Package ‘metap’

January 23, 2020

Type Package
Title Meta-Analysis of Significance Values
Version 1.3
Date 2020-01-22
Description The canonical way to perform meta-analysis involves using effect sizes. When they are not available this package provides a number of methods for meta-analysis of significance values including the methods of Edgington, Fisher, Lancaster, Stouffer, Tippett, and Wilkinson; a number of data-sets to replicate published results; and a routine for graphical display.

Meta-Analysis of Significance Values

Description

The canonical way to perform meta-analysis involves using effect sizes. When they are not available this package provides a number of methods for meta-analysis of significance values including the methods of Edgington, Fisher, Lancaster, Stouffer, Tippett, and Wilkinson; a number of data-sets to replicate published results; and a routine for graphical display.

Details

Index of help topics:

- allmetap: Carry out all or some of the methods in the package
- beckerp: Example data
- invchisq: Combine p values using inverse chi squared method
- invt: Combine p values using inverse t method
- logitp: Combine p values using logit method
- meanp: Combine p values by the mean p method
- meanz: Combine p values using mean z method
- metap-package: Meta-Analysis of Significance Values
- plotp: Q-Q plot of p-values
- schweder: Schweder and Spjotvoll plot
- sumlog: Combine p-values by the sum of logs (Fisher's) method
- sump: Combine p-values using the sum of p (Edgington's) method
- sumz: Combine p-values using the sum of z (Stouffer's) method
- truncated: Truncated product method routine
- two2one: Convert two-sided p-values to one-sided
- votep: Combine p-values by the vote counting method
- wilkinsonp: Combine p-values using Wilkinson's method
Further information is available in the following vignettes:

- `compare` Comparison of methods in the metap package (source)
- `metap` Introduction to the metap package (source)

Provides a number of ways in which significance levels may be combined in a meta-analysis and includes most of the methods in Becker (1994). It includes a number of datasets taken from the literature. It also provides a display and an informal graphical test due to Schweder and Spjotvoll (Schweder and Spjotvoll 1982) and the lowest slope line of Benjamini and Hochberg (Benjamini and Hochberg 2000).

There is a vignette. Some further documentation and, possibly, a development version may be seen at http://www.dewey.myzen.co.uk/meta/meta.html.

See Also

The issue of meta-analysis of significance levels is not completely unconnected with the topic of adjustment for multiple comparisons as in for example `p.adjust`

```
allmetap Carry out all or some of the methods in the package
```

Description

Enables all or a selected number of the package methods to be executed on the same dataset
allmetap

Usage

allmetap(p, method = NULL)

## S3 method for class 'allmetap'
print(x, digits = 5, ...)

Arguments

p       A vector of p-values
method  A vector of character containing names of methods or 'all'
x       An object of class 'allmetap'
digits  How many digits to print?
...     Other arguments to be passed through

Details

The function uses each of the methods specified on the data-set in p. If method contains 'all' then this over-rides any specific method(s) named.

Value

Returns an object of class 'allmetap' and 'data.frame' containing columns

p     The value of p returned
valid The number of valid p values used for that method
eponym The eponym, if any, for the method

The row names are the names of the methods used. If any of the methods cannot be applied to that data-set NA are returned for p and valid.

Author(s)

Michael Dewey

Examples

data(beckerp)
allmetap(beckerp, method = "all")
allmetap(beckerp, method = c("sumz", "sumlog"))
invchisq

Combine p values using inverse chi squared method

Description

Combine p-values by the inverse chi-squared method, also known as Lancaster’s method.

Usage

invchisq(p, k, data = NULL, subset = NULL, na.action = na.fail)
## S3 method for class 'invchisq'
print(x, ...)

Arguments

p 
A vector of significance values

k 
A vector of degrees of freedom to use, see details

data 
Optional data frame containing variables

subset 
Optional vector of logicals to specify a subset of the p-values

na.action 
A function indicating what should happen when data contains NAs

x 
An object of class ‘invchisq’

... 
Other arguments to be passed through

Details

Defined as

\[ \sum_{i=1}^{n} \chi^2_{k_i}(p_i) > \chi^2_{\sum k_i}(\alpha) \]

If k is a single value it is used for all the p of which there are n. If any value of \( k_i \leq 0 \) then the corresponding \( p_i \) is not included.

The values of \( p_i \) should be such that \( 0 < p_i \leq 1 \) and a warning is given if that is not true. An warning is given if, possibly as a result of removing illegal values, fewer than two values remain and the return values are set to NA.

The plot method for class ‘metap’ calls plotp on the valid p-values. Inspection of the distribution of p-values is highly recommended as extreme values in opposite directions do not cancel out. See last example. This may not be what you want.

Value

An object of class ‘invchisq’ and ‘metap’, a list with entries

chisq 
Value of chi-squared statistic

df 
Associated degrees of freedom

p 
Associated p-value

validp 
The input vector with the illegal values removed
Author(s)

Michael Dewey

References

See Also

See also sumlog and plotp

Examples

data(beckerp)
invchisq(beckerp, 2) # same as sumlog
invchisq(c(0.999, 0.999, 0.001, 0.001), 4)

invt

Combine p values using inverse t method

Description

Combine p values using the inverse t method

Usage

invt(p, k, data = NULL, subset = NULL, na.action = na.fail)
## S3 method for class 'invt'
print(x, ...)

Arguments

p A vector of significance values
k A vector of degrees of freedom to use, see details
data Optional data frame containing variables
subset Optional vector of logicals to specify a subset of the p-values
na.action A function indicating what should happen when data contains NAs
x An object of class ‘invt’
... Other arguments to be passed through
Details

Defined as

\[
\frac{\sum_{i=1}^{n} t_{k_i}(p_i)}{\sqrt{\sum_{i=1}^{n} \frac{k_i}{k_i-2}}} > z(\alpha)
\]

If \( k \) is a single value it is used for all the \( p \) of which there are \( n \). If any value of \( k_i \leq 2 \) then the corresponding \( p_i \) is not included.

The values of \( p_i \) should be such that \( 0 < p_i \leq 1 \) and a warning is given if that is not true. An warning is given if, possibly as a result of removing illegal values, fewer than two values remain and the return values are set to NA.

The plot method for class ‘metap’ calls \texttt{plotp} on the valid \( p \)-values.

Value

An object of class ‘invt’ and ‘metap’, a list with entries

- \( z \) Value of \( z \)
- \( p \) Associated \( p \)-value
- \texttt{validp} The input vector with the illegal values removed

Author(s)

Michael Dewey

References

See Also

See also \texttt{plotp}

Examples

data(beckerp)
invt(beckerp, 50)
logitp

Combine p values using logit method

Description

Combine p values using logit method

Usage

logitp(p)

## S3 method for class 'logitp'
print(x, ...)

Arguments

p         A vector of significance values
x         An object of class 'logitp'
...       Other arguments to be passed through

Details

Defined as

\[
t = -\sum_{i=1}^{k} \log \frac{p_i}{1-p_i}
\]

where

\[
C = \sqrt{\frac{k\pi^2(5k + 2)}{3(5k + 4)}}
\]

and k is the number of studies.

The values of p_i should be such that 0 < p_i < 1 and a warning is given if that is not true. An warning is given if, possibly as a result of removing illegal values, fewer than two values remain and the return values are set to NA.

The plot method for class ‘metap’ calls plotp on the valid p-values.

Value

An object of class ‘logitp’ and ‘metap’, a list with entries

\[
t\] Value of Student’s t
\[
df\] Associated degrees of freedom
\[
p\] Associated p-value
\[
validp\] The input vector with illegal values removed

Author(s)

Michael Dewey

Examples

```r
data(teachexpect)
logitp(teachexpect) # t = 2.763, df = 99, p = 0.0034, from Becker
data(beckerp)
logitp(beckerp) # t = 1.62, df = 29, NS, from Becker
data(validity)
logitp(validity) # t = 9.521, df = 104, p = 3.89 * 10^{-16}
```

meanp
Combine p values by the mean p method

Description

Combine p values by the mean p method

Usage

```r
meanp(p)
## S3 method for class 'meanp'
print(x, ...)
```

Arguments

- `p` A vector of significance values
- `x` An object of class ‘meanp’
- `...` Other arguments to be passed through

Details

Defined as

\[ z = (0.5 - \bar{p}) \sqrt{\frac{12}{k}} \]

which is a standard normal and due to Edgington (1972)

The values of \( p_i \) should be such that \( 0 \leq p_i \leq 1 \) and a warning is given if that is not true. An warning is given if, possibly as a result of removing illegal values, fewer than four values remain and the return values are set to NA.

The plot method for class ‘metap’ calls plotp on the valid p-values.
Value

An object of class ‘meanp’ and ‘metap’, a list with entries

- **z**: Value of z
- **p**: Associated p-value
- **validp**: The input vector with illegal values removed

Author(s)

Michael Dewey

References

See Also

See also `plotp`

Examples

```r
data(rosenthal)
meanp(rosenthal$p) # 2.17, p = 0.015 one tailed
```

---

**meanz**  
*Combine p values using mean z method*

Description

Combines p values using the mean of z method

Usage

```r
meanz(p)
# S3 method for class 'meanz'
print(x, ...)
```
Arguments

- **p**: A vector of significance values
- **x**: An object of class ‘meanz’
- **...**: Other arguments to be passed through

Details

Let

\[ \bar{z} = \sum_{i=1}^{k} \frac{z(p_i)}{k} \]

and

\[ s_{\bar{z}} = \frac{s_z}{\sqrt{k}} \]

Defined as

\[ \frac{\bar{z}}{s_{\bar{z}}} > t_{k-1}(\alpha) \]

The values of \( p_i \) should be such that \( 0 \leq p_i \leq 1 \) and a warning is given if that is not true. An warning is given if, possibly as a result of removing illegal values, fewer than two values remain and the return values are set to NA. As can be seen if all the \( p_i \) are equal or close to equal this gives a \( t = \pm \infty \) leading to a returned value of 0 or 1. A set of \( p \) values with small variance will necessarily give a small \( p \) value which may be smaller than that for another set all of whose primary values are less than any in the first set. See examples for a demonstration.

The plot method for class ‘metap’ calls `plotp` on the valid \( p \)-values.

Value

An object of class ‘meanz’ and ‘metap’, a list with entries

- **z**: The value of the mean \( z \) statistic
- **p**: The associated \( p \) value
- **validp**: The input vector with illegal values removed

Author(s)

Michael Dewey

meanz(beckerp)
meanz(c(0.1, 0.2))  # greater than next example
meanz(c(0.3, 0.31))  # less than above

package-data  Example data

Description

The package contains the following datasets: beckerp, cholest, edgington, mourning, naep, rosenthal, teachexpect, and validity.

Usage

data(beckerp)
data(cholest)
data(edgington)
data(mourning)
data(naep)
data(rosenthal)
data(teachexpect)
data(validity)

Format

beckerp A vector of length 5
cholest A vector of length 34
edgington A vector of length 7
naep A data frame with 34 observations on the following 2 variables.
  state a factor with levels AL, AR, AZ, CA, CO, CT, DE, FL, GA, HI, IA, ID, IN, KY, LA, MD, MI, MN,
       NC, ND, NE, NH, NJ, NM, NY, OH, OK, PA, RI, TX, VA, WI, WV, WY,
       p a numeric vector
mourning A data frame with 9 observations on the following 3 variables.
  stance a factor with levels No stand, Opponent, Supporter
  grade a factor with levels G11-12, G7-8, G9-10
  p a numeric vector
rosenthal A data frame with 5 observations on the following 3 variables.
  t  A numeric vector of values of t
  df  a numeric vector of degrees of freedom
  p  a numeric vector of one sided p values
teachexpect A vector of length 19
validity A vector of length 20
Details

- beckerp Hypothetical p values from Becker (1994)
- cholest p-values from studies of cholesterol lowering from Sutton et al. (2000)
- edgington Hypothetical p values from Edgington (1972)
- mourning Results from a study of mourning practices of Israeli youth from Benjamini and Hochberg (2000)
- naep Results on the National Assessment of Educational Progress from Benjamini and Hochberg (2000)
- rosenthal Hypothetical example from Rosenthal (1978)
- teachexpect p-values from studies of the effect of manipulating teacher expectancy from Becker (1994)
- validity p-values from studies of validity of student ratings from Becker (1994)

References

plotp

Q-Q plot of p-values

Description

Produces a Q-Q plot of the p-values supplied

Usage

plotp(pvals, ...)

Arguments

- pvals A vector of p-values
- ... Other parameters to pass through to qqplot and qqline
Details

After eliminating out of range \( p \)-values and missing values produces a Q–Q plot and the line through the quantiles (by default the 0.25 and 0.75).

Value

Invisibly returns a list consisting of

- \texttt{validp} \hspace{1cm} The valid \( p \)-values

Author(s)

Michael Dewey

See Also

\texttt{qqplot} and \texttt{qqline}

Examples

\begin{verbatim}
data(cholest)
plotp(cholest)
\end{verbatim}

Description

Produces the plot suggested by Schweder and Spjotvoll to display a collection of \( p \)-values and also optionally draws the lowest slope line suggested by Benjamini and Hochberg

Usage

\begin{verbatim}
schweder(p, xlab = "Rank of \( p \)", ylab = "\( p \)", drawline = NULL,
          bh.lwd = 1, bh.lty = "solid", bh.col = "black",
          ls.control = list(frac = NULL),
          ls.lwd = 1, ls.lty = "dotted", ls.col = "black",
          ab.control = list(a = NULL, b = NULL),
          ab.lwd = 1, ab.lty = "dashed", ab.col = "black", ...)
\end{verbatim}

Arguments

- \texttt{p} \hspace{1cm} A vector of \( p \)-values
- \texttt{xlab} \hspace{1cm} Label for plot \( x \)-axis
- \texttt{ylab} \hspace{1cm} Label for plot \( y \)-axis
- \texttt{drawline} \hspace{1cm} Which line, if any, to draw. See Details
- \texttt{bh.lwd} \hspace{1cm} Width of the lowest slope line
bh.lty  Line type of the lowest slope line
bh.col  Colour of the lowest slope line
ls.control A list containing a named element frac. See Details
ls.lwd  Width of the least squares line
ls.lty  Line type of the least squares line
ls.col  Colour of the least squares line
ab.control A list containing two elements a and b. See Details
ab.lwd  Width of the specified line
ab.lty  Line type of the specified line
ab.col  Colour of the specified line
...  Further parameters to be passed through to plot

Details

After removing invalid \( p \)-values plots them. Any graphics parameters passed in \ldots affect this part of the plot only. Note that the axes are chosen according to the scheme of Benjamini and Hochberg, Schweder and Spjotvoll used a different system.

By setting drawline appropriately up to three lines may be drawn.

If drawline includes the string "bh" the lowest slope line of Benjamini and Hochberg is drawn. No further parameters are needed here but the characteristics of the line may be set: width, line type, and colour.

If drawline includes the string "ls" a least squares line is drawn passing through the point \( k + 1, 1 \). The parameter frac specified what fraction of the values be used for this and may need experimentation to obtain a suitable line. The characteristics of the line may be set: width, line type, and colour.

If drawline includes the string "ab" a user specified line is drawn. The parameters \( a \) and \( b \) specify the intercept and slope. The characteristics of the line may be set: width, line type, and colour.

Value

A list containing

\( p \)  The values of \( p \) plotted
bh.params A list containing at least items \( a \) and \( b \) the intercept and slope of the line drawn. This is only included if the lowest slope line was drawn
ls.params A list containing at least items \( a \) and \( b \) the intercept and slope of the line drawn. This is only included if the least squares line was drawn
ab.params A list containing at least items \( a \) and \( b \) the intercept and slope of the line drawn. This is only included if the user specified line was drawn

sumlog

Combine p-values by the sum of logs (Fisher’s) method

Description

Combine p-values by the sum of logs method, also known as Fisher’s method, and sometimes as the chi-square (2) method.

Usage

sumlog(p)
## S3 method for class 'sumlog'
print(x, ...)

Arguments

p A vector of significance values
x An object of class ‘sumlog’
... Other arguments to be passed through

Details

The method relies on the fact that

$$\sum_{i=1}^{k} -2\log p_i$$

is a chi-squared with 2k df where k is the number of studies (Fisher 1925).

The values of $p_i$ should be such that $0 < p_i \leq 1$ and a warning is given if that is not true. An warning is given if, possibly as a result of removing illegal values, fewer than two values remain and the return values are set to NA.

The plot method for class ‘metap’ calls plotp on the valid $p$-values. Inspection of the distribution of $p$-values is highly recommended as extreme values in opposite directions do not cancel out. See last example. This may not be what you want.
### Value

An object of class ‘sumlog’ and ‘metap’, a list with entries

- **chisq**: Value of chi-squared statistic
- **df**: Associated degrees of freedom
- **p**: Associated p-value
- **validp**: The input vector with the illegal values removed

### Author(s)

Michael Dewey

### References

### See Also

See also `plotp`

### Examples

```r
data(teachexpect)
sumlog(teachexpect) # chisq = 69.473, df = 38, p = 0.0014, from Becker
data(beckerp)
sumlog(beckerp) # chisq = 18.533, df = 10, sig
data(rosenthal)
sumlog(rosenthal$p) # chisq = 22.97, df = 10, p = 0.006 one sided
data(cholest)
sumlog(cholest) # chisq = 58.62, df = 68, p = 0.78
data(validity)
sumlog(validity) # chisq = 159.82, df = 40, p = 2.91 * 10^{-16}
sumlog(c(0.0001, 0.0001, 0.9999, 0.9999)) # is significant
```
Combine p-values using the sum of p (Edgington’s) method

Description
Combine p-values using the sum p method

Usage

```r
sump(p)
## S3 method for class 'sump'
print(x, ...)
```

Arguments

- `p`: A vector of significance values
- `x`: An object of class ‘sump’
- `...`: Other arguments to be passed through

Details

Defined as

\[
\left( \sum_{i=1}^{k} p_i \right)^k \frac{k!}{1} \left( \sum_{i=1}^{k} p_i - 1 \right)^k \frac{k!}{2} \left( \sum_{i=1}^{k} p_i - 2 \right)^k \frac{k!}{...}
\]

where there are \( k \) studies and the series continues until the numerator becomes negative (Edgington 1972).

Some authors use a simpler version

\[
\left( \sum_{i=1}^{k} p_i \right)^k \frac{k!}{1}
\]

but this can be very conservative when \( \sum_{i=1}^{k} p_i > 1 \). There seems no particular need to use this method but it is returned as the value of conservativep for use in checking published values.

The values of \( p_i \) should be such that \( 0 \leq p_i \leq 1 \) and a warning is given if that is not true. An warning is given if, possibly as a result of removing illegal values, fewer than two values remain and the return values are set to NA. A warning is given when the internal calculations are likely to have been subject to numerical error and an alternative method should be used to check the result.

The plot method for class ‘metap’ calls `plotp` on the valid p-values.

Value

An object of class ‘sump’ and ‘metap’, a list with entries

- `p`: The transformed sum of the p-values
- `conservativep`: See details
- `validp`: The input vector with illegal values removed
Author(s)

Michael Dewey

References

See also `plotp`

Examples

data(edgington)
sump(edgington) # p = 0.097

sumz(p, weights = NULL, data = NULL, subset = NULL, na.action = na.fail)

# S3 method for class 'sumz'
print(x, ...)

Description

Combine *p*-values using the sum *z* method

Usage

sumz(p, weights = NULL, data = NULL, subset = NULL, na.action = na.fail)

Arguments

- **p**: A vector of significance values
- **weights**: A vector of weights
- **data**: Optional data frame containing variables
- **subset**: Optional vector of logicals to specify a subset of the *p*-values
- **na.action**: A function indicating what should happen when data contains NAs
- **x**: An object of class ‘sumz’
- **...**: Other arguments to be passed through
Details

Defined as

\[ \sum_{i=1}^{k} w_i z(p_i) \]
\[ \sqrt{\sum_{i=1}^{k} w_i^2} \]

is a z where k is the number of studies and w are the weights (Stouffer et al. 1949). By default the weights are equal. In the absence of effect sizes (in which case a method for combining effect sizes would be more appropriate anyway) best results are believed to be obtained with weights proportional to the square root of the sample sizes (Zaykin 2011)

The values of \( p_i \) should be such that \( 0 < p_i < 1 \) and a warning is given if that is not true. An warning is given if, possibly as a result of removing illegal values, fewer than two values remain and the return values are set to NA. If the omitted \( p \) values had supplied weights a further warning is issued.

The plot method for class ‘metap’ calls `plotp` on the valid \( p \)-values.

Value

An object of class ‘sumz’ and ‘metap’, a list with entries

- `z` Transformed sum of \( z \) values
- `p` Associated \( p \)-value
- `validp` The input vector with illegal values removed
- `weights` The weight vector corresponding to `validp`

Author(s)

Michael Dewey

Truncated product method routine

Description

Implements two procedures for truncated versions of Fisher’s method

Usage

truncated(p, ptrunc = NULL, rtrunc = NULL, ...)

## S3 method for class 'truncated'
print(x, ...)

## S3 method for class 'truncated'
summary(object, ...)

## S3 method for class 'truncated'
plot(x, pparams = list(pchs = c(16, 1), pcols = c("black", "black")), ...)

Arguments

p A vector of significance values
ptrunc Value of p to truncate at. See Details
rtrunc Which rank p to truncate at. See Details
x An object of class ‘truncated’
object An object of class ‘truncated’
... Other arguments to be passed through
pparams A list containing a vector pchs of plotting symbols and a vector pcols of colours

Details

Uses routines from TFisher to implement truncated Fisher (Zaykin et al. 2007; Zhang et al. 2018) and from mutoss to implement rank-truncated Fisher (Dudbridge and Koeleman 2003)

The print method prints the statistic and its associated p-value. The summary method also prints how many of the input values were actually used. The plot method provides an index plot of the p-values. By default used p-values are plotted with a black filled circle and those not used with a black unfilled circle. The colours and plotting symbols can be changed in pparams. The first element of each vector is for the used p-values and the second for the unused ones.
Value

An object of class ‘truncated’ a list with entries

- **p**: The resultant overall \(p\)-value
- **stat**: The test statistic
- **validp**: The input vector with illegal values removed
- **ptrunc**: The \(p\)-value used for truncation
- **trunc**: The rank value used for truncation
- **n**: A vector containing \(\text{incl}\), the number of valid values included, \(\text{excl}\), the number of valid values not used
- **method**: The method used

Note

Only one of \(\text{ptrunc}\) or \(\text{rtrunc}\) is returned as appropriate. If the function encounters an error it returns NA for the value of \(p\) and gives a warning message. The effect of specifying both \(\text{ptrunc}\) and \(\text{rtrunc}\) is undefined.

Author(s)

Michael Dewey

Examples

```r
data(validity)
truncated(validity, ptrunc = 0.5)
truncated(validity, rtrunc = 5)
```
two2one

Convert two-sided p-values to one-sided

Description

Convert two-sided p-values to one-sided

Usage

two2one(p, two = NULL, invert = NULL)

Arguments

p A vector of p-values
two A logical vector defining which p-values are two-sided and to be converted
invert A logical vector defining which p-values are to be inverted

Details

The p-values supplied to the other functions should be one-sided and all in the same direction. This convenience function will convert two-sided to one-sided and invert as necessary. By default it is assumed that all p-values are two-sided and the function converts them all to one-sided. Use invert to specify if some of the tests resulted in outcomes in the other direction. So for example a value of 0.05 will be converted to 0.025 unless invert is TRUE in which case it is converted to 0.975.

Value

A vector of one-sided p-values all in the correct direction

Author(s)

Michael Dewey

Examples

data(rosenthal)
twop <- with(rosenthal, (pt(t, df)))
votep  

Combine p-values by the vote counting method

Description

Combine p-values by the vote counting method

Usage

votep(p, alpha = c(0.5, 0.5))
## S3 method for class 'votep'
print(x, ...)

Arguments

- **p**
  - A vector of significance values
- **alpha**
  - A vector of length 2 defining the significance value limits
- **x**
  - An object of class ‘votep’
- **...**
  - Other arguments to be passed through

Details

By default splits the p-values at 0.5 with those below counting as positive and those above counting as negative. However setting alpha allows for a different choice of cut-off and also by specifying two different values for a neutral zone. If either value of alpha is greater than unity it is assumed to be a percentage.

The values of \( p_i \) should be such that \( 0 < p_i < 1 \) and a warning is given if that is not true. An warning is given if, possibly as a result of removing illegal values, fewer than two values remain and the return values are set to NA.

The plot method for class ‘metap’ calls plotp on the valid p-values.

Value

An object of class ‘votep’ and ‘votep’, a list with entries

- **p**
  - p value
- **pos**
  - Number of positives
- **neg**
  - Number of negatives
- **alpha**
  - A vector of length 2 defining the significance values and lying in the range 0 to 1
- **validp**
  - The input vector with illegal values removed

**Examples**

```r
data(beckerp)
votep(beckerp)
```

---

**Description**

Combine *p*-values using Wilkinson's method

**Usage**

```r
wilkinsonp(p, r = 1, alpha = 0.05)
maximump(p, alpha = 0.05)
minimump(p, alpha = 0.05)
## S3 method for class 'wilkinsonp'
print(x, ...)
## S3 method for class 'maximump'
print(x, ...)
## S3 method for class 'minimump'
print(x, ...)
```

**Arguments**

- `p` A vector of significance values
- `r` Use the `r`th smallest `p` value
- `alpha` The significance level
- `x` An object of class `wilkinsonp` or of class `maximump` or of class `minimump`
- `...` Other arguments to be passed through
Details

Wilkinson (Wilkinson 1951) originally proposed his method in the context of simultaneous statistical inference: the probability of obtaining \( r \) or more significant statistics by chance in a group of \( k \). The values are obtained from the Beta distribution, see `pbeta`.

If \( \alpha \) is greater than unity it is assumed to be a percentage. Either values greater than 0.5 (assumed to be confidence coefficient) or less than 0.5 are accepted.

The values of \( p_i \) should be such that \( 0 \leq p_i \leq 1 \) and a warning is given if that is not true. An warnin is given if, possibly as a result of removing illegal values, fewer than two values remain and the return values are set to NA.

`maximump` and `minimump` each provide a wrapper for `wilkinsonp` for the special case when \( r = \text{length}(p) \) or \( r = 1 \) respectively and each has its own print method. The method of minimum \( p \) is also known as Tippett’s method (Tippett 1931).

The plot method for class ‘metap’ calls `plotp` on the valid \( p \)-values. Inspection of the distribution of \( p \)-values is highly recommended as extreme values in opposite directions do not cancel out. See last example. This may not be what you want.

Value

An object of class ‘wilkinsonp’ and ‘metap’ or of class ‘maximump’ and ‘metap’ or of class ‘minimump’ and ‘metap’, a list with entries

- \( p \): The \( p \)-value resulting from the meta–analysis
- \( pr \): The \( r \)th smallest \( p \) value used
- \( r \): The value of \( r \)
- \( critp \): The critical value at which the \( r \)th value would have been significant for the chosen \( \alpha \)
- \( validp \): The input vector with illegal values removed
