Package ‘microbenchmark’

October 13, 2022

Title Accurate Timing Functions

Description Provides infrastructure to accurately measure and compare the execution time of R expressions.

URL https://github.com/joshuaulrich/microbenchmark/

BugReports https://github.com/joshuaulrich/microbenchmark/issues/

License BSD_2_clause + file LICENSE

Imports graphics, stats

Suggests ggplot2, multcomp, RUnit

SystemRequirements On a Unix-alike, one of the C functions
mach_absolute_time (macOS), clock_gettime or gethrtime. If none of these is found, the obsolescent POSIX function gettimeofday will be tried.

ByteCompile yes

Version 1.4.9

RoxygenNote 7.1.2

NeedsCompilation yes

autoplot.microbenchmark

Autoplot method for microbenchmark objects: Prettier graphs for microbenchmark using ggplot2

Description

Uses ggplot2 to produce a more legible graph of microbenchmark timings

Usage

\[
\text{autoplot.microbenchmark}( \\
\text{object,} \\
\text{...,} \\
\text{log = TRUE,} \\
\text{y_max = 1.05 * max(object$\text{time})})
\]

Arguments

- **object**: A microbenchmark object
- **...**: Ignored
- **log**: If TRUE the time axis will be on log scale.
- **y_max**: The upper limit of the y axis (defaults to 5 percent more than the maximum value)

Value

A ggplot2 plot

Author(s)

Ari Friedman, Olaf Mersmann
Examples

```r
if (requireNamespace("ggplot2")) {

tm <- microbenchmark(rchisq(100, 0),
                     rchisq(100, 1),
                     rchisq(100, 2),
                     rchisq(100, 3),
                     rchisq(100, 5), times=100L)

ggplot2::autoplot(tm)
}
```

Description

Boxplot of `microbenchmark` timings.

Usage

```r
## S3 method for class 'microbenchmark'
boxplot(x, unit = "t", log = TRUE, xlab, ylab, horizontal = FALSE, ...)
```

Arguments

- `x` A `microbenchmark` object.
- `unit` Unit in which the results be plotted.
- `log` Should times be plotted on log scale?
- `xlab` X axis label.
- `ylab` Y axis label.
- `horizontal` Switch X and Y axes.
- `...` Passed on to `boxplot.formula`.

get_nanotime

Return the current value of the platform timer.

Description

The current value of the most accurate timer of the platform is returned. This can be used as a time stamp for logging or similar purposes. Please note that there is no common reference, that is, the timer value cannot be converted to a date and time value.

Usage

get_nanotime()

Author(s)

Olaf Mersmann

microbenchmark

Sub-millisecond accurate timing of expression evaluation.

Description

microbenchmark serves as a more accurate replacement of the often seen `system.time(replicate(1000, expr))` expression. It tries hard to accurately measure only the time it takes to evaluate `expr`. To achieve this, the sub-millisecond (supposedly nanosecond) accurate timing functions most modern operating systems provide are used. Additionally all evaluations of the expressions are done in C code to minimize any overhead.

Usage

```r
microbenchmark(
  ..., 
  list = NULL, 
  times = 100L, 
  unit = NULL, 
  check = NULL, 
  control = list(), 
  setup = NULL
)
```
Arguments

Expressions to benchmark.

list List of unevaluated expressions to benchmark.
times Number of times to evaluate each expression.
unit Default unit used in summary and print.
check A function to check if the expressions are equal. By default NULL which omits
the check. In addition to a function, a string can be supplied. The string ‘equal’
will compare all values using all.equal, ‘equivalent’ will compare all values
using all.equal and check.attributes = FALSE, and ‘identical’ will compare
all values using identical.
control List of control arguments. See Details.
setup An unevaluated expression to be run (untimed) before each benchmark expres-
sion.

details

This function is only meant for micro-benchmarking small pieces of source code and to compare
their relative performance characteristics. You should generally avoid benchmarking larger chunks
of your code using this function. Instead, try using the R profiler to detect hot spots and consider
rewriting them in C/C++ or FORTRAN.

The control list can contain the following entries:

order the order in which the expressions are evaluated. “random” (the default) randomizes the ex-
ecution order, “inorder” executes each expression in order and “block” executes all repetitions
of each expression as one block.

warmup the number of warm-up iterations performed before the actual benchmark. These are
used to estimate the timing overhead as well as spinning up the processor from any sleep or
idle states it might be in. The default value is 2.

Value

Object of class ‘microbenchmark’, a data frame with columns expr and time. expr contains the de-
parsed expression as passed to microbenchmark or the name of the argument if the expression was
passed as a named argument. time is the measured execution time of the expression in nanoseconds.

The order of the observations in the data frame is the order in which they were executed.

Note

Depending on the underlying operating system, different methods are used for timing. On Win-
dows the QueryPerformanceCounter interface is used to measure the time passed. For Linux the
clock_gettime API is used and on Solaris the gethrtime function. Finally on MacOS X the,
undocumented, mach_absolute_time function is used to avoid a dependency on the CoreServices
Framework.

Before evaluating each expression times times, the overhead of calling the timing functions and the
C function call overhead are estimated. This estimated overhead is subtracted from each measured
evaluation time. Should the resulting timing be negative, a warning is thrown and the respective
value is replaced by 0. If the timing is zero, a warning is raised. Should all evaluations result in one of the two error conditions described above, an error is raised.

One platform on which the clock resolution is known to be too low to measure short runtimes with the required precision is Oracle® Solaris on some SPARC® hardware. Reports of other platforms with similar problems are welcome. Please contact the package maintainer.

See Also
print.microbenchmark to display and boxplot.microbenchmark or autoplot.microbenchmark to plot the results.

Examples

```r
## Measure the time it takes to dispatch a simple function call
## compared to simply evaluating the constant \code{NULL}
f <- function() NULL
res <- microbenchmark(NULL, f(), times=1000L)

## Print results:
print(res)

## Plot results:
boxplot(res)

## Pretty plot:
if (requireNamespace("ggplot2")) {
  ggplot2::autoplot(res)
}

## Example check usage
my_check <- function(values) {
  all(sapply(values[-1], function(x) identical(values[[1]], x)))
}
f <- function(a, b)
  2 + 2
a <- 2
## Check passes
microbenchmark(2 + 2, 2 + a, f(2, a), f(2, 2), check=my_check)
## Not run:
a <- 3
## Check fails
microbenchmark(2 + 2, 2 + a, f(2, a), f(2, 2), check=my_check)

## End(Not run)
## Example setup usage
set.seed(21)
```
microtiming_precision

## Estimate precision of timing routines.

### Description

This function is currently experimental. Its main use is to judge the quality of the underlying timer implementation of the operating system. The function measures the overhead of timing a C function call rounds times and returns all non-zero timings observed. This can be used to judge the granularity and resolution of the timing subsystem.

### Usage

```r
microtiming_precision(rounds = 100L, warmup = 2^18)
```

### Arguments

- `rounds`: Number of measurements used to estimate the precision.
- `warmup`: Number of iterations used to warm up the CPU.

### Value

A vector of observed non-zero timings.

print.microbenchmark  

Print microbenchmark timings.

Description

Print microbenchmark timings.

Usage

```r
## S3 method for class 'microbenchmark'
print(x, unit, order, signif, ...)
```

Arguments

- `x`  
  An object of class `microbenchmark`.

- `unit`  
  What unit to print the timings in. Default value taken from `microbenchmark.unit` (see example).

- `order`  
  If present, order results according to this column of the output.

- `signif`  
  If present, limit the number of significant digits shown.

- `...`  
  Passed to `print.data.frame`

Note

The available units are nanoseconds ("ns"), microseconds ("us"), milliseconds ("ms"), seconds ("s") and evaluations per seconds ("eps") and relative runtime compared to the best median time ("relative").

If the `multcomp` package is available a statistical ranking is calculated and displayed in compact letter display from in the `cld` column.

`boxplot.microbenchmark` and `autoplot.microbenchmark` for a plot methods.

Examples

```r
a1 <- a2 <- a3 <- a4 <- numeric(0)
res <- microbenchmark(a1 <- c(a1, 1),
                      a2 <- append(a2, 1),
                      a3[length(a3) + 1] <- 1,
                      a4[[length(a4) + 1]] <- 1,
                      times=100L)
print(res)
```
## Change default unit to relative runtime
options(microbenchmark.unit="relative")
print(res)

## Change default unit to evaluations per second
options(microbenchmark.unit="eps")
print(res)

---

### summary.microbenchmark

*Summarize microbenchmark timings.*

**Description**

Summarize microbenchmark timings.

**Usage**

```r
## S3 method for class 'microbenchmark'
summary(object, unit, ...)
```

**Arguments**

- **object**: An object of class `microbenchmark`.
- **unit**: What unit to print the timings in. If none is given, either the `unit` attribute of `object` or the option `microbenchmark.unit` is used and if neither is set “t” is used.
- **...**: Passed to `print.data.frame`

**Value**

A `data.frame` containing the aggregated results.

**Note**

The available units are nanoseconds ("ns"), microseconds ("us"), milliseconds ("ms"), seconds ("s") and evaluations per seconds ("eps") and relative runtime compared to the best median time ("relative").
