Package ‘littler’

Type Package

Title R at the Command-Line via ‘r’

Version 0.3.20

Date 2024-03-23

Author Dirk Eddelbuettel and Jeff Horner (2006-2008)

Maintainer Dirk Eddelbuettel <edd@debian.org>

Description A scripting and command-line front-end

is provided by ‘r’ (aka ‘littler’) as a lightweight binary wrapper around
the GNU R language and environment for statistical computing and graphics.
While R can be used in batch mode, the r binary adds full support for
both 'shebang'-style scripting (i.e. using a hash-mark-exclamation-path
expression as the first line in scripts) as well as command-line use in
standard Unix pipelines. In other words, r provides the R language without
the environment.

Description

The \texttt{r} binary provides a convenient and powerful front-end. By embedding R, it permits four distinct ways to leverage the power of R at the shell prompt: scripting, filename execution, piping and direct expression evaluation.

Details

The \texttt{r} front-end was written with four distinct usage modes in mind.

First, it allow to write so-called 'shebang' scripts starting with \texttt{#!/usr/bin/env r}. These 'shebang' scripts are perfectly suited for automation and execution via e.g. via \texttt{cron}.

Second, we can use \texttt{r somefile.R} to quickly execute the name R source file. This is useful as \texttt{r} is both easy to type—and quicker to start that either R itself, or its scripting tool Rscript, while still loading the methods package.

Third, \texttt{r} can be used in 'pipes' which are very common in Unix. A simple and trivial example is \texttt{echo 'cat(2+2)' | r} illustrating that the standard output of one program can be used as the standard input of another program.

Fourth, \texttt{r} can be used as a calculator by supplying expressions after the \texttt{-e} or \texttt{--eval} options.

Value

Common with other shell tools and programs, \texttt{r} returns its exit code where a value of zero indicates success.

Note

On OS X one may have to link the binary to, say, \texttt{lr} instead. As OS X insists that files named R and \texttt{r} are the same, we cannot use the latter.

Author(s)

Jeff Horner and Dirk Eddelbuettel wrote \texttt{littler} from 2006 to today, with contributions from several others.

Dirk Eddelbuettel \texttt{<edd@debian.org>} is the maintainer.
Examples

## Not run:
```
#!/usr/bin/env r  ## for use in scripts
other input | r       ## for use in pipes
r somefile.R ## for running files
r -e 'expr'  ## for evaluating expressions
r --help    ## to show a quick synopsis
```

## End(Not run)

---

Return Path to R Binary

Description

Return the path of the install R binary.

Usage

```
r(usecat = FALSE)
```

Arguments

- `usecat` : Optional toggle to request output to stdout (useful in Makefiles)

Details

The test for Windows is of course superfluous as we have no binary for Windows. Maybe one day...

Value

The path is returned as character variable. If the `usecat` option is set the character variable is displayed via `cat` instead.
