Package ‘openxlsx’

May 28, 2019

Type  Package
Title  Read, Write and Edit XLSX Files
Version  4.1.0.1
Date  2018-05-26

URL  https://github.com/awalker89/openxlsx

BugReports  https://github.com/awalker89/openxlsx/issues

Maintainer  ORPHANED

Description  Simplifies the creation of Excel .xlsx files by providing a high
level interface to writing, styling and editing worksheets. Through the use
of 'Rcpp', read/write times are comparable to the 'xlsx' and 'XLConnect' packages
with the added benefit of removing the dependency on Java.

License  MIT + file LICENSE

LinkingTo  Rcpp

Encoding  UTF-8

Depends  R (>= 3.3.0)
Imports  methods, Rcpp, grDevices, stats, utils, zip

VignetteBuilder  knitr

Suggests  knitr, testthat

RoxygenNote  6.0.1.9000

**addFilter**

Add excel column filters to a worksheet

**Description**

Add excel column filters to a worksheet

**Usage**

```python
addFilter(wb, sheet, rows, cols)
```

**Arguments**

- `wb` A workbook object
- `sheet` A name or index of a worksheet
- `rows` A row number.
- `cols` columns to add filter to.
addStyle

Add a style to a set of cells

Description

Function adds a style to a specified set of cells.

Usage

addStyle(wb, sheet, style, rows, cols, gridExpand = FALSE, stack = FALSE)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wb</td>
<td>A Workbook object containing a worksheet.</td>
</tr>
<tr>
<td>sheet</td>
<td>A worksheet to apply the style to.</td>
</tr>
<tr>
<td>style</td>
<td>A style object returned from createStyle()</td>
</tr>
<tr>
<td>rows</td>
<td>Rows to apply style to.</td>
</tr>
<tr>
<td>cols</td>
<td>Columns to apply style to.</td>
</tr>
</tbody>
</table>
addWorksheet

gridExpand

If TRUE, style will be applied to all combinations of rows and cols.

stack

If TRUE the new style is merged with any existing cell styles. If FALSE, any existing style is replaced by the new style.

expand.grid

Examples

## See package vignette for more examples.

## Create a new workbook
wb <- createWorkbook("My name here")

## Add a worksheet
addWorksheet(wb, "Expenditure", gridLines = FALSE)

## Write data to worksheet 1
writeData(wb, sheet = 1, USPersonalExpenditure, rowNames = TRUE)

## Create and add a style to the column headers
headerStyle <- createStyle(fontSize = 14, fontColour = "#FFFFFF", halign = "center",
fgFill = "#4F81BD", border="TopBottom", borderColour = "#4F81BD")

addStyle(wb, sheet = 1, headerStyle, rows = 1, cols = 1:6, gridExpand = TRUE)

## Style for body
bodyStyle <- createStyle(border="TopBottom", borderColour = "#4F81BD")
addStyle(wb, sheet = 1, bodyStyle, rows = 2:6, cols = 1:6, gridExpand = TRUE)
setColWidths(wb, 1, cols=1, widths = 21) ## Set column width for row names column

saveWorkbook(wb, "addStyleExample.xlsx", overwrite = TRUE)

addWorksheet  Add a worksheet to a workbook

Description

Add a worksheet to a Workbook object
Usage

addWorksheet(wb, sheetName, gridLines = TRUE, tabColour = NULL,
zoom = 100, header = NULL, footer = NULL, evenHeader = NULL,
evenFooter = NULL, firstHeader = NULL, firstFooter = NULL,
visible = TRUE, paperSize = getOption("openxlsx.paperSize", default = 9),
orientation = getOption("openxlsx.orientation", default = "portrait"),
vdpi = getOption("openxlsx.vdpi", default = getOption("openxlsx.dpi", default = 300)),
hdpi = getOption("openxlsx.hdpi", default = getOption("openxlsx.dpi", default = 300)))

Arguments

wb  A Workbook object to attach the new worksheet
sheetName  A name for the new worksheet
gridLines  A logical. If FALSE, the worksheet grid lines will be hidden.
tabColour  Colour of the worksheet tab. A valid colour (belonging to colours()) or a valid
hex colour beginning with "]”
zoom  A numeric between 10 and 400. Worksheet zoom level as a percentage.
header  document header. Character vector of length 3 corresponding to positions left, center, right. Use NA to skip a position.
footer  document footer. Character vector of length 3 corresponding to positions left, center, right. Use NA to skip a position.
evenHeader  document header for even pages.
evenFooter  document footer for even pages.
firstHeader  document header for first page only.
firstFooter  document footer for first page only.
visible  If FALSE, sheet is hidden else visible.
paperSize  An integer corresponding to a paper size. See ?pageSetup for details.
orientation  One of "portrait" or "landscape"
vdpi  Vertical DPI. Can be set with options("openxlsx.dpi" = X) or options("openxlsx.vdpi" = X)
hdpi  Horizontal DPI. Can be set with options("openxlsx.dpi" = X) or options("openxlsx.hdpi" = X)

Details

Headers and footers can contain special tags

- &[Page] Page number
- &[Pages] Number of pages
- &[Date] Current date
- &[Time] Current time
- &[Path] File path
- &[File] File name
- &[Tab] Worksheet name
addWorksheet

Value

XML tree

Author(s)

Examples

## Create a new workbook
wb <- createWorkbook("Fred")

## Add 3 worksheets
addWorksheet(wb, "Sheet 1")
addWorksheet(wb, "Sheet 2", gridLines = FALSE)
addWorksheet(wb, "Sheet 3", tabColour = "red")
addWorksheet(wb, "Sheet 4", gridLines = FALSE, tabColour = "#F81BD")

## Headers and Footers
addWorksheet(wb, "Sheet 5",
  header = c("ODD HEAD LEFT", "ODD HEAD CENTER", "ODD HEAD RIGHT"),
  footer = c("ODD FOOT RIGHT", "ODD FOOT CENTER", "ODD FOOT RIGHT"),
  evenHeader = c("EVEN HEAD LEFT", "EVEN HEAD CENTER", "EVEN HEAD RIGHT"),
  evenFooter = c("EVEN FOOT RIGHT", "EVEN FOOT CENTER", "EVEN FOOT RIGHT"),
  firstHeader = c("TOP", "OF FIRST", "PAGE"),
  firstFooter = c("BOTTOM", "OF FIRST", "PAGE"))

addWorksheet(wb, "Sheet 6",
  header = c("[Date]", "ALL HEAD CENTER 2", "[Page] / [Pages]")
  footer = c("[Path][File]", NA, "&[Tab]")
  firstHeader = c(NA, "Center Header of First Page", NA),
  firstFooter = c(NA, "Center Footer of First Page", NA))

addWorksheet(wb, "Sheet 7",
  header = c("ALL HEAD LEFT 2", "ALL HEAD CENTER 2", "ALL HEAD RIGHT 2")
  footer = c("ALL FOOT RIGHT 2", "ALL FOOT CENTER 2", "ALL FOOT RIGHT 2"))

addWorksheet(wb, "Sheet 8"
  firstHeader = c("FIRST ONLY L", NA, "FIRST ONLY R")
  firstFooter = c("FIRST ONLY L", NA, "FIRST ONLY R"))

## Need data on worksheet to see all headers and footers
writeData(wb, sheet = 5, 1:400)
writeData(wb, sheet = 6, 1:400)
writeData(wb, sheet = 7, 1:400)
writeData(wb, sheet = 8, 1:400)

## Save workbook
saveWorkbook(wb, "addWorksheetExample.xlsx", overwrite = TRUE)
### conditionalFormat

#### Description

Add conditional formatting to cells

#### Usage

```r
conditionalFormat(wb, sheet, cols, rows, rule = NULL, style = NULL, type = "expression")
```

#### Arguments

- **wb** A workbook object
- **sheet** A name or index of a worksheet
- **cols** Columns to apply conditional formatting to
- **rows** Rows to apply conditional formatting to
- **rule** The condition under which to apply the formatting or a vector of colours. See examples.
- **style** A style to apply to those cells that satisfy the rule. A Style object returned from createStyle()
- **type** Either 'expression', 'colorscale' or 'databar'. If 'expression' the formatting is determined by a formula. If colorScale cells are coloured based on cell value. See examples.

---

### all.equal

#### Description

Check equality of workbooks

#### Usage

```r
## S3 method for class 'Workbook'
all.equal(target, current, ...)
```

#### Arguments

- **target** A Workbook object
- **current** A Workbook object
- **...** ignored

---

### conditionalFormat

#### Description

Add conditional formatting to cells

#### Usage

```r
conditionalFormat(wb, sheet, cols, rows, rule = NULL, style = NULL, type = "expression")
```

#### Arguments

- **wb** A workbook object
- **sheet** A name or index of a worksheet
- **cols** Columns to apply conditional formatting to
- **rows** Rows to apply conditional formatting to
- **rule** The condition under which to apply the formatting or a vector of colours. See examples.
- **style** A style to apply to those cells that satisfy the rule. A Style object returned from createStyle()
- **type** Either 'expression', 'colorscale' or 'databar'. If 'expression' the formatting is determined by a formula. If colorScale cells are coloured based on cell value. See examples.
**conditionalFormatting**

**Details**

DEPRECATED! USE `conditionalFormatting`

Valid operators are "<", "<=", ">", ">=", "==", "!=". See Examples. Default style given by: createStyle(fontColour = "#9C0006", bgFill = "#FFC7CE")

**Author(s)**

Alexander Walker

**See Also**

`createStyle`

**Description**

Add conditional formatting to cells

**Usage**

```r
conditionalFormatting(wb, sheet, cols, rows, rule = NULL, style = NULL, type = "expression", ...)
```

**Arguments**

- `wb` A workbook object
- `sheet` A name or index of a worksheet
- `cols` Columns to apply conditional formatting to
- `rows` Rows to apply conditional formatting to
- `rule` The condition under which to apply the formatting. See examples.
- `style` A style to apply to those cells that satisfy the rule. Default is createStyle(fontColour = "#9C0006", bgFill = "#FFC7CE")
- `type` Either 'expression', 'colorscale', 'databar', 'duplicates' or 'contains' (case insensitive).
- `...` See below
Details

See Examples.

If type == "expression"

- style is a Style object. See createStyle
- rule is an expression. Valid operators are "<", "<=", ">", ">=", ">"==", ">!=".

If type == "colourScale"

- style is a vector of colours with length 2 or 3
- rule can be NULL or a vector of colours of equal length to styles

If type == "databar"

- style is a vector of colours with length 2 or 3
- rule is a numeric vector specifying the range of the databar colours. Must be equal length to style
- ...
  - showvalue If FALSE the cell value is hidden. Default TRUE.
  - gradient If FALSE colour gradient is removed. Default TRUE.
  - border If FALSE the border around the database is hidden. Default TRUE.

If type == "duplicates"

- style is a Style object. See createStyle
- rule is ignored.

If type == "contains"

- style is a Style object. See createStyle
- rule is the text to look for within cells

If type == "between"

- style is a Style object. See createStyle
- rule is a numeric vector of length 2 specifying lower and upper bound (Inclusive)

    type = "databar", style = c("#a6a6a6", "#a6a6a6"), showValue = FALSE, gradient = FALSE)

saveWorkbook(wb, file = "databarExample.xlsx", overwrite = TRUE)

---

**convertFromExcelRef**

Convert excel column name to integer index

**Description**

Convert excel column name to integer index e.g. "J" to 10

**Usage**

convertFromExcelRef(col)

**Arguments**

- **col**
  - An excel column reference

**Examples**

convertFromExcelRef("DOG")
convertFromExcelRef("COW")

## numbers will be removed
countFromExcelRef("R22")

---

**convertToDate**

Convert from excel date number to R Date type

**Description**

Convert from excel date number to R Date type

**Usage**

convertToDate(x, origin = "1900-01-01", ...)

---

**conditionalFormatting**

Apply conditional formatting to a given Excel range.

**Arguments**

- **wb**: The Excel workbook object.
- **range**: The range to apply formatting to.
- **type**: The type of conditional formatting to apply (e.g., "databar").
- **style**: The styles to apply (e.g., color codes).
- **showValue**: Whether to show the value in the format.
- **gradient**: Whether to use a gradient for the formatting.

**Examples**

conditionalFormatting(wb, "databar", cols = 7, rows = 1:11,
    type = "databar", style = c("#a6a6a6"), showValue = FALSE, gradient = FALSE)

writeData(wb, "databar", -5:5, startCol = 9)
conditionalFormatting(wb, "databar", cols = 9, rows = 1:11,
    type = "databar", style = c("#a6a6a6", "#a6a6a6"), showValue = FALSE, gradient = FALSE)

saveWorkbook(wb, file = "databarExample.xlsx", overwrite = TRUE)
convertToDateTime

Arguments

|x| A vector of integers |
|origin| date. Default value is for Windows Excel 2010 |
|...| additional parameters passed to as.Date() |

Details

Excel stores dates as number of days from some origin day

See Also

writeData

Examples

```r
#2014 April 21st to 25th
cvtColor(c(41750, 41751, 41752, 41753, 41754, NA) )
cvtColor(c(41750.2, 41751.99, NA, 41753 ))
```

Description

Convert from excel time number to R POSIXct type.

Usage

```
convertToDateTime(x, origin = "1900-01-01", ...)
```

Arguments

|x| A numeric vector |
|origin| date. Default value is for Windows Excel 2010 |
|...| Additional parameters passed to as.POSIXct |

Details

Excel stores dates as number of days from some origin date

Examples

```r
x <- c(41821.8127314815, 41820.8127314815, NA, 41819, NaN)
convertToDateTime(x)
convertToDateTime(x, tz = "Australia/Perth")
```
copyWorkbook

Copy a Workbook object.

Description

Just a wrapper of wb$copy()

Usage

copyWorkbook(wb)

Arguments

wb  A workbook object

Value

Workbook

Examples

wb <- createWorkbook()
w2b <- wb  ## does not create a copy
wb3 <- copyWorkbook(wb)  ## wrapper for wb$copy()

addWorksheet(wb, "Sheet1")  ## adds worksheet to both wb and w2b but not wb3

names(wb)
names(wb2)
names(wb3)

createComment

create a Comment object

Description

Create a cell Comment object to pass to writeComment()

Usage

createComment(comment, author = Sys.getenv("USERNAME"), style = NULL,
visible = TRUE, width = 2, height = 4)
createNamedRegion

Create a named region.

Description
Create a named region

Usage
createNamedRegion(wb, sheet, cols, rows, name)
createNamedRegion

Arguments

- **wb**: A workbook object
- **sheet**: A name or index of a worksheet
- **cols**: Numeric vector specifying columns to include in region
- **rows**: Numeric vector specifying rows to include in region
- **name**: Name for region. A character vector of length 1. Note region names must be case-insensitive unique.

Details

Region is given by: \( \min(\text{cols}) : \max(\text{cols}) \times \min(\text{rows}) : \max(\text{rows}) \)

Author(s)

Alexander Walker

See Also

getNamedRegions

Examples

```r
## create named regions
wb <- createWorkbook()
addWorksheet(wb, "Sheet 1")

## specify region
writeData(wb, sheet = 1, x = iris, startCol = 1, startRow = 1)
createNamedRegion(wb = wb,
                   sheet = 1,
                   name = "iris",
                   rows = 1:(nrow(iris)+1),
                   cols = 1:ncol(iris))

## using writeData 'name' argument
writeData(wb, sheet = 1, x = iris, name = "iris2", startCol = 10)

out_file <- tempfile(fileext = ".xlsx")
saveWorkbook(wb, out_file, overwrite = TRUE)

## see named regions
getNamedRegions(wb) ## From Workbook object
getNamedRegions(out_file) ## From xlsx file

## read named regions
df <- read.xlsx(wb, namedRegion = "iris")
head(df)

df <- read.xlsx(out_file, namedRegion = "iris2")
head(df)
```
createStyle

Create a cell style

Description

Create a new style to apply to worksheet cells

Usage

createStyle(fontName = NULL, fontSize = NULL, fontColour = NULL, numFmt = "GENERAL", border = NULL, borderColour = getOption("openxlsx.borderColour", "black"), borderStyle = getOption("openxlsx.borderStyle", "thin"), bgFill = NULL, fgFill = NULL, halign = NULL, valign = NULL, textDecoration = NULL, wrapText = FALSE, textRotation = NULL, indent = NULL)

Arguments

fontName A name of a font. Note the font name is not validated. If fontName is NULL, the workbook base font is used. (Defaults to Calibri)

fontSize Font size. A numeric greater than 0. If fontSize is NULL, the workbook base font size is used. (Defaults to 11)

fontColour Colour of text in cell. A valid hex colour beginning with "#" or one of colours(). If fontColour is NULL, the workbook base font colours is used. (Defaults to black)

numFmt Cell formatting

- GENERAL
- NUMBER
- CURRENCY
- ACCOUNTING
- DATE
- LONGDATE
- TIME
- PERCENTAGE
- FRACTION
- SCIENTIFIC
- TEXT
- COMMA for comma separated thousands
- For date/datetime styling a combination of d, m, y and punctuation marks
- For numeric rounding use "0.00" with the preferred number of decimal places

border Cell border. A vector of "top", "bottom", "left", "right" or a single string).

- "top" Top border
**createStyle**

- **bottom** Bottom border
- **left** Left border
- **right** Right border
- **TopBottom** or `c("top", "bottom")` Top and bottom border
- **LeftRight** or `c("left", "right")` Left and right border
- **TopLeftRight** or `c("top", "left", "right")` Top, Left and right border
- **TopBottomLeftRight** or `c("top", "bottom", "left", "right")` All borders

**borderColour**  
Colour of cell border vector the same length as the number of sides specified in "border". A valid colour (belonging to `colours()`) or a valid hex colour beginning with "#".

**borderStyle**  
Border line style vector the same length as the number of sides specified in "border"

- **none** No Border
- **thin** thin border
- **medium** medium border
- **dashed** dashed border
- **dotted** dotted border
- **thick** thick border
- **double** double line border
- **hair** Hairline border
- **mediumDashed** medium weight dashed border
- **dashDot** dash-dot border
- **mediumDashDot** medium weight dash-dot border
- **dashDotDot** dash-dot-dot border
- **mediumDashDotDot** medium weight dash-dot-dot border
- **slantDashDot** slanted dash-dot border

**bgFill**  
Cell background fill colour. A valid colour (belonging to `colours()`) or a valid hex colour beginning with "#". – **Use for conditional formatting styles only.**

**fgFill**  
Cell foreground fill colour. A valid colour (belonging to `colours()`) or a valid hex colour beginning with "#"

**halign**  
Horizontal alignment of cell contents

- **left** Left horizontal align cell contents
- **right** Right horizontal align cell contents
- **center** Center horizontal align cell contents

**valign**  
A name Vertical alignment of cell contents

- **top** Top vertical align cell contents
- **center** Center vertical align cell contents
- **bottom** Bottom vertical align cell contents

**textDecoration**  
Text styling.

- **bold** Bold cell contents
- **strikeout** Strikeout cell contents
createStyle

- **italic** Italicise cell contents
- **underline** Underline cell contents
- **underline2** Double underline cell contents

**wrapText**
Logical. If TRUE cell contents will wrap to fit in column.

**textRotation**
Rotation of text in degrees. 255 for vertical text.

**indent**
Horizontal indentation of cell contents.

**Value**
A style object

**Author(s)**
Alexander Walker

**See Also**
addStyle

**Examples**

```r
## See package vignettes for further examples

## Modify default values of border colour and border line style
options("openxlsx.borderColour" = "#4F80BD")
options("openxlsx.borderStyle" = "thin")

## Size 18 Arial, Bold, left horz. aligned, fill colour #1A33CC, all borders,
## style <- createStyle(fontSize = 18,fontName = "Arial",
## textDecoration = "bold", halign = "left", fgFill = "#1A33CC", border= "TopBottomLeftRight")

## Red, size 24, Bold, italic, underline, center aligned Font, bottom border
## style <- createStyle(fontSize = 24, fontColour = rgb(1,0,0),
## textDecoration = c("bold", "italic", "underline"),
## halign = "center", valign = "center", border = "Bottom")

# borderColour is recycled for each border or all colours can be supplied

# colour is recycled 3 times for "Top", "Bottom" & "Right" sides.
createStyle(border = "TopBottomRight", borderColour = "red")

# supply all colours
createStyle(border = "TopBottomLeft", borderColour = c("red", "yellow", "green"))
```
createWorkbook

Create a new Workbook object

Description
Create a new Workbook object

Usage
createWorkbook(creator = ifelse(.Platform$OS.type == "windows", Sys.getenv("USERNAME"), Sys.getenv("USER")), title = NULL, subject = NULL, category = NULL)

Arguments
- creator: Creator of the workbook (your name). Defaults to login username
- title: Workbook properties title
- subject: Workbook properties subject
- category: Workbook properties category

Value
Workbook object

Author(s)
Alexander Walker

See Also
loadWorkbook
saveWorkbook

Examples
```r
## Create a new workbook
wb <- createWorkbook()

## Save workbook to working directory
saveWorkbook(wb, file = "createWorkbookExample.xlsx", overwrite = TRUE)

## Set Workbook properties
wb <- createWorkbook(creator = "Me",
                     title = "title here",
                     subject = "this & that",
                     category = "something")
```
dataValidation

Add data validation to cells

Description
Add Excel data validation to cells

Usage

dataValidation(wb, sheet, cols, rows, type, operator, value,
allowBlank = TRUE, showInputMsg = TRUE, showErrMsg = TRUE)

Arguments

- wb: A workbook object
- sheet: A name or index of a worksheet
- cols: Columns to apply conditional formatting to
- rows: Rows to apply conditional formatting to
- type: One of 'whole', 'decimal', 'date', 'time', 'textLength', 'list' (see examples)
- operator: One of 'between', 'notBetween', 'equal', 'notEqual', 'greaterThan', 'lessThan', 'greaterThanOrEqual', 'lessThanOrEqual'
- value: a vector of length 1 or 2 depending on operator (see examples)
- allowBlank: logical
- showInputMsg: logical
- showErrMsg: logical

Examples

```r
wb <- createWorkbook()
addWorksheet(wb, "Sheet 1")
addWorksheet(wb, "Sheet 2")
writeDataTable(wb, 1, x = iris[1:10,])
dataValidation(wb, 1, col = 1:3, rows = 2:31, type = "whole"
, operator = "between", value = c(1, 9))
dataValidation(wb, 1, col = 5, rows = 2:31, type = "textLength"
, operator = "between", value = c(4, 6))

## Date and Time cell validation
df <- data.frame("d" = as.Date("2016-01-01") + 5:5,
"t" = as.POSIXct("2016-01-01") + 5:5*10000)
writeData(wb, 2, x = df)
```
deleteData

Data Validation

```r
dataValidation(wb, 2, col = 1, rows = 2:12, type = "date",
operator = "greaterThanOrEqual", value = as.Date("2016-01-01"))
dataValidation(wb, 2, col = 2, rows = 2:12, type = "time",
operator = "between", value = df$t[c(4, 8)])
```

```r
saveWorkbook(wb, "dataValidationExample.xlsx", overwrite = TRUE)
```

```r
# If type == 'list'
# operator argument is ignored.
wb <- createWorkbook()
addWorksheet(wb, "Sheet 1")
addWorksheet(wb, "Sheet 2")
writeDataTable(wb, sheet = 1, x = iris[1:30,])
writeData(wb, sheet = 2, x = sample(iris$Sepal.Length, 10))
dataValidation(wb, 1, col = 1, rows = 2:31, type = "list", value = "'Sheet 2'!$A$1:$A$10")
```

---

deleteData

**Delete cell data**

**Description**

Delete contents and styling from a cell.

**Usage**

```r
deleteData(wb, sheet, cols, rows, gridExpand = FALSE)
```

**Arguments**

- **wb**  
  A workbook object
- **sheet**  
  A name or index of a worksheet
- **cols**  
  Columns to delete data from.
- **rows**  
  Rows to delete data from.
- **gridExpand**  
  If TRUE, all data in rectangle min(rows):max(rows) X min(cols):max(cols) will be removed.

**Author(s)**

Alexander Walker
Examples

```r
## write some data
wb <- createWorkbook()
addWorksheet(wb, "Worksheet 1")
x <- data.frame(matrix(runif(200), ncol = 10))
writeData(wb, sheet = 1, x = x, startCol = 2, startRow = 3, colNames = FALSE)

## delete some data
deletedata(wb, sheet = 1, cols = 3:5, rows = 5:7, gridExpand = TRUE)
deletedata(wb, sheet = 1, cols = 7:9, rows = 5:7, gridExpand = TRUE)
deletedata(wb, sheet = 1, cols = LETTERS, rows = 18, gridExpand = TRUE)

saveWorkbook(wb, "deleteDataExample.xlsx", overwrite = TRUE)
```

### freezePane

_Freeze a worksheet pane_

**Description**

Freeze a worksheet pane

**Usage**

```r
freezePane(wb, sheet, firstActiveRow = NULL, firstActiveCol = NULL,
          firstRow = FALSE, firstCol = FALSE)
```

**Arguments**

- `wb`: A workbook object
- `sheet`: A name or index of a worksheet
- `firstActiveRow`: Top row of active region
- `firstActiveCol`: Furthest left column of active region
- `firstRow`: If TRUE, freezes the first row (equivalent to `firstActiveRow = 2`)
- `firstCol`: If TRUE, freezes the first column (equivalent to `firstActiveCol = 2`)

**Author(s)**

Alexander Walker

**Examples**

```r
## Create a new workbook
wb <- createWorkbook("Kenshin")

## Add some worksheets
addWorksheet(wb, "Sheet 1")
addWorksheet(wb, "Sheet 2")
```
**getBaseFont**

_Return the workbook default font_

### Description

Return the workbook default font.

Returns the base font used in the workbook.

### Usage

`getBaseFont(wb)`

### Arguments

- **wb**
  
  A workbook object

### Author(s)

Alexander Walker

### Examples

```r
## create a workbook
wb <- createWorkbook()
getBaseFont(wb)

## modify base font to size 10 Arial Narrow in red
modifyBaseFont(wb, fontSize = 10, fontColour = "#FF0000", fontName = "Arial Narrow")

getBaseFont(wb)
```
**getCellRefs**  
*Return excel cell coordinates from (x,y) coordinates*

**Description**  
Return excel cell coordinates from (x,y) coordinates

**Usage**

```r
getCellRefs(cellCoords)
```

**Arguments**

- `cellCoords`: A data.frame with two columns coordinate pairs.

**Value**

Excel alphanumeric cell reference

**Author(s)**

Alexander Walker

---

**getDateOrigin**  
*Get the date origin an xlsx file is using*

**Description**

Return the date origin used internally by an xlsx or xlsm file

**Usage**

```r
dateGetOrigin(xlsxFile)
```

**Arguments**

- `xlsxFile`: An xlsx or xlsm file.

**Details**

Excel stores dates as the number of days from either 1904-01-01 or 1900-01-01. This function checks the date origin being used in an Excel file and returns it so it can be used in `convertToDate`

**Value**

One of "1900-01-01" or "1904-01-01".
getNamedRegions

Author(s)

Alexander Walker

See Also

convertToDate

Examples

## create a file with some dates
write.xlsx(as.Date("2015-01-10") - (0:4), file = "getDateTimeExample.xlsx")

m <- read.xlsx("getDateTimeExample.xlsx")

## convert to dates

do <- getDateTime(system.file("readTest.xlsx", package = "openxlsx"))
convertToDate(m[[1]], do)

---

getNamedRegions  Get named regions

Description

Return a vector of named regions in a xlsx file or Workbook object

Usage

getNamedRegions(x)

Arguments

x  An xlsx file or Workbook object

See Also

createNamedRegion

Examples

## create named regions
wb <- createWorkbook()
addWorksheet(wb, "Sheet 1")

## specify region
writeData(wb, sheet = 1, x = iris, startCol = 1, startRow = 1)
createNamedRegion(wb = wb,

    sheet = 1,
    name = "iris",

    )
getSheetNames

Get names of worksheets

Description

Returns the worksheet names within an xlsx file

Usage

gSheetNames(file)

Arguments

file An xlsx or xslm file.

Value

Character vector of worksheet names.

Author(s)

Alexander Walker

Examples

getSheetNames(system.file("readTest.xlsx", package = "openxlsx"))
getStyles

Returns a list of all styles in the workbook

Description

Returns list of style objects in the workbook

Usage

getStyles(wb)

Arguments

wb A workbook object

See Also

replaceStyle

Examples

## load a workbook
wb <- loadWorkbook(file = system.file("loadExample.xlsx", package = "openxlsx"))
geatures(wb)[1:3]

getTables

List Excel tables in a workbook

Description

List Excel tables in a workbook

Usage

gettables(wb, sheet)

Arguments

wb A workbook object
sheet A name or index of a worksheet

Value

character vector of table names on the specified sheet
Examples

```
wb <- createWorkbook()
addWorksheet(wb, sheetName = "Sheet 1")
writeDataTable(wb, sheet = "Sheet 1", x = iris)
writeDataTable(wb, sheet = 1, x = mtcars, tableName = "mtcars", startCol = 10)

getTables(wb, sheet = "Sheet 1")
```

---

**insertImage**

*Insert an image into a worksheet*

**Description**

Insert an image into a worksheet

**Usage**

```
insertImage(wb, sheet, file, width = 6, height = 3, startRow = 1,
            startCol = 1, units = "in", dpi = 300)
```

**Arguments**

- **wb**: A workbook object
- **sheet**: A name or index of a worksheet
- **file**: An image file. Valid file types are: jpeg, png, bmp
- **width**: Width of figure.
- **height**: Height of figure.
- **startRow**: Row coordinate of upper left corner of the image
- **startCol**: Column coordinate of upper left corner of the image
- **units**: Units of width and height. Can be "in", "cm" or "px"
- **dpi**: Image resolution used for conversion between units.

**Author(s)**

Alexander Walker

**See Also**

- insertPlot
Examples

```r
## Create a new workbook
wb <- createWorkbook("Ayanami")

## Add some worksheets
addWorksheet(wb, "Sheet 1")
addWorksheet(wb, "Sheet 2")
addWorksheet(wb, "Sheet 3")

## Insert images
img <- system.file("einstein.jpg", package = "openxlsx")
insertImage(wb, "Sheet 1", img, startRow = 5, startCol = 3, width = 6, height = 5)
insertImage(wb, 2, img, startRow = 2, startCol = 2)
insertImage(wb, 3, img, width = 15, height = 12, startRow = 3, startCol = "G", units = "cm")

## Save workbook
saveWorkbook(wb, "insertImageExample.xlsx", overwrite = TRUE)
```

---

**insertPlot**  
*Insert the current plot into a worksheet*

**Description**

The current plot is saved to a temporary image file using dev.copy. This file is then written to the workbook using insertImage.

**Usage**

```
insertPlot(wb, sheet, width = 6, height = 4, xy = NULL, startRow = 1, startCol = 1, fileType = "png", units = "in", dpi = 300)
```

**Arguments**

- **wb**: A workbook object
- **sheet**: A name or index of a worksheet
- **width**: Width of figure. Defaults to 6in.
- **height**: Height of figure. Defaults to 4in.
- **xy**: Alternate way to specify startRow and startCol. A vector of length 2 of form (startCol, startRow)
- **startRow**: Row coordinate of upper left corner of figure. xy[[2]] when xy is given.
- **startCol**: Column coordinate of upper left corner of figure. xy[[1]] when xy is given.
- **fileType**: File type of image
- **units**: Units of width and height. Can be "in", "cm" or "px"
- **dpi**: Image resolution
Author(s)
Alexander Walker

See Also
insertImage

Examples

```r
## Not run:
## Create a new workbook
wb <- createWorkbook()

## Add a worksheet
addWorksheet(wb, "Sheet 1", gridLines = FALSE)

## create plot objects
require(ggplot2)
p1 <- qplot(mpg, data=mtcars, geom="density",
    fill=as.factor(gear), alpha=1(.5), main="Distribution of Gas Mileage")
p2 <- qplot(age, circumference,
    data = Orange, geom = c("point", "line"), colour = Tree)

## Insert currently displayed plot to sheet 1, row 1, column 1
print(p1) #plot needs to be showing
insertPlot(wb, 1, width = 5, height = 3.5, fileType = "png", units = "in")

## Insert plot 2
print(p2)
insertPlot(wb, 1, xy = c("J", 2), width = 16, height = 10, fileType = "png", units = "cm")

## Save workbook
saveWorkbook(wb, "insertPlotExample.xlsx", overwrite = TRUE)

## End(Not run)
```

int2col  
Convert integer to Excel column

Description

Converts an integer to an Excel column label.

Usage

```r
int2col(x)
```

Arguments

- `x` A numeric vector
**loadWorkbook**

*Load an existing .xlsx file*

**Examples**

```r
int2col(1:10)
```

**Description**

`loadWorkbook` returns a workbook object conserving styles and formatting of the original .xlsx file.

**Usage**

```r
loadWorkbook(file, xlsxFile = NULL)
```

**Arguments**

- `file`: A path to an existing .xlsx or .xlsm file
- `xlsxFile`: alias for file

**Value**

Workbook object.

**Author(s)**

Alexander Walker

**See Also**

`removeWorksheet`

**Examples**

```r
## load existing workbook from package folder
wb <- loadWorkbook(file = system.file("loadExample.xlsx", package = "openxlsx"))
names(wb) # list worksheets
wb ## view object
## Add a worksheet
addWorksheet(wb, "A new worksheet")

## Save workbook
saveWorkbook(wb, "loadExample.xlsx", overwrite = TRUE)
```
makeHyperlinkString  

**create Excel hyperlink string**

**Description**

Wrapper to create internal hyperlink string to pass to writeFormula()

**Usage**

`makeHyperlinkString(sheet, row = 1, col = 1, text = NULL, file = NULL)`

**Arguments**

- **sheet**: Name of a worksheet
- **row**: integer row number for hyperlink to link to
- **col**: column number of letter for hyperlink to link to
- **text**: display text
- **file**: Excel file name to point to. If NULL hyperlink is internal.

**See Also**

`writeFormula`

**Examples**

```r
## Writing internal hyperlinks
wb <- createWorkbook()
addWorksheet(wb, "Sheet1")
addWorksheet(wb, "Sheet2")
addWorksheet(wb, "Sheet 3")
writeData(wb, sheet = 3, x = iris)

## External Hyperlink
names(x) <- c("google", "google Aus")
class(x) <- "hyperlink"

writeData(wb, sheet = 1, x = x, startCol = 10)

## Internal Hyperlink - create hyperlink formula manually
writeFormula(wb, "Sheet1", x = '=HYPERLINK("#Sheet2!B3", "Text to Display - Link to Sheet2")', startCol = 3)

## Internal - No text to display using makeHyperlinkString() function
writeFormula(wb, "Sheet1", startRow = 1
, x = makeHyperlinkString(sheet = "Sheet 3", row = 1, col = 2))
```
mergeCells

Merge cells within a worksheet

Description

Merge cells within a worksheet

Usage

mergeCells(wb, sheet, cols, rows)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wb</td>
<td>A workbook object</td>
</tr>
<tr>
<td>sheet</td>
<td>A name or index of a worksheet</td>
</tr>
<tr>
<td>cols</td>
<td>Columns to merge</td>
</tr>
<tr>
<td>rows</td>
<td>corresponding rows to merge</td>
</tr>
</tbody>
</table>

Details

As merged region must be rectangular, only min and max of cols and rows are used.

Author(s)

Alexander Walker

See Also

removeCellMerge
modifyBaseFont

**modifyBaseFont**  
* Modify the default font

**Description**
Modify the default font for this workbook

**Usage**

```
modifyBaseFont(wb, fontSize = 11, fontColour = "black", 
               fontName = "Calibri")
```

**Arguments**

- **wb**: A workbook object
- **fontSize**: font size
- **fontColour**: font colour
- **fontName**: Name of a font
Details

The font name is not validated in anyway. Excel replaces unknown font names with Arial. Base font is black, size 11, Calibri.

Author(s)

Alexander Walker

Examples

```r
## create a workbook
wb <- createWorkbook()
addWorksheet(wb, "S1")
## modify base font to size 10 Arial Narrow in red
modifyBaseFont(wb, fontSize = 10, fontColour = "#FF0000", fontName = "Arial Narrow")

writeData(wb, "S1", iris)
writeDataTable(wb, "S1", x = iris, startCol = 10) ## font colour does not affect tables
saveWorkbook(wb, "modifyBaseFontExample.xlsx", overwrite = TRUE)
```

**names**

*get or set worksheet names*

Description

get or set worksheet names

Usage

```r
## S3 method for class 'Workbook'
names(x)
```

```r
## S3 replacement method for class 'Workbook'
names(x) <- value
```

Arguments

- `x` A Workbook object
- `value` a character vector the same length as `wb`

Examples

```r
wb <- createWorkbook()
addWorksheet(wb, "S1")
addWorksheet(wb, "S2")
addWorksheet(wb, "S3")
```
**openXL**

*Open a Microsoft Excel file (xls/xlsx) or an openxlsx Workbook*

**Description**

This function tries to open a Microsoft Excel (xls/xlsx) file or an openxlsx Workbook with the proper application, in a portable manner.

In Windows (c) and Mac (c), it uses system default handlers, given the file type.

In Linux it searches (via `which`) for available xls/xlsx reader applications (unless `options('openxlsx.excelApp')` is set to the app bin path), and if it finds anything, sets `options('openxlsx.excelApp')` to the program chosen by the user via a menu (if many are present, otherwise it will set the only available).

Currently searched for apps are Libreoffice/Openoffice (soffice bin), Gnumeric (gnumeric) and Calligra Sheets (calligrasheets).

**Usage**

```r
openXL(file=NULL)
```

**Arguments**

- `file` path to the Excel (xls/xlsx) file or Workbook object.

**Author(s)**

Luca Braglia

**Examples**

```r
# file example
ex <- example(writeData)
#openXL("writeDataExample.xlsx")

# (not yet saved) Workbook example
wb <- createWorkbook()
x <- mtcars[1:6,]
addWorksheet(wb, "Cars")
writeData(wb, "Cars", x, startCol = 2, startRow = 3, rowNames = TRUE)
#openXL(wb)
```
openxlsx  

**xlsx reading, writing and editing.**

**Description**

openxlsx simplifies the process of writing and styling Excel xlsx files from R and removes the dependency on Java.

**Details**

The openxlsx package uses global options to simplify formatting:

- `options("openxlsx.borderColour" = "black")`
- `options("openxlsx.borderStyle" = "thin")`
- `options("openxlsx.dateFormat" = "mm/dd/yyyy")`
- `options("openxlsx.datetimeFormat" = "yyyy-mm-dd hh:mm:ss")`
- `options("openxlsx.numFmt" = NULL)`
- `options("openxlsx.pageSize" = 9) ## A4`
- `options("openxlsx.orientation" = "portrait") ## page orientation`

See the Formatting vignette for examples.

**Additional options**

- `options("openxlsx.compressionLevel" = "9") ## set zip compression level, default is "1".``

**See Also**

- `vignette("Introduction", package = "openxlsx")`
- `vignette("formatting", package = "openxlsx")`
- `writeData`
- `writeDataTable`
- `write.xlsx`
- `read.xlsx`

for examples
pageBreak  

*add a page break to a worksheet*

**Description**

insert page breaks into a worksheet

**Usage**

```r
pageBreak(wb, sheet, i, type = "row")
```

**Arguments**

- `wb`  
  A workbook object
- `sheet`  
  A name or index of a worksheet
- `i`  
  row or column number to insert page break.
- `type`  
  One of "row" or "column" for a row break or column break.

**See Also**

`addWorksheet`

**Examples**

```r
wb <- createWorkbook()
addWorksheet(wb, "Sheet 1")
writeData(wb, sheet = 1, x = iris)

pageBreak(wb, sheet = 1, i = 10, type = "row")
pageBreak(wb, sheet = 1, i = 20, type = "row")
pageBreak(wb, sheet = 1, i = 2, type = "column")

saveWorkbook(wb, "pageBreakExample.xlsx", TRUE)
```

## pageSetup

*Set page margins, orientation and print scaling*

**Description**

Set page margins, orientation and print scaling
Usage

pageSetup(wb, sheet, orientation = NULL, scale = 100, left = 0.7, 
           right = 0.7, top = 0.75, bottom = 0.75, header = 0.3, footer = 0.3, 
           fitToWidth = FALSE, fitToHeight = FALSE, paperSize = NULL, 
           printTitleRows = NULL, printTitleCols = NULL)

Arguments

wb               A workbook object
sheet            A name or index of a worksheet
orientation      Page orientation. One of "portrait" or "landscape"
scale            Print scaling. Numeric value between 10 and 400
left             left page margin in inches
right            right page margin in inches
top              top page margin in inches
bottom           bottom page margin in inches
header           header margin in inches
footer           footer margin in inches
fitToWidth       If TRUE, worksheet is scaled to fit to page width on printing.
fitToHeight      If TRUE, worksheet is scaled to fit to page height on printing.
paperSize        See details. Default value is 9 (A4 paper).
printTitleRows   Rows to repeat at top of page when printing. Integer vector.
printTitleCols   Columns to repeat at left when printing. Integer vector.

Details

paperSize is an integer corresponding to:

- 1 Letter paper (8.5 in. by 11 in.)
- 2 Letter small paper (8.5 in. by 11 in.)
- 3 Tabloid paper (11 in. by 17 in.)
- 4 Ledger paper (17 in. by 11 in.)
- 5 Legal paper (8.5 in. by 14 in.)
- 6 Statement paper (5.5 in. by 8.5 in.)
- 7 Executive paper (7.25 in. by 10.5 in.)
- 8 A3 paper (297 mm by 420 mm)
- 9 A4 paper (210 mm by 297 mm)
- 10 A4 small paper (210 mm by 297 mm)
- 11 A5 paper (148 mm by 210 mm)
- 12 B4 paper (250 mm by 353 mm)
- 13 B5 paper (176 mm by 250 mm)
• 14 Folio paper (8.5 in. by 13 in.)
• 15 Quarto paper (215 mm by 275 mm)
• 16 Standard paper (10 in. by 14 in.)
• 17 Standard paper (11 in. by 17 in.)
• 18 Note paper (8.5 in. by 11 in.)
• 19 #9 envelope (3.875 in. by 8.875 in.)
• 20 #10 envelope (4.125 in. by 9.5 in.)
• 21 #11 envelope (4.5 in. by 10.375 in.)
• 22 #12 envelope (4.75 in. by 11 in.)
• 23 #14 envelope (5 in. by 11.5 in.)
• 24 C paper (17 in. by 22 in.)
• 25 D paper (22 in. by 34 in.)
• 26 E paper (34 in. by 44 in.)
• 27 DL envelope (110 mm by 220 mm)
• 28 C5 envelope (162 mm by 229 mm)
• 29 C3 envelope (324 mm by 458 mm)
• 30 C4 envelope (229 mm by 324 mm)
• 31 C6 envelope (114 mm by 162 mm)
• 32 C65 envelope (114 mm by 229 mm)
• 33 B4 envelope (250 mm by 353 mm)
• 34 B5 envelope (176 mm by 250 mm)
• 35 B6 envelope (176 mm by 125 mm)
• 36 Italy envelope (110 mm by 230 mm)
• 37 Monarch envelope (3.875 in. by 7.5 in.).
• 38 6 3/4 envelope (3.625 in. by 6.5 in.)
• 39 US standard fanfold (14.875 in. by 11 in.)
• 40 German standard fanfold (8.5 in. by 12 in.)
• 41 German legal fanfold (8.5 in. by 13 in.)
• 42 ISO B4 (250 mm by 353 mm)
• 43 Japanese double postcard (200 mm by 148 mm)
• 44 Standard paper (9 in. by 11 in.)
• 45 Standard paper (10 in. by 11 in.)
• 46 Standard paper (15 in. by 11 in.)

**Examples**

```r
wb <- createWorkbook()
addWorksheet(wb, "S1")
addWorksheet(wb, "S2")
writeDataTable(wb, 1, x = iris[1:30,])
writeDataTable(wb, 2, x = iris[1:30,], xy = c("C", 5))

## landscape page scaled to 50%
pageSetup(wb, sheet = 1, orientation = "landscape", scale = 50)

## portrait page scales to 300% with 0.5in left and right margins
pageSetup(wb, sheet = 2, orientation = "portrait", scale = 300, left = 0.5, right = 0.5)

## print titles
addWorksheet(wb, "print_title_rows")
addWorksheet(wb, "print_title_cols")

writeData(wb, "print_title_rows", rbind(iris, iris, iris, iris))
writeData(wb, "print_title_cols", x = rbind(mtcars, mtcars, mtcars), rowNames = TRUE)

pageSetup(wb, sheet = "print_title_rows", printTitleRows = 1)  # first row
pageSetup(wb, sheet = "print_title_cols", printTitleCols = 1, printTitleRows = 1)

saveWorkbook(wb, "pageSetupExample.xlsx", overwrite = TRUE)
```
**read.xlsx**

*Read from an Excel file or Workbook object*

**Description**

Read data from an Excel file or Workbook object into a data.frame.

**Usage**

```r
read.xlsx(xlsxfile, sheet = 1, startRow = 1, colNames = TRUE,
          rowNames = FALSE, detectDates = FALSE, skipEmptyRows = TRUE,
          skipEmptyCols = TRUE, rows = NULL, cols = NULL, check.names = FALSE,
          namedRegion = NULL, na.strings = "NA", fillMergedCells = FALSE)
```

**Arguments**

- `xlsxfile`: An xlsx file, Workbook object or URL to xlsx file.
- `sheet`: The name or index of the sheet to read data from.
- `startRow`: first row to begin looking for data. Empty rows at the top of a file are always skipped, regardless of the value of startRow.
- `colNames`: If true, the first row of data will be used as column names.
- `rowNames`: If true, first column of data will be used as row names.
- `detectDates`: If true, attempt to recognise dates and perform conversion.
- `skipEmptyRows`: If true, empty rows are skipped else empty rows after the first row containing data will return a row of NAs.
- `skipEmptyCols`: If true, empty columns are skipped.
- `rows`: A numeric vector specifying which rows in the Excel file to read. If NULL, all rows are read.
- `cols`: A numeric vector specifying which columns in the Excel file to read. If NULL, all columns are read.
- `check.names`: logical. If TRUE then the names of the variables in the data frame are checked to ensure that they are syntactically valid variable names.
- `namedRegion`: A named region in the Workbook. If not NULL startRow, rows and cols parameters are ignored.
- `na.strings`: A character vector of strings which are to be interpreted as NA. Blank cells will be returned as NA.
- `fillMergedCells`: If TRUE, the value in a merged cell is given to all cells within the merge.

**Details**

Formulae written using `writeFormula` to a Workbook object will not get picked up by `read.xlsx()`. This is because only the formula is written and left to be evaluated when the file is opened in Excel. Opening, saving and closing the file with Excel will resolve this.
Value
data.frame

#head(read.xlsx(xlsxFile))
```

---

**readWorkbook**  
Read from an Excel file or Workbook object

**Description**

Read data from an Excel file or Workbook object into a data.frame
Usage

```r
readWorkbook(xlsxFile, sheet = 1, startRow = 1, colNames = TRUE,
             rowNames = FALSE, detectDates = FALSE, skipEmptyRows = TRUE,
             skipEmptyCols = TRUE, rows = NULL, cols = NULL, check.names = FALSE,
             namedRegion = NULL, na.strings = "NA", fillMergedCells = FALSE)
```

Arguments

- **xlsxFile**: An xlsx file, Workbook object or URL to xlsx file.
- **sheet**: The name or index of the sheet to read data from.
- **startRow**: first row to begin looking for data. Empty rows at the top of a file are always skipped, regardless of the value of startRow.
- **colNames**: If TRUE, the first row of data will be used as column names.
- **rowNames**: If TRUE, first column of data will be used as row names.
- **detectDates**: If TRUE, attempt to recognise dates and perform conversion.
- **skipEmptyRows**: If TRUE, empty rows are skipped else empty rows after the first row containing data will return a row of NAs.
- **skipEmptyCols**: If TRUE, empty columns are skipped.
- **rows**: A numeric vector specifying which rows in the Excel file to read. If NULL, all rows are read.
- **cols**: A numeric vector specifying which columns in the Excel file to read. If NULL, all columns are read.
- **check.names**: logical. If TRUE then the names of the variables in the data frame are checked to ensure that they are syntactically valid variable names
- **namedRegion**: A named region in the Workbook. If not NULL startRow, rows and cols parameters are ignored.
- **na.strings**: A character vector of strings which are to be interpreted as NA. Blank cells will be returned as NA.
- **fillMergedCells**: If TRUE, the value in a merged cell is given to all cells within the merge.

Details

Creates a data.frame of all data in worksheet.

Value

- data.frame

read.xlsx

Examples

```r
xlsxFile <- system.file("readTest.xlsx", package = "openxlsx")
df1 <- readWorkbook(xlsxFile = xlsxFile, sheet = 1)

xlsxFile <- system.file("readTest.xlsx", package = "openxlsx")
df1 <- readWorkbook(xlsxFile = xlsxFile, sheet = 1, rows = c(1, 3, 5), cols = 1:3)
```

Description

Unmerges any merged cells that intersect with the region specified by, min(cols):max(cols) X min(rows):max(rows)

Usage

```r
removeCellMerge(wb, sheet, cols, rows)
```

Arguments

- `wb`: A workbook object
- `sheet`: A name or index of a worksheet
- `cols`: vector of column indices
- `rows`: vector of row indices

Examples

```r
## Create a new workbook
wb <- loadWorkbook(file = system.file("loadExample.xlsx", package = "openxlsx"))

## remove column widths in columns 1 to 20
removeColWidths(wb, 1, cols = 1:20)
saveWorkbook(wb, "removeColWidthsExample.xlsx", overwrite = TRUE)
```

removeComment  
Remove a comment from a cell

Description

Remove a cell comment from a worksheet

Usage

removeComment(wb, sheet, cols, rows, gridExpand = TRUE)
removeFilter

Arguments

wb A workbook object
sheet A vector of names or indices of worksheets
cols Columns to delete comments from
rows Rows to delete comments from
gridExpand If TRUE, all data in rectangle min(rows):max(rows) X min(cols):max(cols) will be removed.

See Also

createComment
writeComment

Description

Removes filters from addFilter() and writeData()

Usage

removeFilter(wb, sheet)

Arguments

wb A workbook object
sheet A vector of names or indices of worksheets

Examples

wb <- createWorkbook()
addWorksheet(wb, "Sheet 1")
addWorksheet(wb, "Sheet 2")
addWorksheet(wb, "Sheet 3")

writeData(wb, 1, iris)
addFilter(wb, 1, row = 1, cols = 1:ncol(iris))

## Equivalently
writeData(wb, 2, x = iris, withFilter = TRUE)

## Similarly
writeDataTable(wb, 3, iris)

## remove filters
removeRowHeights

### Description

Remove row heights from a worksheet

### Usage

```r
removeRowHeights(wb, sheet, rows)
```

### Arguments

- `wb`: A workbook object
- `sheet`: A name or index of a worksheet
- `rows`: Indices of rows to remove custom height (if any) from.

### Author(s)

Alexander Walker

### See Also

- `setRowHeights`

### Examples

```r
# Create a new workbook
wb <- loadWorkbook(file = system.file("loadExample.xlsx", package = "openxlsx"))

# remove any custom row heights in rows 1 to 10
removeRowHeights(wb, 1, rows = 1:10)
saveWorkbook(wb, "removeRowHeightsExample.xlsx", overwrite = TRUE)
```
removeTable

Remove an Excel table in a workbook

Description

List Excel tables in a workbook

Usage

removeTable(wb, sheet, table)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wb</td>
<td>A workbook object</td>
</tr>
<tr>
<td>sheet</td>
<td>A name or index of a worksheet</td>
</tr>
<tr>
<td>table</td>
<td>Name of table to remove. See getTables</td>
</tr>
</tbody>
</table>

Value

character vector of table names on the specified sheet

Examples

```r
wb <- createWorkbook()
addWorksheet(wb, sheetName = "Sheet 1")
addWorksheet(wb, sheetName = "Sheet 2")
writeDataTable(wb, sheet = "Sheet 1", x = iris, tableName = "iris")
writeDataTable(wb, sheet = 1, x = mtcars, tableName = "mtcars", startCol = 10)
removeWorksheet(wb, sheet = 1)  ## delete worksheet removes table objects
writeDataTable(wb, sheet = 1, x = iris, tableName = "iris")
writeDataTable(wb, sheet = 1, x = mtcars, tableName = "mtcars", startCol = 10)
## removeTable() deletes table object and all data
getTables(wb, sheet = 1)
removeTable(wb = wb, sheet = 1, table = "iris")
writeDataTable(wb, sheet = 1, x = iris, tableName = "iris", startCol = 1)
getTables(wb, sheet = 1)
removeTable(wb = wb, sheet = 1, table = "iris")
writeDataTable(wb, sheet = 1, x = iris, tableName = "iris", startCol = 1)
saveWorkbook(wb = wb, file = "removeTableExample.xlsx", overwrite = TRUE)
```
renameWorksheet  Remove a worksheet from a workbook

Description

Remove a worksheet from a Workbook object
Remove a worksheet from a workbook

Usage

renameWorksheet(wb, sheet)

Arguments

wb  A workbook object
sheet  A name or index of a worksheet

Author(s)

Alexander Walker

Examples

```r
## load a workbook
wb <- loadWorkbook(file = system.file("loadExample.xlsx", package = "openxlsx"))

## Remove sheet 2
renameWorksheet(wb, 2)

## save the modified workbook
saveWorkbook(wb, "removeWorksheetExample.xlsx", overwrite = TRUE)
```

renameWorksheet  Rename a worksheet

Description

Rename a worksheet

Usage

renameWorksheet(wb, sheet, newName)
replaceStyle

Arguments

wb        A Workbook object containing a worksheet
sheet     The name or index of the worksheet to rename
newName   The new name of the worksheet. No longer than 31 chars.

Details

DEPRECATED. Use names

Author(s)

Alexander Walker

Examples

```r
## Create a new workbook
wb <- createWorkbook("CREATOR")

## Add 3 worksheets
addWorksheet(wb, "Worksheet Name")
addWorksheet(wb, "This is worksheet 2")
addWorksheet(wb, "Not the best name")

#' ## rename all worksheets
names(wb) <- c("A", "B", "C")

## Rename worksheet 1 & 3
renameWorksheet(wb, 1, "New name for sheet 1")
names(wb)[[1]] <- "New name for sheet 1"
names(wb)[[3]] <- "A better name"

## Save workbook
saveWorkbook(wb, "renameWorksheetExample.xlsx", overwrite = TRUE)
```

---

replaceStyle  Replace an existing cell style

Description

Replace an existing cell style

Replace a style object

Usage

replaceStyle(wb, index, newStyle)
saveWorkbook  

save Workbook to file

Description
save a Workbook object to file

Usage
saveWorkbook(wb, file, overwrite = FALSE)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wb</td>
<td>A Workbook object to write to file</td>
</tr>
<tr>
<td>file</td>
<td>A character string naming an xlsx file</td>
</tr>
<tr>
<td>overwrite</td>
<td>If TRUE, overwrite any existing file.</td>
</tr>
</tbody>
</table>
setColWidths

createWorkbook
addWorksheet
loadWorkbook
writeData
writeDataTable

Examples

## Create a new workbook and add a worksheet
wb <- createWorkbook("Creator of workbook"
addWorksheet(wb, sheetName = "My first worksheet")

## Save workbook to working directory
saveWorkbook(wb, file = "saveWorkbookExample.xlsx", overwrite = TRUE)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wb</td>
<td>A workbook object</td>
</tr>
<tr>
<td>sheet</td>
<td>A name or index of a worksheet</td>
</tr>
<tr>
<td>cols</td>
<td>Indices of cols to set width</td>
</tr>
<tr>
<td>widths</td>
<td>widths to set cols to specified in Excel column width units or &quot;auto&quot; for automatic sizing. The widths argument is recycled to the length of cols.</td>
</tr>
<tr>
<td>hidden</td>
<td>Logical vector. If TRUE the column is hidden.</td>
</tr>
<tr>
<td>ignoreMergedCells</td>
<td>Ignore any cells that have been merged with other cells in the calculation of &quot;auto&quot; column widths.</td>
</tr>
</tbody>
</table>
Details
The global min and max column width for "auto" columns is set by (default values show):

- `options("openxlsx.minWidth" = 3)
- `options("openxlsx.maxWidth" = 250) ## This is the maximum width allowed in Excel

NOTE: The calculation of column widths can be slow for large worksheets.

## auto columns
addWorksheet(wb, "Sheet 2")
writeData(wb, sheet = 2, x = iris)
setColWidths(wb, sheet = 2, cols = 1:5, widths = "auto")

## Save workbook
saveWorkbook(wb, "setColWidthsExample.xlsx", overwrite = TRUE)
```

---

**setFooter**

Set footer for all worksheets

---

Description

DEPRECATED

Usage

`setFooter(wb, text, position = "center")`
Arguments

- **wb**: A workbook object
- **text**: Footer text. A character vector of length 1.
- **position**: Position of text in footer. One of "left", "center" or "right"

Author(s)

Alexander Walker

Examples

```r
## Not run:
wb <- createWorkbook("Edgar Anderson")
addWorksheet(wb, "S1")
writeDataTable(wb, "S1", x = iris[1:30,], xy = c("C", 5))

## set all headers
setHeader(wb, "This is a header", position="center")
setHeader(wb, "To the left", position="left")
setHeader(wb, "On the right", position="right")

## set all footers
setFooter(wb, "Center Footer Here", position="center")
setFooter(wb, "Bottom left", position="left")
setFooter(wb, Sys.Date(), position="right")

saveWorkbook(wb, "headerFooterExample.xlsx", overwrite = TRUE)

## End(Not run)
```

---

**setHeader**  
Set header for all worksheets

Description

DEPRECATED

Usage

```r
setHeader(wb, text, position = "center")
```

Arguments

- **wb**: A workbook object
- **text**: Header text. A character vector of length 1.
- **position**: Position of text in header. One of "left", "center" or "right"
**Author(s)**

Alexander Walker

**Examples**

```r
## Not run:
w <- createWorkbook("Edgar Anderson")
addWorksheet(wb, "S1")
writeDataTable(wb, "S1", x = iris[1:30,], xy = c("C", 5))

## set all headers
setHeader(wb, "This is a header", position="center")
setHeader(wb, "To the left", position="left")
setHeader(wb, "On the right", position="right")

## set all footers
setFooter(wb, "Center Footer Here", position="center")
setFooter(wb, "Bottom left", position="left")
setFooter(wb, Sys.Date(), position="right")

saveWorkbook(wb, "headerFooterExample.xlsx", overwrite = TRUE)

## End(Not run)
```

---

**setHeaderFooter**  
*Set document headers and footers*

**Description**

Set document headers and footers

**Usage**

```r
setHeaderFooter(wb, sheet, header = NULL, footer = NULL,
    evenHeader = NULL, evenFooter = NULL, firstHeader = NULL,
    firstFooter = NULL)
```

**Arguments**

- **wb**  
  A workbook object
- **sheet**  
  A name or index of a worksheet
- **header**  
  document header. Character vector of length 3 corresponding to positions left, center, right. Use NA to skip a position.
- **footer**  
  document footer. Character vector of length 3 corresponding to positions left, center, right. Use NA to skip a position.
- **evenHeader**  
  document header for even pages.
- **evenFooter**  
  document footer for even pages.
**setHeaderFooter**

firstHeader  
Document header for first page only.

firstFooter  
Document footer for first page only.

**Details**

Headers and footers can contain special tags:

- **&[Page]** Page number
- **&[Pages]** Number of pages
- **&[Date]** Current date
- **&[Time]** Current time
- **&[Path]** File path
- **&[File]** File name
- **&[Tab]** Worksheet name

**Author(s)**

Alexander Walker

**See Also**

`addWorksheet` to set headers and footers when adding a worksheet

**Examples**

**Examples**  
```r
## Create a new workbook
wb <- createWorkbook()

## Add a worksheet
addWorksheet(wb, "Sheet 1")

## Set row heights
setRowHeights(wb, 1, rows = c(1,4,22,19), heights = c(24,28,32,42,33))
```
sheets

## overwrite row 1 height
setRowHeights(wb, 1, rows = 1, heights = 40)

## Save workbook
saveWorkbook(wb, "setRowHeightsExample.xlsx", overwrite = TRUE)

<table>
<thead>
<tr>
<th>sheets</th>
<th>Returns names of worksheets.</th>
</tr>
</thead>
</table>

### Description

DEPRECATED. Use names().

### Usage

sheets(wb)

### Arguments

- **wb**
  
  A workbook object

### Details

DEPRECATED. Use names

### Value

Name of worksheet(s) for a given index

### Author(s)

Alexander Walker

### See Also

- names to rename a worksheet in a Workbook

### Examples

```r
## Create a new workbook
wb <- createWorkbook()

## Add some worksheets
addWorksheet(wb, "Worksheet Name")
addWorksheet(wb, "This is worksheet 2")
addWorksheet(wb, "The third worksheet")
```
## Return names of sheets, can not be used for assignment.

```r
names(wb)
# openXL(wb)
```

```r
names(wb) <- c("A", "B", "C")
names(wb)
# openXL(wb)
```

---

### Description

Get and set worksheet visible state

### Usage

```r
sheetVisibility(wb)
```

```r
sheetVisibility(wb) <- value
```

### Arguments

- **wb**: A workbook object
- **value**: a logical/character vector the same length as `sheetVisibility(wb)`

### Value

Character vector of worksheet names. Vector of "hidden", "visible", "veryHidden"

### Examples

```r
wb <- createWorkbook()
addWorksheet(wb, sheetName = "S1", visible = FALSE)
addWorksheet(wb, sheetName = "S2", visible = TRUE)
addWorksheet(wb, sheetName = "S3", visible = FALSE)
```

```r
sheetVisibility(wb)
sheetVisibility(wb)[1] <- TRUE ## show sheet 1
sheetVisibility(wb)[2] <- FALSE ## hide sheet 2
sheetVisibility(wb)[3] <- "hidden" ## hide sheet 3
sheetVisibility(wb)[3] <- "veryHidden" ## hide sheet 3 from UI
```
**Description**

DEPRECATED - Use function `sheetVisibility()`

**Usage**

`sheetVisible(wb)`

`sheetVisible(wb) <- value`

**Arguments**

- **wb**: A workbook object
- **value**: a logical vector the same length as `sheetVisible(wb)`

**Value**

Character vector of worksheet names.

TRUE if sheet is visible, FALSE if sheet is hidden

**Author(s)**

Alexander Walker

**Examples**

```r
wb <- createWorkbook()
addWorksheet(wb, sheetName = "S1", visible = FALSE)
addWorksheet(wb, sheetName = "S2", visible = TRUE)
addWorksheet(wb, sheetName = "S3", visible = FALSE)

sheetVisible(wb)
sheetVisible(wb)[1] <- TRUE ## show sheet 1
sheetVisible(wb)[2] <- FALSE ## hide sheet 2
```
set worksheet gridlines to show or hide.

Usage

showgridlines(wb, sheet, showgridLines = FALSE)

Arguments

- wb: A workbook object
- sheet: A name or index of a worksheet
- showgridLines: A logical. If TRUE, grid lines are hidden.

Author(s)

Alexander Walker

Examples

wb <- loadWorkbook(file = system.file("loadExample.xlsx", package = "openxlsx"))
names(wb) # list worksheets in workbook
showGridLines(wb, 1, showGridLines = FALSE)
showGridLines(wb, "testing", showGridLines = FALSE)
saveWorkbook(wb, "showGridLinesExample.xlsx", overwrite = TRUE)

order of worksheets in xlsx file

Description

Get/set order of worksheets in a Workbook object

Usage

worksheetOrder(wb)

worksheetOrder(wb) <- value

Arguments

- wb: A workbook object
- value: Vector specifying order to write worksheets to file
Details

This function does not reorder the worksheets within the workbook object, it simply shuffles the order when writing to file.

Examples

```r
## setup a workbook with 3 worksheets
wb <- createWorkbook()
addWorksheet(wb = wb, sheetName = "Sheet 1", gridLines = FALSE)
writeDataTable(wb = wb, sheet = 1, x = iris)

addWorksheet(wb = wb, sheetName = "mtcars (Sheet 2)", gridLines = FALSE)
writeData(wb = wb, sheet = 2, x = mtcars)

addWorksheet(wb = wb, sheetName = "Sheet 3", gridLines = FALSE)

worksheetOrder(wb) <- c(3, 2, 1)
saveWorkbook(wb, "worksheetOrderExample2.xlsx", overwrite = TRUE)
```

Description

write data to an xlsx file

Usage

`write.xlsx(x, file, asTable = FALSE, ...)`

Arguments

- **x**: object or a list of objects that can be handled by `writeData` to write to file
- **file**: xlsx file name
- **asTable**: write using `writeDataTable` as opposed to `writeData`
- **...**: optional parameters to pass to functions:
  - createWorkbook
  - addWorksheet
• writeData
• freezePane
• saveWorkbook

see details.

Details

Optional parameters are:

createWorkbook Parameters

• creator A string specifying the workbook author

addWorksheet Parameters

• sheetName Name of the worksheet
• gridLines A logical. If FALSE, the worksheet grid lines will be hidden.
• tabColour Colour of the worksheet tab. A valid colour (belonging to colours()) or a valid hex colour beginning with "#".
• zoom A numeric between 10 and 400. Worksheet zoom level as a percentage.

writeData/writeDataTable Parameters

• startCol A vector specifying the starting column(s) to write df
• startRow A vector specifying the starting row(s) to write df
• xy An alternative to specifying startCol and startRow individually. A vector of the form c(startCol, startRow)
• colNames or col.names If TRUE, column names of x are written.
• rowNames or row.names If TRUE, row names of x are written.
• headerStyle Custom style to apply to column names.
• borders Either "surrounding", "columns" or "rows" or NULL. If "surrounding", a border is drawn around the data. If "rows", a surrounding border is drawn a border around each row. If "columns", a surrounding border is drawn with a border between each column. If "all" all cell borders are drawn.
• borderColour Colour of cell border
• borderStyle Border line style.
• keepNA If TRUE, NA values are converted to #N/A in Excel else NA cells will be empty. Defaults to FALSE.

freezePane Parameters

• firstActiveRow Top row of active region to freeze pane.
• firstActiveCol Furthest left column of active region to freeze pane.
• firstRow If TRUE, freezes the first row (equivalent to firstActiveRow = 2)
• firstCol If TRUE, freezes the first column (equivalent to firstActiveCol = 2)

colWidths Parameters
colWidths Must be value "auto". Sets all columns containing data to auto width.

saveWorkbook Parameters

overwrite Overwrite existing file (Defaults to TRUE as with write.table)

columns of x with class Date or POSIXt are automatically styled as dates and datetimes respectively.

Value

A workbook object

createStyle for style parameters

Examples

## write to working directory
options("openxlsx.borderColour" = "#4F80BD") ## set default border colour
write.xlsx(iris, file = "writeXLSX1.xlsx", colNames = TRUE, borders = "columns")
write.xlsx(iris, file = "writeXLSX2.xlsx", colNames = TRUE, borders = "surrounding")

hs <- createStyle(textDecoration = "BOLD", fontColour = "#FFFFFF", fontSize=12,
                   fontFace="Arial Narrow", fgFill = "#4F80BD")
write.xlsx(iris, file = "writeXLSX3.xlsx", colNames = TRUE, borders = "rows", headerStyle = hs)

## Lists elements are written to individual worksheets, using list names as sheet names if available
l <- list("IRIS" = iris, "MTCATS" = mtcars, matrix(runif(1000), ncol = 5))
write.xlsx(l, "writeList1.xlsx", colWidths = c(NA, "auto", "auto"))

## different sheets can be given different parameters
write.xlsx(l, "writeList2.xlsx", startCol = c(1,2,3), startRow = 2,
           asTable = c(TRUE, TRUE, FALSE), withFilter = c(TRUE, FALSE, FALSE))
writeComment

write a cell comment

Description
Write a Comment object to a worksheet

Usage
writeComment(wb, sheet, col, row, comment, xy = NULL)

Arguments
- wb: A workbook object
- sheet: A vector of names or indices of worksheets
- col: Column a column number of letter
- row: A row number.
- comment: A Comment object. See createComment.
- xy: An alternative to specifying col and row individually. A vector of the form c(col, row).

See Also
createComment

Examples
wb <- createWorkbook()
addWorksheet(wb, "Sheet 1")
c1 <- createComment(comment = "this is comment")
writeComment(wb, 1, col = "B", row = 10, comment = c1)
s1 <- createStyle(fontSize = 12, fontColour = "red", textDecoration = c("BOLD"))
s2 <- createStyle(fontSize = 9, fontColour = "black")
c2 <- createComment(comment = c("This Part Bold red\n\n", "This part black"), style = c(s1, s2))
c2
writeComment(wb, 1, col = 6, row = 3, comment = c2)
saveWorkbook(wb, file = "writeCommentExample.xlsx", overwrite = TRUE)
writeData

Write an object to a worksheet

Description
Write an object to worksheet with optional styling.

Usage
writeData(wb, sheet, x, startCol = 1, startRow = 1, xy = NULL,
colNames = TRUE, rowNames = FALSE, headerStyle = NULL,
borders = c("none", "surrounding", "rows", "columns", "all"),
borderColour = getOption("openxlsx.borderColour", "black"),
borderStyle = getOption("openxlsx.borderStyle", "thin"),
withFilter = FALSE, keepNA = FALSE, name = NULL, sep = ",", )

Arguments

wb A Workbook object containing a worksheet.
sheet The worksheet to write to. Can be the worksheet index or name.
x Object to be written. For classes supported look at the examples.
startCol A vector specifying the starting column to write to.
startRow A vector specifying the starting row to write to.
xy An alternative to specifying startCol and startRow individually. A vector of
the form c(startCol, startRow).
colNames If TRUE, column names of x are written.
rowNames If TRUE, data.frame row names of x are written.
headerStyle Custom style to apply to column names.
borders Either "none" (default), "surrounding", "columns", "rows" or respective abbreviations. If "surrounding", a border is drawn around the data. If "rows", a surrounding border is drawn with a border around each row. If "columns", a surrounding border is drawn with a border between each column. If "all" all cell borders are drawn.
borderColour Colour of cell border. A valid colour (belonging to colours() or a hex colour code, eg see here).
borderStyle Border line style
  • none no border
  • thin thin border
  • medium medium border
  • dashed dashed border
  • dotted dotted border
  • thick thick border
• **double** double line border
• **hair** hairline border
• **mediumDashed** medium weight dashed border
• **dashDot** dash-dot border
• **mediumDashDot** medium weight dash-dot border
• **dashDotDot** dash-dot-dot border
• **mediumDashDotDot** medium weight dash-dot-dot border
• **slantDashDot** slanted dash-dot border

**withFilter**  
If TRUE, add filters to the column name row. NOTE can only have one filter per worksheet.

**keepNA**  
If TRUE, NA values are converted to #N/A in Excel else NA cells will be empty.

**name**  
If not NULL, a named region is defined.

**sep**  
Only applies to list columns. The separator used to collapse list columns to a character vector e.g. `sapply(x$list_column, paste, collapse = sep)`.

### Details

Formulae written using writeFormula to a Workbook object will not get picked up by read.xlsx(). This is because only the formula is written and left to Excel to evaluate the formula when the file is opened in Excel.

### Value

`invisible(0)`

### Author(s)

Alexander Walker

### See Also

- `writeDataTable`

addWorksheet(wb, "Formula")

x <- mtcars[1:6,]
writeData(wb, "Cars", x, startCol = 2, startRow = 3, rowNames = TRUE)

#### Bordering
writeData(wb, "Cars", x, rowNames = TRUE, startCol = "O", startRow = 3,
borders="surrounding", borderColour = "black")

writeData(wb, "Cars", x, rowNames = TRUE,
startCol = 2, startRow = 12, borders="columns")

writeData(wb, "Cars", x, rowNames = TRUE,
startCol="O", startRow = 12, borders="rows")

#### Header Styles
hs1 <- createStyle(fgFill = "#DCE6F1", halign = "CENTER", textDecoration = "italic",
border = "Bottom")

writeData(wb, "Cars", x, colNames = TRUE, rowNames = TRUE, startCol="B",
startRow = 23, borders="rows", headerStyle = hs1, borderStyle = "dashed")

hs2 <- createStyle(fontColour = "#FFFFFF", fgFill = "#4F80BD",
   halign = "center", valign = "center", textDecoration = "bold",
   border = "TopBottomLeftRight")

writeData(wb, "Cars", x, colNames = TRUE, rowNames = TRUE,
startCol="O", startRow = 23, borders="columns", headerStyle = hs2)

#### Hyperlinks
## vectors/columns with class 'hyperlink' are written as hyperlinks'
v <- rep("https://CRAN.R-project.org/", 4)
names(v) <- paste("Hyperlink", 1:4) # Optional: names will be used as display text
class(v) <- 'hyperlink'
writeData(wb, "Cars", x = v, xy = c("B", 32))

########################################################################
## Formulas
## - vectors/columns with class 'formula' are written as formulas'

df <- data.frame(x=1:3, y = 1:3,
  z = paste0("A", 1:3+1L), paste0("B", 1:3+1L), sep = " + ",
  stringsAsFactors = FALSE)

class(df$z) <- c(class(df$z), "formula")

writeData(wb, sheet = "Formula", x = df)

########################################################################
## Save workbook
## Open in excel without saving file: openXL(wb)

saveWorkbook(wb, "writeDataExample.xlsx", overwrite = TRUE)

writeDataTable  Write to a worksheet as an Excel table

Description
Write to a worksheet and format as an Excel table

Usage
writeDataTable(wb, sheet, x, startCol = 1, startRow = 1, xy = NULL,
  colNames = TRUE, rowNames = FALSE, tableStyle = "TableStyleLight9",
  tableName = NULL, headerStyle = NULL, withFilter = TRUE,
  keepNA = FALSE, sep = ", ", stack = FALSE, firstColumn = FALSE,
  lastColumn = FALSE, bandedRows = TRUE, bandedCols = FALSE)

Arguments

<table>
<thead>
<tr>
<th>wb</th>
<th>A Workbook object containing a worksheet.</th>
</tr>
</thead>
<tbody>
<tr>
<td>sheet</td>
<td>The worksheet to write to. Can be the worksheet index or name.</td>
</tr>
<tr>
<td>x</td>
<td>A dataframe.</td>
</tr>
<tr>
<td>startCol</td>
<td>A vector specifying the starting column to write df</td>
</tr>
<tr>
<td>startRow</td>
<td>A vector specifying the starting row to write df</td>
</tr>
<tr>
<td>xy</td>
<td>An alternative to specifying startCol and startRow individually. A vector of the form c(startCol, startRow)</td>
</tr>
<tr>
<td>colNames</td>
<td>If TRUE, column names of x are written.</td>
</tr>
</tbody>
</table>
rowNames: If TRUE, row names of x are written.
tableStyle: Any excel table style name or "none" (see "formatting" vignette).
tableName: name of table in workbook. The table name must be unique.
headerStyle: Custom style to apply to column names.
withFilter: If TRUE, columns with have filters in the first row.
keepNA: If TRUE, NA values are converted to #N/A in Excel else NA cells will be empty.
sep: Only applies to list columns. The separator used to collapse list columns to a
character vector e.g. sapply(x$list_column, paste, collapse = sep).
stack: If TRUE the new style is merged with any existing cell styles. If FALSE, any
existing style is replaced by the new style.

The below options correspond to Excel table options:

- Header Row
- First Column
- Filter Button
- Total Row
- Last Column
- Banded Rows
- Banded Columns

- firstColumn: logical. If TRUE, the first column is bold
- lastColumn: logical. If TRUE, the last column is bold
- bandedRows: logical. If TRUE, rows are colour banded
- bandedCols: logical. If TRUE, the columns are colour banded

Details

columns of x with class Date.POSIXt, currency, accounting, hyperlink, percentage are automatically styled as dates, currency, accounting, hyperlinks, percentages respectively.

**writeFormula**

*Write a character vector as an Excel Formula*

**Description**

Write a character vector containing Excel formula to a worksheet.

**Usage**

```r
writeFormula(wb, sheet, x, startCol = 1, startRow = 1, xy = NULL)
```

**Arguments**

- **wb**
  A Workbook object containing a worksheet.
- **sheet**
  The worksheet to write to. Can be the worksheet index or name.
- **x**
  A character vector.
- **startCol**
  A vector specifying the starting column to write to.
- **startRow**
  A vector specifying the starting row to write to.
- **xy**
  An alternative to specifying `startCol` and `startRow` individually. A vector of the form `c(startCol, startRow)`.
