Package ‘naive’

October 13, 2022

Type Package

Title Empirical Extrapolation of Time Feature Patterns

Version 1.2.0

Description An application for the empirical extrapolation of time features selecting and summarizing the most relevant patterns in time sequences.

License GPL-3

Description

Empirical Extrapolation of Time Feature Pattern

Usage

```r
naive(
  df,
  seq_len = NULL,
  ci = 0.8,
  smoother = FALSE,
  cover = NULL,
  stride = NULL,
  method = NULL,
  location = NULL,
  n_windows = 10,
  n_samp = 30,
  dates = NULL,
  error_scale = "naive",
  error_benchmark = "naive",
  seed = 42
)
```

Arguments

- **df**: A data frame with time features on columns (all numerics or all categories, but not both). In case of missing values, automatic missing imputation through kalman filter will be performed.
- **seq_len**: Positive integer. Time-step number of the forecasting sequence. Default: NULL (random selection within boundaries).
- **ci**: Confidence interval for prediction. Default: 0.8
- **smoother**: Logical. Flag to TRUE for loess smoothing (only for numeric series). Default: FALSE.
- **cover**: Positive numeric. The quantile cover around the location parameter (between 0 and 1). Default: NULL (random selection within boundaries).
- **method**: String. Distance method using during the comparison of time sequences. Possible options are: "euclidean", "manhattan", "minkowski". Default: NULL (random selection).
- **location**: String. Statistic used to center the cover parameter. Possible options are: "mean", "mode" (parzen method), "median". Default: NULL (random selection).
naive

n_windows  Positive integer. Number of validation windows to test prediction error. Default: 10.
n_samp  Positive integer. Number of sample selected during random search. Default: 30.
dates  Date. Vector with dates for time features.
error_scale  String. Scale for the scaled error metrics. Two options: "naive" (average of naive one-step absolute error for the historical series) or "deviation" (standard error of the historical series). Default: "naive".
error_benchmark  String. Benchmark for the relative error metrics. Two options: "naive" (sequential extension of last value) or "average" (mean value of true sequence). Default: "naive".
seed  Positive integer. Random seed. Default: 42.

Value

This function returns a list including:

• exploration: collection of all the models explored with random search
• history: a table with the explored models' hyper-parameters and validation errors
• best_model: best combination resulting from the average prediction score across different ranks and features, including:
  – quant_preds: min, max, q25, q50, q75, quantiles at selected ci, mean, sd, mode, skewness, kurtosis, IQR to range, above to below median range, upside probability and divergence for each point of predicted sequences
  – errors: testing errors for each time feature averaged across validation windows
  – plots: standard plot with confidence interval for each time feature
• time_log

Examples

naive(time_features[,c(2, 3)], seq_len = 100, n_samp = 1, n_windows = 3)
Description

A data frame with daily prices for some Big Tech Companies since March 2017.

Usage

time_features

Format

A data frame with 6 columns and 1336 rows.
