

Package ‘metarep’

April 6, 2020

Title Replicability-Analysis Tools for Meta-Analysis

Version 1.0.1

Depends R (>= 3.5)

Imports meta (>= 4.9.10),

Suggests metafor (>= 1.9.9), lme4, numDeriv, BiasedUrn, knitr,
rmarkdown

Date 2020-03-08

URL <https://github.com/IJaljuli/metarep>

Description User-friendly package for reporting replicability-analysis methods, affixed to meta-analyses summary. The replicability-analysis output provides an assessment of the investigated intervention, where it offers quantification of effect replicability and assessment of the consistency of findings.

- Replicability-analysis for fixed-effects and random-effect meta analysis:
- $r(u)$ -value;
- lower bounds on the number of studies with replicated positive and\{ }or negative effect;
- Allows detecting inconsistency of signals;
- forest plots with the summary of replicability analysis results;
- Allows Replicability-analysis with or without the common-effect assumption.

License GPL (>= 2)

CD002943_CMP001	<i>Data in meta-analysis reported in review CD002943, 'Cochrane library'.</i>
-----------------	---

Description

A dataset containing the meta-data of the the intervention 'Invitation letter' (CMP001), in the review "PStrategies for increasing the participation of women in community breast cancer screening" (CD002943) the results were reported by 5 studies, and analysed by Fixed-Effects meta-analysis.

Usage

CD002943_CMP001

Format

A data frame with 5 rows of 12 variables:

STUDY Name of the study.

STUDY_WEIGHT Study weight in meta-analysis as reported in th review.

N_EVENTS1 Number of events in the first group tested.

N_EVENTS2 Number of events in the second group tested.

N_TOTAL1 Number of patirnts in the first group tested.

N_TOTAL2 Number of patirnts in the second group tested.

GROUP1 Names of the first group in each study.

GROUP2 Names of the second group in each study.

N_STUDIES Overall number of studies in the meta-analysis

CMP_ID Cochrane Database review number

SM A character string indicating which summary measure ("RR", "OR", "RD", or "ASD") is to be used for pooling of studies.

RANDOM "YES" or "NO" indicating whether random-effects meta-analysis was performed.

Source

<https://www.cochranelibrary.com/cdsr/doi/10.1002/14651858.CD002943/full>

CD003366_CMP005	<i>Data in meta-analysis reported in review CD003366, 'Cochrane library'.</i>
-----------------	---

Description

A dataset containing the meta-data of the outcome 'Leukopaenia' (CMP005), in the review "Taxane-containing regimens for metastatic breast cancer" (CD003366) the results were reported by 28 studies, and analysed by Random-Effects meta-analysis.

Usage

CD003366_CMP005

Format

A data frame with 28 rows and 12 variables:

STUDY Name of the study.

STUDY_WEIGHT Study weight in meta-analysis as reported in the review.

N_EVENTS1 Number of events in the first group tested.

N_EVENTS2 Number of events in the second group tested.

N_TOTAL1 Number of patients in the first group tested.

N_TOTAL2 Number of patients in the second group tested.

GROUP1 Names of the first group in each study.

GROUP2 Names of the second group in each study.

N_STUDIES Overall number of studies in the meta-analysis

CMP_ID Cochrane Database review number

SM A character string indicating which summary measure ("RR", "OR", "RD", or "ASD") is to be used for pooling of studies.

RANDOM "YES" or "NO" indicating whether random-effects meta-analysis was performed.

Source

<https://www.cochranelibrary.com/cdsr/doi/10.1002/14651858.CD003366.pub3/full>

CD006823_CMP001	<i>Data in meta-analysis reported in review CD006823, 'Cochrane library'.</i>
-----------------	---

Description

A dataset containing the meta-data of the outcome 'Seroma formation' (CMP001), in the review "Wound drainage after axillary dissection for carcinoma of the breast" (CD006823) the results were reported by 7 studies, and analysed by Random-Effects meta-analysis.

Usage

CD006823_CMP001

Format

A data frame with 7 rows and 12 variables:

STUDY Name of the study.

STUDY_WEIGHT Study weight in meta-analysis as reported in the review.

N_EVENTS1 Number of events in the first group tested.

N_EVENTS2 Number of events in the second group tested.

N_TOTAL1 Number of patients in the first group tested.

N_TOTAL2 Number of patients in the second group tested.

GROUP1 Names of the first group in each study.

GROUP2 Names of the second group in each study.

N_STUDIES Overall number of studies in the meta-analysis

CMP_ID Cochrane Database review number

SM A character string indicating which summary measure ("RR", "OR", "RD", or "ASD") is to be used for pooling of studies.

RANDOM "YES" or "NO" indicating whether random-effects meta-analysis was performed.

Source

<https://www.cochranelibrary.com/cdsr/doi/10.1002/14651858.CD006823.pub2/full>

CD007077_CMP001	<i>Data in meta-analysis reported in review CD007077, 'Cochrane library'.</i>
-----------------	---

Description

A dataset containing the meta-data of the outcome 'cosmesis' (CMP001), in the review "Partial breast irradiation for early breast cancer" (CD007077) the results were reported by 5 studies, and analysed by Fixed-Effects meta-analysis.

Usage

CD007077_CMP001

Format

A data frame with 5 rows and 12 variables:

STUDY Name of the study.

STUDY_WEIGHT Study weight in meta-analysis as reported in the review.

N_EVENTS1 Number of events in the first group tested.

N_EVENTS2 Number of events in the second group tested.

N_TOTAL1 Number of patients in the first group tested.

N_TOTAL2 Number of patients in the second group tested.

GROUP1 Names of the first group in each study.

GROUP2 Names of the second group in each study.

N_STUDIES Overall number of studies in the meta-analysis

CMP_ID Cochrane Database review number

SM A character string indicating which summary measure ("RR", "OR", "RD", or "ASD") is to be used for pooling of studies.

RANDOM "YES" or "NO" indicating whether random-effects meta-analysis was performed.

Source

 find_umax

Lower bounds on the number of studies with replicated effect

Description

lower bounds on the number of studies with increased and/or decreased effect.

Usage

```
find_umax(
  x,
  alternative = "two-sided",
  t = 0.05,
  confidence = 0.95,
  common.effect = FALSE
)
```

Arguments

x	Object of class 'meta'
alternative	'less', 'greater' or 'two-sided'
t	truncation threshold for truncated-Pearsons' test ('t=0.05' by default). t is ignored if 'common.effect = TRUE'.
confidence	Confidence level used in the computation of the lower bound(s) u_{max}^L and/or u_{max}^R .
common.effect	Use common.effect = FALSE (default) for replicability-analysis combining with no assumptions (Pearson or truncated-Pearson test).

Value

An object of class list reporting the bounds on the number of studies with a positive or negative effect, as follows:

- **worst.case**A character vector of the names of $n-u_{\max}+1$ studies at which the the $r(u_{\max})$ -value is computed.
- **side**The direction of the replicated signal in the 'worst.case' studies. 'less' if the effect is negative, 'greater' if positive.
- **u_max**The bound on the number of studies with either a positive or a negative effect.
- **r-value**The 'u-out-of-n' $r(u)$ -value calculated with $u=u_{\max}$.
- **Replicability_AnalysisReport** of the replicability lower bounds on the number of studies with negative effect and with positive effect.

Examples

```
n.i.1 <- c( 20, 208, 24, 190, 58, 36, 51)
a.i <- c( 2,79,0,98,15,34,9)
n.i.2 <- c( 20, 119, 22, 185, 29, 51, 47)
c.i <- c(9,106,14,98,12,49,9)
m1 <- meta::metabin( event.e = a.i,n.e = n.i.1,
                    event.c = c.i,n.c = n.i.2,
                    studlab = paste('Study',1:7), sm = 'OR',
                    comb.fixed = FALSE, comb.random = TRUE )
find_umax(m1 , common.effect = FALSE, alternative = 'two-sided',
          t = 0.05 , confidence = 0.95 )
```

forest	<i>Forest plot to display the result of a meta-analysis with replicability analysis results</i>
--------	---

Description

Draws a forest plot in the active graphics window (using grid graphics system).

Usage

```
forest(x, ...)
```

Arguments

x	An object of class 'metarep'.
...	Arguments to be passed to methods, see forest.meta

Value

No return value, called for side effects

See Also

[forest.meta](#), [metarep](#),

Examples

```
n.i.1 <- c( 20, 208, 24, 190, 58, 36, 51)
a.i <- c( 2,79,0,98,15,34,9)
n.i.2 <- c( 20, 119, 22, 185, 29, 51, 47)
c.i <- c(9,106,14,98,12,49,9)
m1 <- meta::metabin( event.e = a.i,n.e = n.i.1,event.c = c.i,n.c = n.i.2,
                    studlab = paste0('Study ', 1:7) , sm = 'OR' ,
                    comb.fixed = FALSE, comb.random = TRUE )
mr1 <- metarep( m1 , u = 2, common.effect = FALSE , t = 0.05 ,
               alternative = 'two-sided', report.u.max = TRUE)
forest(mr1, layout = "RevMan5", comb.fixed = FALSE,
```

```
label.right = "Favours control", col.label.right = "red",
label.left = "Favours experimental", col.label.left = "green",
prediction = TRUE)
```

metarep

Replicability-analysis of a meta-analysis

Description

Add results of replicability-analysis to a meta-analysis, whether fixed- or random-effects.

Usage

```
metarep(
  x,
  u = 2,
  t = 0.05,
  alternative = "two-sided",
  report.u.max = FALSE,
  confidence = 0.95,
  common.effect = FALSE
)
```

Arguments

x	object of class 'meta'
u	replicability requirement. u must be an integer between 2 and n (number of studies in the meta-analysis).
t	truncation threshold for truncated-Pearsons' test ('t=0.05' by default). t is ignored if 'common.effect = TRUE'.
alternative	use 'less', 'greater' or 'two-sided'
report.u.max	use TRUE to report the lower bounds on number of studies with replicated effect.
confidence	Confidence level used in the computation of the lower bound(s) u_{max}^L and/or u_{max}^R .
common.effect	Use common.effect = FALSE (default) for replicability-analysis combining with no assumptions (Pearson or truncated-Pearson test). Replicability-analysis based on the test-statistic of fixed-effects model can be applied using common.effect = TRUE.

Value

An object of class list containing meta-analysis and replicability analysis results, as follows:

- `worst.case.studies` A character vector of the names of $n-u+1$ studies at which the $r(u)$ -value is computed.
- `r.value` $r(u)$ -value for the specified u .
- `side` The direction of the effect with the lower one-sided $r(u)$ -value
- `u_L` , `u_R` Lower bounds of the number of studies with decreased or increased effect, respectively. Both bounds are reported simultaneously only when performing replicability analysis for two-sided alternative with no assumptions

Examples

```
n.i.1 <- c( 20, 208, 24, 190, 58, 36, 51)
a.i <- c( 2,79,0,98,15,34,9)
n.i.2 <- c( 20, 119, 22, 185, 29, 51, 47)
c.i <- c(9,106,14,98,12,49,9)
m1 <- meta::metabin( event.e = a.i,n.e = n.i.1,event.c = c.i,n.c = n.i.2,
                    studlab = paste0('Study ', 1:7) , sm = 'OR' ,
                    comb.fixed = FALSE, comb.random = TRUE )
mr1 <- metarep( m1 , u = 2, common.effect = FALSE , t = 0.05 ,
               alternative = 'two-sided', report.u.max = TRUE)
meta::forest(mr1, layout='revman5',digits.pval = 4 , test.overall = TRUE )
```

metaRvalue.onesided.U *One-sided replicability analysis*

Description

One-sided replicability analysis

Usage

```
metaRvalue.onesided.U(
  x,
  u = 2,
  comb.fixed = F,
  comb.random = T,
  alternative = "less",
  do.truncated.umax = T,
  alpha.tilde = 0.05
)
```

Arguments

x	object of class 'meta'
u	integer between 2-n
comb.fixed	logical
comb.random	logical
alternative	'less' or 'greater' only.
do.truncated.umax	logical.
alpha.tilde	between (0,1)

Value

No return value, called for internal use only.

print.summary.metarep *Print meta-analysis with replicability-analysis results*

Description

Print method for objects of class 'metarep'.

Usage

```
## S3 method for class 'summary.metarep'
print(x, ...)
```

Arguments

x	An object of class 'metarep'
...	Arguments to be passed to methods, see print.summary.meta

Value

No return value, called for side effects.

Examples

```
n.i.1 <- c( 20, 208, 24, 190, 58, 36, 51)
a.i <- c( 2,79,0,98,15,34,9)
n.i.2 <- c( 20, 119, 22, 185, 29, 51, 47)
c.i <- c(9,106,14,98,12,49,9)
m1 <- meta::metabin( event.e = a.i,n.e = n.i.1,event.c = c.i,n.c = n.i.2,
                    studlab = paste0('Study ', 1:7) , sm = 'OR' ,
                    comb.fixed = FALSE, comb.random = TRUE )
mr1 <- metarep( m1 , u = 2, common.effect = FALSE , t = 0.05 ,
               alternative = 'two-sided', report.u.max = TRUE)
print(mr1, digits = 2)
```

summary.metarep	<i>Summary of meta-analysis with replicability-analysis results</i>
-----------------	---

Description

Summary method for objects of class 'metarep'.

Usage

```
## S3 method for class 'metarep'
summary(object, ...)
```

Arguments

object	An object of class 'metarep'.
...	Arguments to be passed to methods, see summary.meta

Value

A list of the quantities for replicability analysis, as follows:

- meta-analysis results: Summary of the supplied 'meta' object.
- r.value: r-value of the tested alternative.
- u.increased: Maximal number of studies at which replicability of increasing effect can be claimed. It will be reported unless the alternative is 'less'.
- u.decreased: Maximal number of studies at which replicability of increasing effect can be claimed. It will be reported unless the alternative is 'greater'.

Examples

```
n.i.1 <- c( 20, 208, 24, 190, 58, 36, 51)
a.i <- c( 2,79,0,98,15,34,9)
n.i.2 <- c( 20, 119, 22, 185, 29, 51, 47)
c.i <- c(9,106,14,98,12,49,9)
m1 <- meta::metabin( event.e = a.i,n.e = n.i.1,event.c = c.i,n.c = n.i.2,
  studlab = paste0('Study ', 1:7) , sm = 'OR' ,
  comb.fixed = FALSE, comb.random = TRUE )
mr1 <- metarep( m1 , u = 2, common.effect = FALSE , t = 0.05 ,
  alternative = 'two-sided', report.u.max = TRUE)
summary(mr1)
```

truncatedPearson *Truncated-Pearsons' test*

Description

Apply Truncated-Pearsons' test or ordinary Pearsons' test on one-sided p-values.

Usage

```
truncatedPearson(p, alpha.tilde = 1)
```

Arguments

p	one-sided p-values of the individual studies for testing one-sided alternative based on z-test.
alpha.tilde	truncation threshold for truncated-Pearson test. Use alpha.tilde = 1 for ordinary Pearsons' test for combining p-values.

Value

A 'list' containing the following quantities:

A list containing results of truncated-Pearson's test, as follows:

- chisq: Pearson test statistic
- df: degrees of freedom of truncated-Pearson statistic
- rvalue: p-value of the test
- validp: p-values used in the test.

Examples

```
truncatedPearson( p = c( 0.001 , 0.01 , 0.1 ) , alpha.tilde = 1 )  
truncatedPearson( p = c( 0.001 , 0.01 , 0.1 ) , alpha.tilde = 0.05 )
```
