Package ‘noctua’

February 16, 2020

Type Package

Title Connect to 'AWS Athena' using R 'AWS SDK' 'paws' ('DBI' Interface)

Version 1.5.1

Description Designed to be compatible with the 'R' package 'DBI' (Database Interface) when connecting to Amazon Web Service ('AWS') Athena <https://aws.amazon.com/athena/>. To do this the 'R' 'AWS' Software Development Kit ('SDK') 'paws' <https://github.com/paws-r/paws> is used as a driver.

Imports data.table (>= 1.12.4), DBI (>= 0.7), methods, paws (>= 0.1.5), stats, utils

Suggests arrow, bit64, dplyr (>= 0.7.0), dbplyr, readr, testthat, vroom (>= 1.2.0)

Depends R (>= 3.2.0)

License MIT + file LICENSE

Encoding UTF-8

LazyData true

RoxygenNote 7.0.2

noctua-package  noctua: a DBI interface into Athena using paws SDK

**Description**

noctua provides a seamless DBI interface into Athena using the python package paws.
Goal of Package

The goal of the `noctua` package is to provide a DBI-compliant interface to Amazon’s Athena using `paws` software development kit (SDK). This allows for an efficient, easy setup connection to Athena using the `paws` SDK as a driver.

AWS Command Line Interface

As noctua is using `paws` as it’s backend, AWS Command Line Interface (AWS CLI) can be used to remove user credentials when interacting with Athena.

This allows AWS profile names to be set up so that noctua can connect to different accounts from the same machine, without needing hard code any credentials.

---

### assume_role

**Assume AWS ARN Role**

**Description**

Returns a set of temporary security credentials that you can use to access AWS resources that you might not normally have access to (link). These temporary credentials consist of an access key ID, a secret access key, and a security token. Typically, you use AssumeRole within your account or for cross-account access.

**Usage**

```r
assume_role(
  profile_name = NULL,
  region_name = NULL,
  role_arn = NULL,
  role_session_name = sprintf("paws-athena-session-%s", as.integer(Sys.time())),
  duration_seconds = 3600L,
  set_env = FALSE
)
```
Arguments

**profile_name**  The name of a profile to use. If not given, then the default profile is used. To set profile name, the AWS Command Line Interface (AWS CLI) will need to be configured. To configure AWS CLI please refer to: Configuring the AWS CLI.

**region_name**  Default region when creating new connections. Please refer to link for AWS region codes (region code example: Region = EU (Ireland) region_name = "eu-west-1")

**role_arn**  The Amazon Resource Name (ARN) of the role to assume (such as `arn:aws:sts::123456789012:assumed-role/role_name/role_session_name`)

**role_session_name**  An identifier for the assumed role session. By default 'noctua' creates a session name `sprintf("noctua-session-%s",as.integer(Sys.time()))`

**duration_seconds**  The duration, in seconds, of the role session. The value can range from 900 seconds (15 minutes) up to the maximum session duration setting for the role. This setting can have a value from 1 hour to 12 hours. By default duration is set to 3600 seconds (1 hour).

**set_env**  If set to TRUE environmental variables AWS_ACCESS_KEY_ID, AWS_SECRET_ACCESS_KEY and AWS_SESSION_TOKEN will be set.

Value

`assume_role()` returns a list containing: "AccessKeyId", "SecretAccessKey", "SessionToken" and "Expiration"

See Also

`dbConnect`

Examples

```r
## Not run:
# Note:
# - Require AWS Account to run below example.
library(noctua)
library(DBI)

# Assuming demo ARN role
assume_role(profile_name = "YOUR_PROFILE_NAME",
role_arn = "arn:aws:sts::123456789012:assumed-role/role_name/role_session_name",
set_env = TRUE)

# Connect to Athena using ARN Role
con <- dbConnect(noctua::athena())

## End(Not run)
```
**Athena Driver**

**Description**

Driver for an Athena paws connection.

**Usage**

```r
athena()
```

**Value**

`athena()` returns a s4 class. This class is used active Athena method for `dbConnect`.

**See Also**

`dbConnect`

---

**AthenaWriteTables**

**Description**

Convenience functions for reading/writing DBMS tables.

**Usage**

```r
## S4 method for signature 'AthenaConnection,character,data.frame'
dbWriteTable(
    conn,
    name,
    value,
    overwrite = FALSE,
    append = FALSE,
    row.names = NA,
    field.types = NULL,
    partition = NULL,
    s3.location = NULL,
    file.type = c("tsv", "csv", "parquet"),
    compress = FALSE,
    max.batch = Inf,
    ...
)
## S4 method for signature 'AthenaConnection,Id,data.frame'
```
AthenaWriteTables

```
dbWriteTable(
  conn,
  name,
  value,
  overwrite = FALSE,
  append = FALSE,
  row.names = NA,
  field.types = NULL,
  partition = NULL,
  s3.location = NULL,
  file.type = c("tsv", "csv", "parquet"),
  compress = FALSE,
  max.batch = Inf,
  ...
)
```

## S4 method for signature 'AthenaConnection,SQL,data.frame'
```
dbWriteTable(
  conn,
  name,
  value,
  overwrite = FALSE,
  append = FALSE,
  row.names = NA,
  field.types = NULL,
  partition = NULL,
  s3.location = NULL,
  file.type = c("tsv", "csv", "parquet"),
  compress = FALSE,
  max.batch = Inf,
  ...
)
```

Arguments

- **conn**: An `AthenaConnection` object, produced by `[DBI::dbConnect()]`
- **name**: A character string specifying a table name. Names will be automatically quoted so you can use any sequence of characters, not just any valid bare table name.
- **value**: A data.frame to write to the database.
- **overwrite**: Allows overwriting the destination table. Cannot be `TRUE` if `append` is also `TRUE`.
- **append**: Allow appending to the destination table. Cannot be `TRUE` if `overwrite` is also `TRUE`. Existing Athena DDL file type will be retained and used when uploading data to AWS Athena. If parameter `file.type` doesn't match AWS Athena DDL file type a warning message will be created notifying user and `noctua` will use the file type for the Athena DDL.
- **row.names**: Either `TRUE`, `FALSE`, `NA` or a string.
If TRUE, always translate row names to a column called "row_names". If FALSE, never translate row names. If NA, translate rownames only if they’re a character vector.

A string is equivalent to TRUE, but allows you to override the default name.

For backward compatibility, NULL is equivalent to FALSE.

field.types Additional field types used to override derived types.

partition Partition Athena table (needs to be a named list or vector) for example: c(var1 = "2019-20-13")

s3.location s3 bucket to store Athena table, must be set as a s3 uri for example ('s3://mybucket/data/'). By default s3.location is set s3 staging directory from AthenaConnection object.

file.type What file type to store data.frame on s3, noctua currently supports ["tsv", "csv", "parquet"]). Default delimited file type is "tsv", in previous versions of noctua (<= 1.4.0) file type "csv" was used as default. The reason for the change is that columns containing Array/JSON format cannot be written to Athena due to the separating value ",". This would cause issues with AWS Athena. **Note:** "parquet" format is supported by the arrow package and it will need to be installed to utilise the "parquet" format.

compress FALSE | TRUE To determine if to compress file.type. If file type is ["csv", "tsv"] then "gzip" compression is used., for file type "parquet" “snappy” compression is used.

max.batch Split the data frame by max number of rows i.e. 100,000 so that multiple files can be uploaded into AWS S3. By default when compression is set to TRUE and file.type is "csv" or "tsv" max.batch will split data.frame into 20 batches. This is to help the performance of AWS Athena when working with files compressed in "gzip" format. max.batch will not split the data.frame when loading file in parquet format. For more information please go to link

Other arguments used by individual methods.

Value

dbWriteTable() returns TRUE, invisibly. If the table exists, and both append and overwrite arguments are unset, or append = TRUE and the data frame with the new data has different column names, an error is raised; the remote table remains unchanged.

See Also
dbWriteTable

Examples

## Not run:
# Note:
# - Require AWS Account to run below example.
# - Different connection methods can be used please see `noctua::dbConnect` documentation

library(DBI)
# Demo connection to Athena using profile name
con <- dbConnect(noctua::athena())

# List existing tables in Athena
dbListTables(con)

# Write data.frame to Athena table
dbWriteTable(con, "mtcars", mtcars,
partition=c("TIMESTAMP" = format(Sys.Date(), "%Y%m%d")),
s3.location = "s3://mybucket/data/"
)

# Read entire table from Athena
dbReadTable(con, "mtcars")

# List all tables in Athena after uploading new table to Athena
dbListTables(con)

# Checking if uploaded table exists in Athena
dbExistsTable(con, "mtcars")

# using default s3.location
dbWriteTable(con, "iris", iris)

# Read entire table from Athena
dbReadTable(con, "iris")

# List all tables in Athena after uploading new table to Athena
dbListTables(con)

# Checking if uploaded table exists in Athena
dbExistsTable(con, "iris")

# Disconnect from Athena
dbDisconnect(con)

## End(Not run)

---

**backend_dbplyr**  
Athena S3 implementation of dbplyr backend functions

---

**Description**

These functions are used to build the different types of SQL queries. The AWS Athena implementation give extra parameters to allow access the to standard DBI Athena methods. They also utilise AWS Glue to speed up sql query execution.

**Usage**

```
db_save_query.AthenaConnection(
```
dbClearResult

```r
con,
sql,
name,
file_type = c("NULL", "csv", "parquet", "json"),
s3_location = NULL,
partition = NULL,
...
)

db_explain.AthenaConnection(con, sql, ...)

db_query_fields.AthenaConnection(con, sql, ...)
```

**Arguments**

- `con`: A `dbConnect` object, as returned by `dbConnect()`
- `sql`: SQL code to be sent to AWS Athena
- `name`: Table name if left default noctua will use default from `dplyr`’s compute function.
- `file_type`: What file type to store data.frame on s3, noctua currently supports ["NULL","csv", "parquet", "json"]). "NULL" will let Athena set the file_type for you.
- `s3_location`: s3 bucket to store Athena table, must be set as a s3 uri for example ("s3://mybucket/data/")
- `partition`: Partition Athena table, requires to be a partitioned variable from previous table.
- `...`: other parameters, currently not implemented

**Value**

- `db_save_query`: Returns table name
- `db_explain`: Raises an error as AWS Athena does not support EXPLAIN queries
- `db_query_fields`: Returns sql query column names

---

**dbClearResult**

**Clear Results**

**Description**

Frees all resources (local and Athena) associated with result set. It does this by removing query output in AWS S3 Bucket, stopping query execution if still running and removed the connection resource locally.

**Usage**

```r
## S4 method for signature 'AthenaResult'
dbClearResult(res, ...)
```
Arguments

res  

An object inheriting from DBIResult.

...  

Other arguments passed on to methods.

Value

dbClearResult() returns TRUE, invisibly.

See Also

dbIsValid

dbIsValid

Examples

# Note:
# - Require AWS Account to run below example.
# - Different connection methods can be used please see 'noctua::dbConnect' documentation

library(DBI)

# Demo connection to Athena using profile name
con <- dbConnect(noctua::athena())

res <- dbSendQuery(con, "show databases")
dbClearResult(res)

# Check if connection if valid after closing connection
dbDisconnect(con)

---

### dbColumnInfo

Information about result types

Description

Produces a data.frame that describes the output of a query.

Usage

```r
## S4 method for signature 'AthenaResult'
dbColumnInfo(res, ...)
```

Arguments

res  

An object inheriting from DBIResult.

...  

Other arguments passed on to methods.
**Value**

dbColumnInfo() returns a data.frame with as many rows as there are output fields in the result. The data.frame has two columns (field_name, type).

**See Also**

dbHasCompleted

**Examples**

```r
# Note:
# - Require AWS Account to run below example.
# - Different connection methods can be used please see `R Athena::dbConnect` documentation
library(DBI)

# Demo connection to Athena using profile name
con <- dbConnect(noctua::athena())

# Get Column information from query
res <- dbSendQuery(con, "select * from information_schema.tables")
dbColumnInfo(res)
dbClearResult(res)

# Disconnect from Athena
dbDisconnect(con)
```

---

**dbConnect,AthenaDriver-method**

*Connect to Athena using R's sdk paws*

**Description**

It is never advised to hard-code credentials when making a connection to Athena (even though the option is there). Instead it is advised to use profile_name (set up by AWS Command Line Interface), Amazon Resource Name roles or environmental variables. Here is a list of supported environment variables:

- **AWS_ACCESS_KEY_ID**: is equivalent to the dbConnect parameter - aws_access_key_id
- **AWS_SECRET_ACCESS_KEY**: is equivalent to the dbConnect parameter - aws_secret_access_key
- **AWS_SESSION_TOKEN**: is equivalent to the dbConnect parameter - aws_session_token
- **AWS_ROLE_ARN**: is equivalent to the dbConnect parameter - role_arn
- **AWS_EXPIRATION**: is equivalent to the dbConnect parameter - duration_seconds
- **AWS_Athena_S3_Staging_DIR**: is equivalent to the dbConnect parameter - s3_staging_dir
- **AWS_Athena_Work_Group**: is equivalent to dbConnect parameter - work_group
Usage

```r
## S4 method for signature 'AthenaDriver'
dbConnect(
  drv,
  aws_access_key_id = NULL,
  aws_secret_access_key = NULL,
  aws_session_token = NULL,
  schema_name = "default",
  work_group = NULL,
  poll_interval = NULL,
  encryption_option = c("NULL", "SSE_S3", "SSE_KMS", "CSE_KMS"),
  kms_key = NULL,
  profile_name = NULL,
  role_arn = NULL,
  role_session_name = sprintf("noctua-session-%s", as.integer(Sys.time())),
  duration_seconds = 3600L,
  s3_staging_dir = NULL,
  region_name = NULL,
  ...
)
```

Arguments

- **drv**: an object that inherits from `DBIDriver`, or an existing `DBIConnection` object (in order to clone an existing connection).
- **aws_access_key_id**: AWS access key ID
- **aws_secret_access_key**: AWS secret access key
- **aws_session_token**: AWS temporary session token
- **schema_name**: The schema_name to which the connection belongs
- **work_group**: The name of the work group to run Athena queries. Currently defaulted to `NULL`.
- **poll_interval**: Amount of time took when checking query execution status. Default set to a random interval between 0.5 - 1 seconds.
- **encryption_option**: Athena encryption at rest link. Supported Amazon S3 Encryption Options ["NULL", "SSE_S3", "SSE_KMS", "CSE_KMS"]. Connection will default to NULL, usually changing this option is not required.
- **kms_key**: AWS Key Management Service, please refer to link for more information around the concept.
- **profile_name**: The name of a profile to use. If not given, then the default profile is used. To set profile name, the AWS Command Line Interface (AWS CLI) will need to be configured. To configure AWS CLI please refer to: Configuring the AWS CLI.
- **role_arn**: The Amazon Resource Name (ARN) of the role to assume (such as `arn:aws:sts::123456789012:assumed-role/role_name/role_session_name`
dbConnect,AthenaDriver-method

role_session_name
An identifier for the assumed role session. By default 'RAthena' creates a session name sprintf("RAthena-session-%s",as.integer(Sys.time()))

duration_seconds
The duration, in seconds, of the role session. The value can range from 900 seconds (15 minutes) up to the maximum session duration setting for the role. This setting can have a value from 1 hour to 12 hours. By default duration is set to 3600 seconds (1 hour).

s3_staging_dir
The location in Amazon S3 where your query results are stored, such as s3://path/to/query/bucket/

region_name
Default region when creating new connections. Please refer to link for AWS region codes (region code example: Region = EU (Ireland) region_name = "eu-west-1")

... other parameters for paws session

Value
dbConnect() returns a s4 class. This object is used to communicate with AWS Athena.

See Also
dbConnect

Examples
## Not run:
# Connect to Athena using your aws access keys
library(DBI)
con <- dbConnect(RAthena:athena(),
aws_access_key_id='YOUR_ACCESS_KEY_ID', #
aws_secret_access_key='YOUR_SECRET_ACCESS_KEY',
s3_staging_dir='s3://path/to/query/bucket/',
region_name='us-west-2')
dbDisconnect(con)

# Connect to Athena using your profile name
# Profile name can be created by using AWS CLI
con <- dbConnect(RAthena::athena(),
profile_name = "YOUR_PROFILE_NAME",
s3_staging_dir = 's3://path/to/query/bucket/')
dbDisconnect(con)

# Connect to Athena using ARN role
con <- dbConnect(athena(),
profile_name = "YOUR_PROFILE_NAME",
role_arn = "arn:aws:sts::123456789012:assumed-role/role_name/role_session_name",
s3_staging_dir = 's3://path/to/query/bucket/')
dbDisconnect(con)

## End(Not run)
Description

Returns a character string that describes the Athena SQL data type for the `obj` object.

Usage

```r
## S4 method for signature 'AthenaDriver,ANY'
dbDataType(dbObj, obj, ...)

## S4 method for signature 'AthenaDriver,list'
dbDataType(dbObj, obj, ...)

## S4 method for signature 'AthenaConnection,ANY'
dbDataType(dbObj, obj, ...)

## S4 method for signature 'AthenaConnection,data.frame'
dbDataType(dbObj, obj, ...)
```

Arguments

- `dbObj` A object inheriting from `DBIDriver` or `DBIConnection`
- `obj` An R object whose SQL type we want to determine.
- `...` Other arguments passed on to methods.

Value

`dbDataType` returns the Athena type that correspond to the obj argument as an non-empty character string.

See Also

- `dbDataType`

Examples

```r
library(noctua)
dbDataType(athena(), 1:5)
dbDataType(athena(), 1)
dbDataType(athena(), TRUE)
dbDataType(athena(), Sys.Date())
dbDataType(athena(), Sys.time())
dbDataType(athena(), c("x", "abc"))
dbDataType(athena(), list(raw(10), raw(20)))
```
vapply(iris, function(x) dbDataType(noctua::athena(), x),
   FUN.VALUE = character(1), USE.NAMES = TRUE)

# Note:
# - Require AWS Account to run below example.
# - Different connection methods can be used please see `noctua::dbConnect` documentation
library(DBI)

# Demo connection to Athena using profile name
con <- dbConnect(noctua::athena())

# Sending Queries to Athena
dbDataType(con, iris)

# Disconnect connection
dbDisconnect(con)

dbDisconnect  | Disconnect (close) an Athena connection

Description
This closes the connection to Athena.

Usage

## S4 method for signature 'AthenaConnection'
dbDisconnect(conn, ...)

Arguments

  conn  | A DBIConnection object, as returned by dbConnect().
     ... | Other parameters passed on to methods.

Value

dbDisconnect() returns TRUE, invisibly.

See Also
dbDisconnect
Examples

# Note:
# - Require AWS Account to run below example.
# - Different connection methods can be used please see `noctua::dbConnect` documentation

library(DBI)

# Demo connection to Athena using profile name
con <- dbConnect(noctua::athena())

# Disconnect connection
dbDisconnect(con)

---

dbExistsTable

### Description

Returns logical scalar if the table exists or not. TRUE if the table exists, FALSE otherwise.

### Usage

```r
## S4 method for signature 'AthenaConnection,character'
dbExistsTable(conn, name, ...)
```

### Arguments

- `conn` A `DBIConnection` object, as returned by `dbConnect()`.
- `name` A character string specifying a DBMS table name.
- `...` Other parameters passed on to methods.

### Value

dbExistsTable() returns logical scalar. TRUE if the table exists, FALSE otherwise.

### See Also

dbExistsTable

### Examples

```r
## Not run:
# Note:
# - Require AWS Account to run below example.
# - Different connection methods can be used please see `noctua::dbConnect` documentation
```
library(DBI)

# Demo connection to Athena using profile name
con <- dbConnect(noctua::athena())

# Write data.frame to Athena table
dbWriteTable(con, "mtcars", mtcars,
  partition=c("TIMESTAMP" = format(Sys.Date(), "%Y%m%d")),
  s3.location = "s3://mybucket/data/"
)

# Check if table exists from Athena
dbExistsTable(con, "mtcars")

# Disconnect connection
dbDisconnect(con)

## End(Not run)

dbFetch

Fetch records from previously executed query

Description

Currently returns the top n elements (rows) from result set or returns entire table from Athena.

Usage

## S4 method for signature 'AthenaResult'
dbFetch(res, n = -1, ...)  

Arguments

res An object inheriting from DBIResult, created by dbSendQuery().
n maximum number of records to retrieve per fetch. Use n = -1 or n = Inf to retrieve all pending records. Some implementations may recognize other special values. Currently chunk sizes range from 0 to 999, if entire dataframe is required use n = -1 or n = Inf.

... Other arguments passed on to methods.

Value

dbFetch() returns a data frame.

See Also

dbFetch
Examples

# Note:
# - Require AWS Account to run below example.
# - Different connection methods can be used please see 'noctua::dbConnect' documentation

library(DBI)

# Demo connection to Athena using profile name
con <- dbConnect(noctua::athena())

res <- dbSendQuery(con, "show databases")
dbFetch(res)
dbClearResult(res)

# Disconnect from Athena
dbDisconnect(con)

dbGetInfo

---

## Description

Get DBMS metadata

## Usage

```r
## S4 method for signature 'AthenaConnection'
dbGetInfo(dbObj, ...)

## S4 method for signature 'AthenaResult'
dbGetInfo(dbObj, ...)
```

## Arguments

- `dbObj` An object inheriting from `DBIObject`, i.e. `DBIDriver`, `DBIConnection`, or a `DBIResult`
- `...` Other arguments to methods.

## Value

A named list

## See Also

`dbGetInfo`
dbGetPartition

Examples

# Note:
# - Require AWS Account to run below example.
# - Different connection methods can be used please see 'noctua::dbConnect' documentation

library(DBI)

# Demo connection to Athena using profile name
con <- dbConnect(noctua::athena())

# Returns metadata from connection object
metadata <- dbGetInfo(con)

# Return metadata from Athena query object
res <- dbSendQuery(con, "show databases")
dbGetInfo(res)

# Clear result
dbClearResult(res)

# disconnect from Athena
dbDisconnect(con)

---

dbGetPartition  Athena table partitions

Description

This method returns all partitions from Athena table.

Usage

dbGetPartition(conn, name, ...)

## S4 method for signature 'AthenaConnection'
dbGetPartition(conn, name, ...)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conn</td>
<td>A DBIConnection object, as returned by dbConnect().</td>
</tr>
<tr>
<td>name</td>
<td>A character string specifying a DBMS table name.</td>
</tr>
<tr>
<td>...</td>
<td>Other parameters passed on to methods.</td>
</tr>
</tbody>
</table>

Value

data.frame that returns all partitions in table, if no partitions in Athena table then function will return error from Athena.
Examples

```r
# Not run:

# Note:
# - Require AWS Account to run below example.
# - Different connection methods can be used please see `noctua::dbConnect` documentation

library(DBI)

# Demo connection to Athena using profile name
c <- dbConnect(noctua::athena())

# write iris table to Athena
dbWriteTable(c, "iris",
iris,
  partition = c("timestamp" = format(Sys.Date(), "%Y%m%d")),
s3.location = "s3://path/to/store/athena/table/"
)

# return table partitions
noctua::dbGetPartition(c, "iris")

# disconnect from Athena
dbDisconnect(c)

## End(Not run)
```

---

dbGetQuery  

*Send query, retrieve results and then clear result set*

Description

Send query, retrieve results and then clear result set

Usage

```r
## S4 method for signature 'AthenaConnection,character'
dbGetQuery(conn, statement = NULL, statistics = FALSE, ...)
```

Arguments

- `conn` A `DBIConnection` object, as returned by `dbConnect()`.
- `statement` a character string containing SQL.
- `statistics` If set to `TRUE` will print out AWS Athena statistics of query.
- `...` Other parameters passed on to methods.

Value

dbGetQuery() returns a dataframe.
\texttt{dbGetTables} \hfill 21

\textbf{See Also}

\texttt{dbGetQuery}

\textbf{Examples}

\begin{verbatim}
# Note:
# - Require AWS Account to run below example.
# - Different connection methods can be used please see \`noctua::dbConnect\' documentation

library(DBI)

# Demo connection to Athena using profile name
con <- dbConnect(noctua::athena())

# Sending Queries to Athena
dbGetQuery(con, "show databases")

# Disconnect connection
dbDisconnect(con)
\end{verbatim}

\textbf{dbGetTables} \hspace{1.5cm} \textit{List Athena Schema, Tables and Table Types}

\textbf{Description}

Method to get Athena schema, tables and table types return as a data.frame

\textbf{Usage}

\begin{verbatim}
dbGetTables(conn, ...)
\end{verbatim}

\begin{verbatim}
## S4 method for signature 'AthenaConnection'
dbGetTables(conn, schema = NULL, ...)
\end{verbatim}

\textbf{Arguments}

\begin{itemize}
\item \texttt{conn} \hspace{1cm} A \texttt{DBIConnection} object, as returned by \texttt{dbConnect()}.  
\item \texttt{...} \hspace{1cm} Other parameters passed on to methods.  
\item \texttt{schema} \hspace{1cm} Athena schema, default set to NULL to return all tables from all Athena schemas. Note: The use of \texttt{DATABASE} and \texttt{SCHEMA} is interchangeable within Athena.
\end{itemize}

\textbf{Value}

\texttt{dbGetTables()} returns a data.frame.
Examples

```r
## Not run:
# Note:
# - Require AWS Account to run below example.
# - Different connection methods can be used please see 'noctua::dbConnect' documentation

library(DBI)
library(noctua)

# Demo connection to Athena using profile name
con <- dbConnect(noctua::athena())

# Return hierarchy of tables in Athena
dbGetTables(con)

# Disconnect connection
dbDisconnect(con)

## End(Not run)
```

---

### dbHasCompleted

**Completion status**

This method returns if the query has completed.

#### Usage

```r
## S4 method for signature 'AthenaResult'
dbHasCompleted(res, ...)
```

#### Arguments

- `res`: An object inheriting from `DBIResult`.
- `...`: Other arguments passed on to methods.

#### Value

`dbHasCompleted()` returns a logical scalar. TRUE if the query has completed, FALSE otherwise.

#### See Also

`dbHasCompleted`
dbIsValid

Examples

# Note:
# - Require AWS Account to run below example.
# - Different connection methods can be used please see `noctua::dbConnect` documentation

library(DBI)

# Demo connection to Athena using profile name
con <- dbConnect(noctua::athena())

# Check if query has completed
res <- dbSendQuery(con, "show databases")
dbHasCompleted(res)

dbClearResult(res)

# Disconnect from Athena
dbDisconnect(con)

dbIsValid

Is this DBMS object still valid?

Description

This method tests whether the dbObj is still valid.

Usage

## S4 method for signature 'AthenaConnection'
dbIsValid(dbObj, ...)

## S4 method for signature 'AthenaResult'
dbIsValid(dbObj, ...)

Arguments

dbObj An object inheriting from DBIObject, i.e. DBIDriver, DBIConnection, or a DBIResult

... Other arguments to methods.

Value

dbIsValid() returns logical scalar, TRUE if the object (dbObj) is valid, FALSE otherwise.

See Also

dbIsValid
### Examples

```
# Note:
# - Require AWS Account to run below example.
# - Different connection methods can be used please see `noctua::dbConnect` documentation

library(DBI)

# Demo connection to Athena using profile name
con <- dbConnect(noctua::athena())

# Check if connection is valid
dbIsValid(con)

# Check if query is valid
res <- dbSendQuery(con, "show databases")
dbIsValid(res)

# Check if query is valid after clearing result
dbClearResult(res)

# Check if connection is valid after closing connection
dbDisconnect(con)

dbIsValid(con)
```

---

| dbListFields | List Field names of Athena table |

### Description

List Field names of Athena table

### Usage

```
## S4 method for signature 'AthenaConnection,character'

dbListFields(conn, name, ...)
```

### Arguments

- **conn** 
  A DBIConnection object, as returned by `dbConnect()`.
- **name** 
  a character string with the name of the remote table.
- **...** 
  Other parameters passed on to methods.

### Value

`dbListFields()` returns a character vector with all the fields from an Athena table.
### dbListTables

**List Athena Tables**

**Description**

Returns the unquoted names of Athena tables accessible through this connection.

**Usage**

```
## S4 method for signature 'AthenaConnection'
dbListTables(conn, schema = NULL, ...)
```

**Arguments**

- **conn**
  - A `DBIConnection` object, as returned by `dbConnect()`.

- **schema**
  - Athena schema, default set to NULL to return all tables from all Athena schemas.
  - Note: The use of DATABASE and SCHEMA is interchangeable within Athena.

- **...**
  - Other parameters passed on to methods.

---

**See Also**

- `dbListFields`

**Examples**

```r
## Not run:
# Note:
# - Require AWS Account to run below example.
# - Different connection methods can be used please see 'noctua::dbConnect' documentation

library(DBI)

# Demo connection to Athena using profile name
con <- dbConnect(noctua::athena())

# Write data.frame to Athena table
dbWriteTable(con, "mtcars", mtcars, 
  partition=c("TIMESTAMP" = format(Sys.Date(), "%Y%m%d")), 
  s3.location = "s3://mybucket/data")

# Return list of fields in table
dbListFields(con, "mtcars")

# Disconnect connection
dbDisconnect(con)

## End(Not run)
```
Value

dbListTables() returns a character vector with all the tables from Athena.

See Also

dbListTables

Examples

```r
## Not run:
# Note:
# - Require AWS Account to run below example.
# - Different connection methods can be used please see 'noctua::dbConnect' documentation

library(DBI)

# Demo connection to Athena using profile name
con <- dbConnect(noctua::athena())

# Return list of tables in Athena
dbListTables(con)

# Disconnect connection
dbDisconnect(con)

## End(Not run)
```

dbQuote

Description

Call this method to generate string that is suitable for use in a query as a column or table name.

Usage

```r
## S4 method for signature 'AthenaConnection,character'
dbQuoteString(conn, x, ...)

## S4 method for signature 'AthenaConnection,SQL'
dbQuoteIdentifier(conn, x, ...)
```

Arguments

- **conn**: A `DBIConnection` object, as returned by `dbConnect()`.
- **x**: A character vector to quote as string.
- **...**: Other arguments passed on to methods.
**dbRemoveTable**

Value

Returns a character object, for more information please check out: `dbQuoteString`, `dbQuoteIdentifier`

See Also

`dbQuoteString`, `dbQuoteIdentifier`

----------

### dbRemoveTable

*Remove table from Athena*

**Description**

Removes Athena table but does not remove the data from Amazon S3 bucket.

**Usage**

```r
## S4 method for signature 'AthenaConnection,character'
dbRemoveTable(conn, name, delete_data = TRUE, confirm = FALSE, ...)
```

**Arguments**

- **conn**: A `DBIConnection` object, as returned by `dbConnect()`.
- **name**: A character string specifying a DBMS table name.
- **delete_data**: Deletes S3 files linking to AWS Athena table
- **confirm**: Allows for S3 files to be deleted without the prompt check. It is recommend to leave this set to `FALSE` to avoid deleting other S3 files when the table’s definition points to the root of S3 bucket.
- **...**: Other parameters passed on to methods.

**Value**

`dbRemoveTable()` returns `TRUE`, invisibly.

See Also

`dbRemoveTable`

**Examples**

```r
## Not run:
# Note:
# - Require AWS Account to run below example.
# - Different connection methods can be used please see `noctua::dbConnect` documentation

library(DBI)

# Demo connection to Athena using profile name
```
con <- dbConnect(noctua::athena())

# Write data.frame to Athena table
dbWriteTable(con, "mtcars", mtcars,
    partition=c("TIMESTAMP" = format(Sys.Date(), "%Y%m%d"),
    s3.location = "s3://mybucket/data/"
)

# Remove Table from Athena
dbRemoveTable(con, "mtcars")

# Disconnect connection
dbDisconnect(con)

## End(Not run)

dbShow

### Show Athena table's DDL

**Description**

Executes a statement to return the data description language (DDL) of the Athena table.

**Usage**

```r
dbShow(conn, name, ...)
```

**Arguments**

- `conn` A DBIConnection object, as returned by `dbConnect()`.
- `name` A character string specifying a DBMS table name.
- `...` Other parameters passed on to methods.

**Value**

`dbShow()` returns SQL characters of the Athena table DDL.

**Examples**

```r
## Not run:
# Note:
# - Require AWS Account to run below example.
# - Different connection methods can be used please see `noctua::dbConnect` documentation

library(DBI)

# Demo connection to Athena using profile name
```
con <- dbConnect(noctua::athena())

# write iris table to Athena
dbWriteTable(con, "iris",
iris,
  partition = c("timestamp" = format(Sys.Date(), "%Y%m%d")),
  s3.location = "s3://path/to/store/athena/table/"
)

# return table ddl
noctua::dbShow(con, "iris")

# disconnect from Athena
dbDisconnect(con)

## End(Not run)

---

**dbStatistics**

*Show AWS Athena Statistics*

**Description**

Returns AWS Athena Statistics from execute queries `dbSendQuery`

**Usage**

```
dbStatistics(res, ...)
```

## S4 method for signature 'AthenaResult'
```
dbStatistics(res, ...)
```

**Arguments**

- `res` An object inheriting from `DBIResult`.
- `...` Other arguments passed on to methods.

**Value**

`dbStatistics()` returns list containing Athena Statistics return from paws.

**Examples**

# Note:
# - Require AWS Account to run below example.
# - Different connection methods can be used please see 'RAthena::dbConnect' documentation

library(DBI)
library(noctua)
### db_compute

S3 implementation of `db_compute` for Athena

**Description**

This is a backend function for dplyr's `compute` function. Users won't be required to access and run this function.

**Usage**

```r
db_compute.AthenaConnection(con, table, sql, ...)
```

**Arguments**

- `con` A `dbConnect` object, as returned by `dbConnect()`
- `table` Table name, if left default noctua will use the default from dplyr's `compute` function.
- `sql` SQL code to be sent to the data
- `...` passes noctua table creation parameters: [file_type,s3_location,partition]
  - `file_type`: What file type to store data.frame on s3, noctua currently supports ["NULL","csv", "parquet", "json"]. "NULL" will let Athena set the file_type for you.
  - `s3_location`: s3 bucket to store Athena table, must be set as a s3 uri for example ("s3://mybucket/data/"")
  - `partition`: Partition Athena table, requires to be a partitioned variable from previous table.

**Value**

`db_compute` returns table name

**See Also**

`backend_dbplyr`
Examples

```r
## Not run:
# Note:
# - Require AWS Account to run below example.
# - Different connection methods can be used please see `noctua::dbConnect` documentation
library(DBI)
library(dplyr)

# Demo connection to Athena using profile name
con <- dbConnect(noctua::athena())

# Write data.frame to Athena table
copy_to(con, mtcars,
       s3_location = "s3://mybucket/data/")

# Write Athena table from tbl_sql
athena_mtcars <- tbl(con, "mtcars")
mtcars_filter <- athena_mtcars %>% filter(gear >=4)

# create athena with unique table name
mtcars_filer %>%
   compute()

# create athena with specified name and s3 location
mtcars_filer %>%
   compute("mtcars_filer",
       s3_location = "s3://mybucket/mtcars_filer")

# Disconnect from Athena
dbDisconnect(con)

## End(Not run)
```

---

db_copy_to

S3 implementation of db_copy_to for Athena

Description

This is an Athena method for dbplyr function db_copy_to to create an Athena table from a data.frame.

Usage

```r
db_copy_to.AthenaConnection(
    con,
    table,
    values,
    overwrite = FALSE,
    append = FALSE,
...)```
types = NULL,
partition = NULL,
s3_location = NULL,
file_type = c("csv", "tsv", "parquet"),
compress = FALSE,
max_batch = Inf,
...}

Arguments

con A dbConnect object, as returned by dbConnect()

A A character string specifying a table name. Names will be automatically quoted so you can use any sequence of characters, not just any valid bare table name.

values A data.frame to write to the database.

overwrite Allows overwriting the destination table. Cannot be TRUE if append is also TRUE.

append Allow appending to the destination table. Cannot be TRUE if overwrite is also TRUE. Existing Athena DDL file type will be retained and used when uploading data to AWS Athena. If parameter file.type doesn’t match AWS Athena DDL file type a warning message will be created notifying user and noctua will use the file type for the Athena DDL.

types Additional field types used to override derived types.

partition Partition Athena table (needs to be a named list or vector) for example: c(var1 = "2019-20-13")

s3_location s3 bucket to store Athena table, must be set as a s3 uri for example ("s3://mybucket/data/")

file_type What file type to store data.frame on s3, noctua currently supports ["tsv", "csv", "parquet"]. Default delimited file type is "tsv", in previous versions of noctua (< 1.4.0) file type "csv" was used as default. The reason for the change is that columns containing Array/JSON format cannot be written to Athena due to the separating value ".", This would cause issues with AWS Athena. Note: "parquet" format is supported by the arrow package and it will need to be installed to utilise the "parquet" format.

compress FALSE | TRUE To determine if to compress file.type. If file type is ["csv", "tsv"] then "gzip" compression is used, for file type "parquet" "snappy" compression is used.

max_batch Split the data frame by max number of rows i.e. 100,000 so that multiple files can be uploaded into AWS S3. By default when compression is set to TRUE and file.type is "csv" or "tsv" max.batch will split data.frame into 20 batches. This is to help the performance of AWS Athena when working with files compressed in "gzip" format. max.batch will not split the data.frame when loading file in parquet format. For more information please go to link

... other parameters currently not supported in noctua

Value

db_copy_to returns table name
See Also

AthenaWriteTables

Examples

## Not run:
# Note:
# - Require AWS Account to run below example.
# - Different connection methods can be used please see `noctua::dbConnect` documentation

library(DBI)
library(dplyr)

# Demo connection to Athena using profile name
con <- dbConnect(noctua::athena())

# List existing tables in Athena
dbListTables(con)

# Write data.frame to Athena table
copy_to(con, mtcars,
    s3_location = "s3://mybucket/data/")

# Checking if uploaded table exists in Athena
dbExistsTable(con, "mtcars")

# Write Athena table from tbl_sql
athena_mtcars <- tbl(con, "mtcars")
mtcars_filter <- athena_mtcars %>% filter(gear >=4)

copy_to(con, mtcars_filter)

# Checking if uploaded table exists in Athena
dbExistsTable(con, "mtcars_filter")

# Disconnect from Athena
dbDisconnect(con)

## End(Not run)

---

**db_desc**

S3 implementation of db_desc for Athena

**Description**

This is a backend function for dplyr to retrieve meta data about Athena queries. Users won’t be required to access and run this function.
Usage

db_desc.AthenaConnection(x)

Arguments

x  A dbConnect object, as returned by dbConnect()

Value

Character variable containing Meta Data about query sent to Athena. The Meta Data is returned in the following format:

“Athena <paws version> [<profile_name>@region/database]"

Description

A method to change noctua backend file parser.

Usage

noctua_options(file_parser = c("data.table", "vroom"))

Arguments

file_parser  Method to read and write tables to Athena, currently defaults to data.table

Value

noctua_options() returns NULL, invisibly.

Examples

library(noctua)

# change file parser from default data.table to vroom
noctua_options("vroom")
**Description**

The `dbSendQuery()` and `dbSendStatement()` method submits a query to Athena but does not wait for query to execute. `dbHasCompleted` method will need to ran to check if query has been completed or not. The `dbExecute()` method submits a query to Athena and waits for the query to be executed.

**Usage**

```r
## S4 method for signature 'AthenaConnection,character'
dbSendQuery(conn, statement = NULL, ...)

## S4 method for signature 'AthenaConnection,character'
dbSendStatement(conn, statement = NULL, ...)

## S4 method for signature 'AthenaConnection,character'
dbExecute(conn, statement = NULL, ...)
```

**Arguments**

- **conn** A `DBIConnection` object, as returned by `dbConnect()`.
- **statement** a character string containing SQL.
- **...** Other parameters passed on to methods.

**Value**

Returns AthenaResult s4 class.

**See Also**

`dbSendQuery`, `dbSendStatement`, `dbExecute`

**Examples**

# Note:
# - Require AWS Account to run below example.
# - Different connection methods can be used please see `noctua::dbConnect` documentation

library(DBI)

# Demo connection to Athena using profile name
con <- dbConnect(noctua::athena())

# Sending Queries to Athena
```
res1 <- dbSendQuery(con, "show databases")
res2 <- dbSendStatement(con, "show databases")
res3 <- dbExecute(con, "show databases")

# Disconnect connection
dbDisconnect(con)
```

---

### session_token

*Get Session Tokens for PAWS Connection*

---

**Description**

Returns a set of temporary credentials for an AWS account or IAM user ([link](#)).

**Usage**

```r
def get_session_token(
  profile_name = NULL,
  region_name = NULL,
  serial_number = NULL,
  token_code = NULL,
  duration_seconds = 3600L,
  set_env = FALSE
)
```

**Arguments**

- **profile_name** The name of a profile to use. If not given, then the default profile is used. To set profile name, the [AWS Command Line Interface](https://aws.amazon.com/cli/) (AWS CLI) will need to be configured. To configure AWS CLI please refer to: [Configuring the AWS CLI](#).

- **region_name** Default region when creating new connections. Please refer to [link](#) for AWS region codes (region code example: Region = EU (Ireland) `region_name = "eu-west-1"`).

- **serial_number** The identification number of the MFA device that is associated with the IAM user who is making the GetSessionToken call. Specify this value if the IAM user has a policy that requires MFA authentication. The value is either the serial number for a hardware device (such as `GAHT12345678`) or an Amazon Resource Name (ARN) for a virtual device (such as `arn:aws:iam::123456789012:mfa/user`).

- **token_code** The value provided by the MFA device, if MFA is required. If any policy requires the IAM user to submit an MFA code, specify this value. If MFA authentication is required, the user must provide a code when requesting a set of temporary security credentials. A user who fails to provide the code receives an "access denied" response when requesting resources that require MFA authentication.
The `sqlCreateTable` function creates a query to create a simple Athena table.

### Description

Creates an interface to compose `CREATE EXTERNAL TABLE`.

### Usage

```r
## S4 method for signature 'AthenaConnection'
sqlCreateTable(
  con,
  table,
  fields,
  field.types = NULL,
  partition = NULL,
  s3.location = NULL,
)```

### Examples

```r
## Not run:
# Note:
# - Require AWS Account to run below example.
library(noctua)
library(DBI)

# Create Temporary Credentials duration 1 hour
get_session_token("YOUR_PROFILE_NAME",
    serial_number="arn:aws:iam::123456789012:mfa/user",
    token_code = "531602",
    set_env = TRUE)

# Connect to Athena using temporary credentials
con <- dbConnect(athena())

## End(Not run)
```
sqlCreateTable

    file.type = c("tsv", "csv", "parquet"),
    compress = FALSE,
    ...
)

Arguments

con        A database connection.
table      Name of the table. Escaped with dbQuoteIdentifier().
fields     Either a character vector or a data frame.
            A named character vector: Names are column names, values are types. Names
            are escaped with dbQuoteIdentifier(). Field types are unescaped.
            A data frame: field types are generated using dbDataType().
field.types Additional field types used to override derived types.
partition  Partition Athena table (needs to be a named list or vector) for example: c(var1
            = "2019-20-13")
s3.location s3 bucket to store Athena table, must be set as a s3 uri for example ("s3://mybucket/data/").
            By default s3.location is set s3 staging directory from AthenaConnection ob-
            ject.
file.type  What file type to store data.frame on s3, noctua currently supports ["csv", "tsv",
            "parquet"]
compress   FALSE | TRUE To determine if to compress file.type. If file type is ["csv", "tsv"]
            then "gzip" compression is used. Currently parquet compression isn’t supported.
...
Other arguments used by individual methods.

Value

sqlCreateTable returns data.frame’s DDL in the SQL format.

See Also

sqlCreateTable

Examples

# Note:
# - Require AWS Account to run below example.
# - Different connection methods can be used please see `noctua::dbConnect` documentation
library(DBI)

# Demo connection to Athena using profile name
con <- dbConnect(noctua:::athena())

# Create DDL for iris data.frame
sqlCreateTable(con, "iris", iris, s3.location = "s3://path/to/athena/table")
# Create DDL for iris data.frame with partition
sqlCreateTable(con, "iris", iris,
    partition = c("timestamp" = format(Sys.Date(), "%Y%m%d"),
    s3.location = "s3://path/to/athena/table")
)

# Create DDL for iris data.frame with partition and file.type parquet
sqlCreateTable(con, "iris", iris,
    partition = c("timestamp" = format(Sys.Date(), "%Y%m%d"),
    s3.location = "s3://path/to/athena/table",
    file.type = "parquet")
)

# Disconnect from Athena
dbDisconnect(con)

---

sqlData  

Converting data frame into suitable format to be uploaded to Athena

Description

This method converts data.frame columns into the correct format so that it can be uploaded to Athena.

Usage

```r
## S4 method for signature 'AthenaConnection'
sqlData(
    con,
    value,
    row.names = NA,
    file.type = c("tsv", "csv", "parquet"),
    ...
)
```

Arguments

- **con**: A database connection.
- **value**: A data frame.
- **row.names**: Either TRUE, FALSE, NA or a string.
  - If TRUE, always translate row names to a column called "row_names". If FALSE, never translate row names. If NA, translate rownames only if they're a character vector.
  - A string is equivalent to TRUE, but allows you to override the default name.
  - For backward compatibility, NULL is equivalent to FALSE.
- **file.type**: What file type to store data.frame on s3, Noctua currently supports ["csv", "tsv", "parquet"]. **Note**: This parameter is used for format any special characters that clash with file type separator.
- **...**: Other arguments used by individual methods.
Value

sqlData returns a dataframe formatted for Athena. Currently converts list variable types into character split by '|', similar to how data.table writes out to files.

See Also

sqlData

sql_translate_env

AWS Athena backend dbplyr

Description

Create s3 implementation of sql_translate_env for AWS Athena sql translate environment based off Athena Data Types and DML Queries, Functions, and Operators

Usage

sql_translate_env.AthenaConnection(con)

sql_escape_string.AthenaConnection(con, x)

Arguments

con An AthenaConnection object, produced by [DBI::dbConnect()]

x An object to escape. Existing sql vectors will be left as is, character vectors are escaped with single quotes, numeric vectors have trailing '.0' added if they're whole numbers, identifiers are escaped with double quotes.

work_group

Athena Work Groups

Description

Lower level API access, allows user to create and delete Athena Work Groups.

create_work_group Creates a workgroup with the specified name (link). The work group utilises parameters from the dbConnect object, to determine the encryption and output location of the work group. The s3_staging_dir, encryption_option and kms_key parameters are gotten from dbConnect
tag_options Helper function to create tag options for function create_work_group()
delete_work_group Deletes the workgroup with the specified name (link). The primary workgroup cannot be deleted.
list_work_groups Lists available workgroups for the account (link).
**get_work_group**  Returns information about the workgroup with the specified name (link).

**update_work_group**  Updates the workgroup with the specified name (link). The workgroup’s name cannot be changed. The work group utilises parameters from the dbConnect object, to determine the encryption and output location of the work group. The s3_staging_dir, encryption_option and kms_key parameters are gotten from dbConnect

**Usage**

```r
create_work_group(
  conn,
  work_group = NULL,
  enforce_work_group_config = FALSE,
  publish_cloud_watch_metrics = FALSE,
  bytes_scanned_cut_off = 1000000L,
  description = NULL,
  tags = tag_options(key = NULL, value = NULL)
)

tag_options(key = NULL, value = NULL)

delete_work_group(conn, work_group = NULL, recursive_delete_option = FALSE)

list_work_groups(conn)

get_work_group(conn, work_group = NULL)

update_work_group(
  conn,
  work_group = NULL,
  remove_output_location = FALSE,
  enforce_work_group_config = FALSE,
  publish_cloud_watch_metrics = FALSE,
  bytes_scanned_cut_off = 1000000L,
  description = NULL,
  state = c("ENABLED", "DISABLED")
)
```

**Arguments**

- **conn**  A dbConnect object, as returned by dbConnect()
- **work_group**  The Athena workgroup name.
- **enforce_work_group_config**  If set to TRUE, the settings for the workgroup override client-side settings. If set to FALSE, client-side settings are used. For more information, see Workgroup Settings Override Client-Side Settings.
- **publish_cloud_watch_metrics**  Indicates that the Amazon CloudWatch metrics are enabled for the workgroup.
bytes_scanned_cut_off
The upper data usage limit (cutoff) for the amount of bytes a single query in a workgroup is allowed to scan.

description
The workgroup description.
tags
A tag that you can add to a resource. A tag is a label that you assign to an AWS Athena resource (a workgroup). Each tag consists of a key and an optional value, both of which you define. Tags enable you to categorize workgroups in Athena, for example, by purpose, owner, or environment. Use a consistent set of tag keys to make it easier to search and filter workgroups in your account. The maximum tag key length is 128 Unicode characters in UTF-8. The maximum tag value length is 256 Unicode characters in UTF-8. You can use letters and numbers representable in UTF-8, and the following characters: "+=._:/@". Tag keys and values are case-sensitive. Tag keys must be unique per resource. Please use the helper function tag_options() to create tags for work group, if no tags are required please put NULL for this parameter.

key
A tag key. The tag key length is from 1 to 128 Unicode characters in UTF-8. You can use letters and numbers representable in UTF-8, and the following characters: "+=._:/@". Tag keys are case-sensitive and must be unique per resource.

value
A tag value. The tag value length is from 0 to 256 Unicode characters in UTF-8. You can use letters and numbers representable in UTF-8, and the following characters: "+=._:/@". Tag values are case-sensitive.

recursive_delete_option
The option to delete the workgroup and its contents even if the workgroup contains any named queries.

remove_output_location
If set to TRUE, indicates that the previously-specified query results location (also known as a client-side setting) for queries in this workgroup should be ignored and set to null. If set to FALSE the output location in the workgroup’s result configuration will be updated with the new value. For more information, see Workgroup Settings Override Client-Side Settings.

state
The workgroup state that will be updated for the given workgroup.

Value
create_work_group Returns NULL but invisible
tag_options Returns list but invisible
delete_work_group Returns NULL but invisible
list_work_groups Returns list of available work groups
get_work_group Returns list of work group meta data
update_work_group Returns NULL but invisible

Examples

# Note:
library(noctua)

# Demo connection to Athena using profile name
con <- dbConnect(noctua::athena())

# List current work group available
list_work_groups(con)

# Create a new work group
wg <- create_work_group(con,
                         "demo_work_group",
                         description = "This is a demo work group",
                         tags = tag_options(key = "demo_work_group", value = "demo_01"))

# List work groups to see new work group
list_work_groups(con)

# get meta data from work group
wg <- get_work_group(con, "demo_work_group")

# Update work group
wg <- update_work_group(con, "demo_work_group",
                         description = "This is a demo work group update")

# get updated meta data from work group
wg <- get_work_group(con, "demo_work_group")

# Delete work group
delete_work_group(con, "demo_work_group")

# Disconnect from Athena
dbDisconnect(con)
