Package ‘nhdplusTools’

October 2, 2023

Type Package
Title NHDPlus Tools
Version 1.0.0
Description Tools for traversing and working with National Hydrography Dataset Plus (NHD-Plus) data. All methods implemented in 'nhdplusTools' are available in the NHDPlus documentation available from the US Environmental Protection Agency <https://www.epa.gov/waterdata/basic-information>.

URL https://doi-usgs.github.io/nhdplusTools/

- get_split_catchment                            39
Add NHDPlus Network Attributes to a provided network.

Description

Given a river network with required base attributes, adds the NHDPlus network attributes: hydrosequence, levelpath, terminalpath, pathlength, down levelpath, down hydroseq, total drainage area, and terminalflag. The function implements two parallelization schemes for small and large basins respectively. If a number of cores is specified, parallel execution will be used.
Usage

```r
add_plus_network_attributes(
  net,
  override = 5,
  cores = NULL,
  split_temp = NULL,
  status = TRUE
)
```

Arguments

- **net**: data.frame containing comid, tocomid, nameID, lengthkm, and areasqkm. Additional attributes will be passed through unchanged. tocomid == 0 is the convention used for outlets. If a "weight" column is provided, it will be used in `get_levelpaths` otherwise, arbolate sum is calculated for the network and used as the weight.
- **override**: numeric factor to be passed to `get_levelpaths`
- **cores**: integer number of processes to spawn if run in parallel.
- **split_temp**: character path to optional temporary copy of the network split into independent sub-networks. If it exists, it will be read from disk rather than recreated.
- **status**: logical should progress be printed?

Value

data.frame with added attributes

Examples

```r
source(system.file("extdata", "walker_data.R", package = "nhdplusTools"))

test_flowline <- prepare_nhdplus(walker_flowline, 0, 0, FALSE)

test_flowline <- data.frame(
  comid = test_flowline$COMID,
  tocomid = test_flowline$toCOMID,
  nameID = walker_flowline$GNIS_ID,
  lengthkm = test_flowline$LENGTHKM,
  areasqkm = test_flowline$AreaSqKM)

add_plus_network_attributes(test_flowline)
```
**align_nhdplus_names**  
*Align NHD Dataset Names*

**Description**
this function takes any NHDPlus dataset and aligns the attribute names with those used in nhdplus-Tools.

**Usage**
```r
align_nhdplus_names(x)
```

**Arguments**
- `x` a sf object of nhdplus flowlines

**Value**
data.frame renamed sf object

**Examples**
```r
source(system.file("extdata/new_hope_data.R", package = "nhdplusTools"))
names(new_hope_flowline)
```
```r
names(new_hope_flowline) <- tolower(names(new_hope_flowline))
new_hope_flowline <- align_nhdplus_names(new_hope_flowline)
names(new_hope_flowline)
```

**calculate_arbolate_sum**  
*Calculate Arbolate Sum*

**Description**
Calculates arbolate sum given a dendritic network and incremental lengths. Arbolate sum is the total length of all upstream flowlines.

**Usage**
```r
calculate_arbolate_sum(x)
```
**calculate_total_drainage_area**

**Total Drainage Area**

**Description**

Calculates total drainage area given a dendritic network and incremental areas.

**Usage**

```r
calculate_total_drainage_area(x)
```

**Arguments**

- `x` data.frame with ID, toID, and area columns.

**Value**

numeric with total area.

---

**calculate_total_drainage_area**

**Arguments**

- `x` data.frame with ID, toID, and length columns.

**Value**

numeric with arbolate sum.

**Examples**

```r
library(dplyr)
source(system.file("extdata", "walker_data.R", package = "nhdplusTools"))
catchment_length <- select(walker_flowline, COMID, AreaSqKM) %>%
  right_join(prepare_nhdplus(walker_flowline, 0, 0,
    purge_non_dendritic = FALSE, warn = FALSE), by = "COMID") %>%
  select(ID = COMID, toID = toCOMID, length = LENGTHKM)

arb_sum <- calculate_arbolate_sum(catchment_length)

catchment_length$arb_sum <- arb_sum
catchment_length$nhd_arb_sum <- walker_flowline$ArbolateSu

mean(abs(catchment_length$arb_sum - catchment_length$nhd_arb_sum))
max(abs(catchment_length$arb_sum - catchment_length$nhd_arb_sum))
```
Examples

```r
catchment_area <- select(walker_flowline, COMID, AreaSqKM) %>%
  right_join(prepare_nhdplus(walker_flowline, 0, 0,
    purge_non_dendritic = FALSE, warn = FALSE), by = "COMID") %>%
  select(ID = COMID, toID = toCOMID, area = AreaSqKM)

new_da <- calculate_total_drainage_area(catchment_area)
catchment_area$totda <- new_da
catchment_area$nhdptotda <- walker_flowline$TotDASqKM
mean(abs(catchment_area$totda - catchment_area$nhdptotda))
max(abs(catchment_area$totda - catchment_area$nhdptotda))
```

---

disambiguate_flowline_indexes

Disambiguate Flowline Indexes

Description

Given a set of flowline indexes and numeric or ascii criteria, return closest match. If numeric criteria are used, the minimum difference in the numeric attribute is used for disambiguation. If ascii criteria are used, the adist function is used with the following algorithm: ‘1 - adist_score / max_string_length’. Comparisons ignore case.

Usage

```r
disambiguate_flowline_indexes(indexes, flowpath, hydro_location)
```

Arguments

- **indexes**: data.frame as output from `get_flowline_index` with more than one hydrologic location per indexed point.
- **flowpath**: data.frame with two columns. The first should join to the COMID field of the indexes and the second should be the numeric or ascii metric such as drainage area or GNIS Name. Names of this data.frame are not used.
- **hydro_location**: data.frame with two columns. The first should join to the id field of the indexes and the second should be the numeric or ascii metric such as drainage area or GNIS Name. Names of this data.frame are not used.

Value

data.frame indexes deduplicated according to the minimum difference between the values in the metric columns. If two or more result in the same "minimum" value, duplicates will be returned.
Examples

```r
source(system.file("extdata", "sample_flines.R", package = "nhdplusTools"))

hydro_location <- sf::st_sf(id = c(1, 2, 3),
    geom = sf::st_sfc(list(sf::st_point(c(-76.86934, 39.49328)),
    sf::st_point(c(-76.91711, 39.40884)),
    sf::st_point(c(-76.88081, 39.36354))),
    crs = 4326),
    totda = c(23.6, 7.3, 427.9),
    nameid = c("Patapsco", ", ", "Falls Run River"))

flowpath <- dplyr::select(sample_flines,
    comid = COMID,
    totda = TotDASqKM,
    nameid = GNIS_NAME,
    REACHCODE,
    ToMeas,
    FromMeas)

indexes <- get_flowline_index(flowpath,
    hydro_location,
    search_radius = 0.2,
    max_matches = 10)

disambiguate_flowline_indexes(indexes,
    dplyr::select(flowpath, comid, totda),
    dplyr::select(hydro_location, id, totda))

result <- disambiguate_flowline_indexes(indexes,
    dplyr::select(flowpath, comid, nameid),
    dplyr::select(hydro_location, id, nameid))

result[result$id == 1, ]
result[result$id == 2, ]
result[result$id == 3, ]
```

**discover_nhdplus_id**  
Discover NHDPlus ID

**Description**

Multipurpose function to find a COMID of interest.

**Usage**

```r
discover_nhdplus_id(point = NULL, nldi_feature = NULL, raindrop = FALSE)
```
**discover_nldi_characteristics**

**Arguments**

- **point**
  - sfc POINT including crs as created by: `sf::st_sfc(sf::st_point(., .), crs)`

- **nldi_feature**
  - list with names ‘featureSource’ and ‘featureID’ where ‘featureSource’ is derived from the "source" column of the response of `get_nldi_sources` and the ‘featureSource’ is a known identifier from the specified ‘featureSource’.

- **raindrop**
  - logical if TRUE will call a raindrop trace web service and return will be the same as `get_raindrop_trace` with direction "none".

**Value**

- integer COMID or list containing COMID and raindrop trace.

**Examples**

```r
point <- sf::st_sfc(sf::st_point(c(-76.874, 39.482)), crs = 4326)
discover_nhdplus_id(point)

discover_nhdplus_id(point, raindrop = TRUE)

nldi_nwis <- list(featureSource = "nwissite", featureID = "USGS-08279500")
discover_nhdplus_id(nldi_feature = nldi_nwis)
```

---

**discover_nldi_characteristics**

*Discover Characteristics Metadata*

**Description**

Provides access to metadata for characteristics that are returned by `get_nldi_characteristics()`.

**Usage**

```r
discover_nldi_characteristics(type = "all")
```

**Arguments**

- **type**
  - character "all", "local", "total", or "divergence_routed".

**Value**

- data.frame containing available characteristics
Examples
chars <- discover_nldi_characteristics()
names(chars)
head(chars$local, 10)

download_nhd(nhd_dir, hu_list, download_files = TRUE)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nhd_dir</td>
<td>character directory to save output into</td>
</tr>
<tr>
<td>hu_list</td>
<td>character vector of hydrologic region(s) to download. Use get_huc to find HU codes of interest. Accepts two digit and four digit codes.</td>
</tr>
<tr>
<td>download_files</td>
<td>boolean if FALSE, only URLs to files will be returned can be hu02s and/or hu04s</td>
</tr>
</tbody>
</table>

Value
character Paths to geodatabases created.

Examples
hu <- get_huc(sf::st_sfc(sf::st_point(c(-73, 42)), crs = 4326),
              type = "huc08")

(hu <- substr(hu$huc8, 1, 2))
download_nhd(tempdir(), c(hu, "0203"), download_files = FALSE)
download_nhdplushr  

*Download NHDPlus HiRes*

**Description**

Download NHDPlus HiRes

**Usage**

```r
download_nhdplushr(nhd_dir, hu_list, download_files = TRUE)
```

**Arguments**

- `nhd_dir`  
  character directory to save output into

- `hu_list`  
  character vector of hydrologic region(s) to download. Use `get_huc` to find HU codes of interest. Accepts two digit and four digit codes.

- `download_files`  
  boolean if FALSE, only URLs to files will be returned can be hu02s and/or hu04s

**Value**

character Paths to geodatabases created.

**Examples**

```r
hu <- get_huc(sf::st_sfc(sf::st_point(c(-73, 42)), crs = 4326),
               type = "huc08")
(hu <- substr(hu$huc8, 1, 2))
download_nhdplushr(tempdir(), c(hu, "0203"), download_files = FALSE)
```

---

download_nhdplusv2  

*Download seamless National Hydrography Dataset Version 2 (NHD-PlusV2)*

**Description**

This function downloads and decompresses staged seamless NHDPlusV2 data. The following requirements are needed: p7zip (MacOS), 7zip (windows) Please see: https://www.epa.gov/waterdata/get-nhdplus-national-hydrography-dataset-plus-data for more information and metadata about this data. Default downloads lower-48 only. See examples for islands. No Alaska data are available.
Usage

download_nhdplusv2(
 outdir,
  url = paste0("https://edap-ow-data-commons.s3.amazonaws.com/NHDPlusV21/",
  "Data/NationalData/NHDPlusV21_NationalData_Seamless","_Geodatabase_Lower48_07.7z"),
  progress = TRUE
)

Arguments

outdir The folder path where data should be downloaded and extracted
url the location of the online resource
progress boolean display download progress?

Value

character path to the local geodatabase

Examples

## Not run:
download_nhdplusv2("./data/nhd/")

download_nhdplusv2(outdir = ":/inst/",
  url = paste0("https://edap-ow-data-commons.s3.amazonaws.com/NHDPlusV21/",
  "Data/NationalData/NHDPlusV21_NationalData_Seamless",
  "_Geodatabase_HI_PR_VI_PI_03.7z"))

## End(Not run)

---

**download_rf1**

*Download the seamless Reach File (RF1) Database*

Description

This function downloads and decompresses staged RF1 data. See: https://water.usgs.gov/GIS/metadata/usgswrd/XML/erf1_2.xml for metadata.

Usage

download_rf1(
  outdir,
  url = "https://water.usgs.gov/GIS/dsdl/erf1_2.e00.gz",
  progress = TRUE
)
download_vaa

Arguments

outdir The folder path where data should be downloaded and extracted
url the location of the online resource
progress boolean display download progress?

Value

character path to the local e00 file

Examples

```r
## Not run:
download_wbd("./data/rfc1/")
## End(Not run)
```

---

download_vaa Download NHDPplusVAA data from HydroShare

Description

downloads and caches NHDPplusVAA data on your computer

Usage

download_vaa(
  path = get_vaa_path(updated_network),
  force = FALSE,
  updated_network = FALSE
)

Arguments

path character path where the file should be saved. Default is a persistent system data
as retrieved by nhdplusTools_data_dir. Also see: get_vaa_path
force logical. Force data re-download. Default = FALSE
updated_network logical default FALSE. If TRUE, updated network attributes from E2NHD and
National Water Model retrieved from doi:10.5066/P976XCVT.

Details

The VAA data is a aggregate table of information from the NHDPplusV2 elevslope.dbf(s), PlusFlow-
lineVAA.dbf(s); and NHDFlowlines. All data originates from the EPA NHDPplus Homepage here.
To see the location of cached data on your machine use get_vaa_path. To view aggregate data and
documentation, see here
download_wbd

Value

character path to cached data

download_wbd Download the seamless Watershed Boundary Dataset (WBD)

Description

This function downloads and decompresses staged seamless WBD data. Please see: https://prd-tnm.s3.amazonaws.com/StagedProducts/Hydrography/WBD/National/GDB/WBD_National_GDB.xml for metadata.

Usage

download_wbd(
  outdir,
  url = paste0("https://prd-tnm.s3.amazonaws.com/StagedProducts/",
                 "Hydrography/WBD/National/GDB/WBD_National_GDB.zip"),
  progress = TRUE
)

Arguments

outdir The folder path where data should be downloaded and extracted
url the location of the online resource
progress boolean display download progress?

Value

character path to the local geodatabase

Examples

## Not run:
download_wbd("./data/wbd/")

## End(Not run)
get_boundaries

Return RPU or VPU boundaries

Description

Return RPU or VPU boundaries

Usage

get_boundaries(type = "vpu")

Arguments

type character. Either "RPU" or "VPU"

Value

An object of class "sf"

get_catchment_characteristics

Get Catchment Characteristics

Description

Downloads (subsets of) catchment characteristics from a cloud data store. See get_characteristics_metadata for available characteristics.

Usage

get_catchment_characteristics(varname, ids, reference_fabric = "nhdplusv2")

Arguments

varname character vector of desired variables. If repeated varnames are provided, they will be downloaded once but duplicated in the output.

ids numeric vector of identifiers (comids) from the specified fabric

reference_fabric (not used) will be used to allow future specification of alternate reference fabrics
**get_characteristics_metadata**

*Get catchment characteristics metadata table*

**Description**

Download and cache table of catchment characteristics.

**Usage**

```r
get_characteristics_metadata(search, cache = TRUE)
```

**Arguments**

- `search` character string of length 1 to free search the metadata table. If no search term is provided the entire table is returned.
- `cache` logical should cached metadata be used?

**Examples**

```r
get_characteristics_metadata()
```

---

**get_DD**

*Navigate Downstream with Diversions*

**Description**

Traverse NHDPlus network downstream with diversions NOTE: This algorithm may not scale well in large watersheds. For reference, the lower Mississippi will take over a minute.

**Usage**

```r
get_DD(network, comid, distance = NULL)
```
get_DM

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>network</td>
<td>data.frame NHDPlus flowlines including at a minimum: COMID, DnMinorHyd,</td>
</tr>
<tr>
<td></td>
<td>DnHydrosq, and Hydroseq.</td>
</tr>
<tr>
<td>comid</td>
<td>integer identifier to start navigating from.</td>
</tr>
<tr>
<td>distance</td>
<td>numeric distance in km to limit how many COMIDs are returned. The COMID</td>
</tr>
<tr>
<td></td>
<td>that exceeds the distance specified is returned. The longest of the diverted</td>
</tr>
<tr>
<td></td>
<td>paths is used for limiting distance.</td>
</tr>
</tbody>
</table>

Value

integer vector of all COMIDs downstream of the starting COMID

Examples

```r
library(sf)
start_COMID <- 11688818
source(system.file("extdata", "sample_flines.R", package = "nhdplusTools"))

DD_COMIDs <- get_DD(sample_flines, start_COMID, distance = 4)
plot(dplyr::filter(sample_flines, COMID %in% DD_COMIDs)$geom,
     col = "red", lwd = 2)

DM_COMIDs <- get_DM(sample_flines, start_COMID, distance = 4)
plot(dplyr::filter(sample_flines, COMID %in% DM_COMIDs)$geom,
     col = "blue", add = TRUE, lwd = 2)
```

get_DM

Navigate Downstream Mainstem

Description

Traverse NHDPlus network downstream main stem

Usage

get_DM(network, comid, distance = NULL, sort = FALSE, include = TRUE)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>network</td>
<td>data.frame NHDPlus flowlines including at a minimum: COMID, LENGTHKM,</td>
</tr>
<tr>
<td></td>
<td>DnHydrosq, and Hydroseq.</td>
</tr>
<tr>
<td>comid</td>
<td>integer identifier to start navigating from.</td>
</tr>
<tr>
<td>distance</td>
<td>numeric distance in km to limit how many COMIDs are returned. The COMID</td>
</tr>
<tr>
<td></td>
<td>that exceeds the distance specified is returned.</td>
</tr>
<tr>
<td>sort</td>
<td>if TRUE, the returned COMID vector will be sorted in order of distance from</td>
</tr>
<tr>
<td></td>
<td>the input COMID (nearest to farthest)</td>
</tr>
<tr>
<td>include</td>
<td>if TRUE, the input COMID will be included in the returned COMID vector</td>
</tr>
</tbody>
</table>
get_elev_along_path

**Value**

integer vector of all COMIDs downstream of the starting COMID along the mainstem

**Examples**

```r
library(sf)

source(system.file("extdata", "sample_flines.R", package = "nhdplusTools"))

plot(sample_flines$geom)
start_COMID <- 11690092
DM_COMIDs <- get_DM(sample_flines, start_COMID)
plot(dplyr::filter(sample_flines, COMID %in% DM_COMIDs)$geom,
    col = "red", add = TRUE, lwd = 3)

DM_COMIDs <- get_DM(sample_flines, start_COMID, distance = 40)
plot(dplyr::filter(sample_flines, COMID %in% DM_COMIDs)$geom,
    col = "blue", add = TRUE, lwd = 2)
```

---

table

| get_elev_along_path | Get Elevation Along Path (experimental) |

**Description**

Uses a cross section retrieval web services to retrieve elevation along a path.

**Usage**

```r
get_elev_along_path(points, num_pts, res = 1, status = TRUE)
```

**Arguments**

- **points**: sf data.frame containing a point column.
- **num_pts**: numeric number of points to retrieve along the cross section.
- **res**: integer resolution of 3D Elevation Program data to request. Must be one of: 1, 3, 5, 10, 30, 60.
- **status**: logical

**Value**

sf data.frame containing points retrieved. Names include "id", "distance_m", "elevation_m", "spatial_ref", "geometry", and ".group". .group tracks which input point each set of output points belongs to.
Examples

```r
point1 <- sf::st_sfc(sf::st_point(x = c(-105.9667, 36.17602)), crs = 4326)
point2 <- sf::st_sfc(sf::st_point(x = c(-105.97768, 36.17526)), crs = 4326)
point3 <- sf::st_sfc(sf::st_point(x = c(-105.98869, 36.17450)), crs = 4326)
points <- sf::st_as_sf(c(point1, point2, point3))
(xs <- get_elev_along_path(points, 100))
if(inherits(xs, "sf")) {
  bbox <- sf::st_bbox(xs) + c(-0.005, -0.005, 0.005, 0.005)
nhdplusTools::plot_nhdplus(bbox = bbox, cache_data = FALSE)
  plot(sf::st_transform(sf::st_geometry(xs), 3857), pch = ".", add = TRUE, col = "red")
  plot(sf::st_transform(sf::st_sfc(point1, crs = 4326), 3857), add = TRUE)
  plot(sf::st_transform(sf::st_sfc(point2, crs = 4326), 3857), add = TRUE)
  plot(sf::st_transform(sf::st_sfc(point3, crs = 4326), 3857), add = TRUE)
  plot(xs$distance_m, xs$elevation_m)
}
```

---

**get_flowline_index**  
*Get Flowline Index*

**Description**

given an sf point geometry column, return COMID, reachcode, and measure for each.

**Usage**

```r
get_flowline_index(
  flines,
  points,
  search_radius = NULL,
  precision = NA,
  max_matches = 1
)
```

**Arguments**

- **flines**: sf data.frame of type LINESTRING or MULTILINESTRING including COMID, REACHCODE, ToMeas, and FromMeas. Can be "download_nhdplusv2" and remote nhdplusv2 data will be downloaded for the bounding box surround.
get_flowline_index

the submitted points. NOTE: The download option may not work for large areas, use with caution.

points sf or sfc of type POINT in analysis projection. NOTE: flines will be projected to the projection of the points layer.

search_radius units distance for the nearest neighbor search to extend in analysis projection. If missing or NULL, and points are in a lon lat projection, a default of 0.01 degree is used, otherwise 200 m is used. Conversion to the linear unit used by the provided crs of points is attempted. See RANN nn2 documentation for more details.

precision numeric the resolution of measure precision in the output in meters.

max_matches numeric the maximum number of matches to return if multiple are found in search_radius

Details

Note 1: Inputs are cast into LINESTRINGS. Because of this, the measure output of inputs that are true multipart lines may be in error.

Note 2: This algorithm finds the nearest node in the input flowlines to identify which flowline the point should belong to. As a second pass, it can calculate the measure to greater precision than the nearest flowline geometry node.

Note 3: Offset is returned in units consistent with the projection of the input points.

Note 4: See ‘dfMaxLength’ input to sf::st_segmentize() for details of handling of precision parameter.

Note 5: ”from” is downstream – 0 is the outlet ”to” is upstream – 100 is the inlet

Value
data.frame with five columns, id, COMID, REACHCODE, REACH_meas, and offset. id is the row or list element in the point input.

Examples

source(system.file("extdata", "sample_flines.R", package = "nhdplusTools"))

point <- sf::st_sfc(sf::st_point(c(-76.87479, 39.48233)),
crs = 4326)

get_flowline_index(sample_flines, point)

point <- sf::st_transform(point, 5070)

get_flowline_index(sample_flines, point,
search_radius = units::set_units(200, "m"))

get_flowline_index("download_nhdplusv2", point)
get_gagesII

Get gagesII Features

Description
Subsets the gagesII dataset by location (POINT), area (POLYGON), or set of IDs.

Usage
get_gagesII(AOI = NULL, id = NULL, t_srs = NULL, buffer = 0.5, basin = FALSE)

Arguments
- **AOI**: sf (MULTI)POINT or (MULTI)POLYGON. An 'area of interest' can be provided as either a location (sf POINT) or area (sf POLYGON) in any Spatial Reference System.
- **id**: character NWIS Gage ID(s)
- **t_srs**: character (PROJ string or EPSG code) or numeric (EPSG code). A user specified - target - Spatial Reference System (SRS/CRS) for returned objects. Will default to the CRS of the input AOI if provided, and to 4326 for ID requests.
- **buffer**: numeric. The amount (in meters) to buffer a POINT AOI by for an extended search. Default = 0.5
- **basin**: logical should the gagesII basin also be returned? If True, return value will be a list with "site" and "basin" elements.

Details
The returned object(s) will have the same Spatial Reference System (SRS) as the input AOI. If a individual or set of IDs are used to query, then the default geoserver CRS of EPSG:4326 is preserved. In all cases, a user-defined SRS can be passed to t_srs which will override all previous SRS (either input or default). All buffer and distance operations are handled internally using in EPSG:5070 Albers Equal Area projection.

Value
a simple features (sf) object
get_hr_data  
*Get NHDPlus HiRes Data*

**Description**

Use to remove unwanted detail NHDPlusHR data. See `get_nhdplushr` for examples.

**Usage**

```r
get_hr_data(
  gdb, 
  layer = NULL, 
  min_size_sqkm = NULL, 
  simp = NULL, 
  proj = NULL, 
  rename = TRUE
)
```

**Arguments**

- `gdb`  
  character path to geodatabase to get data from.
- `layer`  
  character layer name from geodatabase found with `st_layers`.
- `min_size_sqkm`  
  numeric minimum basin size to be included in the output.
- `simp`  
  numeric simplification tolerance in units of projection.
- `proj`  
  a projection specification compatible with `st_crs`.
- `rename`  
  boolean if TRUE, `nhdplusTools` standard attribute values will be applied.

**Value**

sf data.frame containing requested data

get_huc  
*Find WBD HUC 12 unit subsets*

**Description**

Subsets the WBD level 12 features by location (POINT), area (POLYGON), or set of IDs.

**Usage**

```r
get_huc(AOI = NULL, id = NULL, t_srs = NULL, buffer = 0.5, type = "huc12")
```
**get_huc12**

**Arguments**

- **AOI** sf (MULTI)POINT or (MULTI)POLYGON. An ‘area of interest’ can be provided as either a location (sf POINT) or area (sf POLYGON) in any Spatial Reference System.
- **id** WBD HUC ID(s)
- **t_srs** character (PROJ string or EPSG code) or numeric (EPSG code). A user specified target Spatial Reference System (SRS/CRS) for returned objects. Will default to the CRS of the input AOI if provided, and to 4326 for ID requests.
- **buffer** numeric. The amount (in meters) to buffer a POINT AOI by for an extended search. Default = 0.5
- **type** character. Type of feature to return (‘huc02’, ‘huc04’, ‘huc06’, ‘huc08’, ‘huc10’, ‘huc12’). See /linkdownload_nhdplusv2 for documentation of that dataset.

**Details**

The returned object(s) will have the same Spatial Reference System (SRS) as the input AOI. If a individual or set of IDs are used to query, then the default geoserver CRS of EPSG:4326 is preserved. In all cases, a user-defined SRS can be passed to t_srs which will override all previous SRS (either input or default). All buffer and distance operations are handled internally using in EPSG:5070 Albers Equal Area projection.

**Value**

a simple features (sf) object

---

**get_huc12**  
*Find WBD HUC 12 unit subsets (DEPRECATED)*

**Description**

Subsets the WBD level 12 features by location (POINT), area (POLYGON), or set of IDs. Derived from a static snapshot of HUC 12s from: <doi:10.5066/P9BTKP3T>

**Usage**

get_huc12(AOI = NULL, id = NULL, t_srs = NULL, buffer = 0.5)

**Arguments**

- **AOI** sf (MULTI)POINT or (MULTI)POLYGON. An ‘area of interest’ can be provided as either a location (sf POINT) or area (sf POLYGON) in any Spatial Reference System.
- **id** WBD HUC12 ID(s) See /linkdownload_nhdplusv2 for documentation of that dataset.
get_huc8

Find WBD HUC 08 unit subsets (DEPRECATED)

Description

Subsets the WBD level 08 features by location (POINT), area (POLYGON), or set of IDs.

Usage

get_huc8(AOI = NULL, id = NULL, t_srs = NULL, buffer = 0.5)

Arguments

AOI sf (MULTI)POINT or (MULTI)POLYGON. An 'area of interest' can be provided as either a location (sf POINT) or area (sf POLYGON) in any Spatial Reference System.

id WBD HUC08 ID(s)

t_srs character (PROJ string or EPSG code) or numeric (EPSG code). A user specified target -Spatial Reference System (SRS/CRS) for returned objects. Will default to the CRS of the input AOI if provided, and to 4326 for ID requests.

buffer numeric. The amount (in meters) to buffer a POINT AOI by for an extended search. Default = 0.5

Details

The returned object(s) will have the same Spatial Reference System (SRS) as the input AOI. If a individual or set of IDs are used to query, then the default geoserver CRS of EPSG:4326 is preserved. In all cases, a user-defined SRS can be passed to t_srs which will override all previous SRS (either input or default). All buffer and distance operations are handled internally using in EPSG:5070 Albers Equal Area projection.
get_levelpaths

Value

a simple features (sf) object

get_levelpaths  Get Level Paths (DEPRECATED)

Description

Calculates level paths using the stream-leveling approach of NHD and NHDPlus. In addition to a levelpath identifier, a topological sort and levelpath outlet identifier is provided in output. If arbolate sum is provided in the weight column, this will match the behavior of NHDPlus. Any numeric value can be included in this column and the largest value will be followed when no nameID is available.

Usage

get_levelpaths(x, override_factor = NULL, status = FALSE, cores = NULL)

Arguments

x  data.frame with ID, toID, nameID, and weight columns.

override_factor  numeric factor to use to override nameID. If ‘weight’ is ‘numeric_factor’ times larger on a path, it will be followed regardless of the nameID indication.

status  boolean if status updates should be printed.

cores  numeric number of cores to use in initial path ranking calculations.

Details

1. levelpath provides an identifier for the collection of flowlines that make up the single mainstem flowpath of a total upstream aggregate catchment.

2. outletID is the catchment ID (COMID in the case of NHDPlus) for the catchment at the outlet of the levelpath the catchment is part of.

3. topo_sort is similar to Hydroseq in NHDPlus in that large topo_sort values are upstream of small topo_sort values. Note that there are many valid topological sort orders of a directed graph.

Value

data.frame with ID, outletID, topo_sort, and levelpath columns. See details for more info.
get_nhda-area

Examples

source(system.file("extdata", "walker_data.R", package = "nhdplusTools"))

test_flowline <- prepare_nhdplus(walker_flowline, 0, 0, FALSE)

test_flowline <- data.frame(
  ID = test_flowline$COMID,
  toID = test_flowline$toCOMID,
  nameID = walker_flowline$GNIS_ID,
  weight = walker_flowline$ArbolateSu,
  stringsAsFactors = FALSE)

get_levelpaths(test_flowline)

get_nhda-area

Find NHD Areas

Description

Subsets NHD Area features by location (POINT), area (POLYGON), or set of IDs.

Usage

get_nhda-area(AOI = NULL, id = NULL, t_srs = NULL, buffer = 0.5)

Arguments

AOI sf (MULTI)POINT or (MULTI)POLYGON. An 'area of interest' can be provided as either a location (sf POINT) or area (sf POLYGON) in any Spatial Reference System.

id NHD Area COMID(s)

t_srs character (PROJ string or EPSG code) or numeric (EPSG code). A user specified - target -Spatial Reference System (SRS/CRS) for returned objects. Will default to the CRS of the input AOI if provided, and to 4326 for ID requests.

buffer numeric. The amount (in meters) to buffer a POINT AOI by for an extended search. Default = 0.5

Details

The returned object(s) will have the same Spatial Reference System (SRS) as the input AOI. If a individual or set of IDs are used to query, then the default geoserver CRS of EPSG:4326 is preserved. In all cases, a user-defined SRS can be passed to t_srs which will override all previous SRS (either input or default). All buffer and distance operations are handled internally using in EPSG:5070 Albers Equal Area projection.
Value

a simple features (sf) object

---

**get_nhdplus**  
*Get National Hydrography Dataset V2 Subsets (Multirealization)*

**Description**

Subsets NHDPlusV2 features by location (POINT), area (POLYGON), or set of COMIDs. Multi realizations are supported allowing you to query for flowlines, catchments, or outlets.

**Usage**

```r
gerstenplus(
  AOI = NULL,
  comid = NULL,
  nwis = NULL,
  realization = "flowline",
  streamorder = NULL,
  t_srs = NULL
)
```

**Arguments**

- **AOI**: sf (MULTI)POINT or (MULTI)POLYGON. An ’area of interest’ can be provided as either a location (sf POINT) or area (sf POLYGON) in any Spatial Reference System.
- **comid**: numeric or character. Search for NHD features by COMID(s)
- **nwis**: numeric or character. Search for NHD features by collocated NWIS identifiers
- **realization**: character. What realization to return. Default is flowline and options include: outlet, flowline, catchment, and all
- **streamorder**: numeric or character. Only return NHD flowlines with a streamorder greater then or equal to this value for input value and higher. Only usable with AOI and flowline realizations.
- **t_srs**: character (PROJ string or EPSG code) or numeric (EPSG code). A user specified target -Spatial Reference System (SRS/CRS) for returned objects. Will default to the CRS of the input AOI if provided, and to 4326 for ID requests.

**Details**

The returned object(s) will have the same Spatial Reference System (SRS) as the input AOI. If a individual or set of IDs are used to query, then the default geoserver CRS of EPSG:4326 is preserved. In all cases, a user-defined SRS can be passed to t_srs which will override all previous SRS (either input or default). All buffer and distance operations are handled internally using in EPSG:5070 Albers Equal Area projection.
Value

sfc a single, or list, of simple feature objects

Examples

```r
point <- sf::st_sfc(sf::st_point(c(-119.845, 34.4146)), crs = 4326)
get_nhdplus(point)
get_nhdplus(point, realization = "catchment")
get_nhdplus(point, realization = "all")
get_nhdplus(comid = 101)
get_nhdplus(nwis = c(11120000, 11120500))
area <- sf::st_as_sfc(sf::st_bbox(c(xmin = -119.8851, xmax = -119.8361, ymax = 34.42439, ymin = 34.40473), crs = 4326))
get_nhdplus(area)
get_nhdplus(area, realization = "flowline", streamorder = 3)
```

---

get_nhdplushr  

Get NHDPlus HiRes

Description

Get NHDPlus HiRes

Usage

```r
get_nhdplushr(
  hr_dir,
  out_gpkg = NULL,
  layers = c("NHDFlowline", "NHDPlusCatchment"),
  pattern = ".*GDB.gdb$",
  check_terminals = TRUE,
  overwrite = FALSE,
  keep_cols = NULL,
  ...
)
```

Arguments

- **hr_dir**: character directory with geodatabases (gdb search is recursive)
- **out_gpkg**: character path to write output geopackage
get_nhdplushr

pattern character optional regex to select certain files in hr_dir
check_terminals boolean if TRUE, run `make_standalone` on output.
overwrite boolean should the output overwrite? If false and the output layer exists, it will be read and returned so this function will always return data even if called a second time for the same output. This is useful for workflows. Note that this will NOT delete the entire Geopackage. It will overwrite on a per layer basis.
keep_cols character vector of column names to keep in the output. If NULL, all will be kept.
... parameters passed along to `get_hr_data` for "NHDFlowline" layers.

Details

NHDFlowline is joined to value added attributes prior to being returned. Names are not modified from the NHDPlusHR geodatabase. Set layers to "NULL" to get all layers.

Value

sf data.frames containing output that may also be written to a geopackage for later use.

Examples

```r
## Not run:
# Note this will download a lot of data to a temp directory.
# Change 'temp_dir' to your directory of choice.
temp_dir <- file.path(nhdplusTools_data_dir(), "temp_hr_cache")

download_dir <- download_nhdplushr(temp_dir, c("0302", "0303"))

get_nhdplushr(download_dir, file.path(download_dir, "nhdplus_0302-03.gpkg"))

get_nhdplushr(download_dir,
    file.path(download_dir, "nhdplus_0302-03.gpkg"),
    layers = NULL, overwrite = TRUE)

get_nhdplushr(download_dir,
    file.path(download_dir, "nhdplus_0302-03.gpkg"),
    layers = "NHDFlowline", overwrite = TRUE,
    min_size_sqkm = 10, simp = 10, proj = "+init=epsg:5070")

# Cleanup
unlink(temp_dir, recursive = TRUE)
```

## End(Not run)
get_nldi_basin  

Get NLDI Basin Boundary

Description

Get a basin boundary for a given NLDI feature.

Usage

get_nldi_basin(nldi_feature, simplify = TRUE, split = FALSE)

Arguments

nldi_feature  list with names 'featureSource' and 'featureID' where 'featureSource' is derived from the "source" column of the response of get_nldi_sources and the 'featureID' is a known identifier from the specified 'featureSource'.
simplify  logical should response geometry be simplified for visualization and performance?
split  logical should response resolve precisely to the location of the 'nldi_feature'? Setting 'TRUE' calls an additional service and will be slower and less robust.

Details

Only resolves to the nearest NHDPlus catchment divide. See: https://waterdata.usgs.gov/blog/nldi-intro/ for more info on the nldi.

Value

sf data.frame with result basin boundary

Examples

library(sf)
library(dplyr)
nldi_nwis <- list(featureSource = "nwissite", featureID = "USGS-05428500")
site <- get_nldi_feature(nldi_nwis)
basin <- get_nldi_basin(nldi_feature = nldi_nwis)
plot(st_geometry(basin))
basin

basin2 <- get_nldi_basin(nldi_feature = nldi_nwis,
simplify = FALSE, split = TRUE)
get_nldi_characteristics

Get Catchment Characteristics

Description

Retrieves catchment characteristics from the Network Linked Data Index. Metadata for these characteristics can be found using `discover_nldi_characteristics()`.

Usage

```r
get_nldi_characteristics(nldi_feature, type = "local")
```

Arguments

- `nldi_feature`: list with names `featureSource` and `featureID` where `featureSource` is derived from the "source" column of the response of `get_nldi_sources` and the `featureID` is a known identifier from the specified `featureSource`.
- `type`: character "all", "local", "total", or "divergence_routed".

Value

data.frame containing requested characteristics

Examples

```r
chars <- get_nldi_characteristics(list(featureSource = "nwissite", featureID = "USGS-05429700"))
names(chars)
head(chars$local, 10)
```
get_nldi_feature \hspace{1cm} Get NLDI Feature

**Description**

Get a single feature from the NLDI

**Usage**

```r
get_nldi_feature(nldi_feature)
```

**Arguments**

- `nldi_feature`: list with names ‘featureSource’ and ‘featureID’ where ‘featureSource’ is derived from the "source" column of the response of `get_nldi_sources` and the ‘featureID’ is a known identifier from the specified ‘featureSource’.

**Value**

sf data.frame with one feature

**Examples**

```r
get_nldi_feature(list("featureSource" = "nwissite", featureID = "USGS-05428500"))
```

get_nldi_index \hspace{1cm} Get NLDI Index

**Description**

uses the Network Linked Data Index to retrieve and estimated network location for the given point. If not within a grid cell of a flowline, will use a raindrop trace service to find the nearest downslope flowline location.

**Usage**

```r
get_nldi_index(location)
```

**Arguments**

- `location`: numeric WGS84 lon/lat pair (X, Y)
Examples

```r
index <- get_nldi_index(c(-89.276, 42.988))

if(inherits(index, "sf")) {
  plot_nhdplus(bbox = sf::st_bbox(sf::st_buffer(index[1], units::set_units(1000, "m"))))
  plot(sf::st_geometry(sf::st_transform(index, 3857)), add = TRUE)
}
```

---

**get_nwis**

**Discover USGS NWIS Stream Gages**

**Description**

Returns a POINT feature class of active, stream network, NWIS gages for an Area of Interest. If a POINT feature is used as an AOI, then the returned sites within the requested buffer, are sorted by distance (in meters) from that POINT.

**Usage**

```r
get_nwis(AOI = NULL, t_srs = NULL, buffer = 20000)
```

**Arguments**

- **AOI**
  - sf (MULTI)POINT or (MULTI)POLYGON. An 'area of interest' can be provided as either a location (sf POINT) or area (sf POLYGON) in any Spatial Reference System.

- **t_srs**
  - character (PROJ string or EPSG code) or numeric (EPSG code). A user specified target -Spatial Reference System (SRS/CRS) for returned objects. Will default to the CRS of the input AOI if provided, and to 4326 for ID requests.

- **buffer**
  - numeric. The amount (in meters) to buffer a POINT AOI by for an extended search. Default = 20,000. Returned results are arrange by distance from POINT AOI

**Details**

The returned object(s) will have the same Spatial Reference System (SRS) as the input AOI. If a individual or set of IDs are used to query, then the default geoserver CRS of EPSG:4326 is preserved. In all cases, a user-defined SRS can be passed to `t_srs` which will override all previous SRS (either input or default). All buffer and distance operations are handled internally using in EPSG:5070 Albers Equal Area projection

**Value**

- a simple features (sf) object
get_path_length

**Description**

Generates the main path length to a basin’s terminal path.

**Usage**

```
get_pathlength(x)
```

**Arguments**

- `x` data.frame with ID, toID, length columns.

**Value**

data.frame containing pathlength for each ID

**Examples**

```
source(system.file("extdata", "walker_data.R", package = "nhdplusTools"))
fl <- dplyr::select(prepare_nhdplus(walker_flowline, 0, 0),
                   ID = COMID, toID = toCOMID, length = LENGTHKM)
get_pathlength(fl)
```

get_path_lengths

**Description**

Given a network and set of IDs, finds path lengths between all identified flowpath outlets. This algorithm finds distance between outlets regardless of flow direction.

**Usage**

```
get_path_lengths(outlets, network, cores = 1, status = FALSE)
```

**Arguments**

- `outlets` vector of IDs from data.frame
- `network` data.frame with ID, toID, and lengthkm attributes.
- `cores` integer number of cores to use for parallel computation.
- `status` logical print status and progress bars?
**get_path_members**

**Value**

data.frame containing the distance between pairs of network outlets. For a network with one terminal outlet, the data.frame will have \( nrow(network)^2 \) rows.

**Examples**

```r
source(system.file("extdata", "walker_data.R", package = "nhdplusTools"))
fline <- walker_flowline

outlets <- c(5329303, 5329357, 5329317, 5329365, 5329435, 5329817)

# Add toCOMID
fline <- nhdplusTools::get_tocomid(fline, add = TRUE)

fl <- dplyr::select(fline, ID = comid, toID = tocomid, lengthkm)

get_path_lengths(outlets, fl)
```

---

**get_path_members**

*Get Path Members (DEPRECATED)*

**Description**

Given a network and set of IDs, finds paths between all identified flowpath outlets. This algorithm finds members between outlets regardless of flow direction.

**Usage**

```r
get_path_members(outlets, network, cores = 1, status = FALSE)
```

**Arguments**

- `outlets`: vector of IDs from data.frame
- `network`: data.frame with ID, toID, and lengthkm attributes.
- `cores`: integer number of cores to use for parallel computation.
- `status`: logical print status and progress bars?

**Value**

list of lists containing flowpath identifiers along path that connect outlets.
get_pfaf

Examples

source(system.file("extdata", "walker_data.R", package = "nhdplusTools"))
fl <- walker_flowline

outlets <- c(5329303, 5329357, 5329317, 5329365, 5329435, 5329817)

# Add toCOMID
fline <- nhdplusTools::get_tocomid(fline, add = TRUE)

fl <- dplyr::select(fline, ID = comid, toID = tocomid, lengthkm)

get_path_members(outlets, fl)

get_pfaf

Get Pfafstetter Codes (DEPRECATED)

Description

Determines Pfafstetter codes for a dendritic network with total drainage area, levelpath, and topo_sort attributes.

Usage

get_pfaf(x, max_level = 2, status = FALSE)

Arguments

x sf data.frame with ID, toID, totda, outletID, topo_sort, and levelpath attributes.
max_level integer number of pfaf levels to attempt to calculate. If the network doesn’t have resolution to support the desired level, unexpected behavior may occur.
status boolean print status or not

Value

data.frame with ID and pfaf columns.

Examples

library(dplyr)
source(system.file("extdata/nhdplushr_data.R", package = "nhdplusTools"))
hr_flowline <- align_nhdplus_names(hr_data$NHDFlowline)

fl <- select(hr_flowline, COMID, AreaSqKM) %>%
  right_join(prepare_nhdplus(hr_flowline, 0, 0,
    purge_non_dendritic = FALSE,
    warn = FALSE),
get_raindrop_trace

by = "COMID") %>%
sf::st_sf() %>%

pfaf <- get_pfaf(fl, max_level = 2)
fl <- left_join(fl, pfaf, by = "ID")
plot(fl["pf_level_2"], lwd = 2)
Description
Uses a raindrop trace web service to trace the nhdplus digital elevation model to the nearest downslope flowline.

Usage
get_raindrop_trace(point, direction = "down")

Arguments
point sfc POINT including crs as created by: sf::st_sfc(sf::st_point(., ..), crs)
direction character "up", "down", or "none". Controls the portion of the split flowline that is returned along with the raindrop trace line.

Value
sf data.frame containing raindrop trace and requested portion of flowline.

Examples
point <- sf::st_sfc(sf::st_point(x = c(-89.2158, 42.9561)), crs = 4326)
(trace <- get_raindrop_trace(point))
if(inherits(trace, "sf")) {
  bbox <- sf::st_bbox(trace) + c(-0.005, -0.005, 0.005, 0.005)
  nhdplusTools::plot_nhdplus(bbox = bbox, cache_data = FALSE)
  plot(sf::st_transform(sf::st_sfc(point, crs = 4326), 3857), add = TRUE)
  plot(sf::st_transform(sf::st_geometry(trace)[1], 3857), add = TRUE, col = "red")
  plot(sf::st_transform(sf::st_geometry(trace)[2], 3857), add = TRUE, col = "black")
}

get_sorted
Get Sorted Network

Description
given a tree with an id and and toid in the first and second columns, returns a sorted and potentially split set of output.
Can also be used as a very fast implementation of upstream with tributaries navigation. The full network from each outlet is returned in sorted order.
Usage

get_sorted(x, split = FALSE, outlets = NULL)

Arguments

x  data.frame with an identifier and to identifier in the first and second columns.
split  logical if TRUE, the result will be split into independent networks identified by the id of their outlet. The outlet id of each independent network is added as a "terminalID" attribute.
outlets  same as id in x; if specified only the network emanating from these outlets will be considered and returned.

Value

data.frame containing a topologically sorted version of the requested network and optionally a terminal id.

Examples

source(system.file("extdata/new_hope_data.R", package = "nhdplusTools"))

fpath <- get_tocomid(
  dplyr::select(new_hope_flowline, COMID, FromNode, ToNode, Divergence, FTYPE,
                 AreaSqKM, LENGTHKM, GNIS_ID)
)

head(fpath <- get_sorted(fpath, split = TRUE))

fpath['sort_order'] <- 1:nrow(fpath)

plot(fpath['sort_order'])

get_split_catchment  Get split catchment

Description

Uses catchment splitting web service to retrieve the portion of a catchment upstream of the point provided.

Usage

get_split_catchment(point, upstream = TRUE)
get_split_catchment

Arguments

point sf c POINT including crs as created by: sf::st_sfc(sf::st_point(x, y), crs)
upstream logical If TRUE, the entire drainage basin upstream of the point provided is returned in addition to the local catchment.

Value

sf data.frame containing the local catchment, the split portion and optionally the total drainage basin.

Examples

point <- sf::st_sfc(sf::st_point(x = c(-89.2158, 42.9561)), crs = 4326)
trace <- get_raindrop_trace(point)
if(inherits(trace, "sf")) {
  (snap_point <- sf::st_sfc(sf::st_point(trace$intersection_point[[1]]), crs = 4326))
  (catchment <- get_split_catchment(snap_point))
bbox <- sf::st_bbox(catchment) + c(-0.005, -0.005, 0.005, 0.005)
nhdplusTools::plot_nhdplus(bbox = bbox, cache_data = FALSE)
plot(sf::st_transform(sf::st_geometry(catchment)[2], 3857), add = TRUE, col = "black")
plot(sf::st_transform(sf::st_geometry(catchment)[1], 3857), add = TRUE, col = "red")
plot(sf::st_transform(sf::st_sfc(point, crs = 4326), 3857), add = TRUE, col = "white")
(catchment <- get_split_catchment(snap_point, upstream = FALSE))
bbox <- sf::st_bbox(catchment) + c(-0.005, -0.005, 0.005, 0.005)
nhdplusTools::plot_nhdplus(bbox = bbox, cache_data = FALSE)
plot(sf::st_transform(sf::st_geometry(catchment)[2], 3857), add = TRUE, col = "black")
plot(sf::st_transform(sf::st_geometry(catchment)[1], 3857), add = TRUE, col = "red")
plot(sf::st_transform(sf::st_sfc(point, crs = 4326), 3857), add = TRUE, col = "white")
pour_point <- sf::st_sfc(sf::st_point(x = c(-89.25619, 42.98646)), crs = 4326)
(catchment <- get_split_catchment(pour_point, upstream = FALSE))
bbox <- sf::st_bbox(catchment) + c(-0.005, -0.005, 0.005, 0.005)
nhdplusTools::plot_nhdplus(bbox = bbox, cache_data = FALSE)
get_streamlevel

plot(sf::st_transform(sf::st_geometry(catchment)[1], 3857), add = TRUE, col = "red")
plot(sf::st_transform(sf::st_geometry(catchment)[2], 3857), add = TRUE, col = "black")
plot(sf::st_transform(sf::st_sfc(pour_point, crs = 4326), 3857), add = TRUE, col = "white")

get_streamlevel

Get Streamlevel

Description
Applies a topological sort and calculates stream level. Algorithm: Terminal level paths are assigned level 1 (see note 1). Paths that terminate at a level 1 are assigned level 2. This pattern is repeated until no paths remain.

If a TRUE/FALSE coastal attribute is included, coastal terminal paths begin at 1 and internal terminal paths begin at 4 as is implemented by the NHD stream leveling rules.

Usage
get_streamlevel(x)

Arguments
x
data.frame with levelpathi, dnlevelpat, and optionally a coastal flag. If no coastal flag is included, all terminal paths are assumed to be coastal.

Value
numeric stream order in same order as input

Examples
source(system.file("extdata", "walker_data.R", package = "nhdplusTools"))

test_flowline <- data.frame(
  levelpathi = walker_flowline$LevelPathI,
  dnlevelpat = walker_flowline$DnLevelPat)

test_flowline$dnlevelpat[1] <- 0

(level <- get_streamlevel(test_flowline))

walker_flowline$level <- level

plot(sf::st_geometry(walker_flowline), lwd = walker_flowline$level, col = "blue")

test_flowline$coastal <- rep(FALSE, nrow(test_flowline))

(level <- get_streamlevel(test_flowline))
get_streamorder

Description

Applies a topological sort and calculates Strahler stream order. Algorithm: If more than one upstream flowpath has an order equal to the maximum upstream order then the downstream flowpath is assigned the maximum upstream order plus one. Otherwise it is assigned the max upstream order.

Usage

get_streamorder(x, status = TRUE)

Arguments

x data.frame with dendritic ID and toID columns.
status logical show progress update messages?

Value

numeric stream order in same order as input

Examples

source(system.file("extdata", "walker_data.R", package = "nhdplusTools"))

test_flowline <- prepare_nhdplus(walker_flowline, 0, 0, FALSE)

test_flowline <- data.frame(
  ID = test_flowline$COMID,
  toID = test_flowline$toCOMID)

(order <- get_streamorder(test_flowline))

walker_flowline$order <- order

plot(sf::st_geometry(walker_flowline), lwd = walker_flowline$order, col = "blue")
get_terminal

Get Terminal ID (DEPRECATED)

Description

Get the ID of the basin outlet for each flowline. This function has been deprecated in favor of get_sorted.

Usage

get_terminal(x, outlets)

Arguments

- `x`: two column data.frame with IDs and toIDs. Names are ignored.
- `outlets`: IDs of outlet flowlines

Value

data.frame containing the terminal ID for each outlet

Examples

```r
source(system.file("extdata", "walker_data.R", package = "nhdplusTools"))
fl <- dplyr::select(prepare_nhdplus(walker_flowline, 0, 0),
                   ID = COMID, toID = toCOMID)
outlet <- fl$ID[which(!fl$toID %in% fl$ID)]
get_terminal(fl, outlet)
```

get_tocomid

Get tocomid

Description

Given flowlines with fromnode and tonode attributes, will return a toid attribute that is the result of joining tonode and fromnode attributes. In the case that a terminalpa attribute is included, the join is executed by terminalpa group. This is done grouped by terminalpathID because duplicate node ids have been encountered across basins in some datasets. If `remove_coastal` is `TRUE` (the default) either ftype or fcode are required. Uses the add_toids function.
Usage

get_tocomid(
  x,
  return_dendritic = TRUE,
  missing = 0,
  remove_coastal = TRUE,
  add = TRUE
)

Arguments

x data.frame with comid, tonode, fromnode, and (optionally) divergence and terminalpa attributes.

return_dendritic logical if TRUE, a divergence attribute is required (2 indicates diverted path, 1 is main) and diverted paths will be treated as headwaters. If this is FALSE, the return value is a data.frame including the comid and tocomid attributes.

missing integer value to use for terminal nodes.

remove_coastal logical remove coastal features prior to generating tocomid values? ftype or fcode are required if ‘TRUE’. fcode == 56600 or fcode == "Coastline" will be removed.

add logical if TRUE, a tocomid column will be added, otherwise a data.frame with two columns will be returned.

Value

data.frame containing comid and tocomid attributes or all attributes provided with comid and tocomid in the first and second columns.

Examples

source(system.file("extdata", "sample_flines.R", package = "nhdplusTools"))

tocomid <- get_tocomid(sample_flines)

tocomid <- get_tocomid(sample_flines, return_dendritic = FALSE)

---

get_UM

Navigate Upstream Mainstem

Description

Traverse NHDPlus network upstream main stem
get_UT

Usage

get_UM(network, comid, distance = NULL, sort = FALSE, include = TRUE)

Arguments

network data.frame NHDPlus flowlines including at a minimum: COMID, Pathlength, LevelPathI, and Hydroseq.
comid integer identifier to start navigating from.
distance numeric distance in km to limit how many COMIDs are
sort if TRUE, the returned COMID vector will be sorted in order of distance from the input COMID (nearest to farthest)
include if TRUE, the input COMID will be included in the returned COMID vector returned. The COMID that exceeds the distance specified is returned.

Value

integer vector of all COMIDs upstream of the starting COMID along the mainstem

Examples

library(sf)
source(system.file("extdata", "sample_flines.R", package = "nhdplusTools"))

plot(sample_flines$geom)
start_COMID <- 11690196
UM_COMIDs <- get_UM(sample_flines, start_COMID)
plot(dplyr::filter(sample_flines, COMID %in% UM_COMIDs)$geom,
col = "red", add = TRUE, lwd = 3)

UM_COMIDs <- get_UM(sample_flines, start_COMID, distance = 50)
plot(dplyr::filter(sample_flines, COMID %in% UM_COMIDs)$geom,
col = "blue", add = TRUE, lwd = 2)

get_UT

Navigate Upstream with Tributaries

Description

Traverse NHDPlus network upstream with tributaries

Usage

get_UT(network, comid, distance = NULL)
get_vaa

Arguments

- **network**: data.frame NHDPlus flowlines including at a minimum: COMID, Pathlength, LENGTHKM, and Hydroseq.
- **comid**: integer Identifier to start navigating from.
- **distance**: numeric distance in km to limit how many COMIDs are returned. The COMID that exceeds the distance specified is returned.

Value

integer vector of all COMIDs upstream with tributaries of the starting COMID.

Examples

```r
library(sf)
source(system.file("extdata", "sample_flines.R", package = "nhdplusTools"))
plot(sample_flines$geom)
start_COMID <- 11690196
UT_COMIDs <- get_UT(sample_flines, start_COMID)
plot(dplyr::filter(sample_flines, COMID %in% UT_COMIDs)$geom,
     col = "red", add = TRUE)

UT_COMIDs <- get_UT(sample_flines, start_COMID, distance = 50)
plot(dplyr::filter(sample_flines, COMID %in% UT_COMIDs)$geom,
     col = "blue", add = TRUE)
```

---

get_vaa  
**NHDPlusV2 Attribute Subset**

Description

Return requested NHDPlusV2 Attributes.

Usage

```r
get_vaa(
  atts = NULL,
  path = get_vaa_path(),
  download = TRUE,
  updated_network = FALSE
)
```

Arguments

- **atts**: character The variable names you would like, always includes comid
- **path**: character path where the file should be saved. Default is a persistent system data as retrieved by `nhdplusTools_data_dir`. Also see: `get_vaa_path`
get_vaa_names

Available NHDPlusV2 Attributes

Description
Find variables available from the NHDPlusV2 attribute data.frame

Usage
get_vaa_names(updated_network = FALSE)

Arguments
updated_network
logical default FALSE. If TRUE, updated network attributes from E2NHD and National Water Model retrieved from doi:10.5066/P976XCVT.
Details

The VAA data is a aggregate table of information from the NHDPlusV2 elevslope.dbf(s), PlusFlowlineVAA.dbf(s); and NHDFlowlines. All data originates from the EPA NHDPlus Homepage here. To see the location of cached data on your machine use `get_vaa_path`. To view aggregate data and documentation, see here.

Value

character vector

Examples

## Not run:
# This will download the vaa file to the path from get_vaa_path()
get_vaa_names()

#cleanup if desired
unlink(dirname(get_vaa_path()), recursive = TRUE)

## End(Not run)

table

| get_vaa_path | File path to value added attribute (vaa) Cache |

Description

nhdplusTools will download and cache an ‘fst’ file with NHDPlusV2 attribute data sans geometry. This function returns the file path to the cached file. Will use the user data dir indicated by `nhdplusTools_data_dir`.

Usage

get_vaa_path(updated_network = FALSE)

Arguments

updated_network

logical default FALSE. If TRUE, returns path to updated network parameters. See `get_vaa` for more.

Details

The VAA data is a aggregate table of information from the NHDPlusV2 elevslope.dbf(s), PlusFlowlineVAA.dbf(s); and NHDFlowlines. All data originates from the EPA NHDPlus Homepage here. To see the location of cached data on your machine use `get_vaa_path`. To view aggregate data and documentation, see here.
get_waterbodies

Value
character file path

Examples

get_vaa_path()
get_vaa_path(updated_network = TRUE)

get_waterbodies (Find NHD Water Bodies)

Description
Subsets NHD waterbody features by location (POINT), area (POLYGON), or set of IDs.

Usage

gen_waterbodies(AOI = NULL, id = NULL, t_srs = NULL, buffer = 0.5)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AOI</td>
<td>sf (MULTI)POINT or (MULTI)POLYGON. An ‘area of interest’ can be provided as either a location (sf POINT) or area (sf POLYGON) in any Spatial Reference System.</td>
</tr>
<tr>
<td>id</td>
<td>NHD Waterbody COMID(s)</td>
</tr>
<tr>
<td>t_srs</td>
<td>character (PROJ string or EPSG code) or numeric (EPSG code). A user specified target - Spatial Reference System (SRS/CRS) for returned objects. Will default to the CRS of the input AOI if provided, and to 4326 for ID requests.</td>
</tr>
<tr>
<td>buffer</td>
<td>numeric. The amount (in meters) to buffer a POINT AOI by for an extended search. Default = 0.5</td>
</tr>
</tbody>
</table>

Details
The returned object(s) will have the same Spatial Reference System (SRS) as the input AOI. If a individual or set of IDs are used to query, then the default geoserver CRS of EPSG:4326 is preserved. In all cases, a user-defined SRS can be passed to t_srs which will override all previous SRS (either input or default). All buffer and distance operations are handled internally using in EPSG:5070 Albers Equal Area projection

Value

a simple features (sf) object
**get_waterbody_index**  
*Get Waterbody Index*

**Description**

given an sf point geometry column, return waterbody id, and COMID of dominant artificial path

**Usage**

```r
get_waterbody_index(waterbodies, points, flines = NULL, search_radius = NULL)
```

**Arguments**

- `waterbodies` sf data.frame of type POLYGON or MULTIPOLYGON including COMID attributes.
- `points` sfc of type POINT
- `flines` sf data.frame of type LINestring or MULTILINESTRING including COMID, WBAREACOMI, and Hydroseq attributes
- `search_radius` units class with a numeric value indicating how far to search for a waterbody boundary in units of provided projection. Set units with `set_units`.

**Value**

data.frame with two columns, COMID, in_wb_COMID, near_wb_COMID, near_wb_dist, and outlet_fline_COMID. Distance is in units of provided projection.

**Examples**

```
source(system.file("extdata/sample_data.R", package = "nhdplusTools"))

waterbodies <- sf::st_transform(
  sf::read_sf(sample_data, "NHDWaterbody"), 5070)

points <- sf::st_transform(
  sf::st_sfc(sf::st_point(c(-89.356086, 43.079943)),
                  crs = 4326), 5070)

get_waterbody_index(waterbodies, points,
                      search_radius = units::set_units(500, "m"))
```
get_wb_outlet  

**Get Waterbody Outlet**

**Description**

Get Waterbody Outlet

**Usage**

```r
get_wb_outlet(lake_id, network)
```

**Arguments**

- **lake_id**
  - integer COMID (or character permanent identifier for hi res) of lake.
- **network**
  - data.frame of network features containing wbareacomi, and Hydroseq

**Value**

sf data.frame with single record of network COMID associated with most-downstream reach in the NHD Waterbody

**Examples**

```r
source(system.file("extdata/sample_data.R", package = "nhdplusTools"))

fline <- sf::read_sf(sample_data, "NHDFlowline_Network")
wtbdy <- sf::read_sf(sample_data, "NHDWaterbody")

lake_COMID <- wtbdy$COMID[wtbdy$GNIS_NAME=="Lake Mendota 254"]

get_wb_outlet(lake_COMID, fline)
```

get_xs_point  

**Get Cross Section From Point (experimental)**

**Description**

Uses a cross section retrieval web services to retrieve a cross section given a point and specified width. Orientation is determined based on direction of a the flowline found near point. This function uses a 10m National Elevation Dataset request on the back end.
get_xs_points

Usage

get_xs_point(point, width, num_pts)

Arguments

- **point**: sfc POINT including crs as created by: `sf::st_sfc(sf::st_point(...), crs)`
- **width**: Cross section width in meters.
- **num_pts**: numeric number of points to retrieve along the cross section.

Value

sf data.frame containing points retrieved.

Examples

```r
point <- sf::st_sfc(sf::st_point(x = c(-105.97218, 36.17592)), crs = 4326)
(xs <- get_xs_point(point, 300, 100))
if(inherits(xs, "sf")) {
  bbox <- sf::st_bbox(xs) + c(-0.005, -0.005, 0.005, 0.005)
  nhdplusTools::plot_nhdplus(bbox = bbox, cache_data = FALSE)
  plot(sf::st_transform(sf::st_geometry(xs), 3857), pch = ".", add = TRUE, col = "red")
  plot(sf::st_transform(sf::st_sfc(point, crs = 4326), 3857), add = TRUE)
  plot(xs$distance_m, xs$elevation_m)
}
```

get_xs_points

Get Cross Section Endpoints (experimental)

Description

Uses a cross section retrieval web services to retrieve a cross section between two endpoints.

Usage

```
get_xs_points(point1, point2, num_pts, res = 1)
```
make_node_topology

Arguments

- **point1**: sfc POINT including crs as created by: `sf::st_sfc(sf::st_point(x,..), crs)`
- **point2**: sfc POINT including crs.
- **num_pts**: numeric number of points to retrieve along the cross section.
- **res**: integer resolution of 3D Elevation Program data to request. Must be on of: 1, 3, 5, 10, 30, 60.

Value

- sf data.frame containing points retrieved.

Examples

```r
point1 <- sf::st_sfc(sf::st_point(x = c(-105.9667, 36.17602)), crs = 4326)
point2 <- sf::st_sfc(sf::st_point(x = c(-105.97768, 36.17526)), crs = 4326)
(xs <- get_xs_points(point1, point2, 100))

if(inherits(xs, "sf") {  
  bbox <- sf::st_bbox(xs) + c(-0.005, -0.005, 0.005, 0.005)
  nhdplusTools::plot_nhdplus(bbox = bbox, cache_data = FALSE)
  plot(sf::st_transform(sf::st_geometry(xs), 3857), pch = ".", add = TRUE, col = "red")
  plot(sf::st_transform(sf::st_sfc(point1, crs = 4326), 3857), add = TRUE)
  plot(sf::st_transform(sf::st_sfc(point2, crs = 4326), 3857), add = TRUE)
  plot(xs$distance_m, xs$elevation_m)
}
```

make_node_topology  get node topology from edge topology (DEPRECATED)

Description

creates a node topology table from an edge topology

Usage

```r
make_node_topology(x, add_div = NULL, add = TRUE)
```
Arguments

- **x**: data.frame with an identifier and to identifier in the first and second columns.
- **add_div**: data.frame containing id and toid diverted paths to add. Should have id and toid fields in the first and second columns. Names are not used.
- **add**: logical if TRUE, a tocomid column will be added, otherwise a data.frame with two columns will be returned.

Value

data.frame containing id, fromnode, and tonode attributes or all attributes provided with id, fromnode and tonode in the first three columns.

Examples

```r
source(system.file("extdata/new_hope_data.R", package = "nhdplusTools"))

x <- dplyr::select(get_tocomid(dplyr::select(new_hope_flowline, COMID, FromNode, ToNode, Divergence, FTYPE, AreaSqKM, LENGTHKM, GNIS_ID)), -tonode, -fromnode)

head(y <- make_node_topology(x))

# just the divergences which have unique fromids in x but don't in new hope.
div <- get_tocomid(dplyr::select(new_hope_flowline, COMID, FromNode, ToNode),
                   return_dendritic = FALSE,
                   remove_coastal = FALSE)
div <- div[div$tocomid %in%
           new_hope_flowline$COMID[new_hope_flowline$Divergence == 2],]

y <- make_node_topology(x, div)
```

---

### make_standalone

**Make isolated NHDPlusHR region a standalone dataset**

**Description**

Cleans up and prepares NHDPlusHR regional data for use as complete NHDPlus data. The primary modification applied is to ensure that any flowpath that exits the domain is labeled as a terminal path and attributes are propagated upstream such that the domain is independently complete.

**Usage**

```r
make_standalone(flowlines)
```

**Arguments**

- **flowlines**: sf data.frame of NHDPlusHR flowlines.
Value

sf data.frame containing standalone network

Examples

```r
library(dplyr)
library(sf)
source(system.file("extdata/nhdplusr_data.R", package = "nhdplusTools"))

(outlet <- filter(hr_data$NHDFlowline, Hydroseq == min(Hydroseq)))
nrow(filter(hr_data$NHDFlowline, TerminalPa == outlet$Hydroseq))

hr_data$NHDFlowline <- make_standalone(hr_data$NHDFlowline)

(outlet <- filter(hr_data$NHDFlowline, Hydroseq == min(Hydroseq)))
nrow(filter(hr_data$NHDFlowline, TerminalPa == outlet$Hydroseq))

source(system.file("extdata/nhdplusr_data.R", package = "nhdplusTools"))

# Remove mainstem and non-dendritic stuff.
subset <- filter(hr_data$NHDFlowline,
                 StreamLeve > min(hr_data$NHDFlowline$StreamLeve) &
                 StreamOrde == StreamCalc)

subset <- subset_nhdplus(subset$COMID, nhdplus_data = hr_gpkg)$NHDFlowline

plot(sf::st_geometry(hr_data$NHDFlowline))

flowline_mod <- make_standalone(subset)

terminals <- unique(flowline_mod$TerminalPa)

colors <- sample(hcl.colors(length(terminals), palette = "Zissou 1"))

for(i in 1:length(terminals)) {
  fl <- flowline_mod[flowline_mod$TerminalPa == terminals[i], ]
  plot(st_geometry(fl), col = colors[i], lwd = 2, add = TRUE)
}

ol <- filter(flowline_mod, TerminalFl == 1 & TerminalPa %in% terminals)

plot(st_geometry(ol), lwd = 2, add = TRUE)
```

map_nhdplus

Make Interactive Map of NHDPlus

Description

Given a list of outlets, get their basin boundaries and network and return a leaflet map in EPSG:4326.
map_nhdplus

Usage

map_nhdplus(
  outlets = NULL,
  bbox = NULL,
  streamorder = NULL,
  nhdplus_data = NULL,
  gpkg = NULL,
  flowline_only = NULL,
  plot_config = NULL,
  overwrite = TRUE,
  cache_data = NULL,
  return_map = FALSE
)

Arguments

outlets list of nldi outlets. Other inputs are coerced into nldi outlets, see details.
bbox object of class bbox with a defined crs. See examples.
streamorder integer only streams of order greater than or equal will be returned
nhdplus_data geopackage containing source nhdplus data (omit to download)
gpkg path and file with .gpkg ending. If omitted, no file is written.
flowline_only boolean only subset and plot flowlines only, default=FALSE
plot_config list containing plot configuration, see details.
overwrite passed on the subset_nhdplus.
cache_data character path to rds file where all plot data can be cached. If file doesn’t exist, it will be created. If set to FALSE, all caching will be turned off – this includes basemap tiles.
return_map if FALSE (default), a data.frame of plot data is returned invisibly in NAD83 Lat/Lon, if TRUE the leaflet object is returned

Details

map_nhdplus supports several input specifications. An unexported function "as_outlet" is used to convert the outlet formats as described below.

1. if outlets is omitted, the bbox input is required and all nhdplus data in the bounding box is plotted.
2. If outlets is a list of integers, it is assumed to be NHDPlus IDs (comids) and all upstream tributaries are plotted.
3. if outlets is an integer vector, it is assumed to be all NHDPlus IDs (comids) that should be plotted. Allows custom filtering.
4. If outlets is a character vector, it is assumed to be NWIS site ids.
5. if outlets is a list containing only characters, it is assumed to be a list of nldi features and all upstream tributaries are plotted.
6. if outlets is a data.frame with point geometry, a point in polygon match is performed and upstream with tributaries from the identified catchments is plotted.

See plot_nhdplus for details on plot configuration.

Value
data.frame or leaflet map (see return_map)

Examples

```r
map_nhdplus("05428500")
map_nhdplus("05428500", streamorder = 2)
map_nhdplus(list(13293970, 13293750))
source(system.file("extdata/sample_data.R", package = "nhdplusTools"))
map_nhdplus(list(13293970, 13293750), streamorder = 3, nhdplus_data = sample_data)

#return leaflet object
map_nhdplus("05428500", return_map = TRUE)
```

navigate_network  

**Navigate Network**

**Description**

Provides a full feature network navigation function that will work with local or web service data. Parameter details provide context.

**Usage**

```r
navigate_network(
  start,
  mode = "UM",
  network = NULL,
  output = "flowlines",
  distance_km = 10,
  trim_start = FALSE,
  trim_stop = FALSE,
  trim_tolerance = 5
)
```
navigate_network

Arguments

- **start**: list, integer, sf, or sfc if list must be a valid NLDI feature if integer must be a valid comid. If sf, must contain a "comid" field.
- **mode**: character chosen from c(UM, DM, UT, or DD)
- **network**: sf should be compatible with network navigation functions If NULL, network will be derived from requests to the NLDI
- **output**: character flowline or a valid NLDI data source
- **distance_km**: numeric distance to navigate in km
- **trim_start**: logical should start be trimmed or include entire catchment?
- **trim_stop**: logical should stop(s) be trimmed or include entire catchment(s)? # Not supported
- **trim_tolerance**: numeric from 0 to 100 percent of flowline length. If amount to trim is less than this tolerance, no trim will be applied.

Examples

```r
navigate_network(list(featureSource = "nwisSite", featureID = "USGS-06287800"),
    "UM",
    output = "flowlines",
    trim_start = TRUE)
```

```r
source(system.file("extdata", "walker_data.R", package = "nhdplusTools"));
hydro_location <- list(comid = 5329339,
    reachcode = "18050005000078",
    reach_meas = 30)
hydro_location <- sf::st_sf(
    hydro_location,
    geom = nhdplusTools::get_hydro_location(data.frame(hydro_location),
        walker_flowline))
net <- navigate_network(hydro_location,
    mode = "DM", network = walker_flowline,
    trim_start = TRUE, distance_km = 20)
plot(sf::st_geometry(walker_flowline))
plot(sf::st_geometry(hydro_location), add = TRUE)
plot(sf::st_geometry(net), add = TRUE, col = "blue", lwd = 2)
```
navigate_nldi

Navigate NLDI

Description

Navigate the Network Linked Data Index network.

Usage

```r
navigate_nldi(
  nldi_feature,
  mode = "upstreamMain",
  data_source = "flowlines",
  distance_km = 10
)
```

Arguments

- **nldi_feature**: list with names ‘featureSource’ and ‘featureID’ where ‘featureSource’ is derived from the "source" column of the response of `get_nldi_sources` and the ‘featureID’ is a known identifier from the specified ‘featureSource’.
- **mode**: character chosen from ("UM", "UT", "DM", "DD"). See examples.
- **data_source**: character chosen from "source" column of the response of `get_nldi_sources` or empty string for flowline geometry.
- **distance_km**: numeric distance in km to stop navigating.

Value

`sf` data.frame with result

Examples

```r
library(sf)
library(dplyr)

nldi_nwis <- list(featureSource = "nwissite", featureID = "USGS-05428500")

navigate_nldi(nldi_feature = nldi_nwis, 
  mode = "upstreamTributaries")$UT %>%
  st_geometry() %>%
  plot()

navigate_nldi(nldi_feature = nldi_nwis, 
  mode = "UM")$UM %>%
  st_geometry() %>%
  plot(col = "blue", add = TRUE)
```
nwissite <- navigate_nldi(nldi_feature = nldi_nwis,
    mode = "UT",
    data_source = "nwissite")$UT_nwissite

st_geometry(nwissite) %>%
  plot(col = "green", add = TRUE)

nwissite

---

### nhdplusTools_data_dir

*Get or set nhdplusTools data directory*

**Description**

if left unset, will return the user data dir as returned by `tools::R_user_dir` for this package.

**Usage**

```
  nhdplusTools_data_dir(dir = NULL)
```

**Arguments**

- `dir` path of desired data directory

**Value**

character path of data directory (silent when setting)

**Examples**

```
  nhdplusTools_data_dir()
  nhdplusTools_data_dir("demo")
  nhdplusTools_data_dir(tools::R_user_dir("nhdplusTools"))
```
nhdplus_path

nhdplus_path

Description

Allows specification of a custom path to a source dataset. Typically this will be the national seamless dataset in geodatabase or geopackage format.

Usage

nhdplus_path(path = NULL, warn = FALSE)

Arguments

path character path ending in .gdb or .gpkg
warn boolean controls whether warning an status messages are printed

Value

0 (invisibly) if set successfully, character path if no input.

Examples

nhdplus_path("/data/NHDPlusV21_National_Seamless.gdb")
nhdplus_path("/data/NHDPlusV21_National_Seamless.gdb", warn=FALSE)
nhdplus_path()

plot_nhdplus

plot_nhdplus

Description

Given a list of outlets, get their basin boundaries and network and return a plot in EPSG:3857 Web Mercator Projection.

Usage

plot_nhdplus(
  outlets = NULL,
  bbox = NULL,
  streamorder = NULL,
  nhdplus_data = NULL,
  gpkg = NULL,
plot_config = NULL,
basemap = "Esri.NatGeoWorldMap",
zoom = NULL,
add = FALSE,
actually_plot = TRUE,
overwrite = TRUE,
flowline_only = NULL,
cache_data = NULL
)

Arguments

outlets list of nldi outlets. Other inputs are coerced into nldi outlets, see details.
bbox object of class bbox with a defined crs. See examples.
streamorder integer only streams of order greater than or equal will be returned
nhdplus_data geopackage containing source nhdplus data (omit to download)
gpkg path and file with .gpkg ending. If omitted, no file is written.
plot_config list containing plot configuration, see details.
basemap character indicating which basemap type to use. Chose from: get_tiles.
zoom integer passed on to get_tiles. This value will override the default set by the package.
add boolean should this plot be added to an already built map.
actually_plot boolean actually draw the plot? Use to get data subset only.
overwrite passed on the subset_nhdplus.
flowline_only boolean only subset and plot flowlines only, default=FALSE

Details

plot_nhdplus supports several input specifications. An unexported function "as_outlet" is used to convert the outlet formats as described below.

1. if outlets is omitted, the bbox input is required and all nhdplus data in the bounding box is plotted.
2. If outlets is a list of integers, it is assumed to be NHDPlus IDs (comids) and all upstream tributaries are plotted.
3. if outlets is an integer vector, it is assumed to be all NHDPlus IDs (comids) that should be plotted. Allows custom filtering.
4. If outlets is a character vector, it is assumed to be NWIS site ids.
5. if outlets is a list containing only characters, it is assumed to be a list of nldi features and all upstream tributaries are plotted.
6. if outlets is a data.frame with point geometry, a point in polygon match is performed and upstream with tributaries from the identified catchments is plotted.

The `plot_config` parameter is a list with names "basin", "flowline", "outlets", "network_wtbd", and "off_network_wtbd". The following shows the defaults that can be altered.

1. basin
   ```r
   list(lwd = 1, col = NA, border = "black")
   ```

2. flowline
   ```r
   list(lwd = 1, col = "blue")
   ```

3. outlets
   ```r
   list(default = list(col = "black", border = NA, pch = 19, cex = 1),
        nwissite = list(col = "grey40", border = NA, pch = 17, cex = 1),
        huc12pp = list(col = "white", border = "black", pch = 22, cex = 1),
        wqp = list(col = "red", border = NA, pch = 20, cex = 1))
   ```

4. network_wtbd
   ```r
   list(lwd = 1, col = "lightblue", border = "black")
   ```

5. off_network_wtbd
   ```r
   list(lwd = 1, col = "darkblue", border = "black")
   ```

If adding additional layers to the plot, data must be projected to EPSG:3857 with `sf::st_transform(x, 3857)` prior to adding to the plot.

Value

data.frame plot data is returned invisibly in NAD83 Lat/Lon.

Examples

```r
options("rgdal_show_exportToProj4_warnings"="none")  # Beware plot_nhdplus caches data to the default location.
# If you do not want data in "user space" change the default.
old_dir <- nhdplusTools::nhdplusTools_data_dir()
nhdplusTools_data_dir(tempdir())

plot_nhdplus("05428500")

plot_nhdplus("05428500", streamorder = 2)

plot_nhdplus(list(13293970, 13293750))

source(system.file("extdata/sample_data.R", package = "nhdplusTools"))

plot_nhdplus(list(13293970, 13293750), streamorder = 3, nhdplus_data = sample_data)

plot_nhdplus(list(list("comid", "13293970"),
                 list("nwissite", "USGS-05428500"),
                 list("huc12pp", "070900020603"),
                 list("huc12pp", "070900020602")),
             streamorder = 2,
             nhdplus_data = sample_data)
```
prepare_nhdplus(nhdplus_data = sample_data)

plot_nhdplus(sf::st_as_sf(data.frame(x = -89.36083, y = 43.08944),
    coords = c("x", "y"), crs = 4326),
    streamorder = 2,
    nhdplus_data = sample_data)

plot_nhdplus(list(list("comid", "13293970"),
    list("nwissite", "USGS-05428500"),
    list("huc12pp", "070900020603"),
    list("huc12pp", "070900020602")),
    streamorder = 2,
    nhdplus_data = sample_data,
    plot_config = list(basin = list(lwd = 2),
        outlets = list(huc12pp = list(cex = 1.5),
            comid = list(col = "green")))
)

bbox <- sf::st_bbox(c(xmin = -89.43, ymin = 43, xmax = -89.28, ymax = 43.1),
    crs = "+proj=longlat +datum=WGS84 +no_defs")

fline <- sf::read_sf(sample_data, "NHDFlowline_Network")
comids <- nhdplusTools::get_UT(fline, 13293970)

plot_nhdplus(comids)

#' # With Local Data
plot_nhdplus(bbox = bbox, nhdplus_data = sample_data)

# With downloaded data
plot_nhdplus(bbox = bbox, streamorder = 3)

# Can also plot on top of the previous!
plot_nhdplus(bbox = bbox, nhdplus_data = sample_data,
    plot_config = list(flowline = list(lwd = 0.5)))
plot_nhdplus(comids, nhdplus_data = sample_data, streamorder = 3, add = TRUE,
    plot_config = list(flowline = list(col = "darkblue")))

nhdplusTools::nhdplusTools_data_dir(old_dir)

**prepare_nhdplus Prep NHDPlus Data**

**Description**

Function to prep NHDPlus data for use by nhdplusTools functions
prepare_nhdplus

Usage

prepare_nhdplus(
  flines,
  min_network_size = 0,
  min_path_length = 0,
  min_path_size = 0,
  purge_non_dendritic = TRUE,
  warn = TRUE,
  error = TRUE,
  skip_toCOMID = FALSE,
  align_names = TRUE
)

Arguments

  data.frame NHDPlus flowlines including: COMID, LENGTHKM, FTYPE (or FCODE), TerminalFl, FromNode, ToNode, TotDASqKM, StartFlag, StreamOrde, StreamCalc, TerminalPa, Pathlength, and Divergence variables.

  numeric Minimum size (sqkm) of drainage network to include in output.

  numeric Minimum length (km) of terminal level path of a network.

  numeric Minimum size (sqkm) of outlet level path of a drainage basin. Drainage basins with an outlet drainage area smaller than this will be removed.

  logical Should non dendritic paths be removed or not.

  logical controls whether warning an status messages are printed

  logical controls whether to return potentially invalid data with a warning rather than an error

  logical if TRUE, toCOMID will not be added to output.

  logical

Value

  data.frame ready to be used with the refactor_flowlines function.

Examples

source(system.file("extdata", "sample_flines.R", package = "nhdplusTools"))

prepare_nhdplus(sample_flines,
  min_network_size = 10,
  min_path_length = 1,
  warn = FALSE)
rescale_catchment_characteristics

Rescale Catchment Characteristics

Description

Given catchment characteristics to retrieve or process will aggregate and/or split the characteristics according to a lookup table.

Usage

rescale_catchment_characteristics(
  vars,
  lookup_table,
  refactored_areas = NULL,
  catchment_characteristics = NULL,
  catchment_areas = NULL
)

Arguments

vars data.frame containing ‘characteristic_id’ retrieved from get_characteristics_metadata and ‘summary_statistic’ indicating which summary statistic should be applied to rescale each characteristic. Accepted values are "sum," "length_weighted_mean," "area_weighted_mean," "min," and "max."

lookup_table data.frame containing ‘id’ numeric vector of identifiers at the desired scale; "comid" is a numeric vector of NHDPlusV2 identifiers; "member_comid" contains formatted NHDPlusV2 COMIDs indicating that the catchments in question need to be split. If catchments have not been split, the columns "comid" and "member_comid" should be identical.

refactored_areas data.frame containing columns "featureid" and "areasqkm." Used to retrieve adjusted catchment areas in the case of split catchments. If not provided, either no split catchments can be considered or the ‘catchment_areas’ parameter is required.

catchment_characteristics data.frame containing columns "characteristic_id", "comid", "characteristic_value", and "percent_nodata". If not provided, it will be retrieved from get_catchment_characteristics using the characteristic ids from ‘vars’ and the comids from ‘lookup_table’.

catchment_areas data.frame containing columns "comid", "areasqkm", "split_catchment_areasqkm", and "split_area_prop". If not provided, it will be retrieved from ‘refactored_areas’ and/or get_vaa.
Details

NOTE: Since this algorithm works on catchment characteristics that are spatial averages, when splitting, the average condition is apportioned evenly to each split. In some cases, such as with land cover or elevation, this may not be appropriate and source data should be used to derive new characteristics. In addition, this function handles catchment areas for split catchments but makes no adjustments for the length of flowlines in those catchments. Therefore, requests for length-weighted mean values may not be appropriate when working with split catchments.

Examples

```r
vars <- data.frame(characteristic_id = c("CAT_IMPV11", "CAT_BASIN_AREA"),
                    summary_statistic = c("area_weighted_mean", "sum"))
lookup_table <- data.frame(id = rep(10012268, 2),
                           comid = c(4146596, 4147382),
                           member_comid = c(4146596, 4147382))
rescale_catchment_characteristics(vars, lookup_table)

vars <- data.frame(characteristic_id = c("CAT_ELEV_MIN", "CAT_ELEV_MAX"),
                    summary_statistic = c("min", "max"))
lookup_table <- data.frame(id = rep(10012268, 2),
                           comid = c(4146596, 4147382),
                           member_comid = c(4146596, 4147382))
rescale_catchment_characteristics(vars, lookup_table)

vars <- data.frame(characteristic_id = c("CAT_EWT", "CAT_TW1", "CAT_BASIN_AREA"),
                    summary_statistic = c("area_weighted_mean", "area_weighted_mean", "sum"))
lookup_table <- data.frame(id = c(10012268, 10012268, 10024047, 10024048),
                           comid = c(4146596, 4147382, 4147396, 4147396),
                           member_comid = c("4146596", "4147382", "4147396.1", "4147396.2"))
comid_areas <- data.frame(featureid = c("4146596", "4147382", "4147396.1", "4147396.2"),
                          areasqkm = c(0.9558, 11.9790, 6.513294, 1.439999))
rescale_catchment_characteristics(vars, lookup_table, refactored_areas = comid_areas)
```

rpu_boundaries

**RPU Boundaries Raster Processing Unit boundaries**

**Description**

RPU Boundaries Raster Processing Unit boundaries

**Usage**

rpu_boundaries
Format

An object of class "sf"

---

**subset_nhdplus**  
*Subset NHDPlus*

Description

Saves a subset of the National Seamless database or other nhdplusTools compatible data based on a specified collection of COMIDs. This function uses `get_nhdplus` for the "download" data source but returns data consistent with local data subsets in a subset file.

Usage

```r
subset_nhdplus(
  comids = NULL,
  output_file = NULL,
  nhdplus_data = NULL,
  bbox = NULL,
  simplified = TRUE,
  overwrite = FALSE,
  return_data = TRUE,
  status = TRUE,
  flowline_only = NULL,
  streamorder = NULL,
  out_prj = 4269
)
```

Arguments

- **comids** integer vector of COMIDs to include.
- **output_file** character path to save the output to defaults to the directory of the nhdplus_data.
- **nhdplus_data** character path to the .gpkg or .gdb containing the national seamless database, a subset of NHDPlusHR, or "download" to use a web service to download NHD-PlusV2.1 data. Not required if `nhdplus_path` has been set or the default has been adopted. See details for more.
- **bbox** object of class "bbox" as returned by sf::st_bbox in Latitude/Longitude. If no CRS is present, will be assumed to be in WGS84 Latitude Longitude.
- **simplified** boolean if TRUE (the default) the CatchmentSP layer will be included. Not relevant to the "download" option or NHDPlusHR data.
- **overwrite** boolean should the output file be overwritten
- **return_data** boolean if FALSE path to output file is returned silently otherwise data is returned in a list.
- **status** boolean should the function print status messages
subset_nhdplus

flowline_only

boolean WARNING: experimental if TRUE only the flowline network and attributes will be returned

streamorder

integer only streams of order greater than or equal will be downloaded. Not implemented for local data.

out_prj

character override the default output CRS of NAD83 lat/ion (EPSG:4269)

Details

This function relies on the National Seamless Geodatabase or Geopackage. It can be downloaded here.

The "download" option of this function should be considered preliminary and subject to revision. It does not include as many layers and may not be available permanently.

Value

character path to the saved subset geopackage

Examples

source(system.file("extdata/sample_data.R", package = "nhdplusTools"))

nhdplus_path(sample_data)

sample_flines <- sf::st_zm(sf::read_sf(nhdplus_path(), "NHDFlowline_Network"))

---

**subset_rpu**  
*Subset by Raster Processing Unit*

**Description**

Given flowlines and an rpu_code, performs a network-safe subset such that the result can be used in downstream processing. Has been tested to work against the entire NHDPlusV2 domain and satisfies a number of edge cases.
subset_vpu

Usage
subset_rpu(fline, rpu, run_make_standalone = TRUE, strict = FALSE)

Arguments
fline sf data.frame NHD Flowlines with comid, pathlength, lengthkm, hydroseq, levelpathi, rpuid, and arbolatesu (dnhydroseq is required if tocomid is not provided).
rpu character e.g. "01a"
run_make_standalone logical default TRUE should the run_make_standalone function be run on result?
strict logical if TRUE, paths that extend outside the RPU but have no tributaries in the upstream RPU will be included in the output.

Value
data.frame containing subset network

Examples
source(system.file("extdata/sample_data.R", package = "nhdplusTools"))
sample_flines <- sf::read_sf(sample_data, "NHDFlowline_Network")
subset_rpu(sample_flines, rpu = "07b")

subset_vpu

Subset by Vector Processing Unit

Description
Calls subset_rpu for all raster processing units for the requested vector processing unit.

Usage
subset_vpu(fline, vpu, include_null_rpuid = TRUE, run_make_standalone = TRUE)

Arguments
fline sf data.frame NHD Flowlines with comid, pathlength, lengthkm, hydroseq, levelpathi, rpuid, vpuid, and arbolatesu (dnhydroseq is required if tocomid is not provided).
vpu character e.g. "01"
include_null_rpuid
   logical default TRUE. Note that there are some flowlines that may have a NULL
   rpuid but be included in the vector processing unit.
run_make_standalone
   logical default TRUE should the run_make_standalone function be run on re-
   sult?

Value
   data.frame containing subset network

Examples

   source(system.file("extdata/sample_data.R", package = "nhdplusTools"))
   sample_flines <- sf::read_sf(sample_data, "NHDFlowline_Network")
   subset_vpu(sample_flines, "07")

vpu_boundaries

VPU Boundaries Vector Processing Unit boundaries

Description

   VPU Boundaries Vector Processing Unit boundaries

Usage

   vpu_boundaries

Format

   An object of class "sf"
