Package ‘loon.ggplot’

February 7, 2022

Type Package

Title A Grammar of Interactive Graphics

Version 1.3.1

Description Provides a bridge between the ‘loon’ and ‘ggplot2’ packages. Extends the grammar of ggplot to add clauses to create interactive ‘loon’ plots. Existing ggplot(s) can be turned into interactive ‘loon’ plots and ‘loon’ plots into static ggplot(s); the function ‘loon.ggplot()’ is the bridge from one plot structure to the other.

License GPL-2

BugReports https://github.com/great-northern-diver/loon.ggplot/issues

Depends R (>= 3.4.0), tcltk, methods, loon (>= 1.3.2), ggplot2, ggmulti

Imports stats, utils, grDevices, grid, gridExtra, scales, patchwork, rlang

Suggests GGally, magrittr, tidyr, zenplots, dplyr, gtable, png, tools, tibble, testthat, knitr, rmarkdown, covr, maps, hexbin, nycflights13, ggplot2movies

RoxygenNote 7.1.1

Encoding UTF-8

VignetteBuilder knitr

Language en-US

NeedsCompilation no

Author Zehao Xu [aut, cre], R. Wayne Oldford [aut]

Date/Publication 2022-02-07 21:50:06 UTC
### Description

Set `active` and/or `activeGeomLayers`

### Usage

```r
active(active = NULL, activeGeomLayers = NULL)
```

### Arguments

- **active**
  - a logical or a logical vector of length `n` that determines which observations are active (TRUE and hence appear in the plot) and which are inactive (FALSE and hence do not appear). Default is TRUE.
activeGeomLayers
determine which geom layer is interactive by its ‘geom_...’ position in the grammar of the expression. Currently, only `geom_point()` and `geom_histogram()` can be set as the active geom layer(s) so far. (N.B. more than one `geom_point()` layer can be set as an active layer, but only one `geom_histogram()` can be set as an active geom layer and it can be the only active layer.)

Value

a ggproto object

See Also

`linking`, `selection`, `zoom`, `hover`, `interactivity`

Examples

```r
if(interactive()) {
  # set active layer
  l_ggplot(mtcars, aes(mpg, wt, shape = factor(cyl))) +
  geom_point(colour = "black", size = 4.5) +
  geom_point(colour = "pink", size = 4) +
  geom_point(aes(shape = factor(cyl))) +
  # only show manual transmission cars
  # in the second interactive layer
  active(active = mtcars$am == 1,
         activeGeomLayers = 2)

  # Then, click the 'reactivate' button on loon inspector
  # to display all interactive points
}
```

---

**Cartesianxy2Polarxy**

*Transform the x, y positions from a Cartesian coordinate to a polar coordinate*

**Description**

Used in the ‘loonLayer’ construction to access the x, y positions embedded in the polar coordinate system.

**Usage**

```r
Cartesianxy2Polarxy(layerGeom, coordinates, data, ggplotPanelParams, ...)
```
get_activeGeomLayers

Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>layerGeom</td>
<td>A ggplot layer object</td>
</tr>
<tr>
<td>coordinates</td>
<td>A ggplot object coordinate system</td>
</tr>
<tr>
<td>data</td>
<td>the data used for the transformation</td>
</tr>
<tr>
<td>ggplotPanelParams</td>
<td>some non-data panel parameters, i.e. the range of theta, the range of radius, theta major, theta minor, etc. It is obtained from the ggplot_build(p)$layout$panel_params where &quot;p&quot; is a ggplot object</td>
</tr>
</tbody>
</table>

Examples

```r
p <- ggplot(mtcars, aes(wt, mpg)) +
  geom_point() +
  coord_polar()

layerGeom <- p$layers[[1L]]$geom
coordinates <- p$coordinates
build <- ggplot_build(p)
data <- build$data[[1L]]
ggplotPanelParams <- build$layout$panel_params[[1L]]

polarXY <- Cartesianxy2Polarxy(layerGeom, coordinates, data, ggplotPanelParams)
plot(polarXY$x, polarXY$y)
```

Description

‘get_activeGeomLayers’ will return the geom layer index which can be active

Usage

get_activeGeomLayers(ggObj)

Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ggObj</td>
<td>a ggplot object</td>
</tr>
</tbody>
</table>

Details

‘ggplot2loon’ has an argument called ‘activeGeomLayers’. It is a vector to determine which geom layers can be active. The default setting is ‘integer(0)’; however, ‘ggplot2loon’ will automatically search the first ‘geom_histogram’ or ‘geom_point’ layer to make it active. ‘get_activeGeomLayers’ is more like a guidance and give us a hint which one can be set as active.
get_scaledData

Value

a numerical vector of indices (which layer can be interactive)

See Also

ggplot2loon

Examples

```r
if(interactive()) {
    df <- data.frame(x = 1:3, y = 1:3, colour = c(1,3,5))
    xgrid <- with(df, seq(min(x), max(x), length = 50))
    interp <- data.frame(
        x = xgrid,
        y = approx(df$x, df$y, xout = xgrid)$y,
        colour = approx(df$x, df$colour, xout = xgrid)$y
    )
    p1 <- ggplot(data = df, aes(x, y, colour = colour)) +
        geom_line(interp, mapping = aes(x, y, colour = colour), size = 2) +
        geom_point(size = 5)
    agL <- get_activeGeomLayers(p1)
    ggplot2loon(p1, activeGeomLayers = agL)
    p2 <- ggplot(economics) +
        geom_rect(
            aes(xmin = start, xmax = end, fill = party),
            ymin = -Inf, ymax = Inf, alpha = 0.2,
            data = presidential
        ) +
        geom_text(
            aes(x = start, y = 2500, label = name), data = presidential,
            size = 3, vjust = 0, hjust = 0, nudge_x = 50
        ) +
        geom_line(aes(date, unemploy)) +
        scale_fill_manual(values = c("blue", "red"))
    # none can be interactive
    agL <- get_activeGeomLayers(p2)
    #transparency is not allowed in tcltk
    ggplot2loon(p2, ggGuides = TRUE, activeGeomLayers = agL)
}
```

get_scaledData  scale data

Description

It is mainly used in serial axes
Usage

get_scaledData(
  data,
  sequence = NULL,
  scaling = c("variable", "data", "observation", "none"),
  displayOrder = NULL,
  keep = FALSE,
  as.data.frame = FALSE
)

Arguments

data A data frame
sequence vector with variable names that defines the axes sequence. If NULL, it will be set as the column names automatically.
scaling one of 'variable', 'data', 'observation' or 'none' to specify how the data is scaled.
displayOrder the order of the display
keep If TRUE, return the variables not shown in sequence as well; else only return the variables defined in sequence.
as.data.frame Return a matrix or a data.frame

---

ggplot2loon  ggplot to loon

Description

Create an interactive ‘loon’ widget from a ggplot object

Usage

ggplot2loon(
  ggObj,
  ...,
  activeGeomLayers = integer(0),
  layerId = NULL,
  scaleToFun = NULL,
  ggGuides = FALSE,
  parent = NULL,
  pack = TRUE,
  exteriorLabelProportion = 1/5,
  canvasHeight = 700,
  canvasWidth = 850,
  tkLabels = NULL
)
Arguments

- **ggObj**: a ggplot or ggmatrix object
- **activeGeomLayers**: to determine which geom layer is active. Only geom_point() and geom_histogram() can be set as active geom layer(s) so far. (Notice, more than one geom_point() layers can be set as active layers, but only one geom_histogram() can be set as an active geom layer)

Additional arguments...

- **layerId**: numerical; which layer to scale to
- **scaleToFun**: scale to function. See zoom.
- **ggGuides**: logical (default FALSE) to determine whether to draw a ggplot background or not.
- **parent**: parent widget path (Tk toplevel)
- **pack**: logical (default TRUE) to pack widgets. If FALSE, widgets will be produced but won’t be packed and so will not appear in the display.

- **exteriorLabelProportion**: space assigned to the vertical height/horizontal width of each exterior label expressed as a proportion of a single plot’s height/width. Default is 0.2. This is translated to a row/column span = 1 / exteriorLabelProportion for the plot size in tkgrid().

- **canvasHeight**: the height of canvas
- **canvasWidth**: the width of canvas

- **tkLabels**: Deprecated: logical (or NULL) to indicate whether the plot(s) are to be wrapped by exterior labels (title, subtitle, xlabel or ylabel) using tk.grid()

Value

- A loon single widget or a compound object

Examples

```r
if(interactive()) {
  p <- ggplot(mtcars, aes(wt, mpg)) + geom_point()
  g <- ggplot2loon(p)

  p1 <- ggplot(mtcars) +
    geom_point(aes(x = wt, y = mpg,
                  colour = factor(gear))) +
    facet_wrap(~am)
  g1 <- ggplot2loon(p1)

  df <- data.frame(
    x = rnorm(120, c(0, 2, 4)),  
    y = rnorm(120, c(1, 2, 1)),  
    z = letters[1:3]
  )
}
```
df2 <- dplyr::select(df, -z)
scatterplots <- ggplot(df, aes(x, y)) +
  geom_point(data = df2, colour = "grey70") +
  geom_point(aes(colour = z)) +
  facet_wrap(~z)

# The first point layer is set as the model layer
suppressWarnings(
  lp_scatterplots_active1 <- ggplot2loon(scatterplots,
    activeGeomLayers = 1,
    linkingGroup = "test")
)
# Here, the gray points are interactive (not the colourful ones)

# The second point layer is set as the model layer
lp_scatterplots_active2 <- ggplot2loon(scatterplots,
    activeGeomLayers = 2)
# Here, the colourful points are interactive

# Both point layers could be interactive
suppressWarnings(
  lp_scatterplots_active12 <- ggplot2loon(scatterplots,
    activeGeomLayers = c(1,2))
)
# Here, all points are interactive

########### ggmatrix to loon ###########
if(requireNamespace("GGally")) {
  pm <- GGally::ggpairs(iris, column = 1:4,
    ggplot2::aes(colour=Species))
  lg <- ggplot2loon(pm)
}

########### patchwork to loon ###########
if(requireNamespace("patchwork")) {
  p1 <- ggplot(mtcars) +
    geom_point(aes(mpg, disp))
  p2 <- ggplot(mtcars) +
    geom_boxplot(aes(gear, disp, group = gear))
  # place two plots side by side
  patchwork <- p1 + p2
  ggplot2loon(patchwork)
  # See vignette `ggplots --> loon plots` for more details
}
}
Description
Pack a ggplot object forward to ggplot2loon expressions via a pipe-operator "%>%".

Usage
\[ \text{gg\_pipe(data, ggObj)} \]

Arguments
- **data**: a data frame to use for ggplot
- **ggObj**: a ggplot object to be passed through

Details
When "+" and "%>%" both appear in pipe operations, "%>%" takes the priority of "+", e.g:
\[ \text{mtcars} \%\% \text{ggplot(aes(mpg, wt, colour = cyl)) + geom\_point()} \%\% \text{ggplot2loon()}. \]
an error would occur. The reason is
\[ \text{geom\_point()} \%\% \text{ggplot2loon()} \]
would run before
\[ \text{ggplot(aes(mpg, wt, colour = cyl)) + geom\_point()}. \]
Hence, we need a function \text{gg\_pipe()} to pack the ggplot object and force operations happen in order.

Value
- a ggplot evaluate object

Examples
```r
if(requireNamespace("magrittr") \&\& interactive()) {
## Not run:
# Error
  g <- mtcars \%\%
  ggplot(aes(mpg, wt, colour = cyl)) +
  geom_point() \%\% ggplot2loon()

## End(Not run)
  g <- mtcars \%\%
  gg\_pipe(
    ggplot(aes(mpg, wt, colour = cyl)) + geom_point()
  ) \%\%
  ggplot2loon()
}
```
**g_getLocations**

*get locations for ggmatrix*

**Description**

For the target compound loon plot, determines location in ggmatrix.

**Usage**

```r
g_getLocations(target)
```

## Default S3 method:

```r
g_getLocations(target)
```

## S3 method for class 'l_pairs'

```r
g_getLocations(target)
```

**Arguments**

- **target**
  - the (compound) loon plot whose locations are needed to lay out.

**Value**

- a list of an appropriate subset of the named location arguments `c("ncol", "nrow", "layout_matrix", "heights", "widths")`. `layout_matrix` is an `nrow` by `ncol` matrix whose entries identify the location of each plot in `g_getPlots()` by their index.

**See Also**

- `l_getLocations`, `g_getPlots`

---

**g_getPlots**

*get ggplots*

**Description**

For the target compound loon plot, determines all the ggplots based on the compound loon plot.

**Usage**

```r
g_getPlots(
  target,
  asAes = TRUE,
  selectedOnTop = TRUE,
  showNearestColor = FALSE
)
```
## Default S3 method:

```r
g_getPlots(
  target,
  asAes = TRUE,
  selectedOnTop = TRUE,
  showNearestColor = FALSE
)
```

## S3 method for class 'l_pairs'

```r
g_getPlots(
  target,
  asAes = TRUE,
  selectedOnTop = TRUE,
  showNearestColor = FALSE
)
```

### Arguments

- **target**: the (compound) loon plot
- **asAes**: logical; set aesthetics attributes, i.e. 'color', 'fill' as variables (default TRUE) or general visual properties (FALSE). See details
- **selectedOnTop**: logical and default is TRUE; whether to display the selected points on top. See details.
- **showNearestColor**: logical and default is FALSE; if TRUE, the legend of color and fill (hex code) would be converted to the R built-in color names. For some hex codes, there are no precise matching. Consequently, these colors will be converted to the R built-in color names which are the "nearest" of these hex codes.

### Value

- a list of ggplots.

### See Also

- `l_getPlots`, `g_getLocations`

---

### hover

**Modify the hover component**

#### Description

Provides a pop up display as the mouse hovers over a plot element in the interactive plot.

#### Usage

```r
hover(itemLabel = NULL, showItemLabels = NULL)
```
interactivity

Arguments

itemLabel  A character vector of length n with a string to be used to pop up when the mouse hovers above that element.

showItemLabels  A single logical value: TRUE if pop up labels are to appear on hover, FALSE (the default) if they are not.

Value

a ggproto object

See Also

active, linking, zoom, selection, interactivity

Examples

if(interactive()) {

l_ggplot(mpg, mapping = aes(x = displ, y = cty)) +
  geom_point(size = 4) +
  # push the states of scatter plot to the histogram
  hover(itemLabel =
    with(mpg,
    paste0("model: ", manufacturer, " ", model, "\n",
    "year: ", year, "\n",
    "drive way: ", drv, "\n",
    "fuel type: ", fl)
    ),
    showItemLabels = TRUE
  )
  # hover the mouse on top of any point to query
}

interactivity  Modify the interactivity component

Description

Set interactive components (e.g. linking, selection, etc)

Usage

interactivity(
  linkingGroup = NULL,
  linkingKey = NULL,
  linkedStates = NULL,
  sync = NULL,
  active = NULL,
activeGeomLayers = NULL,
selected = NULL,
selectBy = NULL,
selectionLogic = NULL,
layerId = NULL,
scaleToFun = NULL,
itemLabel = NULL,
showItemLabels = NULL,
...
)

Arguments

linkingGroup The string identifying the group of linked plots that the current plot will join. Default is none.

linkingKey The length \( n \) character vector of unique keys. Default will be \( "0","1",\ldots,"n-1" \) where \( n \) is the number of elements (e.g., points) displayed.

linkedStates The character vector of display states to be linked. These can be "color", "selected", "active", "size" and "glyph" for an \('l_plot\) object and "color", "selected", "active" for an \('l_hist\) object. (These roughly correspond to aesthetics in a \('ggplot\).)

sync Either "pull" (the default) or "push" to indicate whether the values of the linked states of the plot are to be pulled from those of the other plots in the linking group, or the values are to be pushed to all other plots in the linking group. This matters only when joining an existing group of plots and the default value is typically the right thing to do.

active a logical or a logical vector of length \( n \) that determines which observations are active (TRUE and hence appear in the plot) and which are inactive (FALSE and hence do not appear). Default is TRUE.

activeGeomLayers determine which geom layer is interactive by its \('geom_\ldots\)' position in the grammar of the expression. Currently, only \( \text{geom_point()} \) and \( \text{geom_histogram()} \) can be set as the active geom layer(s) so far. (N.B. more than one \( \text{geom_point()} \) layer can be set as an active layer, but only one \( \text{geom_histogram()} \) can be set as an active geom layer and it can be the only active layer.)

selected a logical or a logical vector of length \( n \) that determines which observations are selected (TRUE and hence appear highlighted in the plot) and which are not. Default is FALSE and no points are highlighted.

selectBy A string determining how selection will occur in the interactive plot. Default is "sweeping" where a rectangular region is reshaped or "swept" out to select observations.; alternately "brushing" will indicate that a fixed rectangular region is moved about the display to select observations.

selectionLogic One of "select" (the default), "deselect", and "invert". The first highlights observations as selected, the second downlights them, and the third inverts them (downlighting highlighted observations and highlighting downlighted ones).

layerId numerical; which layer to scale to
scaleToFUn  scale to function. See zoom.
itemLabel  A character vector of length n with a string to be used to pop up when the mouse hovers above that element.
showItemLabels  A single logical value: TRUE if pop up labels are to appear on hover, FALSE (the default) if they are not.
...

Details
In interactive graphics, there are several fundamental infrastructures, such as querying, linking and selection. Component interactivity is used to set these features.

<table>

Value
a ggproto object

Examples

```r
if(interactive()) {
  # Modify the 'linkingGroup' and 'origin' of a hist object
  l_ggplot(mtcars, mapping = aes(x = wt)) +
  geom_histogram() +
  interactivity(linkingGroup = "mt", origin = 2)

  # linking with the histogram
  l_ggplot(mtcars, mapping = aes(x = wt, y = hp)) +
  geom_point(size = 4) +
  interactivity(linkingGroup = "mt") +
  facet_wrap(~cyl)

  p <- ggplot(economics_long, aes(value)) +
  facet_wrap(-variable, scales = 'free_x') +
  geom_histogram()

  # `p` is a ggplot object
  p
  # turn static `ggplot` to interactive `loon`
  p + interactivity()
}
```
is.CoordPolar  Is polar coordinate system?

Description
Determine whether the ggplot object has polar coordinate system

Usage
is.CoordPolar(coord)

Arguments
coord A ggplot object coordinate system

is.l_ggplot Reports whether x is a l_ggplot object

Description
Reports whether x is a l_ggplot object

Usage
is.l_ggplot(x)

Arguments
x An object to test

layout.coords layout matrix

Description
return the layout matrix of a list of loon plots

Usage
layout.coords(target)

Arguments
target an object ggplot2loon() returns
Value

a layout coordinate matrix

linking

Modify the linking component

Description

A group-key-state linking model is used to link plots in loon. This allows changes in one plot to propagate to all plots in the same linkingGroup and enables interactive features like brushing. Elements to be matched between plots are identified by linkingKey; within each plot, the key for each element (e.g., case, observation) is unique. The linkedStates identify which display states (e.g., "color") should change in concert with other plots in the linkingGroup.

Usage

linking(
  linkingGroup = NULL,
  linkingKey = NULL,
  linkedStates = NULL,
  sync = NULL
)

Arguments

linkingGroup The string identifying the group of linked plots that the current plot will join. Default is none.

linkingKey The length n character vector of unique keys. Default will be "0","1",...,"n-1" where n is the number of elements (e.g., points) displayed.

linkedStates The character vector of display states to be linked. These can be "color", "selected", "active", "size" and "glyph" for an 'l_plot' object and "color", "selected", "active" for an 'l_hist' object. (These roughly correspond to aesthetics in a 'ggplot'.)

sync Either "pull" (the default) or "push" to indicate whether the values of the linked states of the plot are to be pulled from those of the other plots in the linking group, or the values are to be pushed to all other plots in the linking group. This matters only when joining an existing group of plots and the default value is typically the right thing to do.

Value

a ggproto object

See Also

active, selection, zoom, hover, interactivity, l_getLinkedStates, l_setLinkedStates, l_configure
Examples

```r
if(interactive() && requireNamespace("dplyr")) {
  h <- l_hist(mtcars$hp,
              linkingKey = rownames(mtcars),
              linkingGroup = "mtcars")

  mtcars %>%
    mutate(carName = rownames(mtcars)) %>%
    l_ggplot(mapping = aes(x = wt, y = hp, color = factor(cyl))) +
    geom_point(size = 4) +
    # push the states of scatter plot to the histogram
    linking(linkingGroup = "mtcars",
            linkingKey = ~carName,
            sync = "push")
}
```

Description

A bridge between loon widgets and gg objects. It can take either a loon widget, a gg object (ggplot, GGally::ggmatrix) or a l_ggplot object, then create a corresponding gg (or loon) graphics.

Usage

```r
loon.ggplot(x, ...)

## S3 method for class 'gg'
loon.ggplot(x, ...)

## S3 method for class 'loon'
loon.ggplot(x, ...)

## S3 method for class 'zenplot'
loon.ggplot(x, ...)

## S3 method for class 'l_ggplot'
loon.ggplot(x, ...)
```

Arguments

- **x**: A loon widget, a ggplot object or a l_ggplot object.
- **...**: arguments used in either loon2ggplot() or ggplot2loon()
Value

If the input is a ggplot object, the output would be a loon widget; conversely, if the input is a loon widget, then it returns a ggplot object. If it is a l_ggplot object, loon.ggplot helps to return a loon widget.

See Also

Richer examples are in loon2ggplot, ggplot2loon, l_ggplot

Examples

```r
if(interactive()) {
  ######### loon --> gg #########
  # loon 3D plot
  l <- with(quakes,
            l_plot3D(long, lat, depth, linkingGroup = "quakes")
  )
  # equivalent to `loon2ggplot(l)`
  g <- loon.ggplot(l)
  g # a ggplot object
  
  ######### gg --> loon #########
  # ggplot histogram
  g <- ggplot(iris, mapping = aes(Sepal.Length, fill = Species)) +
        geom_histogram()
  # equivalent to `ggplot2loon(g)`
  l <- loon.ggplot(g)
  l # a loon widget
  
  ######### l_ggplot #########
  p <- l_ggplot(mpg, aes(displ, fill = factor(cyl))) +
        geom_histogram()
  class(p)
  # Function "print.l_ggplot" is called automatically
  p
  # Function "loon.ggplot" helps to return a loon widget
  q <- loon.ggplot(p)
  q
}
```

loon2ggplot.l_compound

Turn a loon widget to a ggplot object

Description

Create a ggplot object from a loon widget
Usage

```r
# S3 method for class 'l_compound'
loon2ggplot(
  target,
  asAes = TRUE,
  selectedOnTop = TRUE,
  showNearestColor = FALSE,
  ...
)

# S3 method for class 'l_facet_ggplot'
loon2ggplot(
  target,
  asAes = TRUE,
  selectedOnTop = TRUE,
  showNearestColor = FALSE,
  ...
)

# S3 method for class 'l_facet_grid'
loon2ggplot(
  target,
  asAes = TRUE,
  selectedOnTop = TRUE,
  showNearestColor = FALSE,
  ...
)

# S3 method for class 'l_facet_wrap'
loon2ggplot(
  target,
  asAes = TRUE,
  selectedOnTop = TRUE,
  showNearestColor = FALSE,
  ...
)

# S3 method for class 'l_layer_graph'
loon2ggplot(
  target,
  asAes = TRUE,
  selectedOnTop = TRUE,
  showNearestColor = FALSE,
  ...
)

# S3 method for class 'l_layer_histogram'
loon2ggplot(
```
target,
   asAes = TRUE,
   selectedOnTop = TRUE,
   showNearestColor = FALSE,
   ...
)

## S3 method for class 'l_layer_scatterplot'
loon2ggplot(
    target,
    asAes = TRUE,
    selectedOnTop = TRUE,
    showNearestColor = FALSE,
    ...
)

## S3 method for class 'l_pairs'
loon2ggplot(
    target,
    asAes = TRUE,
    selectedOnTop = TRUE,
    showNearestColor = FALSE,
    ...
)

## S3 method for class 'l_patchwork'
loon2ggplot(
    target,
    asAes = TRUE,
    selectedOnTop = TRUE,
    showNearestColor = FALSE,
    ...
)

## S3 method for class 'l_serialaxes'
loon2ggplot(
    target,
    asAes = TRUE,
    selectedOnTop = TRUE,
    showNearestColor = FALSE,
    ...
)

## S3 method for class 'zenLoon'
loon2ggplot(
    target,
    asAes = TRUE,
    selectedOnTop = TRUE,
loon2ggplot.l_compound

showNearestColor = FALSE,
...
)

loon2ggplot(
  target,
  asAes = TRUE,
  selectedOnTop = TRUE,
  showNearestColor = FALSE,
  ...
)

## Default S3 method:
loon2ggplot(
  target,
  asAes = TRUE,
  selectedOnTop = TRUE,
  showNearestColor = FALSE,
  ...
)

## S3 method for class 'l_plot'
loon2ggplot(
  target,
  asAes = TRUE,
  selectedOnTop = TRUE,
  showNearestColor = FALSE,
  ...
)

## S3 method for class 'l_hist'
loon2ggplot(
  target,
  asAes = TRUE,
  selectedOnTop = TRUE,
  showNearestColor = FALSE,
  ...
)

## S3 method for class 'l_plot3D'
loon2ggplot(
  target,
  asAes = TRUE,
  selectedOnTop = TRUE,
  showNearestColor = FALSE,
  ...
)
Arguments

target  a loon or a vector that specifies the widget, layer, glyph, navigator or context completely. The widget is specified by the widget path name (e.g. `.l0.plot`), the remaining objects by their ids.

asAes  logical; set aesthetics attributes, i.e. ‘color’, ‘fill’ as variables (default TRUE) or general visual properties (FALSE). See details

selectedOnTop  logical and default is TRUE; whether to display the selected points on top. See details.

showNearestColor  logical and default is FALSE; if TRUE, the legend of color and fill (hex code) would be converted to the R built-in color names. For some hex codes, there are no precise matching. Consequently, these colors will be converted to the R built-in color names which are the “nearest” of these hex codes.

... arguments used inside loon2ggplot(), not used by this method

Details

In ggplot2, typically, there are two ways to set the aesthetic attributes, either take them as variables asAes = TRUE (set in the function aes()) or constants asAes = FALSE. The main benefits to consider them as variables are that 1. legend could be displayed; 2. convenient for further analysis.

In loon, when points were selected (highlighted), the order would be changed so that the highlighted points would be displayed at the front. To turn the loon plot static, if selectedOnTop = TRUE, the points would be partitioned into two groups – one group representing the un-highlighted points, and the other group representing the highlighted points. The un-highlighted group would be drawn first, then the selected group; if selectedOnTop = FALSE, no partition would be applied so that the displayed order remained. However, the highlighted points could be displayed at the back. See examples.

Value

a ggplot object (or a patchwork object, a extension of ggplot2)

Examples

```r
if(interactive()) {
  ######## Basic ########
  lp <- l_plot(iris,
               color = iris$Species,
               glyph = "circle")
  gp <- loon2ggplot(lp)
  gp # a ggplot object

  # add smooth layer, grouped by color
  gp +
    geom_smooth(aes(color = color)) +
  # give meaningful legend label names
  scale_color_manual(
    # make sure the order is correct
    values = unique(hex12tohex6(lp['color'])),
```
```r
labels = c("setosa", "versicolor", "virginica")

# histogram
lh <- l_hist(mtcars$mpg, 
  color = factor(mtcars$gear))

gh0 <- loon2ggplot(lh)
# facet by `fill`
gh0 + facet_wrap(~fill)

######## Argument `asAes` ########
gh1 <- loon2ggplot(lh, asAes = FALSE)
gh1
## Not run:
# The bins are constructed by `ggplot2::geom_rect`
# Very limited manipulations can be made
# ERROR
gh1 + facet_wrap(~fill)
## End(Not run)

######## Argument `selectedOnTop` ########
p <- l_plot(iris, color = iris$Species)
p[\textquotesingle selected\textquotesingle][iris$Petal.Length > 5] <- TRUE
g <- loon.ggplot(p)
# It looks correct.
g
# facet by "Species"
## Not run:
g + facet_wrap(iris$Species)
## End(Not run)

# Something is wrong here. There is a pink point (at least one)
# in species "versicolor"! It is because after points are
# highlighted, the displayed order has been changed.
# Set `selectedOnTop` as FALSE, as in
loon.ggplot(p, selectedOnTop = FALSE) + 
  facet_wrap(iris$Species)

######## l_patchwork --> ggplot ########
library(patchwork)
p1 <- ggplot(mtcars) + geom_point(aes(mpg, disp))
p2 <- ggplot(mtcars) + 
  geom_boxplot(aes(gear, disp, group = gear))
p3 <- ggplot(mtcars) + geom_smooth(aes(disp, qsec))
design <- c(
  area(1,1),
  area(1,2),
  area(2,1,2,2)
)
pp <- p1 + p2 + p3 + plot_layout(design = design)
```
# turn a patchwork obj to a loon (l_compound)
lp <- ggplot2loon(pp)
# turn a loon (l_compound) back to a patchwork
plp <- loon2ggplot(lp)
plp # almost identical to pp

####### zneplots --> ggplot #######
library(zenplots)
stopifnot(packageVersion("zenplots") > "1.0.4")
zen <- zenplots::zenplot(iris, plot1d = "density", pkg = "loon")
ggzen <- loon.ggplot(zen)
ggzen +
  patchwork::plot_annotation(title = "This is a ggplot")
}

loonLayer

Transform geom layers to loon layers

Description

Function loonLayer is used to create loon non-interactive layers. For some ggplot2 extension packages, one can edit this function to realize the transformation.

Usage

loonLayer(
  widget,
  layerGeom,
  data,
  ggplotPanelParams,
  ggObj,
  parent,
  label,
  ...
)

Arguments

widget a loon widget
layerGeom a ggplot Geom layer object
data a data frame (i.e. x, y, etc) of this particular layer
ggplotPanelParams ggplot panel parameters
 ggObj the ggplot object
parent a valid Tk parent widget path.
label label used in the layers inspector
... not for users

---

### `l_getSubtitles`

**Description**

Return the subtitles

**Usage**

```r
l_getSubtitles(target)
```

```r
## S3 method for class 'l_facet_ggplot'
l_getSubtitles(target)
```

```r
## S3 method for class 'l_facet_wrap'
l_getSubtitles(target)
```

```r
## S3 method for class 'l_facet_grid'
l_getSubtitles(target)
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>target</td>
<td>an <code>l_facet_ggplot</code> object. If the ggplot object is faceted (either by <code>facet_wrap</code> or <code>facet_grid</code>), an <code>l_facet_ggplot</code> object will be returned once it is turned to a loon plot.</td>
</tr>
</tbody>
</table>

**Value**

A list of labels, i.e. subtitles, labels, title, etc

**Examples**

```r
if(interactive()) {
p <- ggplot(mpg, aes(displ, hwy)) + geom_point() + facet_wrap(vars(class))
lp <- loon.ggplot(p)
l_getSubtitles(lp)
}
```
l_ggplot

Automatically create a loon widget

Description
Create a loon widget with ggplot syntax

Usage

```r
l_ggplot(data = NULL, mapping = aes(), ..., environment = parent.frame())
```

Arguments

- `data`: Default dataset to use for plot. If not already a data.frame, will be converted to one by `fortify()`. If not specified, must be supplied in each layer added to the plot.
- `mapping`: Default list of aesthetic mappings to use for plot. If not specified, must be supplied in each layer added to the plot.
- `...`: Other arguments passed on to methods. Not currently used.
- `environment`: DEPRECATED. Used prior to tidy evaluation.

Details

function `l_ggplot()` wraps function `ggplot()` with assigning an additional class "l_ggplot" to the output. The returned object is called an `l_ggplot` object. To draw a ggplot object, S3 method `print.ggplot` will be rendered so that a static graphic is displayed. While, for an `l_ggplot()` object, S3 method `print.l_ggplot` will be rendered which will return an interactive loon widget.

Value

It will return an `l_ggplot` object with class `c("l_ggplot", "gg", "ggplot")`. Then print a loon plot automatically.

See Also

- `ggplot`, `ggplot2loon`, `print.l_ggplot`  
- `loon.ggplot`

Examples

```r
if(interactive()) {
  p <- l_ggplot(mpg, aes(displ, cty)) +
  geom_point(
    size = 4,
    mapping = aes(color = factor(cyl))
  )
  # p is an `l_ggplot` object, `print.l_ggplot(p)` will be called automatically.
```
# Then, at printing time, an `l_ggplot` object will be transformed to a `loon` widget

```r
## Not run:
# Assign a widget from current path
# suppose the path of `p` is `.l0.ggplot`
q <- l_getFromPath('.l0.ggplot')
# q is a `loon` widget
q

## End(Not run)

# An alternative way to return a real loon widget from `p` (a `l_ggplot` object)
# is to call the function `loon.ggplot()`.
q <- loon.ggplot(p)
q

# pipe more components
p +
  facet_grid(rows = vars(drv)) +
  linking(linkingGroup = "mpg") +
  ggtitle("displ versus cty")
# a linked bar plot
l_hist(mpg$class, linkingGroup = "mpg")

# a 3D object
# press the button key `R` to rotate the plot
l_ggplot(mtcars,
         mapping = aes(x = wt, y = hp, z = drat)) +
         geom_point(size = 4) +
         scale_multi()
```

---

**print.l_ggplot**

Explicitly draw plot

**Description**

Explicitly draw plot

**Usage**

```r
## S3 method for class 'l_ggplot'
print(x, message = TRUE, ...)
```

**Arguments**

- `x` plot to display
- `message` logical; if TRUE, the way to create handle will be printed out.
- `...` other arguments used to modify function ggplot2loon
Value

Invisibly returns a loon widget

---

**scaleBox**  
*Box scaling in 3D rotation*

---

**Description**

the variable is scaled to have equal ranges and, when center = TRUE, to be centred by the average of the min and max.

**Usage**

```
scaleBox(center = TRUE)
```

**Arguments**

- `center` either a logical value or numeric-alike vector of length equal to the number of columns of x, where ‘numeric-alike’ means that `as.numeric(.)` will be applied successfully if `is.numeric(.)` is not true.

**Value**

A trans object

**See Also**

`l_scale3D`

---

**scale_multi**  
*Position scales for continuous data (x, y & z)*

---

**Description**

Scaling the coordinates for 3D visualization

**Usage**

```
scale_multi(trans = scaleBox(center = TRUE), ...)
```
Arguments

trans  For continuous scales, the name of a transformation object or the object itself.
       Built-in transformations include "asn", "atanh", "boxcox", "date", "exp", "hms", 
       "identity", "log", "log10", "log1p", "log2", "logit", "modulus", "probability", 
       "probit", "pseudo_log", "reciprocal", "reverse", "sqrt" and "time". A transforma-
       tion object bundles together a transform, its inverse, and methods for generating 
       breaks and labels. Transformation objects are defined in the scales package, 
       and are called <name>_trans (e.g., scales::boxcox_trans()). You can create 
       your own transformation with scales::trans_new().

...  Other arguments passed on to scale_(x|y)_continuous(). To set the position 
      scales, three scales (x, y, z) has to be set simultaneously.

Details

In 3D rotation, different scales of variables x, y and z may cause an issue that the points appear to 
be off the window even with a minor tweak. Additionally, if one variable is in a large scale, the 
shape of the 3D plot may be dominated. Setting scale_multi can ensure the scales in the same 
measurement, as we rotate the plot, most points will stay inside the current view.

Value

a list of the ggproto objects

Examples

if(interactive()) {

    dsamp <- dplyr::sample_n(diamonds, 100)

    # Not run:
    # press 'R'\, then rotate with a minor tweak,
    # Issues:
    # 1: the points are off the window
    # 2: Always in a line shape
    l_ggplot(dsamp, aes(x = carat, y = price, 
                      z = depth, colour = color)) +
        geom_point()
    # End(Not run)

    # set scales
    l_ggplot(dsamp, aes(x = carat, y = price, 
                      z = depth, colour = color)) +
        geom_point() +
        scale_multi()

    # customized 'trans'
    logp1_base10_trans <- scales::trans_new(
        name = "logp",
        trans = function(x) log(x + 1, base = 10),
        inverse = function(x) 10**x - 1,

...
breaks = scales::log_breaks()

l_ggplot(dsamp, aes(x = carat, y = price,
       z = depth, colour = color)) +
  geom_point() +
  scale_multi(trans = log10_base10_trans)
}

---

## selection

Modify the selected component

### Description

Set which elements (i.e., observations) are "selected". These will be shown as highlighted in the plot using the current "highlight" colour (see `l_userOptions`).

### Usage

```r
selection(selected = NULL, selectBy = NULL, selectionLogic = NULL)
```

### Arguments

- **selected**
  - a logical or a logical vector of length $n$ that determines which observations are selected (true and hence appear highlighted in the plot) and which are not. Default is FALSE and no points are highlighted.

- **selectBy**
  - A string determining how selection will occur in the interactive plot. Default is "sweeping" where a rectangular region is reshaped or "swept" out to select observations; alternately "brushing" will indicate that a fixed rectangular region is moved about the display to select observations.

- **selectionLogic**
  - One of "select" (the default), "deselect", and "invert". The first highlights observations as selected, the second downlights them, and the third inverts them (downlighting highlight observations and highlighting downlighted ones).

### Details

There are two ways to directly select elements on, for example, a scatterplot using the mouse: either by "sweeping" or by "brushing". "Sweeping" allows us to sweep out a contiguous rectangular area of the plot, while, by "brushing", a fixed rectangular area is brushes across the plot selecting all points within the rectangle.

The selection logic give users more flexibility to users not only highlight the elements, but also to downlight, and even to invert selections (changing the highlighted to downlighted, and vice versa).

### Value

- a ggproto object
See Also

active, linking, zoom, hover, interactivity, l_userOptions

Examples

if(interactive()) {

    # highlight the four gear cars
    fourGear <- rep(FALSE, nrow(mtcars))
    fourGear[mtcars$gear == 4] <- TRUE

    l_ggplot(mtcars, mapping = aes(x = wt, y = hp, color = factor(cyl))) +
             geom_point(size = 4) +
    # push the states of scatter plot to the histogram
    selection(selected = fourGear)
}

Description

Change the visible plot region by scaling to different elements of the display.

Usage

zoom(layerId = NULL, scaleToFun = NULL)

Arguments

layerId numerical; which layer to scale the plot by.
scaleToFun scale to function. See details.

Details

Argument layerId is used for additional plot region settings. If the layerId is set as NULL (default), the region of the interactive graphics loon will be determined by the ggplot object (i.e. coord_cartesian, xlim, etc); else one can use scaleToFun to modify the region of the layer.

The scaleToFun is a function to scale the region. If it is NULL (default), based on different layers, different scale functions will be applied. For example, if the layer is the main graphic model, i.e. l_plot l_hist, then the default scaleToFun is l_scaleto_plot; else if the layer is a general l_layer widget, the default scaleToFun would be l_scaleto_layer (see get_activeGeomLayers).

If it is not NULL, users can select one that precisely tailor their own problems. The table shows the available scaleToFun functions

<table>
<thead>
<tr>
<th>scale to</th>
<th>Subfunction</th>
</tr>
</thead>
<tbody>
<tr>
<td>plot</td>
<td>l_scaleto_plot</td>
</tr>
</tbody>
</table>
Users can also supply their own function, providing its arguments match those of the functions shown in the above table.

**Value**

a ggproto object

**See Also**

`active, linking, selection, hover, interactivity`

**Examples**

```r
if(interactive()) {
  p <- l_ggplot(mtcars, 
               mapping = aes(x = hp, y = mpg)) +
    geom_point(mapping = aes(color = factor(gear))) +
    geom_smooth(data = mtcars[mtcars$gear == 4, ],
               method = "lm")
  # a scatter plot with a fitted line on 4 gear cars
  p
  # scale to the second layer (smooth line)
  p + zoom(layerId = 2)
  # highlight the 3 gear cars
  # scale to the selected points
  p +
    selection(mtcars$gear == 3) +
    zoom(layerId = 1,
         scaleToFun = loon::l_scaleto_selected)
}
```
