Package ‘longurl’

October 13, 2022

Title  Expand Short ’URLs’
Version  0.3.3
Description  Tools are provided to expand vectors of short URLs into long ’URLs’.
            No ’API’ services are used, which may mean that this operates more slowly than ’API’ services do (since they usually cache results of expansions that every user of the service requests). You can setup your own caching layer with the ’memoise’ package if you wish to have a speedup during single sessions or add larger dependencies, such as ’Redis’, to gain a longer-term performance boost at the expense of added complexity.

expand_urls

Expand a vector of (short) URLs using

Description
Pass in a vector of URLs (ostensibly "short" URLs) and receive a data frame of the original URLs and expanded URLs.

Usage

```r
expand_urls(
  urls_to_expand,
  warn = TRUE,
  agent = "longurl-r-package",
  seconds = 5,
  .progress = FALSE
)
```

Arguments

- `urls_to_expand`: character vector of URLs.
- `warn`: show any warnings (API or otherwise) as messages.
- `agent`: user agent to use (some sites switchup content based on user agents). Defaults to "longurl-r-package".
- `seconds`: number of seconds to wait for a response until giving up. Cannot be <1ms.
- `.progress`: kept for legacy functionality but ignored.

Value

A tibble/data frame with the original URLs in ‘orig_url’, expanded URLs in ‘expanded_url’ and the HTTP ‘status_code’ of the expanded URL. Completely invalid URLs result in a ‘NA’ value for ‘expanded_url’ & ‘status_code’.

Examples

```r
test_urls <- c("http://t.co/D4C7aWYIiA",
               "1.usa.gov/1J6GNoW",
               "ift.tt/1L2L1fr")
big_urls <- expand_urls(test_urls)
head(big_urls)
```
**Description**

Tools are provided to expand vectors of short URLs into long URLs. No ‘API’ services are used, which may mean that this operates more slowly than ‘API’ services do (since they usually cache results of expansions that every user of the service requests). You can setup your own caching layer with the ‘memoise’ package if you wish to have a speedup during single sessions or add larger dependencies, such as ‘Redis’, to gain a longer-term performance boost at the expense of added complexity.
