Package ‘mlbplotR’

June 20, 2023

Type Package

Title Create 'ggplot2' and 'gt' Visuals with Major League Baseball Logos

Version 1.1.0

Description Tools to help visualize Major League Baseball analysis in 'ggplot2' and 'gt'. You provide team/player information and 'mlbplotR' will transform that information into team colors, logos, or player headshots for graphics.

URL https://github.com/camdenk/mlbplotR,
    https://camdenk.github.io/mlbplotR/

BugReports https://github.com/camdenk/mlbplotR/issues

Imports cli, data.table, ggplot2, gt, lifecycle, magick, magrittr, rlang, scales

Suggests base64enc, dplyr, ggtext, gridtext, knitr, rsvg, rmarkdown, rstudioapi, sjmisc

Encoding UTF-8

License MIT + file LICENSE

RoxygenNote 7.2.3

Depends R (>= 3.5.0)

NeedsCompilation no

element ................................................................. 3
clean_team_abbrs

Description

This function standardizes MLB team abbreviations to Baseball Savant defaults. This helps for joins and plotting.

Usage

clean_team_abbrs(abbr, keep_non_matches = TRUE)

Arguments

abbr a character vector of abbreviations
keep_non_matches will non-matches be kept in the vector?

Value

A character vector with the length of abbr and cleaned team abbreviations if they are included in team_data. Non matches may be replaced with NA (depending on the value of keep_non_matches).
Examples

```r
x <- c("PIE", "STL", "WSN", "CWS", "CHW")
# use current location and keep non matches
clean_team_abbrs(x)
```

---

**Theme Elements for Image Grobs**

**Description**

In conjunction with the `ggplot2::theme` system, the following `element_` functions enable images in non-data components of the plot, e.g. axis text.

- `element_mlb_logo()`, `element_mlb_scoreboard_logo()`, `element_mlb_dot_logo()`: draws MLB team logos instead of their abbreviations.
- `element_mlb_dark_cap_logo()` and `element_mlb_light_cap_logo()`: draws MLB team cap logos instead of their abbreviations.
- `element_mlb_headshot()`: draws MLB player headshots instead of their MLB IDs
- `element_path()`: draws images from valid image URLs instead of the URL.

**Usage**

```r
element_mlb_logo(
  alpha = NULL,
  colour = NA,
  hjust = NULL,
  vjust = NULL,
  color = NULL,
  size = 0.5
)
```

```r
element_mlb_scoreboard_logo(
  alpha = NULL,
  colour = NA,
  hjust = NULL,
  vjust = NULL,
  color = NULL,
  size = 0.5
)
```

```r
element_mlb_dot_logo(
  alpha = NULL,
  colour = NA,
  hjust = NULL,
)
```
Arguments

alpha The alpha channel, i.e. transparency level, as a numerical value between 0 and 1.

colour, color The image will be colorized with this color. Use the special character "b/w" to set it to black and white. For more information on valid color names in ggplot2 see https://ggplot2.tidyverse.org/articles/ggplot2-specs.html?q=colour#
element

colour-and-fill.

hjust, vjust  The horizontal and vertical adjustment respectively. Must be a numerical value between 0 and 1.

size  The output grob size in cm (!).

Details

The elements translate MLB team abbreviations or MLB player IDs into logo images or headshots, respectively.

Value

An S3 object of class element.

See Also

geom_mlb_logos(), geom_mlb_headshots(), and geom_from_path() for more information on valid team abbreviations, player ids, and other parameters.

Examples

library(mlbplotR)
library(ggplot2)

team_abbr <- valid_team_names()
# remove league logos from this example
team_abbr <- team_abbr[!team_abbr %in% c("AL", "NL", "MLB")]

df <- data.frame(
  random_value = runif(length(team_abbr), 0, 1),
  teams = team_abbr
)

# use logos for x-axis
ggplot(df, aes(x = teams, y = random_value)) +
  geom_col(aes(color = teams, fill = teams), width = 0.5) +
  scale_color_mlb(type = "secondary") +
  scale_fill_mlb(alpha = 0.4) +
  theme_minimal() +
  theme(axis.text.x = element_mlb_logo())

# use logos for y-axis
ggplot(df, aes(y = teams, x = random_value)) +
  geom_col(aes(color = teams, fill = teams), width = 0.5) +
  scale_color_mlb(type = "secondary") +
  scale_fill_mlb(alpha = 0.4) +
  theme_minimal() +
  theme(axis.text.y = element_mlb_logo())

###########################################################################
# Headshot Examples

library(mlbplotR)
library(ggplot2)

dfh <- data.frame(
    random_value = runif(9, 0, 1),
    player_id = c("594798",
                   "592450",
                   "605141",
                   "665742",
                   "545361",
                   "665487",
                   "571448",
                   "0",
                   "543037")
)

# use headshots for x-axis
ggplot(dfh, aes(x = player_id, y = random_value)) +
geom_col(width = 0.5) +
theme_minimal() +
theme(axis.text.x = element_mlb_headshot())

# use headshots for y-axis
ggplot(dfh, aes(y = player_id, x = random_value)) +
geom_col(width = 0.5) +
theme_minimal() +
theme(axis.text.y = element_mlb_headshot())

---

**geom_cap_logos**

**ggplot2 Layer for Visualizing MLB Team Cap Logos**

**Description**

`geom_mlb_dark_cap_logos()` and `geom_mlb_dark_cap_logos()` are used to plot MLB team cap and league logos instead of points in a ggplot. It requires x, y aesthetics as well as a valid MLB team abbreviation. The latter can be checked with `valid_team_names()` but is also cleaned before being plotted.

**Usage**

```r
geom_mlb_dark_cap_logos(
    mapping = NULL,
    data = NULL,
    stat = "identity",
    position = "identity",
)```
geom_cap_logos

...,  
nudge_x = 0,  
nudge_y = 0,  
na.rm = FALSE,  
show.legend = FALSE,  
inherit.aes = TRUE
)

geom_mlb_light_cap_logos(
  mapping = NULL,  
data = NULL,  
stat = "identity",  
position = "identity",  
...,  
nudge_x = 0,  
nudge_y = 0,  
na.rm = FALSE,  
show.legend = FALSE,  
inherit.aes = TRUE
)

Arguments

mapping Set of aesthetic mappings created by aes(). If specified and inherit.aes = TRUE (the default), it is combined with the default mapping at the top level of the plot. You must supply mapping if there is no plot mapping.

data The data to be displayed in this layer. There are three options:
  If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot().
  A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created.
  A function will be called with a single argument, the plot data. The return value must be a data.frame, and will be used as the layer data. A function can be created from a formula (e.g. ~ head(.x, 10)).

stat The statistical transformation to use on the data for this layer, either as a ggproto Geom subclass or as a string naming the stat stripped of the stat_ prefix (e.g. "count" rather than "stat_count")

position Position adjustment, either as a string naming the adjustment (e.g. "jitter" to use position_jitter), or the result of a call to a position adjustment function. Use the latter if you need to change the settings of the adjustment.

... Other arguments passed on to ggplot2::layer(). These are often aesthetics, used to set an aesthetic to a fixed value. See the below section "Aesthetics" for a full list of possible arguments.

nudge_x, nudge_y Horizontal and vertical adjustment to nudge labels by. Useful for offsetting text from points, particularly on discrete scales. Cannot be jointly specified with position.
If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.

Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. `borders()`.

A ggplot2 layer (`ggplot2::layer()`) that can be added to a plot created with `ggplot2::ggplot()`.

`geom_mlb_dark_cap_logos()` and `geom_mlb_dark_cap_logos()` understand the following aesthetics (required aesthetics are in bold):

- **x** - The x-coordinate.
- **y** - The y-coordinate.
- **team_abbr** - The team abbreviation. Need to use Savant’s abbreviation.
- **alpha = NULL** - The alpha channel, i.e. transparency level, as a numerical value between 0 and 1.
- **colour = NULL** - The image will be colourized with this colour. Use the special character "b/w" to set it to black and white. For more information on valid colour names in ggplot2 see https://ggplot2.tidyverse.org/articles/ggplot2-specs.html?q=colour#colour-and-fill
- **angle = 0** - The angle of the image as a numerical value between 0° and 360°.
- **hjust = 0.5** - The horizontal adjustment relative to the given x coordinate. Must be a numerical value between 0 and 1.
- **vjust = 0.5** - The vertical adjustment relative to the given y coordinate. Must be a numerical value between 0 and 1.
- **height = 1.0** - The desired height of the image in npc (Normalised Parent Coordinates). The default value is set to 1.0 which is big but it is necessary because all used values are computed relative to the default. A typical size is height = 0.1 (see below examples). For cap logos, the scaling works better when adjusting height and not width.
- **width = 1.0** - The desired width of the image in npc (Normalised Parent Coordinates). The default value is set to 1.0 which is big but it is necessary because all used values are computed relative to the default. A typical size is height = 0.075 (see below examples). For cap logos, the scaling works better when adjusting height and not width.

Examples

```r
library(mlbplotR)
library(ggplot2)
```
team_abbr <- valid_team_names()
# remove conference logos from this example
# remove conference logos from this example
team_abbr <- team_abbr[!team_abbr %in% c("NL", "AL", "MLB")]

df <- data.frame(
  a = rep(1:6, 5),
  b = sort(rep(1:5, 6), decreasing = TRUE),
  teams = team_abbr
)

# keep alpha == 1 for all teams including an "A"
matches <- grepl("A", team_abbr)
df$alpha <- ifelse(matches, 1, 0.2)
# also set a custom fill colour for the non "A" teams
df$colour <- ifelse(matches, NA, "gray")

# scatterplot of all logos
ggplot(df, aes(x = a, y = b)) +
  geom_mlb_dark_cap_logos(aes(team_abbr = teams), height = 0.075) +
  geom_label(aes(label = teams), nudge_y = -0.35, alpha = 0.5) +
  theme_void()

# apply alpha via an aesthetic from inside the dataset `df`
# please note that you have to add scale_alpha_identity() to use the alpha
# values in your dataset!
# apply alpha via an aesthetic from inside the dataset `df`
# please note that you have to add scale_alpha_identity() to use the alpha
# values in your dataset!
# apply alpha and colour via an aesthetic from inside the dataset `df`
# please note that you have to add scale_alpha_identity() as well as
# scale_colour_identity() to use the alpha and colour values in your dataset!
# apply alpha as constant for all logos
# it's also possible to plot league logos
league <- data.frame(a = 1:3, b = 0, teams = c("AL", "NL", "MLB"))
ggplot(league, aes(x = a, y = b)) +
  geom_mlb_dark_cap_logos(aes(team_abbr = teams), width = 0.3) +
  geom_label(aes(label = teams), nudge_y = -0.4, alpha = 0.5) +
coord_cartesian(xlim = c(0.5,3.5), ylim = c(-0.75,.75)) +
theme_void()

---

### geom_from_path

**ggplot2 Layer for Visualizing Images from URLs or Local Paths**

#### Description

This geom is used to plot MLB images instead of points in a ggplot. It requires x, y aesthetics as well as a path.

#### Usage

```r
geom_from_path(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ..., 
  nudge_x = 0,
  nudge_y = 0,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = TRUE
)
```

#### Arguments

- **mapping**: Set of aesthetic mappings created by `aes()`. If specified and `inherit.aes = TRUE` (the default), it is combined with the default mapping at the top level of the plot. You must supply mapping if there is no plot mapping.

- **data**: The data to be displayed in this layer. There are three options:
  - If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
  - A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.
  - A function will be called with a single argument, the plot data. The return value must be a `data.frame`, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x, 10)`).

- **stat**: The statistical transformation to use on the data for this layer, either as a `ggproto` `Geom` subclass or as a string naming the stat stripped of the `stat_` prefix (e.g. "count" rather than "stat_count")

- **position**: Position adjustment, either as a string naming the adjustment (e.g. "jitter" to use `position_jitter`), or the result of a call to a position adjustment function. Use the latter if you need to change the settings of the adjustment.
geom_from_path

... Other arguments passed on to `ggplot2::layer()`. These are often aesthetics, used to set an aesthetic to a fixed value. See the below section "Aesthetics" for a full list of possible arguments.

nudge_x, nudge_y
Horizontal and vertical adjustment to nudge labels by. Useful for offsetting text from points, particularly on discrete scales. Cannot be jointly specified with position.

na.rm
If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.

show.legend
logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

inherit.aes
If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. `borders()`.

Value
A ggplot2 layer (`ggplot2::layer()`) that can be added to a plot created with `ggplot2::ggplot()`.

Aesthetics
`geom_mlb_logos()` understands the following aesthetics (required aesthetics are in bold):

- **x** - The x-coordinate.
- **y** - The y-coordinate.
- **path** - a file path, url, raster object or bitmap array. See `magick::image_read()` for further information.
- **alpha = NULL** - The alpha channel, i.e. transparency level, as a numerical value between 0 and 1.
- **colour = NULL** - The image will be colorized with this colour. Use the special character "b/w" to set it to black and white. For more information on valid colour names in ggplot2 see https://ggplot2.tidyverse.org/articles/ggplot2-specs.html?q=colour#colour-and-fill
- **angle = 0** - The angle of the image as a numerical value between 0° and 360°.
- **hjust = 0.5** - The horizontal adjustment relative to the given x coordinate. Must be a numerical value between 0 and 1.
- **vjust = 0.5** - The vertical adjustment relative to the given y coordinate. Must be a numerical value between 0 and 1.
- **width = 1.0** - The desired width of the image innpc (Normalised Parent Coordinates). The default value is set to 1.0 which is big but it is necessary because all used values are computed relative to the default. A typical size is `width = 0.1` (see below examples).
- **height = 1.0** - The desired height of the image innpc (Normalised Parent Coordinates). The default value is set to 1.0 which is big but it is necessary because all used values are computed relative to the default. A typical size is `height = 0.1` (see below examples).
library(mlbplotR)
library(ggplot2)

# create x-y-coordinates of a triangle and add league logo urls
df <- data.frame(
a = c(sin(2 * pi * (0:4) / 5), 0),
b = c(cos(2 * pi * (0:4) / 5), 0),
url = c(
  "https://i.turner.ncaa.com/sites/default/files/images/logos/schools/bgl/virginia.svg",
  "https://i.turner.ncaa.com/sites/default/files/images/logos/schools/bgl/michigan-st.svg",
  "https://i.turner.ncaa.com/sites/default/files/images/logos/schools/bgl/lsu.svg",
  "https://i.turner.ncaa.com/sites/default/files/images/logos/schools/bgl/texas.svg",
  "https://i.turner.ncaa.com/sites/default/files/images/logos/schools/bgl/oregon.svg",
  "https://i.turner.ncaa.com/sites/default/files/images/logos/schools/bgl/james-madison.svg"
)
)

# plot images directly from url
ggplot(df, aes(x = a, y = b)) +
  geom_from_path(aes(path = url), width = 0.15) +
  coord_cartesian(xlim = c(-2, 2), ylim = c(-1.3, 1.5)) +
  theme_void()

# plot images directly from url and apply transparency
ggplot(df, aes(x = a, y = b)) +
  geom_from_path(aes(path = url), width = 0.15, alpha = 0.5) +
  coord_cartesian(xlim = c(-2, 2), ylim = c(-1.3, 1.5)) +
  theme_void()

# It is also possible and recommended to use the underlying Geom inside a
# ggplot2 annotation
ggplot() +
  annotate(
    mlbplotR::GeomFromPath,
    x = 0,
    y = 0,
    width = 0.4
  ) +
  theme_minimal()

### geom_lines

**ggplot2 Layer for Horizontal and Vertical Reference Lines**

**Description**

These geoms can be used to draw horizontal or vertical reference lines in a ggplot. They use the data in the aesthetics `v_var` and `h_var` to compute their median or mean and draw the as a line.
Usage

`geom_median_lines(
    mapping = NULL,
    data = NULL,
    ..., 
    na.rm = FALSE,
    show.legend = NA,
    inherit.aes = TRUE
)

`geom_mean_lines(
    mapping = NULL,
    data = NULL,
    ..., 
    na.rm = FALSE,
    show.legend = NA,
    inherit.aes = TRUE
)

Arguments

mapping     Set of aesthetic mappings created by `aes()`.  
data        The data to be displayed in this layer. There are three options:  
            If `NULL`, the default, the data is inherited from the plot data as specified in the 
            call to `ggplot()`.  
            A `data.frame`, or other object, will override the plot data. All objects will be 
            fortified to produce a data frame. See `fortify()` for which variables will be 
            created.  
            A function will be called with a single argument, the plot data. The return 
            value must be a `data.frame`, and will be used as the layer data. A function 
            can be created from a `formula` (e.g. `~ head(.x, 10)`).  
            ...        Other arguments passed on to `layer()`. These are often aesthetics, used to set 
                        an aesthetic to a fixed value, like `colour = "red"` or `size = 3`. They may also 
                        be parameters to the paired geom/stat.  
            na.rm       If `FALSE`, the default, missing values are removed with a warning. If `TRUE`, 
                        missing values are silently removed.  
            show.legend logical. Should this layer be included in the legends? `NA`, the default, includes if 
                        any aesthetics are mapped. `FALSE` never includes, and `TRUE` always includes. It 
                        can also be a named logical vector to finely select the aesthetics to display.  
            inherit.aes If `FALSE`, overrides the default aesthetics, rather than combining with them. 
                        This is most useful for helper functions that define both data and aesthetics and 
                        shouldn’t inherit behavior from the default plot specification.

Value

A `ggplot2` layer (`ggplot2::layer()`) that can be added to a plot created with `ggplot2::ggplot()`. 
### Aesthetics

`geom_median_lines()` and `geom_mean_lines()` understand the following aesthetics (at least one of the bold aesthetics is required):

- **v_var** - The variable for which to compute the median/mean that is drawn as vertical line.
- **h_var** - The variable for which to compute the median/mean that is drawn as horizontal line.
- **alpha = NA** - The alpha channel, i.e. transparency level, as a numerical value between 0 and 1.
- **color = "black"** - The color of the drawn lines.
- **linetype = 2** - The linetype of the drawn lines.
- **linewidth = 0.5** - The size of the drawn lines.

### See Also

The underlying ggplot2 geoms `geom_hline()` and `geom_vline()`

### Examples

```r
library(mlbplotR)
library(ggplot2)

# inherit top level aesthetics
ggplot(mtcars, aes(x = disp, y = mpg, h_var = mpg, v_var = disp)) +
  geom_point() +
  geom_median_lines() +
  geom_mean_lines(color = "blue") +
  theme_minimal()

# draw horizontal line only
ggplot(mtcars, aes(x = disp, y = mpg, h_var = mpg)) +
  geom_point() +
  geom_median_lines() +
  geom_mean_lines(color = "blue") +
  theme_minimal()

# draw vertical line only
ggplot(mtcars, aes(x = disp, y = mpg, v_var = disp)) +
  geom_point() +
  geom_median_lines() +
  geom_mean_lines(color = "blue") +
  theme_minimal()

# choose your own value
ggplot(mtcars, aes(x = disp, y = mpg)) +
  geom_point() +
  geom_median_lines(v_var = 400, h_var = 15) +
  geom_mean_lines(v_var = 150, h_var = 30, color = "blue") +
  theme_minimal()
```
Description

This geom is used to plot MLB player headshots instead of points in a ggplot. It requires x, y aesthetics as well as a valid MLBAM id (The same ID associated with their Baseball Savant page).

Usage

```r
geom_mlb_headshots(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ...,
  nudge_x = 0,
  nudge_y = 0,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = TRUE
)
```

Arguments

- **mapping**
  - Set of aesthetic mappings created by `aes()`. If specified and `inherit.aes = TRUE` (the default), it is combined with the default mapping at the top level of the plot. You must supply `mapping` if there is no plot mapping.

- **data**
  - The data to be displayed in this layer. There are three options:
    - If `NULL`, the default, the data is inherited from the plot data as specified in the call to `ggplot()`.
    - A `data.frame`, or other object, will override the plot data. All objects will be fortified to produce a data frame. See `fortify()` for which variables will be created.
    - A function will be called with a single argument, the plot data. The return value must be a `data.frame`, and will be used as the layer data. A function can be created from a formula (e.g. `~ head(.x, 10)`).

- **stat**
  - The statistical transformation to use on the data for this layer, either as a ggproto Geom subclass or as a string naming the stat stripped of the stat_ prefix (e.g. "count" rather than "stat_count")

- **position**
  - Position adjustment, either as a string naming the adjustment (e.g. "jitter" to use `position_jitter`), or the result of a call to a position adjustment function. Use the latter if you need to change the settings of the adjustment.

- **...**
  - Other arguments passed on to `ggplot2::layer()`. These are often aesthetics, used to set an aesthetic to a fixed value. See the below section "Aesthetics" for a full list of possible arguments.
nudge_x, nudge_y

Horizontal and vertical adjustment to nudge labels by. Useful for offsetting text from points, particularly on discrete scales. Cannot be jointly specified with position.

na.rm

If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.

show.legend

logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.

inherit.aes

If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders().

Value

A ggplot2 layer (ggplot2::layer()) that can be added to a plot created with ggplot2::ggplot().

Aesthetics

gem_mlb_headshots() understands the following aesthetics (required aesthetics are in bold):

- **x** - The x-coordinate.
- **y** - The y-coordinate.
- **player_id** - The players’ MLB (Baseball Savant) id.
- **na_headshot_to_logo = TRUE** - Should NA/non-matches return the MLB logo instead of a grayed out blank headshot? Defaults to TRUE
- **alpha = NULL** - The alpha channel, i.e. transparency level, as a numerical value between 0 and 1.
- **colour = NULL** - The image will be colorized with this colour. Use the special character "b/w" to set it to black and white. For more information on valid colour names in ggplot2 see https://ggplot2.tidyverse.org/articles/ggplot2-specs.html?q=colour#colour-and-fill
- **angle = 0** - The angle of the image as a numerical value between 0° and 360°.
- **hjust = 0.5** - The horizontal adjustment relative to the given x coordinate. Must be a numerical value between 0 and 1.
- **vjust = 0.5** - The vertical adjustment relative to the given y coordinate. Must be a numerical value between 0 and 1.
- **width = 1.0** - The desired width of the image in npc (Normalised Parent Coordinates). The default value is set to 1.0 which is big but it is necessary because all used values are computed relative to the default. A typical size is width = 0.075 (see below examples).
- **height = 1.0** - The desired height of the image in npc (Normalised Parent Coordinates). The default value is set to 1.0 which is big but it is necessary because all used values are computed relative to the default. A typical size is height = 0.1 (see below examples).
Examples

    library(mlbplotR)
    library(ggplot2)

    df <- data.frame(
        a = c(rep(1:3, 3), 1.5, 2.5),
        b = c(sort(rep(1:3, 3), decreasing = TRUE), 2.5, 2.5),
        player_id = c(NA, NA, NA, 545361, 605141, 571448, 594798, 518692, 0, 521692, 120074, 665487, 518934),
    )

    # set a custom fill colour for one player
    df$colour <- ifelse(df$a == 2 & df$b == 2, NA, "b/w")

    # scatterplot of the headshots
    ggplot(df, aes(x = a, y = b)) +
    geom_mlb_headshots(aes(player_id = player_id), height = 0.2) +
    geom_label(aes(label = player_name), nudge_y = -0.35, alpha = 0.5) +
    coord_cartesian(xlim = c(0.75, 3.25), ylim = c(0.7, 3.25)) +
    theme_void()

    # apply alpha as constant and use non default na replacement
    ggplot(df, aes(x = a, y = b)) +
    geom_mlb_headshots(aes(player_id = player_id), height = 0.2, alpha = 0.5, na_headshot_to_logo = FALSE) +
    geom_label(aes(label = player_name), nudge_y = -0.35, alpha = 0.5) +
    coord_cartesian(xlim = c(0.75, 3.25), ylim = c(0.7, 3.25)) +
    theme_void()

    # apply colour as an aesthetic
    ggplot(df, aes(x = a, y = b)) +
**geom_mlb_logos**

`geom_mlb_logos()` is a ggplot2 Layer for Visualizing MLB Team Logos. It requires x, y aesthetics as well as a valid MLB team abbreviation. This latter can be checked with `valid_team_names()` but is also cleaned before being plotted.

**Usage**

```r
gem_mlb_logos(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ..., 
  nudge_x = 0,
  nudge_y = 0,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = TRUE
)
```

```r
gem_mlb_scoreboard_logos(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ..., 
  nudge_x = 0,
  nudge_y = 0,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = TRUE
)
```

```r
gem_mlb_dot_logos(
  mapping = NULL,
  data = NULL,
  stat = "identity",
  position = "identity",
  ..., 
  nudge_x = 0,
  nudge_y = 0,
  na.rm = FALSE,
  show.legend = FALSE,
  inherit.aes = TRUE
)
```
geom_mlb_logos = NULL,
data = NULL,
stat = "identity",
position = "identity",
..., 
nudge_x = 0,
nudge_y = 0,
na.rm = FALSE,
show.legend = FALSE,
inherit.aes = TRUE
)

Arguments

mapping Set of aesthetic mappings created by aes(). If specified and inherit.aes = TRUE (the default), it is combined with the default mapping at the top level of the plot. You must supply mapping if there is no plot mapping.
data The data to be displayed in this layer. There are three options:
If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot().
A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify() for which variables will be created.
A function will be called with a single argument, the plot data. The return value must be a data.frame, and will be used as the layer data. A function can be created from a formula (e.g. ~ head(.x, 10)).
stat The statistical transformation to use on the data for this layer, either as a ggprotoGeom subclass or as a string naming the stat stripped of the stat_ prefix (e.g. "count" rather than "stat_count")
position Position adjustment, either as a string naming the adjustment (e.g. "jitter" to use position_jitter), or the result of a call to a position adjustment function. Use the latter if you need to change the settings of the adjustment.
...
Other arguments passed on to ggplot2::layer(). These are often aesthetics, used to set an aesthetic to a fixed value. See the below section "Aesthetics" for a full list of possible arguments.
nudge_x, nudge_y Horizontal and vertical adjustment to nudge labels by. Useful for offsetting text from points, particularly on discrete scales. Cannot be jointly specified with position.
na.rm If FALSE, the default, missing values are removed with a warning. If TRUE, missing values are silently removed.
show.legend logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes. It can also be a named logical vector to finely select the aesthetics to display.
inherit.aes If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders().
Value

A ggplot2 layer (ggplot2::layer()) that can be added to a plot created with ggplot2::ggplot().

Aesthetics

gem_mlb_logos(), geom_mlb_scoreboard_logos(), and geom_mlb_dot_logos() understand the following aesthetics (required aesthetics are in bold):

- **x** - The x-coordinate.
- **y** - The y-coordinate.
- **team_abbr** - The team abbreviation. Need to use Savant’s abbreviation.
- **alpha = NULL** - The alpha channel, i.e. transparency level, as a numerical value between 0 and 1.
- **colour = NULL** - The image will be colourized with this colour. Use the special character "b/w" to set it to black and white. For more information on valid colour names in ggplot2 see https://ggplot2.tidyverse.org/articles/ggplot2-specs.html?q=colour#colour-and-fill
- **angle = 0** - The angle of the image as a numerical value between 0° and 360°.
- **hjust = 0.5** - The horizontal adjustment relative to the given x coordinate. Must be a numerical value between 0 and 1.
- **vjust = 0.5** - The vertical adjustment relative to the given y coordinate. Must be a numerical value between 0 and 1.
- **width = 1.0** - The desired width of the image in npc (Normalised Parent Coordinates). The default value is set to 1.0 which is big but it is necessary because all used values are computed relative to the default. A typical size is width = 0.075 (see below examples).
- **height = 1.0** - The desired height of the image in npc (Normalised Parent Coordinates). The default value is set to 1.0 which is big but it is necessary because all used values are computed relative to the default. A typical size is height = 0.1 (see below examples).

Examples

```r
library(mlbplotR)
library(ggplot2)

team_abbr <- valid_team_names()
# remove conference logos from this example
team_abbr <- team_abbr[!team_abbr %in% c("NL", "AL", "MLB")]

df <- data.frame(
  a = rep(1:6, 5),
  b = sort(rep(1:5, 6), decreasing = TRUE),
  teams = team_abbr
)

# keep alpha == 1 for all teams including an "A"
matches <- grepl("A", team_abbr)
```
df$alpha <- ifelse(matches, 1, 0.2)
# also set a custom fill colour for the non "A" teams
df$colour <- ifelse(matches, NA, "gray")

# scatterplot of all logos
ggplot(df, aes(x = a, y = b)) +
  geom_mlb_logos(aes(team_abbr = teams), width = 0.075) +
  geom_label(aes(label = teams), nudge.y = -0.35, alpha = 0.5) +
  theme_void()

# apply alpha via an aesthetic from inside the dataset `df`
# please note that you have to add scale_alpha_identity() to use the alpha
# values in your dataset!
eggplot(df, aes(x = a, y = b)) +
  geom_mlb_scoreboard_logos(aes(team_abbr = teams, alpha = alpha), width = 0.075) +
  geom_label(aes(label = teams), nudge.y = -0.35, alpha = 0.5) +
  scale_alpha_identity() +
  theme_void()

# apply alpha and colour via an aesthetic from inside the dataset `df`
# please note that you have to add scale_alpha_identity() as well as
# scale_colour_identity() to use the alpha and colour values in your dataset!
eggplot(df, aes(x = a, y = b)) +
  geom_mlb_logos(aes(team_abbr = teams, alpha = alpha, colour = colour), width = 0.075) +
  geom_label(aes(label = teams), nudge.y = -0.35, alpha = 0.5) +
  scale_alpha_identity() +
  scale_colour_identity() +
  theme_void()

# apply alpha as constant for all logos
eggplot(df, aes(x = a, y = b)) +
  geom_mlb_dot_logos(aes(team_abbr = teams), width = 0.075, alpha = 0.6) +
  geom_label(aes(label = teams), nudge.y = -0.35, alpha = 0.5) +
  theme_void()

# it's also possible to plot league logos
league <- data.frame(a = 1:3, b = 0, teams = c("AL", "NL", "MLB"))
eggplot(league, aes(x = a, y = b)) +
  geom_mlb_logos(aes(team_abbr = teams), width = 0.3) +
  geom_label(aes(label = teams), nudge.y = -0.4, alpha = 0.5) +
  coord_cartesian(xlim = c(0.5,3.5), ylim = c(-0.75,.75)) +
  theme_void()
Usage

```r
ggpreview(
  plot = ggplot2::last_plot(),
  width = NA,
  height = NA,
  asp = NULL,
  dpi = 300,
  device = "png",
  units = c("in", "cm", "mm", "px"),
  scale = 1,
  limitsize = TRUE,
  bg = NULL,
  ...
)
```

Arguments

- **plot**: Plot to save, defaults to last plot displayed.
- **width, height, units**: Plot size in units ("in", "cm", "mm", or "px"). If not supplied, uses the size of current graphics device.
- **asp**: The aspect ratio of the plot calculated as width / height. If this is a numeric value (and not NULL) the height of the plot will be recalculated to height = width / asp.
- **dpi**: Plot resolution. Also accepts a string input: "retina" (320), "print" (300), or "screen" (72). Applies only to raster output types.
- **device**: Device to use. Can either be a device function (e.g. `png`), or one of "eps", "ps", "tex" (pictex), "pdf", "jpeg", "tiff", "png", "bmp", "svg" or "wmf" (windows only).
- **scale**: Multiplicative scaling factor.
- **limitsize**: When TRUE (the default), `ggsave()` will not save images larger than 50x50 inches, to prevent the common error of specifying dimensions in pixels.
- **bg**: Background colour. If NULL, uses the `plot.background` fill value from the plot theme.
- **...**: Other arguments passed on to the graphics device function, as specified by device.

Value

No return value, called for side effects.

Examples

```r
library(mlbplotR)
library(ggplot2)
```
team_abbr <- valid_team_names()
# remove league logos from this example
team_abbr <- team_abbr[!team_abbr %in% c("AL", "NL", "MLB")]

df <- data.frame(
  random_value = runif(length(team_abbr), 0, 1),
  teams = team_abbr
)

# use logos for x-axis
# note that the plot is assigned to the object "p"
p <- ggplot(df, aes(x = teams, y = random_value)) +
  geom_col(aes(color = teams, fill = teams), width = 0.5) +
  scale_color_mlb(type = "secondary") +
  scale_fill_mlb(alpha = 0.4) +
  theme_minimal() +
  theme(axis.text.x = element_mlb_logo())

# preview p with defined width and aspect ratio (only available in RStudio)
if (rstudioapi::isAvailable()){
  ggpreview(p, width = 5, asp = 16/9)
}

---

**gt_fmt_mlb_headshot**  
*Render Player Headshots in 'gt' Tables*

**Description**

*gt_fmt_mlb_headshot* takes an existing *gt_tbl* object and converts player ids into headshots. This is a wrapper around *gtExtras::gt_image_rows()* written by Tom Mock, which is a wrapper around *gt::text_transform()* + *gt::web_image()/gt::local_image()* with the necessary boilerplate already applied.

**Usage**

```r
gt_fmt_mlb_headshot(
  gt_object,  
  columns,  
  height = 30,  
  na_headshot_to_logo = TRUE
)
```

**Arguments**

- **gt_object**  
  An existing *gt_table* object of class *gt_tbl*

- **columns**  
  The columns wherein changes to cell data colors should occur. Has no effect if locations is not NULL
gt_merge_stack_team_color

height The absolute height (px) of the image in the table cell

na_headshot_to_logo should NA/non matches return the MLB logo instead of a grayed out blank headshot? Defaults to TRUE

Value An object of class gt_tbl.

Examples

library(gt)
library(mlbplotR)
gt_headshot_example <- mlbplotR::load_headshots() %>%
  head(5) %>%
  dplyr::select(player_name, savant_id) %>%
gt::gt() %>%
gt_fmt_mlb_headshot(columns = "savant_id")

---

gt_merge_stack_team_color

Merge and stack text from two columns in gt and color one with team colors

Description

The gt_merge_stack_team_color() function takes an existing gt table and merges column 1 and column 2, stacking column 1’s text on top of column 2’s. Top text is in all caps while the lower text is bigger, bolded, and colored by the team name in another column. This is a slightly modified version of gtExtras::gt_merge_stack() written by Tom Mock.

Usage

```r
gt_merge_stack_team_color(
  gt_object,
  col1,
  col2,
  team_col,
  font_sizes = c(12, 14),
  font_weights = c("lighter", "bold"),
  font_variants = c("small-caps"),
  color = "black"
)
```
Arguments

gt_object An existing gt table object of class gt_tbl

col1 The column to stack on top.

col2 The column to merge and place below with the text team color that corresponds to team_col.

team_col The column of team abbreviations (cleaned with clean_team_abbrs()) that match valid_team_names() for the color of the bottom text.

font_sizes the font size for the top and bottom text in px. Can be vector of length 1 or 2. Defaults to c(12, 14)

font_weights the font weight of the top and bottom text. Can be vector of length 1 or 2. Defaults to c("lighter", "bold")

font_variants the font variant of the top and bottom text. Can be vector of length 1 or 2. Defaults to "small-caps"

color The color for the top text.

Value

An object of class gt_tbl.

Examples

```r
library(gt)
library(mlbplotR)

gt_merge_example <- mlbplotR::load_mlb_teams() %>%
dplyr::slice(1:5) %>%
dplyr::select(team_abbr, team_location, team_mascot) %>%
gt::gt() %>%
gt_merge_stack_team_color(col1 = "team_location",
col2 = "team_mascot",
team_col = "team_abbr")
```

---

Add MLB team logos into rows of a gt table

Description

The gt_fmt_mlb_logo, gt_fmt_mlb_scoreboard_logo, and gt_fmt_mlb_dot_logo functions take an existing gt_tbl object and converts MLB team names from valid_team_names() into team logos. This is a wrapper around gtExtras::gt_image_rows() written by Tom Mock, which is a wrapper around gt::text_transform() + gt::web_image() / gt::local_image() with the necessary boilerplate already applied.
Usage

```r
gt_fmt_mlb_logo(gt_object, columns, height = 30)
gt_fmt_mlb_scoreboard_logo(gt_object, columns, height = 30)
gt_fmt_mlb_dot_logo(gt_object, columns, height = 30)
```

Arguments

- `gt_object`: An existing `gt` table object of class `gt_tbl`
- `columns`: The columns wherein changes to cell data colors should occur.
- `height`: The absolute height (px) of the image in the table cell

Value

An object of class `gt_tbl`.

Examples

```r
library(gt)
library(mlbplotR)

df <- data.frame(team = valid_team_names()[1:5],
                 logo = valid_team_names()[1:5],
                 scoreboard_logo = valid_team_names()[1:5],
                 dot_logo = valid_team_names()[1:5])

gt_logo_example <- df %>%
gt::gt() %>%
gt_fmt_mlb_logo(columns = "logo") %>%
gt_fmt_mlb_scoreboard_logo(columns = "scoreboard_logo") %>%
gt_fmt_mlb_dot_logo(columns = "dot_logo")
```

---

**gt_mlb_column_labels**

Replace Team Abbreviations/Player IDs With Images In Column Labels

**Description**

`gt_column_example` takes in a value of a team abbreviation or player id and converts the designated column to the corresponding image.
Usage

gt_mlb_column_labels(
  value,
  type = c("mlb_logo", "scoreboard_logo", "headshot"),
  height = 30,
  na_headshot_to_logo = TRUE
)

Arguments

value          What team abbreviation/player id should be replaced with an image?
type           What type of image is replacing the value?
height         The absolute height (px) of the image
na_headshot_to_logo          should NA/non player id matches return the MLB logo instead of a grayed out blank headshot? Defaults to TRUE

Value

HTML tag for image

Examples

library(gt)
library(mlbplotR)

df <- data.frame(BAL = 1,
                 TEX = 1,
                 "Mike_Trout" = 1,
                 "Shohei_Ohtani" = 1
)

gt_column_example <- df %>%
gt::gt() %>%
gt::cols_label(BAL = gt_mlb_column_labels("BAL", "mlb_logo"),
                TEX = gt_mlb_column_labels("TEX", "scoreboard_logo"),
                "Mike_Trout" = gt_mlb_column_labels(545361, "headshot"),
                "Shohei_Ohtani" = gt_mlb_column_labels(660271, "headshot"))

load_headshots  Output MLB Team Abbreviations

Description

Output MLB Team Abbreviations
Usage

load_headshots()

Value

A tibble of player names and ids from various sources.

Examples

load_headshots()

load_mlb_teams

Load MLB Team Colors, and Logos

Description

Loads team colors, and logos - useful for plots!

Usage

load_mlb_teams()

Value

A tibble of team-level abbreviations, image URLs, and hex color codes.

See Also

Issues with this data should be filed here: https://github.com/camdenk/mlbplotR

Examples

load_mlb_teams()
mlb_player_tiers

Create MLB Player Tiers

Description

This function sets up a ggplot to visualize MLB player tiers. Adapted from nflplotR

Usage

mlb_player_tiers(
  data,
  title = "MLB Player Tiers",
  subtitle = "Created with the #mlbplotR Tiermaker",
  caption = NULL,
  tier_desc = c("1" = "MVP Candidates", "2" = "Very Good", "3" = "Medium", "4" = "Bad",
                "5" = "Negative WAR", "6" = "", "7" = ""),
  presort = FALSE,
  alpha = 1,
  width = 0.1,
  no_line_below_tier = NULL,
  devel = FALSE,
  background_color = "#1e1e1e",
  line_color = "#e0e0e0",
  title_color = "white",
  subtitle_color = "#8e8e93",
  caption_color = subtitle_color,
  tier_label_color = title_color,
  na_headshot_to_logo = TRUE
)

Arguments

data A data frame that has to include the variables tier_no (the number of the tier starting from the top tier no. 1) and player_id (the player’s MLBAM/Savant ID). If data includes the variable tier_rank, these ranks will be used within each tier. Otherwise, if presort = FALSE, the function will assume that data is already sorted and if presort = TRUE, teams will be sorted alphabetically within tiers.

title The title of the plot. If NULL, it will be omitted.

subtitle The subtitle of the plot. If NULL, it will be omitted.

caption The caption of the plot. If NULL, it will be omitted.

tier_desc A named vector consisting of the tier descriptions. The names must equal the tier numbers from tier_no

presort If FALSE (the default) the function assumes that the teams are already sorted within the tiers. Will otherwise sort alphabetically.
alpha The alpha channel of the logos, i.e. transparency level, as a numerical value between 0 and 1. Defaults to 1.

width The desired width of the logo in npc (Normalised Parent Coordinates). A typical size is 0.1.

no_line_below_tier Vector of tier numbers. The function won’t draw tier separation lines below these tiers. This is intended to be used for tiers that shall be combined (see examples).

devel Determines if headshots shall be rendered. If FALSE (the default), headshots will be rendered on each run. If TRUE the player ids will be plotted instead of the logos. This is much faster and helps with the plot development.

background_color Background color for the plot. Defaults to "#1e1e1e"

line_color Line color for the plot. Defaults to "#e0e0e0"

title_color Text color for the title. Defaults to "white"

subtitle_color Text color the the subtitle. Defaults to "#8e8e93"

caption_color Text color the the caption. Defaults to be equal to the subtitle

tier_label_color Text color for the tier labels. Defaults to be equal to the title

na_headshot_to_logo Should NA/non-matches return the MLB logo instead of a grayed out blank headshot? Defaults to TRUE

Value

A plot object created with ggplot2::ggplot().

Examples

library(ggplot2)
library(dplyr, warn.conflicts = FALSE)
player_ids <- load_headshots() |>  
  head(35) |>  
pull(savant_id)

# Build the player tiers data frame  
# This is completely random!  
df <- data.frame(  
  tier_no = sample(1:5, length(player_ids), replace = TRUE),
  player_id = player_ids
) %>%  
dplyr::group_by(tier_no) %>%  
dplyr::mutate(tier_rank = sample(1:n(), n()))

# Plot player tiers  
mlb_player_tiers(df)
Create a combined tier which is useful for tiers with lots of players that should be split up in two or more rows. This is done by setting an empty string for the tier 5 description and removing the tier separation line below tier number 4. This example also shows how to turn off the subtitle and add a caption.

```r
mlb_player_tiers(df,
  subtitle = NULL,
  caption = "This is the caption",
  tier_desc = c("1" = "MVP Candidates",
                "2" = "Very Good",
                "3" = "Medium",
                "4" = "A Combined Tier",
                "5" = ""),
  no_line_below_tier = 4)
```

For the development of the tiers, it can be useful to turn off image rendering as this can take quite a long time. By setting `devel = TRUE`, the headshots are replaced by player ids which is much faster.

```r
mlb_player_tiers(df,
  tier_desc = c("1" = "MVP Candidates",
                "2" = "Very Good",
                "3" = "",
                "4" = "A Combined Tier",
                "5" = ""),
  no_line_below_tier = c(2, 4),
  devel = TRUE)
```

---

**mlb_team_factor**

Create Ordered MLB Team Factor

**Description**

Convert a vector of MLB team abbreviations to an ordered factor by division and team name. Intended to be used for faceted plots where team logos are used in strip texts.

**Usage**

```r
mlb_team_factor(teams)
```

**Arguments**

- **teams** A vector of MLB team abbreviations that should be included in `valid_team_names()`. The function tries to clean team names internally by calling `clean_team_abbrs()`.

**Value**

Object of class "factor"
Examples

```r
# unsorted vector including NFL team abbreviations
teams <- c("ATL", "WSH", "MIA", "BAL", "NYY", "BOS", "PHI", "NYM", "TB", "TOR")

# defaults to sort by division and nick name in ascending order
mlb_team_factor(teams)

######### HOW TO USE IN PRACTICE #########
library(ggplot2)
library(magrittr)
# load some sample data from the ggplot2 package
plot_data <- mpg
# add a new column by randomly sampling the above defined teams vector
plot_data$team <- sample(teams, nrow(mpg), replace = TRUE)

# Now we plot the data and facet by team abbreviation. ggplot automatically
# converts the team names to a factor and sorts it alphabetically
ggplot(plot_data, aes(displ, hwy)) +
  geom_point() +
  facet_wrap(~team, ncol = 5) +
  theme_minimal()

# We'll change the order of facets by making another team name column and
# converting it to an ordered factor. Again, this defaults to sort by division,
# league, and location in ascending order.
plot_data$ordered_team <- sample(teams, nrow(mpg), replace = TRUE) %>%
  mlb_team_factor()

# Let's check how the facets are ordered now.
ggplot(plot_data, aes(displ, hwy)) +
  geom_point() +
  facet_wrap(~ordered_team, ncol = 5) +
  theme_minimal()

# The facet order looks weird because the defaults is meant to be used with
# MLB team logos. So let's use the actual logos and look at the result.
ggplot(plot_data, aes(displ, hwy)) +
  geom_point() +
  facet_wrap(~ordered_team, ncol = 5) +
  theme_minimal() +
  theme(strip.text = element_mlb_logo(size = .85))
```
**Description**

This function sets up a ggplot to visualize MLB team tiers. Adapted from nflplotR

**Usage**

```r
mlb_team_tiers(
  data, 
  title = "MLB Team Tiers", 
  subtitle = "Created with the #mlbplotR Tiermaker", 
  caption = NULL, 
  tier_desc = c(`1` = "World Series", `2` = "Very Good", `3` = "Medium", `4` = "Bad", `5` = "Tankathon", `6` = "", `7` = ""), 
  presort = FALSE, 
  alpha = 1, 
  width = 0.075, 
  no_line_below_tier = NULL, 
  devel = FALSE, 
  background_color = "#1e1e1e", 
  line_color = "#e0e0e0", 
  title_color = "white", 
  subtitle_color = "#8e8e93", 
  caption_color = subtitle_color, 
  tier_label_color = title_color, 
  logo_type = "main"
)
```

**Arguments**

- **data**: A data frame that has to include the variables `tier_no` (the number of the tier starting from the top tier no. 1) and `team_abbr` (the team abbreviation). `team_abbr` should be one of `valid_team_names()` and the function tries to clean team names internally by calling `clean_team_abbrs()`. If data includes the variable `tier_rank`, these ranks will be used within each tier. Otherwise, if `presort = FALSE`, the function will assume that data is already sorted and if `presort = TRUE`, teams will be sorted alphabetically within tiers.

- **title**: The title of the plot. If NULL, it will be omitted.

- **subtitle**: The subtitle of the plot. If NULL, it will be omitted.

- **caption**: The caption of the plot. If NULL, it will be omitted.

- **tier_desc**: A named vector consisting of the tier descriptions. The names must equal the tier numbers from `tier_no`.

- **presort**: If FALSE (the default) the function assumes that the teams are already sorted within the tiers. Will otherwise sort alphabetically.

- **alpha**: The alpha channel of the logos, i.e. transparency level, as a numerical value between 0 and 1. Defaults to 1.

- **width**: The desired width of the logo in npc (Normalised Parent Coordinates). A typical size is 0.075.
no_line_below_tier
   Vector of tier numbers. The function won’t draw tier separation lines below these tiers. This is intended to be used for tiers that shall be combined (see examples).

devel
   Determines if logos shall be rendered. If FALSE (the default), logos will be rendered on each run. If TRUE the team abbreviations will be plotted instead of the logos. This is much faster and helps with the plot development.

background_color
   Background color for the plot. Defaults to "#1e1e1e"

line_color
   Line color for the plot. Defaults to "#e0e0e0"

title_color
   Text color for the title. Defaults to "white"

subtitle_color
   Text color the the subtitle. Defaults to "#8e8e93"

caption_color
   Text color the the caption. Defaults to be equal to the subtitle

tier_label_color
   Text color for the tier labels. Defaults to be equal to the title

logo_type
   What logo should be used for each team ("main", "scoreboard", or "dot")? Defaults to "main"

Value

A plot object created with ggplot2::ggplot().

Examples

library(ggplot2)
library(dplyr, warn.conflicts = FALSE)
teams <- valid_team_names()
# remove conference logos from this example
teams <- teams[!teams %in% c("AL", "NL", "MLB")]

# Build the team tiers data frame
# This is completely random!
df <- data.frame(
  tier_no = sample(1:5, length(teams), replace = TRUE),
  team_abbr = teams
) %>%
  dplyr::group_by(tier_no) %>%
  dplyr::mutate(tier_rank = sample(1:n(), n()))

# Plot team tiers
mlb_team_tiers(df)

# Create a combined tier which is useful for tiers with lots of teams that should be split up in two or more rows. This is done by setting an empty string for the tier 5 description and removing the tier separation line below tier number 4.
# This example also shows how to turn off the subtitle and add a caption
mlb_team_tiers(df,
subtitle = NULL,
caption = "This is the caption",
tier_desc = c("1" = "World Series",
          "2" = "Very Good",
          "3" = "Medium",
          "4" = "A Combined Tier",
          "5" = ""),
no_line_below_tier = 4)

# For the development of the tiers, it can be useful to turn off logo image
# rendering as this can take quite a long time. By setting `devel = TRUE`, the
# logo images are replaced by team abbreviations which is much faster
mlb_team_tiers(df,
tier_desc = c("1" = "World Series",
          "2" = "Very Good",
          "3" = "",
          "4" = "A Combined Tier",
          "5" = ""),
no_line_below_tier = c(2, 4),
devel = TRUE)

scale_axes_mlb

Axis Scales for MLB Team Logos

Description

[Superseded] scale_x_mlb() and scale_y_mlb() have been superceded in favor of element_*_logo() functions. These functions map MLB team names to their team logos and make them available as axis labels.

Usage

scale_x_mlb(
  ...,  
  expand = ggplot2::waiver(),
  guide = ggplot2::waiver(),
  position = "bottom",
  size = 12
)

scale_y_mlb(
  ...,  
  expand = ggplot2::waiver(),
  guide = ggplot2::waiver(),
  position = "left",
  size = 12
)
Arguments

Arguments passed on to `discrete_scale`

`palette` A palette function that when called with a single integer argument (the number of levels in the scale) returns the values that they should take (e.g., `scales::hue_pal()`).

`breaks` One of:
- `NULL` for no breaks
- `waiver()` for the default breaks (the scale limits)
- A character vector of breaks
- A function that takes the limits as input and returns breaks as output. Also accepts rlang lambda function notation.

`limits` One of:
- `NULL` to use the default scale values
- A character vector that defines possible values of the scale and their order
- A function that accepts the existing (automatic) values and returns new ones. Also accepts rlang lambda function notation.

`drop` Should unused factor levels be omitted from the scale? The default, `TRUE`, uses the levels that appear in the data; `FALSE` uses all the levels in the factor.

`na.translate` Unlike continuous scales, discrete scales can easily show missing values, and do so by default. If you want to remove missing values from a discrete scale, specify `na.translate = FALSE`.

`na.value` If `na.translate = TRUE`, what aesthetic value should the missing values be displayed as? Does not apply to position scales where `NA` is always placed at the far right.

`aesthetics` The names of the aesthetics that this scale works with.

`scale_name` The name of the scale that should be used for error messages associated with this scale.

`name` The name of the scale. Used as the axis or legend title. If `waiver()`, the default, the name of the scale is taken from the first mapping used for that aesthetic. If `NULL`, the legend title will be omitted.

`labels` One of:
- `NULL` for no labels
- `waiver()` for the default labels computed by the transformation object
- A character vector giving labels (must be same length as `breaks`)
- An expression vector (must be the same length as `breaks`). See `plotmath` for details.
- A function that takes the breaks as input and returns labels as output. Also accepts rlang lambda function notation.

`super` The super class to use for the constructed scale

`expand` For position scales, a vector of range expansion constants used to add some padding around the data to ensure that they are placed some distance away from the axes. Use the convenience function `expansion()` to generate the values for the `expand` argument. The defaults are to expand the scale by 5% on each side for continuous variables, and by 0.6 units on each side for discrete variables.
guide A function used to create a guide or its name. See `guides()` for more information.

position For position scales, The position of the axis. left or right for y axes, top or bottom for x axes.

size The logo size in pixels. It is applied as height for an x-scale and as width for an y-scale.

Details

The scale translates MLB team abbreviations into raw image html and places the html as axis labels. Because of the way ggplots are constructed, it is necessary to adjust the `theme()` after calling this scale. This can be done by calling `theme_x_mlb()` or `theme_y_mlb()` or alternatively by manually changing the relevant axis.text to `ggtext::element_markdown()`. However, this will only work if an underlying dependency, "gridtext", is installed with a newer version than 0.1.4.

Value

A discrete ggplot2 scale created with `ggplot2::scale_x_discrete()` or `ggplot2::scale_y_discrete()`.

Examples

```r
library(mlbplotR)
library(ggplot2)

team_abbr <- valid_team_names()
# remove league logos from this example
team_abbr <- team_abbr[!team_abbr %in% c("AL", "NL", "MLB")]

df <- data.frame(
  random_value = runif(length(team_abbr), 0, 1),
  teams = team_abbr
)

if (utils::packageVersion("gridtext") > "0.1.4"){
  # use logos for x-axis
  ggplot(df, aes(x = teams, y = random_value)) +
    geom_col(aes(color = teams, fill = teams), width = 0.5) +
    scale_color_mlb(type = "secondary") +
    scale_fill_mlb(alpha = 0.4) +
    scale_x_mlb() +
    theme_minimal() +
    theme_x_mlb()

  # use logos for y-axis
  ggplot(df, aes(y = teams, x = random_value)) +
    geom_col(aes(color = teams, fill = teams), width = 0.5) +
    scale_color_mlb(type = "secondary") +
    scale_fill_mlb(alpha = 0.4) +
    scale_y_mlb() +
```
theme_minimal() +
# theme_*_mlb requires gridtext version > 0.1.4
theme_y_mlb() 

scale_mlb

Scales for MLB Team Colors

Description

These functions map MLB team names to their team colors in color and fill aesthetics

Usage

scale_color_mlb(
  type = c("primary", "secondary"),
  values = NULL,
  ...
  aesthetics = "colour",
  breaks = ggplot2::waiver(),
  na.value = "grey50",
  guide = NULL,
  alpha = NA
)

scale_colour_mlb(
  type = c("primary", "secondary"),
  values = NULL,
  ...
  aesthetics = "colour",
  breaks = ggplot2::waiver(),
  na.value = "grey50",
  guide = NULL,
  alpha = NA
)

scale_fill_mlb(
  type = c("primary", "secondary"),
  values = NULL,
  ...
  aesthetics = "fill",
  breaks = ggplot2::waiver(),
  na.value = "grey50",
  guide = NULL,
  alpha = NA
)
Arguments

- **type**
  One of "primary" or "secondary" to decide which colortype to use.

- **values**
  If NULL (the default) use the internal team color vectors. Otherwise a set of aesthetic values to map data values to. The values will be matched in order (usually alphabetical) with the limits of the scale, or with breaks if provided. If this is a named vector, then the values will be matched based on the names instead. Data values that don’t match will be given na.value.

... Arguments passed on to `discrete_scale`

- **palette**
  A palette function that when called with a single integer argument (the number of levels in the scale) returns the values that they should take (e.g., `scales::hue_pal()`).

- **limits**
  One of:
  - NULL to use the default scale values
  - A character vector that defines possible values of the scale and their order
  - A function that accepts the existing (automatic) values and returns new ones. Also accepts rlang lambda function notation.

- **drop**
  Should unused factor levels be omitted from the scale? The default, TRUE, uses the levels that appear in the data; FALSE uses all the levels in the factor.

- **na.translate**
  Unlike continuous scales, discrete scales can easily show missing values, and do so by default. If you want to remove missing values from a discrete scale, specify na.translate = FALSE.

- **scale_name**
  The name of the scale that should be used for error messages associated with this scale.

- **name**
  The name of the scale. Used as the axis or legend title. If waiver(), the default, the name of the scale is taken from the first mapping used for that aesthetic. If NULL, the legend title will be omitted.

- **labels**
  One of:
  - NULL for no labels
  - waiver() for the default labels computed by the transformation object
  - A character vector giving labels (must be same length as breaks)
  - An expression vector (must be the same length as breaks). See ?plotmath for details.
  - A function that takes the breaks as input and returns labels as output. Also accepts rlang lambda function notation.

- **guide**
  A function used to create a guide or its name. See `guides()` for more information.

- **super**
  The super class to use for the constructed scale

- **aesthetics**
  Character string or vector of character strings listing the name(s) of the aesthetic(s) that this scale works with. This can be useful, for example, to apply colour settings to the colour and fill aesthetics at the same time, via aesthetics = c("colour", "fill").

- **breaks**
  One of:
  - NULL for no breaks
• waiver() for the default breaks (the scale limits)
• A character vector of breaks
• A function that takes the limits as input and returns breaks as output

na.value
The aesthetic value to use for missing (NA) values

guide
A function used to create a guide or its name. If NULL (the default) no guide will be plotted for this scale. See `ggplot2::guides()` for more information.

alpha
Factor to modify color transparency via a call to `scales::alpha()`. If NA (the default) no transparency will be applied. Can also be a vector of alphas. All alpha levels must be in range [0,1].

Value
A discrete ggplot2 scale created with `ggplot2::scale_color_manual()` or `ggplot2::scale_fill_manual()`.

Examples

```r
library(mlbplotR)
library(ggplot2)

team_abbr <- valid_team_names()
# remove league logos from this example
team_abbr <- team_abbr[!team_abbr %in% c("AL", "NL", "MLB")]

df <- data.frame(
  random_value = runif(length(team_abbr), 0, 1),
  teams = team_abbr
)
ggplot(df, aes(x = teams, y = random_value)) +
  geom_col(aes(color = teams, fill = teams), width = 0.5) +
  scale_color_mlb(type = "secondary") +
  scale_fill_mlb(alpha = 0.4) +
  theme_minimal() +
  theme(axis.text.x = element_text(angle = 45, hjust = 1))
```

Theme for MLB Team Logos

Description

[Superseded] theme_x_mlb() and theme_y_mlb() have been superceded in favor of element_*_logo() functions. These functions are convenience wrappers around a theme call that activates markdown in x-axis and y-axis labels using `ggtext::element_markdown()`.
**theme_mlb**

**Usage**

theme_x_mlb()

theme_y_mlb()

**Details**

These functions are a wrapper around the function calls `ggplot2::theme(axis.text.x = ggtext::element_markdown())` as well as `ggplot2::theme(axis.text.y = ggtext::element_markdown())`. They are made to be used in conjunction with `scale_x_mlb()` and `scale_y_mlb()` respectively.

**Value**

A ggplot2 theme created with `ggplot2::theme()`.

**See Also**

`theme_x_mlb()`, `theme_y_mlb()`

**Examples**

```r
library(mlbplotR)
library(ggplot2)

team_abbr <- valid_team_names()
# remove conference logos from this example
team_abbr <- team_abbr[!team_abbr %in% c("AL", "NL", "MLB")]

df <- data.frame(
  random_value = runif(length(team_abbr), 0, 1),
  teams = team_abbr
)

if (utils::packageVersion("gridtext") > "0.1.4"){
  ggplot(df, aes(x = teams, y = random_value)) +
  geom_col(aes(color = teams, fill = teams, width = 0.5)) +
  scale_color_mlb(type = "secondary") +
  scale_fill_mlb(alpha = 0.4) +
  scale_x_mlb() +
  theme_minimal() +
  # theme_*_mlb requires gridtext version > 0.1.4
  theme_x_mlb()
}
```
valid_team_names

**Output Valid MLB Team Abbreviations**

### Description
Output Valid MLB Team Abbreviations

### Usage
```
valid_team_names(remove_league_info = FALSE)
```

### Arguments
- `remove_league_info`
  - Should "AL", "NL", and "MLB" be removed from the returned vector? Defaults to FALSE.

### Value
A vector of type "character".

### Examples
```
# List valid team abbreviations excluding duplicates
valid_team_names()
valid_team_names(TRUE)
```
