Contrasts(Fitted.students, contrast.matrix=cm)

AIC.mixor

Return AIC for a Fitted Mixor Model

Description

Returns the AIC of a fitted mixor model.

Usage

## S3 method for class 'mixor'
AIC(object, ...)

Arguments

object a mixor object.
...
other arguments.

Value

AIC of the fitted mixor model.

Author(s)

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons

See Also

See Also as mixor, summary.mixor
Examples

library("mixor")
data(\"schizophrenia\")
### Random intercept
SCHIZO1.fit<-mixor(limps79o ~ TxDrug + SqrtWeek + TxSWeek, data=schizophrenia, 
  id=id, link="probit")
summary(SCHIZO1.fit)
AIC(SCHIZO1.fit)

BIC.mixor  
Return BIC for a Fitted Mixor Model

Description

Returns the BIC of a fitted mixor model.

Usage

## S3 method for class 'mixor'
BIC(object, ...)

Arguments

  object    a mixor object.
    ...
  ...      other arguments.

Value

BIC of the fitted mixor model.

Author(s)

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons

See Also

See Also as mixor, summary.mixor

Examples

library("mixor")
data(\"schizophrenia\")
### Random intercept
SCHIZO1.fit<-mixor(limps79o ~ TxDrug + SqrtWeek + TxSWeek, data=schizophrenia, 
  id=id, link="probit")
summary(SCHIZO1.fit)
BIC(SCHIZO1.fit)
Description

c coef.mixor is a generic function which extracts the model coefficients from a fitted model object fit using mixor

Usage

## S3 method for class 'mixor'
coef(object, ...)

Arguments

object a mixor object.

... other arguments.

Value

Coefficients extracted from the model object.

Author(s)

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons

See Also

See Also as mixor, summary.mixor

Examples

library("mixor")
data("schizophrenia")
### Random intercept model
SCHIZ01.fit<-mixor(imps79o ~ TxDrug + SqrtWeek + TxSWeek, data=schizophrenia, id=id, link="probit")
coef(SCHIZ01.fit)
Twins Trouble Concentrating Data

Description

Monozygotic and dizygotic twins trouble concentrating data

Usage

data(concen)

Format

A data frame with 16 observations on the following 6 variables.

ID  a numeric vector indicating the unique twin pair ID
TConcen an indicator variable representing trouble concentrating (0 = absent, 1 = present)
int  a numeric vector of ones; used in the stand-alone MIXOR program to represent the intercept
Mz  an indicator variable representing MZ twins (1 = MZ, 0 = DZ)
Dz  an indicator variable representing DZ twins (1 = DZ, 0 = MZ)
freq a numeric vector representing the frequency of the pattern

References

Examples

library("mixor")
data("concen")
# sort the data by twin pair ID
concen<-concen[order(concen$ID),]
# common ICC probit model
Common.ICC<-mixor(TConcen~Mz, data=concen, id=ID, weights=freq,
   link="probit", nAGQ=10, random.effect.mean=FALSE)
summary(Common.ICC)
# Varying ICC probit model
Varying.ICC<-mixor(TConcen~Mz+Dz, data=concen, id=ID, weights=freq,
   which.random.slope=1:2, exclude.fixed.effect=2, link="probit",
   nAGQ=20, random.effect.mean=FALSE, UNID=1)
summary(Varying.ICC)
**Contrasts**

**Estimate Contrasts for Mixor Object**

---

### Description

This function is used to specify and estimate contrasts of interest for a `mixor` object.

### Usage

```r
Contrasts(fit, contrast.matrix, digits=max(3,getOption("digits") - 2),
          signif.stars=TRUE, dig.tst = max(1, min(5, digits - 1)))
```

### Arguments

- **fit**: A `mixor` object.
- **contrast.matrix**: A matrix of contrasts of interest. Each column in the contrast matrix should be of the same length as the `coef` vector of the fitted `mixor` object.
- **digits**: minimum number of significant digits to be used for most numbers.
- **signif.stars**: logical; if TRUE, P-values are additionally encoded visually as "significance stars" in order to help scanning of long coefficient tables.
- **dig.tst**: minimum number of significant digits for the test statistics.

### Value

A list containing the following components:

- **contrast.matrix**: a matrix specifying the contrasts of interest.
- **Contrasts**: a matrix containing the estimates, SEs, Z-values, and p-values for the contrasts of interest.

### Author(s)

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons

summary(Fitted.students)
coef(Fitted.students)
vcov(Fitted.students)
cm<-matrix(c(-1,-1,-1,0,0,0,0,0,
             0, 0, 0,0,0,0,0,0,
             0, 0, 0,0,0,0,0,1),ncol=3,byrow=TRUE)
Contrasts(Fitted.students, contrast.matrix=cm)

---

deviance.mixor  
Return the deviance for a Fitted Mixor Model

Description

Returns the deviance of a fitted mixor model.

Usage

## S3 method for class 'mixor'
deviance(object, ...)

Arguments

object  
a mixor object.

...  
other arguments.

Value

Deviance of the fitted mixor model.

Author(s)

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons

See Also

See Also as mixor, summary.mixor, loglik.mixor
Examples

library("mixor")

### Random intercept
SCHIZ01.fit <- mixor(formula=~imps79o + TxDrug + SqrtWeek + TxSWeek, data=schizophrenia, id=id, link="probit")
summary(SCHIZ01.fit)
deviance(SCHIZ01.fit)

irt.data

Armed Services Vocational Aptitude Battery

Description

Arithmetic reasoning items from the Armed Services Vocational Aptitude Battery

Usage

data(irt.data)

Format

A data frame with 128 observations on the following 13 variables.

ID  a numeric vector indicating unique pattern identifier
Resp  item response (0 = incorrect; 1 = correct)
int  a numeric vector of ones; used in MIXOR stand-alone program to represent the intercept
Item1  Arithmetic reasoning item 1 (0 = no; 1 = yes)
Item2  Arithmetic reasoning item 2 (0 = no; 1 = yes)
Item3  Arithmetic reasoning item 3 (0 = no; 1 = yes)
Item4  Arithmetic reasoning item 4 (0 = no; 1 = yes)
SexF  an indicator variable representing gender (0 = female; 1 = male)
SexItem1  Gender by Item1 interaction
SexItem2  Gender by Item2 interaction
SexItem3  Gender by Item3 interaction
SexItem4  Gender by Item4 interaction
freq  frequency weight of pattern

References

Examples

```r
library("mixor")
data("irt.data")
##  Sort data by ID
irt.data<-irt.data[order(irt.data$ID),]
# 2 parameter logistic IRT model
Fitted.irt<-mixor(Resp~Item1+Item2+Item3+Item4-1, data=irt.data, id=ID,
weights=freq, which.random.slope=1:4, link="logit", nAGQ=10,
random.effect.mean=FALSE, UNID=1, vcov=FALSE)
summary(Fitted.irt)
# 2 parameter logistic IRT model with Sex interactions on item parameters
Fitted.irt2<-mixor(Resp~Item1+Item2+Item3+Item4+SexItem1+SexItem2+SexItem3+SexItem4-1,
data=irt.data, id=ID, weights=freq, which.random.slope=1:8, link="logit",
nAGQ=10, random.effect.mean=FALSE, UNID=1, vcov=FALSE)
summary(Fitted.irt2)
```

---

logLik.mixor

*Return the log-likelihood for a Fitted Mixor Model*

Description

Returns the log-likelihood of a fitted `mixor` model.

Usage

```r
## S3 method for class 'mixor'
logLik(object, ...)
```

Arguments

- `object` a `mixor` object.
- `...` other arguments.

Value

Log-likelihood of the fitted `mixor` model.

Author(s)

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons

See Also

See Also as `mixor`, `summary.mixor`, `deviance.mixor`

---

mixor

*Mixed-Effects Ordinal Regression Analysis*

Description

This function fits mixed-effects ordinal and binary response models. Various link functions are supported including probit, logistic, and complementary log-log. For longitudinal data, the `mixor` function allows for individual varying intercepts and slopes across times.

Usage

```r
mixor(formula, data, id, which.random.slope = NA, subset, weights,
      exclude.fixed.effect = NA, conv = 1e-04, empirical.prior = FALSE,
      quadrature.dist = "Normal", nAGQ = 11, adaptive.quadrature = TRUE,
      link = "probit", KG = 0, KS = 0, IADD = -1, indep.re = FALSE,
      random.effect.mean = TRUE, UNID = 0, vcov = TRUE)
```

Arguments

- `formula` an object of class "formula" (or one that can be coerced to that class): a symbolic description of the model to be fitted.
- `data` an optional `data.frame` containing the variables in the model. Note the `data.frame` must be sorted by `id` prior to invoking the `mixor` function.
- `id` name of clustering variable in the `data.frame`
- `which.random.slope` which.random.slope=NA means no random slope, only a random intercept is fit. To specify a random slope, which.random.slope is the number of the predictor variable on the RHS of the model formula. More than one variable can have a random slope.
- `subset` an optional vector specifying a subset of observations to be used in the fitting process.
- `weights` when supplied, indicates differential weights are used; otherwise each id is weighted equally. `weights` are the frequency weights to be assigned to each id.

exclude.fixed.effect
the RHS of the model includes both fixed and random effects. Variables are identified as random effects using which.random.slope. If it is desired that a variable be included in the model without a fixed effect (random only), the number of that variable(s) in the RHS formula should be passed to exclude.fixed.effects.

CONV
convergence criteria, default is 0.0001.

empirical.prior
logical. If TRUE, uses empirical prior for random effects.

quadrature.dist
distribution for random effects. Either "Normal" (default) or "Uniform".

nAGQ
number of quadrature nodes per dimension. For one random effect, nAGQ=20 is reasonable but should be reduced to 5-10 for multiple random effects.

adaptive.quadrature
logical indicating whether adaptive quadrature (default) or non-adaptive quadrature is performed.

link
Link function, either "probit", "logit", or "cloglog"

KG
an optional integer reflecting the number of covariates to interact with threshold parameters (the first KG variables on the RHS of the model formula, so the order of the variables on the RHS of the model formula is important when using KG). Note that if KG is non-zero, KS must be zero.

KS
an optional integer reflecting the number of covariates used in scaling (the first KS variables on the RHS of the model formula, so the order of the variables on the RHS of the model formula is important when using KS). Note that if KS is non-zero, KG must be zero.

IADD
indicates how XB part of model is included; -1 subtract covariates and mean of random effects from thresholds; 1 add covariates and mean of random effects to thresholds. Default is -1 (subtract XB).

indep.re
logical. If TRUE, independent random effects. Default is FALSE which assumes correlated random effects.

random.effect.mean
logical. If TRUE, estimate the mean of the random effects.

UNID
indicator variable where 0 = random effects are multi-dimensional; 1 = random effects are variables related to a uni-dimensional random effect (e.g., item indicators of a latent variable).

vcov
logical. Default is vcov=TRUE which returns estimates of the the random-effect variance-covariance matrix. When vcov=FALSE, then estimates of the Cholesky (matrix square-root) of the random-effect variance-covariance matrix are returned.

Details
A typical model has the form response ~ terms where response is the (numeric) response vector and terms is a series of terms which specifies a linear predictor for response. The response can also be a censored survival response, of the form Surv(time,censorvariable)
Value

A list with components:

- **call**: Model call formula
- **Deviance**: Model deviance
- **Quadrature.points**: number of quadrature nodes per dimension used in fit
- **Model**: a matrix summarizing the model fit including columns Estimate, SE, Z, and P-value
- **varcov**: The variance-covariance matrix
- **EBmean**: empirical Bayes estimates of the means of the posterior distribution for each id
- **EBvar**: empirical Bayes estimates of posterior variance/covariance for each id
- **RIDGE**: Ridge
- **LOG**: Log-likelihood
- **SE**: a matrix corresponding the standard errors of the parameters estimates in coef
- **AIC**: AIC
- **SBC**: Schwarz criterion
- **AICD**: Akaike information criterion
- **SBCD**: deviance information criterion
- **MU**: mean of random effects
- **ALPHA**: fixed effects estimates
- **SIGMA**: random effects variance-covariance matrix
- **GAM**: thresholds
- **TAU**: scaling parameter estimates when proportional odds are not assumed. Returns when KG is non-zero.
- **IADD**: indicates how the XB part of model was included; -1 subtract covariates and mean of random effects from thresholds; 1 add covariates and mean of random effects to thresholds.
- **Y**: the response from the fitted model.
- **X**: the random effects terms from the fitted model.
- **W**: the fixed effects terms from the fitted model.
- **MAXJ**: the number of ordinal levels.
- **random.effect.mean**: If TRUE, the mean of the random effects was estimated.
- **KS**: integer reflecting the number of covariates that were specified to use in scaling (the first KS variables on the RHS of the model formula).
- **KG**: integer reflecting the number of covariates that were specified to interact with the threshold parameters (the first KG variables on the RHS of the model formula).
- **id**: name of clustering variable in the data.frame
**mixor**

which.random.slope  
the number of the predictor variable on the RHS of the model formula having a random slope. When which.random.slope=NA, only a random intercept model was fit.

ICEN  
if 1 indicates right-censoring was considered in the model fit.

link  
Link function, either "probit", "logit", or "cloglog"

terms  
terms from the fitted model.

**Note**

This function is essentially a wrapper for the MIXOR stand-alone program by Hedeker and Gibbons with added generic methods in R to enhance functionality. Note that the Fortran wrapper requires missing values to be denoted by -9 rather than NA.

Deprecated Functions in Package mixor

Description

These functions are provided for compatibility with older versions of mixor only, and will be defunct at the next release.

Details

The following functions are deprecated and will be made defunct; use the replacement indicated below:

- mixord: mixor

Author(s)

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons, Maintainer: Kellie J. Archer <kjarcher@vcu.edu>

Old Function Name Replaced with mixor

Description

The mixord function has been deprecated. Please use the mixor function for fitting longitudinal/clustered ordinal response models.

Author(s)

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons

See Also as mixor, summary.mixor
Attitudes Towards Sex Data from the 1989 General Social Survey

Description

Each subject provided ordinal responses on three items concerning their opinion on early teens (age 14-16) having sex before marriage (Item1), a man and a woman having sex before marriage (Item2), and a married person having sex with someone other than their spouse (Item3). Data are provided as frequencies by response pattern.

Usage

data(norcag)

Format

A data frame with 105 observations on the following 6 variables.

ID a numeric vector indicating unique patient identifier
SexItems ordinal item response coded as 1 = always wrong; 2 = almost always wrong; 3 = wrong only sometimes; 4 = not wrong
int a numeric vector of ones; used in the stand-alone MIXOR program to indicate the intercept
Item2vs1 attitude towards premarital vs teenage sex
Item3vs1 attitude towards extramarital vs teenage sex
freq frequency weight of the pattern

Source

References

Examples

library("mixor")
data("norcag")

# random intercepts model assuming proportional odds for differences in item responses
Fitted.norcag<-mixor(SexItems~Item2vs1+Item3vs1, data=norcag, id=ID, weights=freq, link="logit", nAGQ=20)
summary(Fitted.norcag)

# random intercepts model assuming non-proportional odds for differences in item responses
Fitted.norcag.np<-mixor(SexItems~Item2vs1+Item3vs1, data=norcag, id=ID, weights=freq, link="logit", nAGQ=10, KG=2)
plot.mixor

Plot empirical Bayes estimates of random effects for a Mixor Model Object

Description

Plot of empirical Bayes estimates of random effects from a fitted mixor model object.

Usage

## S3 method for class 'mixor'
plot(x, ...)

Arguments

x  
a mixor object.

...  
other arguments.

Value

For each random effect, a histogram and normal quantile-quantile plot of empirical Bayes estimates.

Author(s)

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons

### Random intercept
SCHIZ01.fit<-mixor(imps79o ~ TxDrug + SqrtWeek + TxSWeek, data=schizophrenia,
                   id=id, link="probit")
plot(SCHIZ01.fit)
predict.mixor: Predict Outcome From Mixor Fitted Model

Description

predict method for class mixor.

Usage

## S3 method for class 'mixor'
predict(object, newdata = NULL, na.action = na.fail, ...)

Arguments

- **object**: an object of class mixor.
- **newdata**: an optional data frame to be used for obtaining predictions when the random effects are zero. When newdata is not supplied, the random effects estimates are used in obtaining model predictions. All variables used in the mixor model, the fixed and the random effects models, as well as the grouping factors, must be present in the data frame.
- **na.action**: a function that indicates what should happen when newdata contains NAS. The default action (na.fail) causes the function to print an error message and terminate if there are any incomplete observations.
- **...**: other arguments.

Details

This function returns fitted probabilities and the predicted class from a fitted mixor object. When the newdata parameter is specified, the random effects are taken to be zero and predictions are returned. Otherwise conditional predictions, which includes both fixed and random effects terms, for the observed data are returned.

Value

- **predicted**: class specific probabilities from the fitted model.
- **class**: predicted class, that having the largest fitted probability, from the fitted model.

id=id, link="probit")
pihat<-predict(SCHIZO1.fit)
table(pihat$class, schizophrenia$impso)
head(pihat$predicted)
```

Description

print method for class mixor.

Usage

```r
## S3 method for class 'mixor'
print(x, digits = max(3L,getOption("digits") - 3L), ...)
```

Arguments

- `x`: an object of class mixor.
- `digits`: the number of significant digits to use when printing.
- `...`: further arguments passed to or from other methods.

Value

The function `print.mixor` prints the model call and coefficients from the mixor object.

print(SCHIZO1.fit)
### Random intercept and slope
SCHIZO2.fit<-mixor(imps79o ~ TxDrug + SqrtWeek + TxSWeek, data=schizophrenia, id=id, which.random.slope=2, link="probit")
print(SCHIZO2.fit)
```

schizophrenia  National Institute of Mental Health Schizophrenia Collaborative Study

Description

In the NIMH Schizophrenia Collaborative Study, patients were randomized to receive one of four medications, either placebo or one of three different anti-psychotic drugs. The protocol indicated subjects were to then be evaluated at weeks 0, 1, 3, 6 to assess severity of illness; additionally some measurements were made at weeks 2, 4, and 5.

Usage

```r
data(schizophrenia)
```

Format

A data frame with 1603 observations on the following 9 variables.

- `id` a numeric vector indicating the unique patient identifier
- `impsWY` a numeric vector from item 79 on the Inpatient Multidimensional Psychiatric Scale indicating severity of illness. The scores were applied to be interpreted as follows: 1 = normal, not ill at all; 2 = borderline mentally ill; 3 = mildly ill; 4 = moderately ill; 5 = markedly ill; 6 = severely ill; 7 = among the most extremely ill
- `impsWYo` an ordinally scaled version of imps79
- `imps79b` a binary version of imps79
- `imps79o` an ordinally scaled version of imps79
- `int` a numeric vector of ones; used in stand-alone package to indicate intercept
- `TxDrug` a numeric vector indicating treatment with drug (1) or placebo (0)
- `Week` a numeric vector indicating time, in weeks
- `SqrtWeek` the square root of the Week variable
- `TxSWeek` a variable representing the TxDrug x Week interaction

SCHIZ03.fit<-mixor(imps79o ~ TxDrug + SqrtWeek + TxSWeek, data=schizophrenia, id=id, which.random.slope=2, indep.re=TRUE, link="logit")
summary(SCHIZ03.fit)
```

SmokeOnset  Smoking Onset Data

Description

From the Television School and Family Smoking Prevention and Cessation Project, a study designed to increase knowledge of the effects of tobacco use in school-age children.

Usage

```r
data(SmokeOnset)
```

Format

A data frame with 1556 observations on the following 10 variables.

- `school`  a numeric vector identifying the unique school in the Los Angeles area
- `class`  a numeric vector identifying classroom
- `student`  a numeric vector identifying student
- `smkonset`  a numeric vector indicating time to smoking or right-censoring (post-intervention=1, 1 year follow-up=2, and 2 year follow-up=3). For these data right-censoring means that the observation was observed at the indicated timepoint (and had not smoked at that timepoint or at earlier timepoints), but was not observed at subsequent timepoints or thereafter.
- `event`  a numeric vector indicating whether the student smoked (1) or did not (0)
- `int`  a numeric vector of ones; used in stand-alone MIXOR program to represent the intercept
SexMale a numeric vector indicating gender of the student (0=Female, 1=Male)

cc a numeric vector indicating whether the school was randomized to a social-resistance classroom curriculum (1=Yes, 0=No)

tv a numeric vector indicating whether the school was randomized to a media (television) intervention (1=Yes, 0=No)

cctv a numeric vector indicating whether the school was randomized to CC combined with TV

students.mixor
```

Description

From the Television School and Family Smoking Prevention and Cessation Project, a study designed to increase knowledge of the effects of tobacco use in school-age children.
Usage

data(SmokingPrevention)

Format

A data frame with 1600 observations on the following 9 variables.

- school: a numeric vector identifying the Los Angeles school
- class: a numeric vector identifying classroom
- thksord: a numeric vector reflecting quartiles of the post-intervention tobacco and health knowledge scale score
- thksbin: a binary version of the post-intervention tobacco and health knowledge scale score
- int: a numeric vector of ones; used in the stand-alone MIXOR program to represent the intercept
- thkspre: the pre-intervention tobacco and health knowledge scale score
- cc: a numeric vector indicating whether the school was randomized to a social-resistance classroom curriculum (1=Yes, 0=No)
- tv: a numeric vector indicating whether the school was randomized to a media (television) intervention (1=Yes, 0=No)
- cctv: a numeric vector indicating whether the school was randomized to CC combined with TV

Examples

```r
library("mixor")
data("SmokingPrevention")
# sort dataset by id; note for these data sorting by class will also sort by school
SmokingPrevention<-SmokingPrevention[order(SmokingPrevention$class),]
# school model
Fitted.school<-mixor(thksord~thkspre+cc+tv+cctv, data=SmokingPrevention, id=school, link="logit")
summary(Fitted.school)
vcov(Fitted.school)
# students in classrooms analysis; not run
#Fitted.students<-mixor(thksord~thkspre+cc+tv+cctv, data=SmokingPrevention, id=class, link="logit")
#summary(Fitted.students)
#vcov(Fitted.students)
```
summarize.mixor

**summary.mixor**  
*Summarize Mixor Model Fit*

**Description**

summary method for class mixor.

**Usage**

```r
## S3 method for class 'mixor'
summary(object, digits=max(3, getOption("digits") - 2),
         signif.stars=TRUE, dig.tst = max(1, min(5, digits - 1)), ...)
```

**Arguments**

- `object`: an object of class mixor.
- `digits`: minimum number of significant digits to be used for most numbers.
- `signif.stars`: logical; if TRUE, P-values are additionally encoded visually as "significance stars" in order to help scanning of long coefficient tables.
- `dig.tst`: minimum number of significant digits for the test statistics.
- `...`: other arguments.

**Value**

Prints the following items extracted from the fitted mixor object: the call to mixor (model formula), mode Deviance, Log-likelihood, RIDGEMAX, AIC, SBC, and model parameter estimates along with their SE, Z, and p-value.

**Author(s)**

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons

**See Also**

See Also `mixor`, `print.mixor`, `coef.mixor`

**Examples**

```r
library("mixor")
data("schizophrenia")
### Random intercept
SCHIZ01.fit<-mixor(imps79o ~ TxDrug + SqrtWeek + TxSWeek, data=schizophrenia,
                  id=id, link="probit")
summary(SCHIZ01.fit)
```
Return Variance-Covariance Matrix for a Mixor Model Object

Description

Returns the variance-covariance matrix of a fitted mixor model object.

Usage

```r
## S3 method for class 'mixor'
vcov(object, ...)
```

Arguments

- `object`: a mixor object.
- `...`: other arguments.

Value

A matrix of the estimated covariances between the parameter estimates in the model.

Author(s)

Kellie J. Archer, Donald Hedeker, Rachel Nordgren, Robert D. Gibbons
