
- full creates a lintr config using all available linters via `linters_with_tags()`.

Value

Path to the generated configuration, invisibly.

See Also

vignette("lintr") for detailed introduction to using and configuring lintr.

Examples

```r
if (FALSE) {
  # use the default set of linters
  lintr::use_lintr()
  # or try all linters
  lintr::use_lintr(type = "full")

  # then
  lintr::lint_dir()
}
```

vector_logic_linter  
Enforce usage of scalar logical operators in conditional statements

Description

Usage of & in conditional statements is error-prone and inefficient. condition in if (condition) expr must always be of length 1, in which case && is to be preferred. Ditto for | vs. ||.

Usage

`vector_logic_linter()`

Details

This linter covers inputs to if() and while() conditions and to `testthat::expect_true()` and `testthat::expect_false()`.

Note that because & and | are generics, it is possible that && / || are not perfect substitutes because & is doing method dispatch in an incompatible way.

Moreover, be wary of code that may have side effects, most commonly assignments. Consider `if ((a <- foo(x)) | (b <- bar(y))) {... } vs. if ((a <- foo(x)) || (b <- bar(y))) {... }`. Because || exits early, if `a` is TRUE, the second condition will never be evaluated and `b` will not be assigned. Such usage is not allowed by the Tidyverse style guide, and the code can easily be refactored by pulling the assignment outside the condition, so using || is still preferable.

Examples

```r
# will produce lints
lint(
  text = "if (TRUE & FALSE) 1",
  linters = vector_logic_linter()
)

lint(
  text = "if (TRUE && (TRUE | FALSE)) 4",
  linters = vector_logic_linter()
)

# okay
lint(
  text = "if (TRUE && FALSE) 1",
  linters = vector_logic_linter()
)

lint(
  text = "if (TRUE && (TRUE || FALSE)) 4",
  linters = vector_logic_linter()
)
```

### whitespace_linter

**Whitespace linter**

**Description**

Check that the correct character is used for indentation.

**Usage**

```r
whitespace_linter()
```

**Details**

Currently, only supports linting in the presence of tabs.

Much ink has been spilled on this topic, and we encourage you to check out references for more information.

xml_nodes_to_lints

Convert an XML node or nodeset into a Lint

Description

Convenience function for converting nodes matched by XPath-based linter logic into a Lint() object to return.

Usage

xml_nodes_to_lints(
  xml, 
  source_expression, 
  lint_message, 
  type = c("style", "warning", "error"), 
  column_number_xpath = range_start_xpath, 
  range_start_xpath = "number(./@col1)" , 
  range_end_xpath = "number(./@col2)"
)

Arguments

xml
An xml_node object (to generate one Lint) or an xml_nodeset object (to generate several Lints), e.g. as returned by xml2::xml_find_all() or xml2::xml_find_first() or a list of xml_node objects.

source_expression
A source expression object, e.g. as returned typically by lint(), or more generally by get_source_expressions().

linters for a complete list of linters available in lintr.

Examples

# will produce lints
lint(
  text = "\tx",
  linters = whitespace_linter()
)

# okay
lint(
  text = " x",
  linters = whitespace_linter()
)
yoda_test_linter

lint_message  The message to be included as the message to the Lint object. If lint_message
is a character vector the same length as xml, the i-th lint will be given the i-th
message.

Type  type of lint.

column_number_xpath  XPath expression to return the column number location of the lint. Defaults to
the start of the range matched by range_start_xpath. See details for more
information.

range_start_xpath  XPath expression to return the range start location of the lint. Defaults to the
start of the expression matched by xml. See details for more information.

range_end_xpath  XPath expression to return the range end location of the lint. Defaults to the end
of the expression matched by xml. See details for more information.

Details

The location XPaths, column_number_xpath, range_start_xpath and range_end_xpath are eval-
uated using xml2::xml_find_num() and will usually be of the form "number(/relative/xpath)".
Note that the location line number cannot be changed and lints spanning multiple lines will ignore
range_end_xpath. column_number_xpath and range_start_xpath are assumed to always refer
to locations on the starting line of the xml node.

Value

For xml_nodes, a lint. For xml_nodesets, lints (a list of lints).

Description

Yoda tests use (expected, actual) instead of the more common (actual, expected). This is
not always possible to detect statically; this linter focuses on the simple case of testing an expression
against a literal value, e.g. (1L, foo(x)) should be (foo(x), 1L).

Usage

yoda_test_linter()
