odbc-package  odbc: Connect to ODBC Compatible Databases (using the DBI Interface)

Description

A DBI-compatible interface to ODBC databases.

Author(s)

Maintainer: Jim Hester <james.hesterg@rstudio.com>
Authors:

• Hadley Wickham <hadley@rstudio.com>

Other contributors:

• lexicalunit (nanodbc library) [copyright holder]
• Google Inc. (cctz library) [copyright holder]
• RStudio [copyright holder, funder]

dbConnect,OdbcDriver-method

Connect to a ODBC compatible database

Description

Connect to a ODBC compatible database

Usage

```r
## S4 method for signature 'OdbcDriver'
dbConnect(drv, dsn = NULL, ..., timezone = "UTC",
            encoding = "", bigint = c("integer64", "integer", "numeric", "character"),
            driver = NULL, server = NULL, database = NULL, uid = NULL,
            pwd = NULL, .connection_string = NULL)
```

Arguments

- `drv` an object that inherits from DBIDriver, or an existing DBIConnection object (in order to clone an existing connection).
- `dsn` The Data Source Name.
- `...` Additional ODBC keywords, these will be joined with the other arguments to form the final connection string.
- `timezone` The Server time zone. Useful if the database has an internal timezone that is not 'UTC'. If the database is in your local timezone set to Sys.timezone(). See OlsonNames() for a complete list of available timezones on your system.
- `encoding` The text encoding used on the Database. If the database is the same as your local encoding set to "". See iconvlist() for a complete list of available encodings on your system. Note strings are always returned UTF-8 encoded.
- `bigint` The R type that SQL_BIGINT types should be mapped to, default is bit64::integer64, which allows the full range of 64 bit integers.
- `driver` The ODBC driver name.
- `server` The server hostname.
- `database` The database on the server.
- `uid` The user identifier.
- `pwd` The password to use.
- `.connection_string` A complete connection string, useful if you are copy pasting it from another source. If this argument is used any additional arguments will be appended to this string.

Details

The connection string keywords are driver dependent. The parameters documented here are common, but some drivers may not accept them. Please see the specific driver documentation for allowed parameters, https://www.connectionstrings.com is also a useful resource of example connection strings for a variety of databases.
Un-Quote identifiers

Description
Call this method to generate a string that is unquoted. This is the inverse of DBI::dbQuoteIdentifier.

Usage
```
dbUnQuoteIdentifier(conn, x, ...)
```

### S4 method for signature 'OdbcConnection,SQL'
```
dbUnQuoteIdentifier(conn, x)
```

### S4 method for signature 'OdbcConnection,character'
```
dbUnQuoteIdentifier(conn, x)
```

Arguments

- **conn**  
  A subclass of `DBIConnection`, representing an active connection to an DBMS.
- **x**  
  A character vector to un-quote.
- **...**  
  Other arguments passed on to methods.

Odbc driver

Description
Driver for an ODBC database.

Usage
```
odbc()
```

Examples
```
## Not run:
#' library(DBI)
odbc::odbc()
## End(Not run)
```
Convenience functions for reading/writing DBMS tables

Description

Convenience functions for reading/writing DBMS tables

Usage

```r
## S4 method for signature 'OdbcConnection,character,data.frame'
dbWriteTable(conn, name, value,
   overwrite = FALSE, append = FALSE, temporary = FALSE, row.names = NA,
   field.types = NULL, ...)

## S4 method for signature 'OdbcConnection'
sqldata(con, value, row.names = NA, ...)

## S4 method for signature 'OdbcConnection'
sqlcreateTable(con, table, fields,
   field.types = NULL, row.names = NA, temporary = FALSE, ...)
```

Arguments

- **conn**
  - A `OdbcConnection` object, produced by `DBI::dbConnect()`

- **name**
  - A character string specifying a table name. Names will be automatically quoted so you can use any sequence of characters, not just any valid bare table name.

- **value**
  - A data frame to write to the database.

- **overwrite**
  - Allow overwriting the destination table. Cannot be `TRUE` if `append` is also `TRUE`.

- **append**
  - Allow appending to the destination table. Cannot be `TRUE` if `overwrite` is also `TRUE`.

- **temporary**
  - If `TRUE`, will generate a temporary table statement.

- **row.names**
  - Either `TRUE`, `FALSE`, `NA` or a string.
    - If `TRUE`, always translate row names to a column called "row_names". If `FALSE`, never translate row names. If `NA`, translate rownames only if they’re a character vector.
    - A string is equivalent to `TRUE`, but allows you to override the default name.
    - For backward compatibility, `NULL` is equivalent to `FALSE`.

- **field.types**
  - Additional field types used to override derived types.

- **...**
  - Other arguments used by individual methods.

- **con**
  - A database connection.

- **table**
  - Name of the table. Escaped with `dbQuoteIdentifier()`.

- **fields**
  - Either a character vector or a data frame.
    - A named character vector: Names are column names, values are types. Names are escaped with `dbQuoteIdentifier()`. Field types are unescaped.
    - A data frame: field types are generated using `dbDataType()`.
Examples

```r
## Not run:
library(DBI)
con <- dbConnect(odbc::odbc())
dbListTables(con)
dbWriteTable(con, "mtcars", mtcars, temporary = TRUE)
dbReadTable(con, "mtcars")

dbListTables(con)
dbExistsTable(con, "mtcars")

# A zero row data frame just creates a table definition.
dbWriteTable(con, "mtcars2", mtcars[0, ], temporary = TRUE)
dbReadTable(con, "mtcars2")

dbDisconnect(con)

## End(Not run)
```

---

**OdbcConnection**

---

**Odbc Connection Methods**

---

**Description**

Implementations of pure virtual functions defined in the DBI package for OdbcConnection objects.

**Usage**

```r
## S4 method for signature 'OdbcConnection'
show(object)

## S4 method for signature 'OdbcConnection'
dbIsValid(dbObj, ...)

## S4 method for signature 'OdbcConnection'
dbDisconnect(conn, ...)

## S4 method for signature 'OdbcConnection,character'
dbSendQuery(conn, statement, ...)

## S4 method for signature 'OdbcConnection,character'
dbSendStatement(conn, statement, ...)

## S4 method for signature 'OdbcConnection,ANY'
dbDataType(dbObj, obj, ...)

## S4 method for signature 'OdbcConnection,data.frame'
dbDataType(dbObj, obj, ...)

## S4 method for signature 'OdbcConnection,character'
dbQuoteString(conn, x, ...)
```
## Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>object</code></td>
<td>Any R object</td>
</tr>
<tr>
<td><code>dbObj</code></td>
<td>An object inheriting from DBIObject, i.e. DBIDriver, DBIConnection, or a DBIResult</td>
</tr>
<tr>
<td><code>...</code></td>
<td>Other arguments to methods.</td>
</tr>
<tr>
<td><code>conn</code></td>
<td>A DBIConnection object, as returned by <code>dbConnect()</code>.</td>
</tr>
<tr>
<td><code>statement</code></td>
<td>A character string containing SQL.</td>
</tr>
<tr>
<td><code>obj</code></td>
<td>An R object whose SQL type we want to determine.</td>
</tr>
<tr>
<td><code>x</code></td>
<td>A character vector to quote as string.</td>
</tr>
<tr>
<td><code>name</code></td>
<td>A character string specifying a DBMS table name.</td>
</tr>
<tr>
<td><code>n</code></td>
<td>Maximum number of records to retrieve per fetch. Use <code>n = -1</code> or <code>n = Inf</code> to retrieve all pending records. Some implementations may recognize other special values.</td>
</tr>
</tbody>
</table>
odbcConnectionActions  List the actions supported for the connection

Description
Return a list of actions that can be performed on the connection.

Usage
odbcConnectionActions(connection)

Arguments
connection  A connection object, as returned by dbConnect().

Details
The list returned is a named list of actions, where each action has the following properties:

- **callback**  A function to be invoked to perform the action
- **icon**  An optional path to an icon representing the action

Value
A named list of actions that can be performed on the connection.

odbcConnectionIcon  Get an icon representing a connection.

Description
Return the path on disk to an icon representing a connection.

Usage
odbcConnectionIcon(connection)

Arguments
connection  A connection object, as returned by dbConnect().

Details
The icon returned should be a 32x32 square image file.

Value
The path to an icon file on disk.
Return the corresponding ODBC data type for an R object

Description

This is used when creating a new table with `dbWriteTable()`. Databases with default methods defined are
- MySQL
- PostgreSQL
- SQL Server
- SQLite
- Spark
- Hive
- Impala
- Redshift
- Vertica

Usage

`odbcDataType(con, obj, ...)`

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>con</td>
<td>A driver connection object, as returned by <code>dbConnect()</code>.</td>
</tr>
<tr>
<td>obj</td>
<td>An R object.</td>
</tr>
<tr>
<td>...</td>
<td>Additional arguments passed to methods.</td>
</tr>
</tbody>
</table>

Details

If you are using a different database and `dbWriteTable()` fails with a SQL parsing error the default method is not appropriate, you will need to write a new method.

Value

Corresponding SQL type for the `obj`.

Defining a new `dbDataType` method

The object type for your connection will be the database name retrieved by `dbGetInfo(con)$dbms.name`. Use the documentation provided with your database to determine appropriate values for each R data type. An example method definition of a fictional `foo` database follows.

```r
con <- dbConnect(odbc::odbc(), "FooConnection")
dbGetInfo(con)$dbms.name
#> [1] "foo"

`odbcDataType.foo <- function(con, obj, ...){
  switch_type(obj)
```

```r
```

```r
```
factor = "VARCHAR(255)",
datetime = "TIMESTAMP",
date = "DATE",
binary = "BINARY",
integer = "INTEGER",
double = "DOUBLE",
character = "VARCHAR(255)",
logical = "BIT",
list = "VARCHAR(255)",
stop("Unsupported type", call. = FALSE)
}
}

## OdbcDriver Methods

### Description
Implementations of pure virtual functions defined in the DBI package for OdbcDriver objects.

### Usage

```r
## S4 method for signature 'OdbcDriver'
show(object)

## S4 method for signature 'OdbcDriver,ANY'
dbDataType(dbObj, obj, ...)

## S4 method for signature 'OdbcDriver,list'
dbDataType(dbObj, obj, ...)

## S4 method for signature 'OdbcDriver,data.frame'
dbDataType(dbObj, obj, ...)

## S4 method for signature 'OdbcDriver'
dbIsValid(dbObj, ...)

## S4 method for signature 'OdbcDriver'
dbGetInfo(dbObj, ...)
```

### Arguments

- `object`: Any R object
- `dbObj`: A object inheriting from `DBI::DBIConnection`
- `obj`: An R object whose SQL type we want to determine.
- `...`: Other arguments passed on to methods.
**odbcListColumns**  
*List columns in an object.*

**Description**

Lists the names and types of each column (field) of a specified object.

**Usage**

```r
odbcListColumns(connection, ...)  
```

**Arguments**

- `connection`: A connection object, as returned by `dbConnect()`.
- `...`: Parameters specifying the object.

**Details**

The object to inspect must be specified as one of the arguments (e.g. `table = "employees"`); depending on the driver and underlying data store, additional specification arguments may be required.

**Value**

A data frame with `name` and `type` columns, listing the object’s fields.

---

**odbcListDataSources**  
*List Available Data Source Names*

**Description**

List Available Data Source Names

**Usage**

```r
odbcListDataSources()  
```

**Value**

A data frame with two columns.

- `name`: Name of the data source
- `description`: Data Source description
odbcListDrivers  
*List Available ODBC Drivers*

**Description**

List Available ODBC Drivers

**Usage**

`odbcListDrivers()`

**Value**

A data frame with three columns. If a given driver does not have any attributes the last two columns will be NA.

- **name**  Name of the driver
- **attribute**  Driver attribute name
- **value**  Driver attribute value

---

odbcListObjects  
*List objects in a connection.*

**Description**

Lists all of the objects in the connection, or all the objects which have specific attributes.

**Usage**

`odbcListObjects(connection, ...)`

**Arguments**

- **connection**  A connection object, as returned by `dbConnect()`.
- **...**  Attributes to filter by.

**Details**

When used without parameters, this function returns all of the objects known by the connection. Any parameters passed will filter the list to only objects which have the given attributes; for instance, passing `schema = "foo"` will return only objects matching the schema `foo`.

**Value**

A data frame with name and type columns, listing the objects.
odbcListObjectTypes  
Return the object hierarchy supported by a connection.

Description
Lists the object types and metadata known by the connection, and how those object types relate to each other.

Usage
odbcListObjectTypes(connection)

Arguments
connection  A connection object, as returned by dbConnect().

Details
The returned hierarchy takes the form of a nested list, in which each object type supported by the connection is a named list with the following attributes:

contains  A list of other object types contained by the object, or "data" if the object contains data
icon  An optional path to an icon representing the type

For instance, a connection in which the top-level object is a schema that contains tables and views, the function will return a list like the following:

list(schema = list(contains = list(  
  list(name = "table", contains = "data")  
  list(name = "view", contains = "data"))))

Value
The hierarchy of object types supported by the connection.

odbcPreviewObject  Preview the data in an object.

Description
Return the data inside an object as a data frame.

Usage
odbcPreviewObject(connection, rowLimit, ...)

Arguments

- **connection**: A connection object, as returned by `dbConnect()`.
- **rowLimit**: The maximum number of rows to display.
- **...**: Parameters specifying the object.

Details

The object to previewed must be specified as one of the arguments (e.g. `table = "employees"`); depending on the driver and underlying data store, additional specification arguments may be required.

Value

A data frame containing the data in the object.

---

OdbcResult  

**Odbc Result Methods**

Description

Implementations of pure virtual functions defined in the DBI package for OdbcResult objects.

Usage

```r
## S4 method for signature 'OdbcResult'
dbClearResult(res, ...)

## S4 method for signature 'OdbcResult'
dbFetch(res, n = -1, ...)

## S4 method for signature 'OdbcResult'
dbHasCompleted(res, ...)

## S4 method for signature 'OdbcResult'
dbGetInfo(dbObj, ...)

## S4 method for signature 'OdbcResult'
dbIsValid(dbObj, ...)

## S4 method for signature 'OdbcResult'
dbGetStatement(res, ...)

## S4 method for signature 'OdbcResult'
dbColumnInfo(res, ...)

## S4 method for signature 'OdbcResult'
dbGetRowCount(res, ...)

## S4 method for signature 'OdbcResult'
dbGetRowsAffected(res, ...)
```
## odbcSetTransactionIsolationLevel

### Set the Transaction Isolation Level for a Connection

**Description**

Set the Transaction Isolation Level for a Connection

**Usage**

```r
odbcSetTransactionIsolationLevel(conn, levels)
```

**Arguments**

- `conn`: A `DBIConnection` object, as returned by `dbConnect()`.
- `levels`: One or more of `read_uncommitted`, `read_committed`, `repeatable_read`, `serializable`.

**See Also**

**Examples**

```r
## Not run:
# Can use spaces or underscores in between words.
odbcSetTransactionIsolationLevel(con, "read_uncommitted")

# Can also use the full constant name.
odbcSetTransactionIsolationLevel(con, "SQL_TXN_READ_UNCOMMITTED")
```

## Arguments

- **res**: An object inheriting from `DBIResult`.
- **params**: Other arguments passed on to methods.
- **n**: maximum number of records to retrieve per fetch. Use `n = -1` or `n = Inf` to retrieve all pending records. Some implementations may recognize other special values.
- **dbObj**: An object inheriting from `DBIObject`, i.e. `DBIDriver`, `DBIConnection`, or a `DBIResult`.
- **params**: A list of bindings, named or unnamed.
test_roundtrip  Test round tripping a simple table

Description

This tests all the supported data types, including missing values. It first writes them to the database, then reads them back and verifies the data is identical to the original.

Usage

test_roundtrip(con = DBItest:::connect(DBItest:::get_default_context()),
columns = "", invert = TRUE, force_sorted = FALSE)

Arguments

con  An established DBI connection.
columns  Table columns to exclude (default) or include, dependent on the value of invert. One of datetime, date, binary, integer, double, character, logical.
invert  If TRUE, change the definition of columns to be inclusive, rather than exclusive.
force_sorted  If TRUE, a sorted id column is added to the sent data, and the received data is sorted by this column before doing the comparison. This is necessary for some databases that do not preserve row order.

Details

This function is not exported and should only be used during tests and as a sanity check when writing new odbcDataType() methods.

Examples

```r
## Not run:
test_roundtrip(con)

# exclude a few columns
test_roundtrip(con, c("integer", "double"))

# Only test a specific column
test_roundtrip(con, "integer", invert = FALSE)
```

## End(Not run)
