Package ‘oro.nifti’

October 14, 2022

Version 0.11.4

Title Rigorous - 'NIfTI' + 'ANALYZE' + 'AFNI' : Input / Output

Description Functions for the input/output and visualization of medical imaging data that follow either the 'ANALYZE', 'NIfTI' or 'AFNI' formats. This package is part of the Rigorous Analytics bundle.

Depends R (>= 2.14.0)

Suggests XML, testthat, covr, knitr, rmarkdown, rticles

Imports stats, bitops, splines, graphics, grDevices, methods, utils, abind, RNifti (>= 0.9.0)

Enhances fmri, oro.dicom

License BSD_3_clause + file LICENSE

BugReports https://github.com/bjw34032/oro.nifti/issues

afni-class

Class "afni"

Description

The AFNI class for medical imaging data.

Usage

## S4 method for signature 'afni'

show(object)

Arguments

object 

An object of class afni.

Objects from the Class

Objects can be created by calls of the form new("afni", data, dim, dimnames, ...).

Slots

.Data: Object of class "array" contains the imaging data

DATASET_RANK: Object of class "integer"

DATASET_DIMENSIONS: Object of class "integer"

TYPESTRING: Object of class "character"

SCENE_DATA: Object of class "integer"

ORIENT_SPECIFIC: Object of class "integer"

ORIGIN: Object of class "numeric"

DELTA: Object of class "numeric"

TAXIS_NUMS: Object of class "integer"

TAXIS_FLOATS: Object of class "numeric"

TAXIS_OFFSETS: Object of class "numeric"

IDCODE_STRING: Object of class "character"

IDCODE_DATE: Object of class "character"

BYTEORDER_STRING: Object of class "character"
BRICK_STATS: Object of class "numeric"
BRICK_TYPES: Object of class "integer"
BRICK_FLOAT_FACS: Object of class "numeric"
BRICK_LABS: Object of class "character"
BRICK_STAT_AUX: Object of class "numeric"
STAT_AUX: Object of class "numeric"
HISTORY_NOTE: Object of class "character"
NOTES_COUNT: Object of class "integer"
NOTE_NUMBER: Object of class "character"
TAGALIGN_MATVEC: Object of class "numeric"
VOLREG_MATVEC: Object of class "array"
VOLREG_ROTCOM: Object of class "character"
VOLREG_CENTER_OLD: Object of class "numeric"
VOLREG_CENTER_BASE: Object of class "numeric"
VOLREG_ROT_PARENT_IDCODE: Object of class "character"
VOLREG_ROT_PARENT_NAME: Object of class "character"
VOLREG_GRID_PARENT_IDCODE: Object of class "character"
VOLREG_GRID_PARENT_NAME: Object of class "character"
VOLREG_INPUT_IDCODE: Object of class "character"
VOLREG_INPUT_NAME: Object of class "character"
VOLREG_BASE_IDCODE: Object of class "character"

BRICK_KEYWORDS: Object of class "character"
anlz

Extends
Class "array", from data part.
Class "matrix", by class “array”, distance 2, with explicit test and coerce.
Class "structure", by class “array”, distance 2.
Class "vector", by class “array”, distance 3, with explicit coerce.
Class "vector", by class “array”, distance 5, with explicit test and coerce.

**anlz**  
*Constructor for Analyze*

---

Description
Constructor for Analyze class objects.

Usage

```
anlz(img = array(0, dim = rep(1, 4)), dim, datatype = 2, ...)
```

Arguments

- **img** is a multidimensional array of data.
- **dim** is the dimension of the data (default = missing).
- **datatype** is an integer that denotes the type of data contained in each voxel. See the function `convert.datatype.anlz` or the ANALYZE documentation for more details.
- **...** allows for additional ‘slots’ to be specified.

Value
An object of class anlz.
Author(s)
Brandon Whitcher <bwhitcher@gmail.com>

Examples

aim <- anlz() # default

anlz-class

Description
The ANALYZE class for medical imaging data.

Usage

## S4 method for signature 'anlz'
show(object)

Arguments

object An object of class anlz.

Objects from the Class

Objects can be created by calls of the form new("anlz", data, dim, dimnames, ...) or by calling the anlz function.

Slots

.Data: Object of class "array" contains the imaging data
sizeof_hdr: Object of class "numeric" contains the size of the header (= 348)
data_type: Object of class "character"
db_name: Object of class "character"
extents: Object of class "numeric"
session_error: Object of class "numeric"
regular: Object of class "character"

hkey_un0: Object of class "character"

dim_: Object of class "vector" contains the dimensions of the imaging data

vox_units: Object of class "character"

cal_units: Object of class "character"

unused1: Object of class "numeric"

datatype: Object of class "numeric"

bitpix: Object of class "numeric" contains the number of bits per voxel (pixel)

dim_un0: Object of class "numeric"

pixdim: Object of class "vector" contains the real-world dimensions of the imaging data

vox_offset: Object of class "numeric"

funused1: Object of class "numeric"

funused2: Object of class "numeric"

funused3: Object of class "numeric"

cal_max: Object of class "numeric" contains the maximum display intensity

cal_min: Object of class "numeric" contains the minimum display intensity

compressed: Object of class "numeric"

verified: Object of class "numeric"

glmax: Object of class "numeric"

glmin: Object of class "numeric"

descrip: Object of class "character"

aux_file: Object of class "character"

orient: Object of class "character"

origin: Object of class "numeric"

generated: Object of class "character"

scannum: Object of class "character"

patient_id: Object of class "character"

exp_date: Object of class "character"

exp_time: Object of class "character"

hist_un0: Object of class "character"

views: Object of class "numeric"

vols_added: Object of class "numeric"

start_field: Object of class "numeric"

field_skip: Object of class "numeric"

omax: Object of class "numeric"

omin: Object of class "numeric"

smax: Object of class "numeric"

smin: Object of class "numeric"
Extends

Class "array", from data part.
Class "matrix", by class "array", distance 2, with explicit test and coerce.
Class "structure", by class "array", distance 2.
Class "vector", by class "array", distance 3, with explicit coerce.
Class "vector", by class "array", distance 5, with explicit test and coerce.

Methods

image signature(x = "anlz"): displays the image(s).
show signature(object = "anlz"): prints out a summary of the imaging data.

anlz-nifti-ops  Operations for Objects in the ANALYZE and NIfTI classes

Description

Overloaded operators for anlz and nifti objects

Usage

## S4 method for signature 'anlz,anlz'
Ops(e1, e2)

## S4 method for signature 'anlz,numeric'
Ops(e1, e2)

## S4 method for signature 'numeric,anlz'
Ops(e1, e2)
as.anlz

## S4 method for signature 'nifti,anlz'
Ops(e1, e2)

## S4 method for signature 'anlz,nifti'
Ops(e1, e2)

Arguments

- e1: object
- e2: object

Author(s)

John Muschelli <muschellij2@gmail.com>

Examples

```r
img01 <- anlz(array(1:64, c(4,4,4,1)), datatype=4)
img02 <- anlz(array(64:1, c(4,4,4,1)), datatype=4)
is.anlz(img01 + img02)
is.anlz(sqrt(2) * img01)
is.anlz(img02 / pi)
```

---

### Description

Internal function that converts multidimensional arrays to ANALYZE class objects.

### Usage

```r
as.anlz(from, value = NULL, verbose = FALSE)
```

### Arguments

- **from**: is the object to be converted.
- **value**: is the nifti class object to use as a template for various ANALYZE header information.
- **verbose**: is a logical variable (default = FALSE) that allows text-based feedback during execution of the function.

### Value

An object of class anlz.
Audit Trails

Author(s)
Andrew Thornton <zeripath@users.sourceforge.net>,
Brandon Whitcher <bwhitcher@gmail.com>

as.nifti as.nifti

Description
Internal function that converts multidimensional arrays to NIfTI class objects.

Usage
as.nifti(from, value = NULL, verbose = FALSE)

Arguments
from is the object to be converted.
value is the anlz class object to use as a template for various NIfTI header information.
verbose is a logical variable (default = FALSE) that allows text-based feedback during execution of the function.

Value
An object of class nifti.

Author(s)
Andrew Thornton <zeripath@users.sourceforge.net>.
Brandon Whitcher <bwhitcher@gmail.com>

Audit Trails Facilitate the Creation and Modification of Audit Trails

Description
Facilitate the creation and modification of audit trails for NIfTI class objects.
Usage

oro.nifti.info(type)

enableAuditTrail()

getLastCallWithName(functionName)

newAuditTrail()

niftiExtensionToAuditTrail(
    nim,
    workingDirectory = NULL,
    filename = NULL,
    call = NULL
)

niftiAuditTrailSystemNode(
    type = "system-info",
    workingDirectory = NULL,
    filename = NULL,
    call = NULL
)

niftiAuditTrailSystemNodeEvent(
    trail,
    type = NULL,
    call = NULL,
    workingDirectory = NULL,
    filename = NULL,
    comment = NULL
)

niftiAuditTrailCreated(
    history = NULL,
    call = NULL,
    workingDirectory = NULL,
    filename = NULL
)

niftiAuditTrailEvent(trail, type = NULL, call = NULL, comment = NULL)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>An identifier to add some meaning to the event.</td>
</tr>
<tr>
<td>functionName</td>
<td>The name of a function on the call stack.</td>
</tr>
<tr>
<td>nim</td>
<td>is an object of class niftiAuditTrail or can be converted to such.</td>
</tr>
<tr>
<td>workingDirectory</td>
<td>The working directory associated with the ‘filename’.</td>
</tr>
</tbody>
</table>
Audit Trails

filename: The filename associated with the nifti object.
call: A call, function name in the call-stack or a string.
trail: The XMLAbstractNode representing the audit trail or the niftiAuditTrail object with a trail that will be amended.
comment: Some textual comment
history: An XMLAbstractNode to store historical events for inclusion in the ‘trail’.

Details

The function oro.nifti.info is used to find the ecode or the XML namespace relevant to the audit trail.

The function enableAuditTrail is turned “off” by default to minimize package dependencies. Should one wish to turn “on” the audit trail functionality, then one should set the option NIfTI.audit.trail to TRUE and call the function enableAuditTrail. Setting the option NIfTI.audit.trail to FALSE will disable the audit trail.

The function newAuditTrail returns an XMLAbstractNode representing the root node of an audit trail. This is mostly intended as an internal function.

The function niftiExtensionToAuditTrail takes an object representing a NIfTI object, casts it as a niftiAuditTrail and checks if there is an extension (a niftiExtensionSection) with ecode equal to oro.nifti.info("ecode"); i.e. has an extension with data representing a serialized audit trail. The function will then strip the object of this extension parsing the serialized edata into an audit trail and adding a ‘read’ event to the trail.

The function niftiAuditTrailToExtension takes a niftiAuditTrail and returns a niftiExtensionSection with edata containing the serialized form of the audit trail after adding a ‘saved’ event to the trail.

The function niftiAuditTrailSystemNodeEvent adds an element with name equal to type to the trail. It uses the niftiAuditTrailSystemNode function to create the node.

The function niftiAuditTrailSystemNode is an internal function creating an XMLAbstractNode element with name type and attributes giving information about the R system and library. The filename and call will also be added as attributes if available.

The function niftiAuditTrailEvent adds an element with name event to the trail. The arguments type, filename, call are added as attributes and the comment is the text value of the element.

The function niftiAuditTrailCreated will create a new audit trail containing a system node element created with the child history with the contents history. If the last element of the history given is an event with type=”processing”, then this node will be removed from the history and its call attribute will be used as the value of the call attribute on the created node.

The function getLastCallWithName will search the call stack for a call of the function functionName, returning last call to that function if possible. It will default to the call of the function which called the function which called getLasCallWithName if there was no such call (and if there was no such call it will return the call of itself).

Note

These functions are mostly intended to be used internally in order to document the changes that occur to NIfTI objects due to functions that are audit-trail aware. However, as the precise manner
in which these functions are used is not documented anywhere else, we shall proceed to describe
which functions are audit-trail aware and how they interact with the audit trail.

as.nifti and its S4 alias as(nim, "nifti") will always produce niftiAuditTrail objects if the
functionality is turned on. The function niftiAuditTrailCreated will be used and if an exemplar
object is provided (e.g., as.nifti(array, niftiExemplar)) then the trail of the exemplar will be
used as the history.

readNIfTI and writeNIfTI also always produce niftiAuditTrail objects if the functionality is
turned on. The functions niftiExtensionToAuditTrail and niftiAuditTrailToExtension are
used internally by these functions to facilitate this behaviour.

Author(s)
Andrew Thornton <zeripath@users.sourceforge.net> and Brandon Whitcher <bwhitcher@gmail.com>

Examples

## A good example of the use of these functions is shown by this
## wrapper function which takes a function fun(nim, ...) returning
## lists of arrays which are nifti-ized using as(...)
options("niftiAuditTrail"=TRUE)

```r
wrapper <- function(functionToWrap, nameOfCallingFunction, nim, ...) {
  if (!is(nim, "nifti"))
    nim <- as(nim, "nifti")
  if (is(nim, "niftiAuditTrail")) {
    ## This will force as(...) to set the call which created the
    ## results to the calling function's call rather than
    ## as(result, nifti) as it would otherwise do
    slot(nim, "trail") <- niftiAuditTrailEvent(slot(nim, "trail"), "processing",
                                             nameOfCallingFunction)
  }
  result <- functionToWrap(nim, ...)
  as(result, "nifti") <- nim
  return(result)
}
```

## An example of how wrapper is used follows:
functionToWrap <- function(ignored, x, y) {
  return(array(1, dim=c(x,y)))
}

## The nifti-ized form
niftiizedForm <- function(nim,...) {
  return(wrapper(functionToWrap, "niftiizedForm", nim, ...))
}

## Not run:
if (isTRUE(getOption("niftiAuditTrail"))) {
```
audit.trail-methods

Extract or Replace NIfTI Audit Trail

Description

Operators that act on the audit trail (XML) in the NIfTI header.

Usage

audit.trail(object)

## S4 method for signature 'nifti'
audit.trail(object)

audit.trail(object) <- value

## S4 replacement method for signature 'nifti'
audit.trail(object) <- value

Arguments

object is of class nifti.
value Value to assign to trail slot

Methods

object = "nifti" Extract or replace NIfTI audit trail.

Author(s)

Andrew Thornton <zeripath@users.sourceforge.net>
Description

Methods that act on the aux_file field in the NIfTI/ANALYZE header.

Usage

```r
aux_file(object)

## S4 method for signature 'nifti'
aux_file(object)

## S4 method for signature 'anlz'
aux_file(object)

aux_file(object) <- value

## S4 replacement method for signature 'nifti'
aux_file(object) <- value

## S4 replacement method for signature 'anlz'
aux_file(object) <- value

aux.file(object)

## S4 method for signature 'nifti'
aux.file(object)

## S4 method for signature 'anlz'
aux.file(object)

aux.file(object) <- value

## S4 replacement method for signature 'nifti'
aux.file(object) <- value

## S4 replacement method for signature 'anlz'
aux.file(object) <- value

## S4 method for signature 'niftiImage'
aux_file(object)

## S4 replacement method for signature 'niftiImage'
aux_file(object) <- value
```
Arguments

object is an object of class nifti or anlz.
value is the value to assign to the aux_file field.

Details

See documentation on the ANALYZE and/or NIfTI data standards for more details.

John Muschelli <muschellij2@gmail.com>,
Brandon Whitcher <bwhitcher@gmail.com>

References

ANALYZE 7.5
http://eeg.sourceforge.net/ANALYZE75.pdf
NIfTI-1
http://nifti.nimh.nih.gov/

Examples

## Not run:
urlfile <- file.path(system.file("nifti", package="oro.nifti"),
  "mniRL.nii.gz")
download.file(url, urlfile, quiet=TRUE)

## End(Not run)
options("niftiAuditTrail"=FALSE)

urlfile <- file.path(system.file("nifti", package="oro.nifti"),
  "mniRL.nii.gz")
mniRL <- readNIfTI(urlfile)
aux.file(mniRL)
aux.file(mniRL) <- "avg152T1_RL_nifti"
aux.file(mniRL)
file = system.file("extdata", "example.nii.gz", package = "RNifti")
img = RNifti::readNifti(file)
aux.file(img)
aux.file(img) = "hey"
stopifnot(aux.file(img) == "hey")
Description

Methods that act on the bitpix field in the NIfTI/ANALYZE header.

Usage

```r
bitpix(object)
## S4 method for signature 'nifti'
bitpix(object)
## S4 method for signature 'anlz'
bitpix(object)

bitpix(object) <- value
## S4 replacement method for signature 'nifti'
bitpix(object) <- value
## S4 replacement method for signature 'anlz'
bitpix(object) <- value
## S4 method for signature 'niftiImage'
bitpix(object)
```

Arguments

- `object` is an object of class `nifti` or `anlz`.
- `value` is the value to assign to the `bitpix` field.

Details

See documentation on the ANALYZE and/or NIfTI data standards for more details.

---

**blend**

Merge Two NIfTI or ANALYZE Volumes

**Description**

Two volumes of medical imaging data are merged together in the superior-inferior (or $z$) direction. One assumes that there is at least one slice that overlaps between the two volumes.

**Usage**

```r
blendVolumes(x, y, seqX, seqY, method = "linear")
```

```
## S4 method for signature 'nifti,nifti'
blend(x, y, seqX, seqY, method = "linear")
```

```
## S4 method for signature 'anlz,anlz'
blend(x, y, seqX, seqY, method = "linear")
```

```
## S4 method for signature 'anlz,nifti'
blend(x, y, seqX, seqY, method = "linear")
```

```
## S4 method for signature 'nifti,anlz'
blend(x, y, seqX, seqY, method = "linear")
```

**Arguments**

- `x, y` are objects of class `nifti` or `anlz`.
- `seqX, seqY` are vectors that provide the $z$-coordinate values for the two imaging volumes.
- `method` is the type of weighing to use when combining information where there is an overlap (default = "linear").

**Value**

A single volume that blends the voxel-wise information from `x` and `y`.

**Methods**

- `x = "nifti", y = "nifti"` Merge `x` and `y`.
- `x = "anlz", y = "anlz"` Merge `x` on `y`.
- `x = "nifti", y = "anlz"` Merge `x` on `y`.
- `x = "anlz", y = "nifti"` Merge `x` and `y`.
calibrateImage

calibrateImage  Set Minimum/Maximum Values for NIfTI data

Description
Rescales image cal_max and cal_min slots to be the max and min, respectively, of an object of class nifti, with na.rm = TRUE. This is so that when images are rendered/written, the values correspond to those in the array (stored in .Data slot) are plotted on correct greyscale and no error is given by writeNIfTI.

Usage

calibrateImage(img, infok = TRUE)
cal_img(img, infok = TRUE)

Arguments

img  is a nifti object.
infok  is a logical value whether or not Inf and -Inf are acceptable (default = TRUE). If FALSE and max or min is infinity, then cal_min or cal_max is set to infinity (negative or positive), respectively.

Value
An object of class nifti.

Author(s)
John Muschelli <muschellij2@gmail.com>
Description

Methods that act on the cal_max field in the NIfTI/ANALYZE header.

Usage

cal_max(object)

## S4 method for signature 'nifti'
cal_max(object)

## S4 method for signature 'anlz'
cal_max(object)

cal_max(object) <- value

## S4 replacement method for signature 'nifti'
cal_max(object) <- value

## S4 replacement method for signature 'anlz'
cal_max(object) <- value

cal.max(object)

## S4 method for signature 'nifti'
cal.max(object)

## S4 method for signature 'anlz'
cal.max(object)

cal.max(object) <- value

## S4 replacement method for signature 'nifti'
cal.max(object) <- value

## S4 replacement method for signature 'anlz'
cal.max(object) <- value

## S4 method for signature 'niftiImage'
cal.max(object)

## S4 replacement method for signature 'niftiImage'
cal.max(object) <- value
## S4 method for signature 'niftiImage'

`cal_max(object)`

## S4 replacement method for signature 'niftiImage'

`cal_max(object) <- value`

### Arguments

- `object` is an object of class `nifti` or `anlz`.
- `value` is the value to assign to the `cal_max` field.

### Details

See documentation on the ANALYZE and/or NIfTI data standards for more details.

**coerce-methods**  
*Force an Object to Belong to the ANALYZE or NIfTI Class*

**Description**

Methods for function `coerce` in Package ‘methods’.

**Arguments**

- `object` is an object of class `array` or inherits from `array`.
- `Class` is the name of the class to which ‘object’ should be coerced; i.e., `nifti`.
- `from` is the object to be converted.
- `value` is the `nifti` class object to use as a template for various ANALYZE/NIfTI header information.
- `verbose` is a logical variable (default = `FALSE`) that allows text-based feedback during execution of the function.

**Value**

An object of class `anlz` or `nifti`.

**Methods**

- `from = "anlz", to = "nifti"` An object of class `anlz` is coerced into a NIfTI object.
- `from = "array", to = "anlz"` An object of class `array` is coerced into an ANALYZE object.
- `from = "array", to = "nifti"` An object of class `array` is coerced into a NIfTI object.
- `from = "list", to = "anlz"` All objects of class `array` in the list are coerced into ANALYZE objects. All other objects are left alone. The original list structure is retained.
- `from = "list", to = "nifti"` All objects of class `array` in the list are coerced into NIfTI objects. All other objects are left alone. The original list structure is retained.

`as`
Description

Methods that act on the compressed field in the NIfTI/ANALYZE header.

Usage

```r
compressed(object)

## S4 method for signature 'anlz'
compressed(object)

compressed(object) <- value

## S4 replacement method for signature 'anlz'
compressed(object) <- value
```

Arguments

- `object` is an object of class `nifti` or `anlz`.
- `value` is the value to assign to the compressed field.

Convert ANALYZE Codes

Description

Codes that appear in the ANALYZE header are mapped to meaningful character strings.

Usage

convert.bitpix.anlz(bitpix = NULL)
convert.datatype.anlz(datatype.code = NULL)
convert.orient.anlz(orientation)

Arguments

bitpix is the bit-per-pixel code.
datatype.code defines data type.
orientation defines the orientation.

Details

switch statements are used to map a numeric code to the appropriate string.

Value

A character string.

Author(s)

Brandon Whitcher <bwhitcher@gmail.com>

References

ANALYZE 7.5
http://eeg.sourceforge.net/ANALYZE75.pdf

See Also

convert.datatype, convert.bitpix, convert.intent, convert.form, convert.units, convert.slice
Examples

## 4 = SIGNED_SHORT
`convert.datatype.anlz(4)`

## 16 = FLOAT
`convert.datatype.anlz(16)`

## 2 = "saggital unflipped"
`convert.orient.anlz(2)`

## 4 = "coronal flipped"
`convert.orient.anlz(4)`

Description

Codes that appear in the ANALYZE header are mapped to meaningful character strings.

Usage

`convert.bitpix(bitpix = NULL)`

`convert.datatype(datatype.code = NULL)`

`convert.intent(intent.code = NULL)`

`convert.form(form.code)`

`convert.units(units, inverse = FALSE)`

`convert.slice(slice.code)`

Arguments

- `bitpix`: is the bit-per-pixel code.
- `datatype.code`: defines data type.
- `intent.code`: is the NIfTI intent code.
- `form.code`: is the \((x, y, z)\) coordinate system.
- `units`: is the units of `pixdim[1..4]`.
- `inverse`: is a logical value that denotes the direction of unit conversion.
- `slice.code`: is the slice timing order.

Details

Switch statements are used to map a numeric code to the appropriate string.
**convert.scene**

**Value**

A character string.

**Author(s)**

Brandon Whitcher <bwhitcher@gmail.com>

**References**

Neuroimaging Informatics Technology Initiative (NIfTI)

**Examples**

```r
## 4 = SIGNED_SHORT
convert.datatype.anlz(4)
## 16 = FLOAT
convert.datatype.anlz(16)
## 2 = "sagittal unflipped"
convert.orient.anlz(2)
## 4 = "coronal flipped"
convert.orient.anlz(4)
```

**Description**

Codes that appear in the AFNI header are mapped to meaningful character strings.

**Usage**

```r
convert.scene(scene.data, typestring)
```

**Arguments**

- `scene.data`: defines data type.
- `typestring`: defines whether func or anat data.

**Details**

Switch statements are used to map a numeric code to the appropriate string.

**Value**

A character string.

Drop Image Dimension

Description

Drops a dimension of an image that has one-dimension and sets respective values to 0 in pixdim or 1 in dim.

Usage

\[
\text{dropImageDimension}(\text{img}, \text{onlylast} = \text{TRUE}, \text{warn} = \text{TRUE})
\]

\[
\text{drop_img_dim}(\text{img}, \text{onlylast} = \text{TRUE}, \text{warn} = \text{TRUE})
\]

Arguments

- **img**: nifti object
- **onlylast**: is a logical variable (default = TRUE). Drop the dimension only if it is the last dimension. For example, if dim is 10x10x1x10 then no dimension is dropped, but if dim is 10x10x10x1 then it will be changed to 10x10x10.
- **warn**: produces a text output if the number of dimensions is under three.

Value

Object of class nifti

Examples

```r
nim <- nifti(array(rnorm(10^3), dim = rep(10, 3)))
nim2 <- nifti(array(rnorm(10^3), dim = c(10, 10, 1, 10)))
dropImageDimension(nim2)
dropImageDimension(nim2, onlylast = FALSE)
nim3 <- nifti(array(rnorm(10^3), dim = c(10, 10, 10, 1)))
dropImageDimension(nim3)
dropImageDimension(nim3, onlylast = FALSE) # the same as above
nim4 <- nifti(array(rnorm(10^3), dim = c(10, 10, 10, 1, 10)))
dim(nim4[,1,])
dim(nim4[,1,,drop=TRUE])
dropImageDimension(nim4)

nim5 <- nifti(array(rnorm(10^4), dim = c(1, 10, 10, 10, 1, 10)))
dropImageDimension(nim5)
dropImageDimension(nim5, onlylast = FALSE)

nim6 <- nifti(array(rnorm(10^3), dim = c(1, 10, 10, 10, 1, 1)))
dropImageDimension(nim6)
## Not run:
```
## 27 scans of Colin Holmes (MNI) brain co-registered and averaged
## NIfTI two-file format

```r
URL <- "http://imaging.mrc-cbu.cam.ac.uk/downloads/Colin/colin_1mm.tgz"
urlfile <- file.path(tempdir(), "colin_1mm.tgz")
download.file(URL, dest=urlfile, quiet=TRUE)
untar(urlfile, exdir=tempdir())
colin <- readNIfTI(file.path(tempdir(), "colin_1mm"))
dim(colin)
dim_(colin)
pixdim(colin)
# this will error
writeNIfTI(colin, filename = tempfile())
colin <- dropImageDimension(colin)
writeNIfTI(colin, filename = tempfile())
```

## End(Not run)

---

**exp_date-methods**

*Extract Image Attribute exp_date*

### Description

Methods that act on the `exp_date` field in the NIfTI/ANALYZE header.

### Usage

```
exp_date(object)
```

```
## S4 method for signature 'anlz'
exp_date(object)
```

```
exp_date(object) <- value
```

```
## S4 replacement method for signature 'anlz'
exp_date(object) <- value
```

### Arguments

- `object` is an object of class nifti or anlz.
- `value` is the value to assign to the exp_date field.

### Details

See documentation on the ANALYZE and/or NIfTI data standards for more details.

exp_time-methods  Extract Image Attribute exp_time

Description

Methods that act on the exp_time field in the NIfTI/ANALYZE header.

Usage

exp_time(object)

## S4 method for signature 'anlz'
exp_time(object)

exp_time(object) <- value

## S4 replacement method for signature 'anlz'
exp_time(object) <- value

Arguments

object is an object of class nifti or anlz.
value is the value to assign to the exp_time field.

Details

See documentation on the ANALYZE and/or NIfTI data standards for more details.

extender-methods  Extract Image Attribute extender

Description

Methods that act on the extender field in the NIfTI/ANALYZE header.

Usage

extender(object)

## S4 method for signature 'nifti'
extender(object)

extender(object) <- value

## S4 replacement method for signature 'nifti'
extender(object) <- value

Arguments

object is an object of class nifti or anlz.

value is the value to assign to the extender field.

Details

See documentation on the ANALYZE and/or NIfTI data standards for more details.

Description

Methods that act on the extents field in the NIfTI/ANALYZE header.

Usage

```r
extents(object)
```

```r
## S4 method for signature 'nifti'
extents(object)
```

```r
## S4 method for signature 'anlz'
extents(object)
```

```r
extents(object) <- value
```

```r
## S4 replacement method for signature 'nifti'
eextents(object) <- value
```

```r
## S4 replacement method for signature 'anlz'
eextents(object) <- value
```

Arguments

- **object**: an object of class `nifti` or `anlz`.
- **value**: is the value to assign to the extents field.

Details

See documentation on the ANALYZE and/or NIfTI data standards for more details.

Description

Methods that act on the field_skip field in the NIfTI/ANALYZE header.

Usage

```r
field_skip(object)

## S4 method for signature 'anlz'
field_skip(object)

field_skip(object) <- value

## S4 replacement method for signature 'anlz'
field_skip(object) <- value

field.skip(object)

## S4 method for signature 'anlz'
field.skip(object)

field.skip(object) <- value

## S4 replacement method for signature 'anlz'
field.skip(object) <- value
```

Arguments

- `object` is an object of class nifti or anlz.
- `value` is the value to assign to the field_skip field.

Details

See documentation on the ANALYZE and/or NIfTI data standards for more details.

ANALYZE 7.5
http://eeg.sourceforge.net/ANALYZE75.pdf
NIfTI-1
http://nifti.nimh.nih.gov/

Description

The hotmetal color table patterned after the one used in Matlab.

Usage

hotmetal(n = 64)

Arguments

n is the number of color levels (default = 64).

Details

Based on the tim.colors function in the fields package. The hotmetal function has been modified to break any dependence on code in the fields package. Spline interpolation (interpSpline) is used when the number of requested colors is not the default.

Value

A vector of character strings giving the colors in hexadecimal format.

See Also

terrain.colors, tim.colors, topo.colors

Examples

hotmetal(10)
image(outer(1:20,1:20,"+"), col=hotmetal(75), main="hotmetal")
Description

Produce “lightbox” layout of images for nifti, anlz and afni objects.

Usage

```r
## S4 method for signature 'nifti'
image(
x, 
  z = 1,
  w = 1,
  col = gray(0:64/64),
  plane = c("axial", "coronal", "sagittal"),
  plot.type = c("multiple", "single"),
  zlim = NULL,
  xlab = "",
  ylab = "",
  axes = FALSE,
  oma = rep(0, 4),
  mar = rep(0, 4),
  bg = "black",
  ...
)

## S4 method for signature 'anlz'
image(
x, 
  z = 1,
  w = 1,
  col = gray(0:64/64),
  plane = c("axial", "coronal", "sagittal"),
  plot.type = c("multiple", "single"),
  zlim = NULL,
  xlab = "",
  ylab = "",
  axes = FALSE,
  oma = rep(0, 4),
  mar = rep(0, 4),
  bg = "black",
  ...
)

## S4 method for signature 'afni'
image(x, ...)```
Arguments

- `x` is an object of class `nifti` or similar.
- `z` is the slice to be displayed (ignored when `plot.type = "multiple"`).
- `w` is the time point to be displayed (4D arrays only).
- `col` is grayscale (by default).
- `plane` is the plane of acquisition to be displayed (choices are ‘axial’, ‘coronal’, ‘sagittal’).
- `plot.type` allows the choice between all slices being displayed, in a matrix (left-to-right, top-to-bottom), or a single slice.
- `zlim` is set to NULL by default and utilizes the internal image range.
- `xlab` is set to “” since all margins are set to zero.
- `ylab` is set to “” since all margins are set to zero.
- `axes` is set to FALSE since all margins are set to zero.
- `oma` is the size of the outer margins in the `par` function.
- `mar` is the number of lines of margin in the `par` function.
- `bg` is the background color in the `par` function.
- `...` other arguments to the `image` function may be provided here.

Details

Uses the S3 generic function `image`, with medical-image friendly settings, to display `nifti`, `anlz` and `afni` class objects in a “lightbox” layout.

Methods

- `x = "ANY"` Generic function: see `image`.
- `x = "nifti"` Produce images for `x`.
- `x = "anlz"` Produce images for `x`.
- `x = "afni"` Produce images for `x`.

- `orthographic-methods`, `overlay-methods`
**Description**

Methods that act on the `.Data` field in the NIfTI/ANALYZE header.

**Usage**

```r
img_data(object)
```

### S4 method for signature 'nifti'

```r
img_data(object)
```

### S4 method for signature 'anlz'

```r
img_data(object)
```

### S4 method for signature 'character'

```r
img_data(object)
```

### S4 method for signature 'ANY'

```r
img_data(object)
```

```r
img_data(object) <- value
```

### S4 replacement method for signature 'nifti'

```r
img_data(object) <- value
```

### S4 replacement method for signature 'anlz'

```r
img_data(object) <- value
```

**Arguments**

- `object` is an object of class `nifti` or `anlz`.
- `value` is the value to assign to the `.Data` field.

**Details**

See documentation on the ANALYZE and/or NIfTI data standards for more details.

**Author(s)**

John Muschelli <muschelli2@gmail.com>,
Brandon Whitcher <bwhitcher@gmail.com>
### img_length

**Description**

Multiplies the number of slices by the voxel resolution for each direction.

**Usage**

```r
desc(img_length(img, units = c("mm", "cm")))
```

**Arguments**

- `img` Image object, any method with `voxdim` and `dim_`
- `units` output unit, either cubic mm or cubic cm.

**Value**

Scalar numeric, one number, in mm or cm.

**Examples**

```r
nim <- nifti(array(rnorm(10^3), dim = c(5, 2, 100)),
             pixdim = c(1, 0.5, 0.2, 1))
img_length(nim)
```

### integerTranslation

**Description**

...

**Usage**

```r
integerTranslation(nim, data, verbose = FALSE)
invertIntegerTranslation(nim, verbose = FALSE)
```
**Arguments**

- `nim` is an object of class `nifti`.
- `data` is ...
- `Verbose` is a logical variable (default = `FALSE`) that allows text-based feedback during execution of the function.

**Details**

...

**Value**

**intent_code-methods**  
*Extract Image Attribute* intent_code

**Description**

Methods that act on the `intent_code` field in the NIfTI/ANALYZE header.

**Usage**

```
intent_code(object)
```

```r
## S4 method for signature 'nifti'
intent_code(object)
```

```
intent_code(object) <- value
```

```r
## S4 replacement method for signature 'nifti'
intent_code(object) <- value
```

```
intent.code(object)
```

```r
## S4 method for signature 'nifti'
intent.code(object)
```

```
intent.code(object) <- value
```

```r
## S4 replacement method for signature 'nifti'
intent.code(object) <- value
```
## S4 method for signature 'niftiImage'
intent_code(object)

## S4 replacement method for signature 'niftiImage'
intent_code(object) <- value

### Arguments

- **object**: is an object of class nifti or anlz.
- **value**: is the value to assign to the `intent_code` field.

### Details

See documentation on the ANALYZE and/or NIfTI data standards for more details.

stopifnot(intent_code(img) == 4)
```

---

**intent_name-methods**

**Extract Image Attribute**

**intent_name**

### Description

Methods that act on the `intent_name` field in the NIfTI/ANALYZE header.
Usage

```r
intent_name(object)
```

```r
## S4 method for signature 'nifti'
intent_name(object)
```

```r
intent_name(object) <- value
```

```r
## S4 replacement method for signature 'nifti'
intent_name(object) <- value
```

```r
intent.name(object)
```

```r
## S4 method for signature 'nifti'
intent.name(object)
```

```r
intent.name(object) <- value
```

```r
## S4 replacement method for signature 'nifti'
intent.name(object) <- value
```

```r
## S4 method for signature 'niftiImage'
intent_name(object)
```

```r
## S4 replacement method for signature 'niftiImage'
intent_name(object) <- value
```

Arguments

- `object` is an object of class `nifti` or `anlz`.
- `value` is the value to assign to the `intent_name` field.

Details

See documentation on the ANALYZE and/or NIfTI data standards for more details.

Usage

```r
nifti(
  img = array(0, dim = rep(1, 4)),
  dim,
  datatype = 2,
  cal.min = NULL,
  cal.max = NULL,
  pixdim = NULL,
```

Arguments

- **img**: is a multidimensional array of data.
- **dim**: is the dimension of the data (default = missing).
- **datatype**: is an integer that denotes the type of data contained in each voxel. See `convert.datatype` or the NIfTI documentation for more details.
- **cal.min**: allows user-specified minimum value in the array (visualization purposes only).
- **cal.max**: allows user-specified minimum value in the array (visualization purposes only).
- **pixdim**: allows user-specified pixel dimension vector (length = 8).
- **...**: allows for additional ‘slots’ to be specified.

Value

An object of class `nifti`.

nim <- nifti() # default
nim
nim <- nifti(datatype=4) # 2-byte integers
nim
```
Description

The NIfTI class for medical imaging data.

Usage

## S4 method for signature 'nifti'
show(object)

Arguments

object An object of class nifti.

Objects from the Class

Objects can be created by calls of the form new("nifti", data, dim, dimnames, ...) or by calling the nifti function.

Slots

.Data: Object of class "array" contains the imaging data
sizeof_hdr: Object of class "numeric" contains the size of the header (= 348)
data_type: Object of class "character"
db_name: Object of class "character"
extents: Object of class "numeric"
session_error: Object of class "numeric"
regular: Object of class "character"
dim_info: Object of class "numeric" contains MRI slice ordering
dim.: Object of class "vector" contains the dimensions of the imaging data
intent_p1: Object of class "numeric"
intent_p2: Object of class "numeric"
intent_p3: Object of class "numeric"
intent_code: Object of class "numeric"
datatype: Object of class "numeric"
bitpix: Object of class "numeric" contains the number of bits per voxel (pixel)
slice_start: Object of class "numeric"
pixdim: Object of class "vector" contains the real-world dimensions of the imaging data
vox_offset: Object of class "numeric" contains the voxel offset (= 352 when no extensions exist)
scl_slope: Object of class "numeric"
scl_inter: Object of class "numeric"
slice_end: Object of class "numeric"
slice_code: Object of class "numeric"
xyzt_units: Object of class "numeric"
cal_max: Object of class "numeric" contains the maximum display intensity
cal_min: Object of class "numeric" contains the minimum display intensity
slice_duration: Object of class "numeric"
toffset: Object of class "numeric"
glmax: Object of class "numeric"
glmin: Object of class "numeric"
descrip: Object of class "character"
aux_file: Object of class "character"
qform_code: Object of class "numeric"
sform_code: Object of class "numeric"
quatern_b: Object of class "numeric"
quatern_c: Object of class "numeric"
quatern_d: Object of class "numeric"
quoffset_x: Object of class "numeric"
quoffset_y: Object of class "numeric"
quoffset_z: Object of class "numeric"
srow_x: Object of class "vector"
srow_y: Object of class "vector"
srow_z: Object of class "vector"
intent_name: Object of class "character"
magic: Object of class "character"
estender: Object of class "vector"
reoriented: Object of class "logical"

Extends

Class "array", from data part.
Class "matrix", by class "array", distance 2, with explicit test and coerce.
Class "structure", by class "array", distance 2.
Class "vector", by class "array", distance 3, with explicit coerce.
Class "vector", by class "array", distance 5, with explicit test and coerce.

Methods

image signature(x = "nifti"): displays the image(s).
orthographic signature(x = "nifti"): displays the image(s).
overlay signature(x = "nifti", y = "nifti"): displays the image(s).
show signature(object = "nifti"): prints out a summary of the imaging data.

showClass("nifti")

nifti-operators Operations for NIfTI Objects

Description
Overloaded operators for nifti objects

Usage

```r
## S4 method for signature 'nifti,nifti'
Ops(e1, e2)

## S4 method for signature 'nifti,numeric'
Ops(e1, e2)

## S4 method for signature 'numeric,nifti'
Ops(e1, e2)
```

Arguments

- `e1` is an object of class nifti.
- `e2` is an object of class nifti.

Author(s)
John Muschelli <muschelli2@gmail.com>
Examples

```r
img01 <- nifti(array(1:64, c(4,4,4,1)), datatype=4)
img02 <- nifti(array(64:1, c(4,4,4,1)), datatype=4)
is.nifti(img01 + img02)
is.nifti(sqrt(2) * img01)
is.nifti(img02 / pi)
```

Description

An extension of the NIfTI class that adds an audit trail in XML format.

Objects from the Class

Objects can be created by calls of the form `new("niftiAuditTrail", data, dim, dimnames, ...).

Methods

**show** signature(object = "niftiAuditTrail"): prints out a summary of the imaging data.

Methods for Function 
<-
 in Package 'base'

Methods

Methods for function 
<-
 in Package 'base'

Methods

x = "nifti", i = "ANY", j = "ANY", value = "ANY"  Replaces the data at the provided co-ordinates with the value provided and updates the header.

x = "nifti", i = "numeric", j = "numeric", value = "ANY"  Replaces the data at the provided co-ordinates with the value provided and updates the header.

x = "nifti", i = "ANY", j = "missing", value = "ANY"  Replaces the data row i of the provided nifti object with the value provided and updates the header.

x = "nifti", i = "numeric", j = "missing", value = "ANY"  Replaces the data row i of the provided nifti object with the value provided and updates the header.

x = "nifti", i = "missing", j = "missing", value = "array"  Replaces the data of the provided nifti object with the array provided and updates the header.
nii2oro  
*Convert RNifti niftiImage to oro.nifti nifti object*

**Description**

Converts a niftiImage from RNifti to a nifti object from the oro.nifti package.

**Usage**

```r
nii2oro(image)
```

**Arguments**

- `image` niftiImage object

**Value**

Object of class `nifti`

---

nsli  
*Dimension Accessor Functions*

**Description**

Functions to extract the higher dimensions from ANALYZE/NIfTI data.

**Usage**

```r
nsli(x)
NSLI(x)
tim(x)
TIM(x)
```

**Arguments**

- `x` is a three- or four-dimensional array (e.g., read in from an ANALYZE/NIfTI file).

**Details**

Simple calls to `dim` to replicate the functionality of `nrow` and `ncol` for higher dimensions of an array that are commonly required when manipulating medical imaging data.
Value
Third (slice) or fourth (time) dimension of the array.

Author(s)
Brandon Whitcher <bwhitcher@gmail.com>

See Also
readNIfTI, readANALYZE

Description
Methods that act on the omax field in the NIfTI/ANALYZE header.

Usage
omax(object)

## S4 method for signature 'anlz'
omax(object)

omax(object) <- value

## S4 replacement method for signature 'anlz'
omax(object) <- value

Arguments
object is an object of class nifti or anlz.
value is the value to assign to the omax field.

Details
See documentation on the ANALYZE and/or NIfTI data standards for more details.

omin-methods

**Description**

Methods that act on the omin field in the NIfTI/ANALYZE header.

**Usage**

```r
omin(object)

## S4 method for signature 'anlz'
omin(object)

omin(object) <- value

## S4 replacement method for signature 'anlz'
omin(object) <- value
```

**Arguments**

- `object` is an object of class nifti or anlz.
- `value` is the value to assign to the omin field.

**Details**

See documentation on the ANALYZE and/or NIfTI data standards for more details.

onefile

Onefile

Creates the onefile Specification for NIfTI

Description
Changes the magic and vox_offset slots to be consistent with the onefile option in writeNIfTI. As of version 0.4.0, oro.nifti did not support the "ni1" magic type for output.

Usage
onefile(img)

Arguments

img is a nifti-class object.

Value
Object of class nifti.

NIfTI-1
http://nifti.nimh.nih.gov/

Description

Methods that act on the “qform” and “sform” information in the NIfTI header.

Usage

sform(object)

## S4 method for signature 'nifti'
sform(object)

qform(object)

## S4 method for signature 'nifti'
qform(object)

Arguments

object is an object of class nifti.

Methods

object = "nifti" Extract or replace NIfTI description.
Author(s)

Brandon Whitcher <bwhitcher@gmail.com>

Examples

```r
## Not run:
urlfile <- file.path(system.file("nifti", package="oro.nifti"),
                           "mniLR.nii.gz")
download.file(url, urlfile, quiet=TRUE)

## End(Not run)
urlfile <- file.path(system.file("nifti", package="oro.nifti"),
                           "mniLR.nii.gz")
mniLR <- readNIfTI(urlfile)
sform(mniLR)
```

---

**origin-methods**

*Extract Image Attribute origin*

Description

Methods that act on the origin field in the NIfTI/ANALYZE header.

Usage

```r
origin(object)
```

```r
## S4 method for signature 'nifti'
origin(object)
```

```r
## S4 method for signature 'anlz'
origin(object)
```

```r
## S4 method for signature 'ANY'
origin(object)
```

```r
origin(object) <- value
```

```r
## S4 replacement method for signature 'anlz'
origin(object) <- value
```

```r
## S4 replacement method for signature 'nifti'
origin(object) <- value
```
Arguments

- `object` is an object of class `nifti` or `anlz`.
- `value` is the value to assign to the `origin` field.

Details

See documentation on the ANALYZE and/or NIfTI data standards for more details.

**oro2nii**

*Convert oro.nifti nifti to RNifti niftiImage object*

Description

Converts a nifti from oro.nifti to a niftiImage object from the RNifti package

Usage

```
oro2nii(image, verbose = FALSE)
```

Arguments

- `image` *nifti* object
- `verbose` print messages, passed to `writeNIfTI`
Value

Object of class niftiImage

Description

Produce orthographic display for nifti, anlz and afni objects.

Usage

orthographic.nifti(
  x,
  y = NULL,
  xyz = NULL,
  w = 1,
  col = gray(0:64/64),
  col.y = hotmetal(),
  zlim = NULL,
  zlim.y = NULL,
  crosshairs = TRUE,
  col.crosshairs = "red",
  xlab = "",
  ylab = "",
  axes = FALSE,
  oma = rep(0, 4),
  mar = rep(0, 4),
  bg = "black",
  text = NULL,
  text.color = "white",
  text.cex = 2,
  ...
)

orthographic(x, ...)

## S4 method for signature 'nifti'
orthographic(
  x,
  y = NULL,
  xyz = NULL,
  w = 1,
  col = gray(0:64/64),
  col.y = hotmetal(),
  zlim = NULL,
zlim.y = NULL,
crosshairs = TRUE,
col.crosshairs = "red",
xlab = "",
ylab = "",
axes = FALSE,
oma = rep(0, 4),
mar = rep(0, 4),
bg = "black",
text = NULL,
text.color = "white",
text.cex = 2,
...
)

## S4 method for signature 'anlz'

orthographic(
  x,
  y = NULL,
  xyz = NULL,
  w = 1,
  col = gray(0:64/64),
  col.y = hotmetal(),
  zlim = NULL,
  zlim.y = NULL,
crosshairs = TRUE,
col.crosshairs = "red",
xlab = "",
ylab = "",
axes = FALSE,
oma = rep(0, 4),
mar = rep(0, 4),
bg = "black",
text = NULL,
text.color = "white",
text.cex = 2,
...
)

## S4 method for signature 'array'

orthographic(x, ...)

## S4 method for signature 'afni'

orthographic(x, ...)

Arguments

x is an object of class nifti or similar.
**Methods**

- **x = "afni"** Produce orthographic display for `x`.
- **x = "anlz"** Produce orthographic display for `x`.
- **x = "array"** Produce orthographic display for `x`.
- **x = "nifti"** Produce orthographic display for `x`.

)

## S4 method for signature 'array,array'
overlay(x, y, ...)

## S4 method for signature 'array,nifti'
overlay(x, y, ...)

## S4 method for signature 'nifti,array'
overlay(x, y, ...)

## S4 method for signature 'array,anlz'
overlay(x, y, ...)

## S4 method for signature 'anlz,array'
overlay(x, y, ...)

## S4 method for signature 'afni,afni'
overlay(x, y, ...)

## S4 method for signature 'afni,array'
overlay(x, y, ...)

Arguments

x, y
is an object of class nifti or similar.

z
is the slice to be displayed (ignored when plot.type = "multiple").

w
is the time point to be displayed (4D arrays only).

col.x
is grayscale (by default).

col.y
is hotmetal (by default).

zlim.x, zlim.y
are set to NULL (by default) and taken from the header information.

plane
is the plane of acquisition to be displayed (choices are 'axial', 'coronal', 'sagittal').
plot.type allows the choice between all slices being displayed, in a matrix (left-to-right, top-to-bottom), or a single slice.

xlab is set to "" since all margins are set to zero.

ylab is set to "" since all margins are set to zero.

axes is set to FALSE since all margins are set to zero.

oma is the size of the outer margins in the par function.

mar is the number of lines of margin in the par function.

bg is the background color in the par function.

NA.x Set any values of 0 in x to NA

NA.y Set any values of 0 in y to NA

... other arguments to the image function may be provided here.

Details

The image command is used multiple times to simultaneously visualize one of the three orthogonal planes in two multidimensional arrays, one on top of the other, for medical imaging data.

Methods

x = "nifti", y = "nifti" Produce overlay of y on x.

x = "anlz", y = "anlz" Produce overlay of y on x.

x = "afni", y = "afni" Produce overlay of y on x.

Author(s)

Brandon Whitcher <bwhitcher@gmail.com>

image-methods, overlay-methods

Description

Methods that act on the patient_id field in the NIfTI/ANALYZE header.
Usage

```r
patient_id(object)

## S4 method for signature 'anlz'
patient_id(object)

patient_id(object) <- value

## S4 replacement method for signature 'anlz'
patient_id(object) <- value

patient.id(object)

## S4 method for signature 'anlz'
patient.id(object)

patient.id(object) <- value

## S4 replacement method for signature 'anlz'
patient.id(object) <- value
```

Arguments

- `object` is an object of class `nifti` or `anlz`.
- `value` is the value to assign to the `patient_id` field.

Details

See documentation on the ANALYZE and/or NIfTI data standards for more details.

### performPermutation

**Transform array with orthogonal permutation matrix**

#### Description

Given an orthogonal permutation matrix $T$, an array of dimensions and a one-dimensional representation of data. It will return a transformed array with the transformed dimensions.

#### Usage

```r
performPermutation(T, real.dimensions, data, verbose = FALSE)
```

#### Arguments

- **T** is an orthogonal matrix.
- **real.dimensions** is a one-dimensional array, representing the length of dimensions in data.
- **data** is a one-dimensional representation of the data to be transformed.
- **verbose** is a logical variable (default = FALSE) that allows text-based feedback during execution of the function.

#### Details

This function is mainly used by the `reorient` function to transform nifti data into neuroradiological convention.

#### Author(s)

Andrew Thornton <zeripath@users.sourceforge.net>

#### See Also

- `reorient`, `inverseReorient`

---

### pixdim-methods

**Extract Image Attribute pixdim**

#### Description

Methods that act on the `pixdim` field in the NIfTI/ANALYZE header.
Usage

```
pixdim(object)
## S4 method for signature 'nifti'
pixdim(object)

## S4 method for signature 'ANY'
pixdim(object)

## S4 method for signature 'anlz'
pixdim(object)
```

```
pixdim(object) <- value
## S4 replacement method for signature 'nifti'
pixdim(object) <- value

## S4 replacement method for signature 'anlz'
pixdim(object) <- value

## S4 replacement method for signature 'ANY'
pixdim(object) <- value
```

Arguments

- **object** is an object of class `nifti` or `anlz`.
- **value** is the value to assign to the `pixdim` field.

Details

See documentation on the ANALYZE and/or NIfTI data standards for more details.

## S4 replacement method for signature 'niftiImage'
qform_code(object) <- value

**Arguments**

- **object** is an object of class nifti or anlz.
- **value** is the value to assign to the qform_code field.
Details

See documentation on the ANALYZE and/or NIfTI data standards for more details.

file = system.file("extdata", "example.nii.gz", package = "RNifti")
img = RNifti::readNifti(file)
qform_code(img)
qform_code(img) = 8
stopifnot(qform_code(img) == 8)
```

qoffset_x-methods

Extract Image Attribute qoffset_x

Description

Methods that act on the qoffset_x field in the NIfTI/ANALYZE header.

Usage

```r
qoffset_x(object)

## S4 method for signature 'nifti'
qoffset_x(object)

qoffset_x(object) <- value

## S4 replacement method for signature 'nifti'
qoffset_x(object) <- value

qoffset.x(object)

## S4 method for signature 'nifti'
qoffset.x(object)
```
qoffset.x(object) <- value

## S4 replacement method for signature 'nifti'
qoffset.x(object) <- value

## S4 method for signature 'niftiImage'
qoffset.x(object)

## S4 replacement method for signature 'niftiImage'
qoffset.x(object) <- value

Arguments

object is an object of class nifti or anlz.
value is the value to assign to the qoffset_x field.

Details

See documentation on the ANALYZE and/or NIfTI data standards for more details.

img = RNifti::readNifti(file)
qoffset_y(img)
qoffset_y(img) = 10
stopifnot(qoffset_y(img) == 10)
```

Description

Methods that act on the qoffset_z field in the NIfTI/ANALYZE header.

Usage

```r
qoffset_z(object)
```

## S4 method for signature 'nifti'
```r
qoffset_z(object)
qoffset_z(object) <- value
```

## S4 replacement method for signature 'nifti'
```r
qoffset.z(object)
qoffset.z(object) <- value
```

## S4 method for signature 'nifti'
```r
qoffset.z(object)
qoffset.z(object) <- value
```

## S4 replacement method for signature 'nifti'
```r
qoffset.z(object)
```

Arguments

- `object` is an object of class nifti or anlz.
- `value` is the value to assign to the qoffset_z field.
quaternion2rotation

qoffset_z(img) = 10
stopifnot(qoffset_z(img) == 10)
```

---

**quaternion2rotation**  
Convert Quaternion into a Rotation Matrix

Description
The affine/rotation matrix $R$ is calculated from the quaternion parameters.

Usage
```r
quaternion2rotation(b, c, d, tol = 1e-07)
quaternion2mat44(nim, tol = 1e-07)
```

Arguments
- `b` is the quaternion $b$ parameter.
- `c` is the quaternion $c$ parameter.
- `d` is the quaternion $d$ parameter.
- `tol` is a very small value used to judge if a number is essentially zero.
- `nim` is an object of class `nifti`. 
The quaternion representation is chosen for its compactness in representing rotations. The orientation of the \((x, y, z)\) axes relative to the \((i, j, k)\) axes in 3D space is specified using a unit quaternion \([a, b, c, d]\), where \(a^2 + b^2 + c^2 + d^2 = 1\). The \((b, c, d)\) values are all that is needed, since we require that \(a = \sqrt{1 - (b^2 + c^2 + d^2)}\) be non-negative. The \((b, c, d)\) values are stored in the (quatern_b, quatern_c, quatern_d) fields.

Value

The (proper) \(3 \times 3\) rotation matrix or \(4 \times 4\) affine matrix.

Author(s)

Brandon Whitcher <bwhitcher@gmail.com>

References

NIfTI-1
http://nifti.nimh.nih.gov/

Examples

```r
## This R matrix is represented by quaternion \([a,b,c,d] = [0,1,0,0]\)
## (which encodes a 180 degree rotation about the x-axis).
(R <- quaternion2rotation(1, 0, 0))
```

Description

Methods that act on the quatern_b field in the NIfTI/ANALYZE header.

Usage

quatern_b(object)

## S4 method for signature 'nifti'
quatern_b(object)

quatern_b(object) <- value

## S4 replacement method for signature 'nifti'
quatern_b(object) <- value

quatern.b(object)
## S4 method for signature 'nifti'
quatern.b(object)

quatern.b(object) <- value

## S4 replacement method for signature 'nifti'
quatern.b(object) <- value

## S4 method for signature 'niftiImage'
quatern_b(object)

## S4 replacement method for signature 'niftiImage'
quatern_b(object) <- value

**Arguments**

- **object** is an object of class `nifti` or `anlz`.
- **value** is the value to assign to the `quatern_b` field.

**Details**

See documentation on the ANALYZE and/or NIfTI data standards for more details.

John Muschelli <muschellij2@gmail.com>,
Brandon Whitcher <bwhitcher@gmail.com>

References

ANALYZE 7.5
http://eeg.sourceforge.net/ANALYZE75.pdf
NIfTI-1
http://nifti.nimh.nih.gov/

Description

These functions read in the header information and multidimensional array from a binary file in AFNI format into a `afni`-class object.

Usage

```r
readAFNI(fname, vol = NULL, verbose = FALSE, warn = -1, call = NULL)
```

Arguments

- `fname` is the file name of the AFNI file.
- `vol` vector of brick numbers to be read from file.
- `verbose` is a logical variable (default = FALSE) that allows text-based feedback during execution of the function.
- `warn` is a number to regulate the display of warnings (default = -1). See `options` for more details.
- `call` keeps track of the current function call for use in the AFNI extension.

Details

The `readAFNI` function utilizes internal methods `readBin` and `readLines` to efficiently extract information from the header and binary file(s). Compression is allowed on the BRIK file using gzip.

Current acceptable data types include

- `list("INT16")` DT SIGNED SHORT (16 bits per voxel)
- `list("FLOAT32")` DT FLOAT (32 bits per voxel)
- `list("COMPLEX128")` DT COMPLEX (128 bits per voxel)
Value

object of class `afni`

Author(s)

Karsten Tabelow <karsten.tabelow@wias-berlin.de>

References

AFNI

http://afni.nimh.nih.gov/pub/dist/src/README.attributes

`readANALYZE`, `readNIfTI`

Examples

```r
## Not run:
## Taken from the AFNI Matlab Library
## http://afni.nimh.nih.gov/pub/dist/data/afni_matlab_data.tgz
afni.path <- system.file("afni", package="oro.nifti")
orig <- readAFNI(file.path(afni.path, "ARzs_CW_avvr.DEL+orig"))
image(orig, zlim=c(0.5,256), oma=rep(2,4))
orthographic(orig, zlim=c(0.5,256), oma=rep(2,4))
## Taken from the AFNI installation
TT <- readAFNI(file.path(afni.path, "TT_N27_EZ_LR+tlrc"))
image(TT, zlim=c(0.5,256), oma=rep(2,4))
orthographic(TT, zlim=c(0.5,256), oma=rep(2,4))
## End(Not run)
```

Description

These functions read in the header information and multi-dimensional array from a binary file in Analyze 7.5 format.

Usage

```r
readANALYZE(fname, SPM = FALSE, verbose = FALSE, warn = -1)
```
Arguments

fname
Pathname of the Analyze pair of files .img and .hdr without the suffix.

SPM
is a logical variable (default = FALSE) that forces the voxel data values to be rescaled using the funused1 ANALYZE header field. This is an undocumented convention of ANALYZE files processed using the Statistical Parametric Mapping (SPM) software.

verbose
is a logical variable (default = FALSE) that allows text-based feedback during execution of the function.

warn
is a number to regulate the display of warnings (default = -1). See options for more details.

Details

The internal functions readBin and rawToChar are utilized in order to efficiently extract information from a binary file. The types of data are limited to 1- and 2-byte integers, 4-byte floats and 8-byte doubles.

Value

An object of class anlz is produced.

Author(s)

Brandon Whitcher <bwhitcher@gmail.com>,
Volker Schmid <volkerschmid@users.sourceforge.net>

References

ANALYZE 7.5
http://eeg.sourceforge.net/ANALYZE75.pdf

See Also

readNIfTI

Examples

## avg152T1
anlz.path <- system.file("anlz", package="oro.nifti")
mni152 <- readANALYZE(file.path(anlz.path, "avg152T1"))
image(mni152, oma=rep(2,4))
orthographic(mni152, oma=rep(2,4))
Description

These functions read in the header information and multidimensional array from a binary file in NIfTI-1 format into a nifti-class object.

Usage

```r
readNIfTI(
  fname,
  verbose = FALSE,
  warn = -1,
  reorient = TRUE,
  call = NULL,
  read_data = TRUE,
  rescale_data = TRUE
)
```

```r
nifti_header(fname, verbose = FALSE, warn = -1)
```

Arguments

- `fname` is the file name of the NIfTI file(s).
- `verbose` is a logical variable (default = FALSE) that allows text-based feedback during execution of the function.
- `warn` is a number to regulate the display of warnings (default = -1). See options for more details.
- `reorient` is a logical variable (default = TRUE) that enforces Qform/Sform transformations.
- `call` keeps track of the current function call for use in the NIfTI extension.
- `read_data` Should the data be read in? If this is FALSE, then an array of NAs are given instead of the true data. Useful if you are simply interested in the header.
- `rescale_data` Should the data be rescaled using the slope and intercept values? If so, slope and intercept will be reset

Details

The readNIfTI function utilizes internal methods readBin and readChar to efficiently extract information from the binary file(s).

Current acceptable data types include

- `list("UINT8")` BINARY (1 bit per voxel)
- `list("INT16")` SIGNED SHORT (16 bits per voxel)
- `list("INT32")` SIGNED INT (32 bits per voxel)
list("FLOAT32")  FLOAT (32 bits per voxel)
list("DOUBLE64")  DOUBLE (64 bits per voxel)
list("UINT16")  UNSIGNED SHORT (16 bits per voxel)
list("UINT32")  UNSIGNED INT (32 bits per voxel)

Value
An object of class nifti.

NIfTI-1
http://nifti.nimh.nih.gov/
**Reorient Image using NIfTI header**

**Description**

Transforms in the NIfTI header are parsed and normalized versions of these transforms are applied.

**Usage**

```r
reorient(nim, data, verbose = FALSE, invert = FALSE, tol = 1e-07)
inverseReorient(nim, verbose = FALSE)
```

**Arguments**

- `nim` is an object of class `nifti`.
- `data` is an array associated with `nim`.
- `verbose` is a logical variable (default = `FALSE`) that allows text-based feedback during execution of the function.
- `invert` stores the inverse transform.
- `tol` is a very small value used to judge if a number is essentially zero.

**Details**

This function utilizes the `performPermutation` function internally.

**Author(s)**

Andrew Thornton <zeripath@users.sourceforge.net>, Brandon Whitcher <bwhitcher@gmail.com>

**See Also**

`performPermutation`
resetSlopeIntercept

Change Intercept to 0 and Slope to 1 in NIfTI Object

Description

Forces image `scl_slope` to 1 and `scl_inter` to be 0 of slots of class `nifti`. This is so that when images are rendered/written, the values correspond to those in the array (stored in the `.Data` slot) and are not scaled.

Usage

```r
resetSlopeIntercept(img)
zero_trans(img)
```

Arguments

- `img` is a `nifti` object (or character of filename). If an `anlz` object is passed, the unaltered `anlz` object is returned.

Value

An object of the same type passed.

Author(s)

John Muschelli <muschellij2@gmail.com>

rmniigz

Remove File Extensions Around the NIfTI/ANALYZE Formats

Description

Simple function(s) that remove file extensions commonly found when using NIfTI-1 or ANALYZE format files.

Usage

```r
rmniigz(x)
rmnii(x)
rmgz(x)
rmhdrgz(x)
```
scannum-methods

rmhdr(x)
rmimggz(x)
rmimg(x)

Arguments

x is the file name.

Value

The file name without offending suffix.

Author(s)

Brandon Whitcher <bwhitcher@gmail.com>

scannum-methods Extract Image Attribute scannum

Description

Methods that act on the scannum field in the NIfTI/ANALYZE header.

Usage

scannum(object)

## S4 method for signature 'anlz'
scannum(object)
scannum(object) <- value

## S4 replacement method for signature 'anlz'
scannum(object) <- value

Arguments

object is an object of class nifti or anlz.
value is the value to assign to the scannum field.

```

### Description
Methods that act on the `sizeof_hdr` field in the NIfTI/ANALYZE header.

### Usage
```r
sizeof_hdr(object)
```

## S4 method for signature 'nifti'
`sizeof_hdr(object)`

## S4 method for signature 'anlz'
`sizeof_hdr(object)`
slice-methods

sizeof.hdr(object)

## S4 method for signature 'nifti'
sizeof.hdr(object)

## S4 method for signature 'anlz'
sizeof.hdr(object)

sizeof_hdr(object) <- value

## S4 replacement method for signature 'nifti'
sizeof_hdr(object) <- value

## S4 replacement method for signature 'anlz'
sizeof_hdr(object) <- value

Arguments

object is an object of class nifti or anlz.
value is the value to assign to the data_type field.

Details

See documentation on the ANALYZE and/or NIfTI data standards for more details.

slice-methods  Methods for Function 'slice'

Description

Produce “lightbox” layout of slices for nifti, anlz and afni objects.
Usage

slice(x, ...)

## S4 method for signature 'nifti'

slice(
    x,
    z = 1,
    w = 1,
    col = gray(0:64/64),
    plane = c("axial", "coronal", "sagittal"),
    zlim = NULL,
    xlab = "",
    ylab = "",
    axes = FALSE,
    oma = rep(0, 4),
    mar = rep(0, 4),
    bg = "black",
    useRaster = TRUE,
    ...
)

## S4 method for signature 'anlz'

slice(
    x,
    z = 1,
    w = 1,
    col = gray(0:64/64),
    plane = c("axial", "coronal", "sagittal"),
    zlim = NULL,
    xlab = "",
    ylab = "",
    axes = FALSE,
    oma = rep(0, 4),
    mar = rep(0, 4),
    bg = "black",
    useRaster = TRUE,
    ...
)

## S4 method for signature 'array'

slice(x, ...)

## S4 method for signature 'afni'

slice(x, ...)

Arguments

x is an object of class nifti or similar.
other arguments to the `image` function may be provided here.

- `z` is the slice to be displayed (ignored when `plot.type = "multiple"`).
- `w` is the time point to be displayed (4D arrays only).
- `col` is grayscale (by default).
- `plane` is the plane of acquisition to be displayed (choices are ‘axial’, ‘coronal’, ‘sagittal’).
- `zlim` is set to `NULL` by default and utilizes the internal image range.
- `xlab` is set to “” since all margins are set to zero.
- `ylab` is set to “” since all margins are set to zero.
- `axes` is set to `FALSE` since all margins are set to zero.
- `oma` is the size of the outer margins in the `par` function.
- `mar` is the number of lines of margin in the `par` function.
- `bg` is the background color in the `par` function.
- `useRaster` if `TRUE`, a bitmap raster is used to plot the image instead of polygons. Passed to `image`

Details

Uses the S3 generic function `slice`, with medical-image friendly settings, to display `nifti`, `anlz` and `afni` class objects in a “lightbox” layout.

Methods

- `x = "ANY"` Generic function: see `image`.
- `x = "nifti"` Produce images for `x`.
- `x = "anlz"` Produce images for `x`.
- `x = "afni"` Produce images for `x`.

Description

Methods that act on the slice_code field in the NIfTI/ANALYZE header.

Usage

slice_code(object)

## S4 method for signature 'nifti'
slice_code(object)

slice_code(object) <- value

## S4 replacement method for signature 'nifti'
slice_code(object) <- value

slice.code(object)

## S4 method for signature 'nifti'
slice.code(object)

slice.code(object) <- value

## S4 replacement method for signature 'nifti'
slice.code(object) <- value

## S4 method for signature 'niftiImage'
slice_code(object)

## S4 replacement method for signature 'niftiImage'
slice_code(object) <- value

Arguments

- object is an object of class nifti or anlz.
- value is the value to assign to the slice_code field.

Details

See documentation on the ANALYZE and/or NIfTI data standards for more details.

img = RNifti::readNifti(file)
slice_code(img)
slice_code(img) = 8
stopifnot(slice_code(img) == 8)
```

Description

Methods that act on the `slice_duration` field in the NIfTI/ANALYZE header.

Usage

```r
slice_duration(object) # S4 method for signature 'nifti'
slice_duration(object)
slice_duration(object) <- value # S4 replacement method for signature 'nifti'
slice.duration(object) # S4 method for signature 'nifti'
slice.duration(object)
slice.duration(object) <- value # S4 replacement method for signature 'nifti'
slice.duration(object) # S4 method for signature 'niftiImage'
slice.duration(object)
```
## S4 replacement method for signature 'niftiImage'

```r
slice_duration(object) <- value
```

### Arguments

- `object` is an object of class `nifti` or `anlz`.
- `value` is the value to assign to the `slice_duration` field.

### Details

See documentation on the ANALYZE and/or NIfTI data standards for more details.

...
```

## S4 method for signature 'array,array'
slice_overlay(x, y, ...)

## S4 method for signature 'array,nifti'
slice_overlay(x, y, ...)

## S4 method for signature 'nifti,array'
slice_overlay(x, y, ...)

## S4 method for signature 'array,anlz'
slice_overlay(x, y, ...)

## S4 method for signature 'anlz,array'
slice_overlay(x, y, ...)

## S4 method for signature 'afni,afni'
slice_overlay(x, y, ...)

## S4 method for signature 'afni,array'
slice_overlay(x, y, ...)

### Arguments

- **x, y** is an object of class nifti or similar.
- **z** is the slice to be displayed (ignored when plot.type = "multiple").
- **w** is the time point to be displayed (4D arrays only).
- **col.x** is grayscale (by default).
- **col.y** is hotmetal (by default).
- **zlim.x, zlim.y** are set to NULL (by default) and taken from the header information.
- **plane** is the plane of acquisition to be displayed (choices are ‘axial’, ‘coronal’, ‘sagittal’).
- **xlab** is set to "" since all margins are set to zero.
- **ylab** is set to "" since all margins are set to zero.
- **axes** is set to FALSE since all margins are set to zero.
oma is the size of the outer margins in the `par` function.

mar is the number of lines of margin in the `par` function.

bg is the background color in the `par` function.

NA.x Set any values of 0 in x to NA

NA.y Set any values of 0 in y to NA

useRaster if TRUE, a bitmap raster is used to plot the image instead of polygons. Passed to `image`

... other arguments to the `image` function may be provided here.

**Details**

The `image` command is used multiple times to simultaneously visualize one of the three orthogonal planes in two multidimensional arrays, one on top of the other, for medical imaging data.

**Methods**

- x = "nifti", y = "nifti" Produce slice_overlay of y on x.
- x = "anlz", y = "anlz" Produce slice_overlay of y on x.
- x = "afni", y = "afni" Produce slice_overlay of y on x.

`smax-methods` Extract Image Attribute `smax`

## Description
Methods that act on the `smax` field in the NIfTI/ANALYZE header.

## Usage
```
smax(object)
```

```
## S4 method for signature 'anlz'
smax(object)
```

```
smax(object) <- value
```

```
## S4 replacement method for signature 'anlz'
smax(object) <- value
```

## Arguments
- `object` is an object of class `nifti` or `anlz`.
- `value` is the value to assign to the `smax` field.

## Details
See documentation on the ANALYZE and/or NIfTI data standards for more details.

ANALYZE 7.5
http://eeg.sourceforge.net/ANALYZE75.pdf
NIfTI-1
http://nifti.nimh.nih.gov/

Description

A pleasing rainbow style color table patterned after that used in Matlab.

Usage

tim.colors(n = 64)

Arguments

n is the number of color levels (default = 64).
Details

Based on the `tim.colors` function in the fields package. The `tim.colors` function here has been modified to break any dependence on code in the fields package. Spline interpolation (interpSpline) is used when the number of requested colors is not the default.

Value

A vector of character strings giving the colors in hexadecimal format.

Author(s)

Tim Hoar (GSP-NCAR); modified by Brandon Whitcher

See Also

toffset(img)
toffset(img) = 8
stopifnot(toffset(img) == 8)
```

translateCoordinate  Translate Voxel Coordinates

Description

Translates a voxel index into the continuous coordinate space defined by the NIfTI qform and sform information.

Usage

`translateCoordinate(i, nim, verbose = FALSE)`

Arguments

<table>
<thead>
<tr>
<th>i</th>
<th>An index vector in nim.</th>
</tr>
</thead>
<tbody>
<tr>
<td>nim</td>
<td>An object of class nifti.</td>
</tr>
<tr>
<td>verbose</td>
<td>Provide detailed output to the user.</td>
</tr>
</tbody>
</table>
Details

This function takes as input a nifti object and an index vector in the voxel space of the object and translates that voxel index into the continuous coordinate space defined by the object’s qform and sform.

Please note:

1. By default the index \( i \) varies most rapidly, etc.
2. The ANALYZE 7.5 coordinate system is

\[
\begin{align*}
+x &= \text{Left} \\
+y &= \text{Anterior} \\
+z &= \text{Superior}
\end{align*}
\]

(A left-handed co-ordinate system).
3. The three methods below give the locations of the voxel centres in the x,y,z system. In many cases programs will want to display the data on other grids. In which case the program will be required to convert the desired (x,y,z) values in to voxel values using the inverse transformation.
4. Method 2 uses a factor qfac which is either -1 or 1. qfac is stored in pixdim[0]. If pixdim[0] != 1 or -1, which should not occur, we assume 1.
5. The units of the xyzt are set in xyzt_units field.

Value

A nifti-class object with translated coordinates.

Author(s)

Andrew Thornton <zeripath@users.sourceforge.net>

Examples

```r
ffd <- readNIfTI(file.path(system.file("nifti", package="oro.nifti"),  
                    "filtered_func_data"))
xyz <- c(1,1,1)
translateCoordinate(xyz, ffd, verbose=TRUE)
xyz <- trunc(dim(ffd)[1:3]/2)
translateCoordinate(xyz, ffd, verbose=TRUE)
```

Description

Methods that act on the unused1 field in the NIfTI/ANALYZE header.
Usage

```r
unused1(object)

## S4 method for signature 'anlz'
unused1(object)

unused1(object) <- value

## S4 replacement method for signature 'anlz'
unused1(object) <- value
```

Arguments

- `object` is an object of class `nifti` or `anlz`.
- `value` is the value to assign to the `unused1` field.

Details

See documentation on the ANALYZE and/or NIfTI data standards for more details.

Description

Methods that act on the `verified` field in the NIfTI/ANALYZE header.

Usage

```r
verified(object)

## S4 method for signature 'anlz'
verified(object)

verified(object) <- value
```
## S4 replacement method for signature 'anlz'

```r
verified(object) <- value
```

### Arguments

- **object**: is an object of class `nifti` or `anlz`.
- **value**: is the value to assign to the `verified` field.

### Details

See documentation on the ANALYZE and/or NIfTI data standards for more details.

### Description

Methods that act on the `views` field in the NIfTI/ANALYZE header.

### Usage

```r
views(object)
```

```r
## S4 method for signature 'anlz'
views(object)
```

```r
views(object) <- value
```

```r
## S4 replacement method for signature 'anlz'
views(object) <- value
```

### Arguments

- **object**: is an object of class `nifti` or `anlz`.
- **value**: is the value to assign to the `views` field.
Details
See documentation on the ANALYZE and/or NIfTI data standards for more details.

| voxdim       | Gets Voxel Dimensions |

Description

Grabs the pixdim and takes the correct elements

Usage

voxdim(img)

Arguments

img nifti object

Value

Vector of length 3

Examples

nim <- nifti(array(rnorm(10^3), dim = c(5, 2, 100)), pixdim = c(1, 0.5, 0.2, 1))
voxdim(nim)
voxres

*Gets Voxel Resolution*

**Description**
Grabs the 3 voxel dimensions and takes the product

**Usage**

```r
voxres(img, units = c("mm", "cm"))
```

**Arguments**

- `img` nifti object
- `units` output unit, either cubic mm or cubic cm.

**Value**
Scalar numeric, one number, in cubic mm or cubic cm (cc/mL).

---

**vox_offset-methods**

*Extract Image Attribute vox_offset*

**Description**
Methods that act on the `vox_offset` field in the NIfTI/ANALYZE header.

**Usage**

```r
oxo_offset(object)
```

```r
double S4 method for signature 'nifti'
  vox_offset<object>

## S4 method for signature 'anlz'
  vox_offset<object>

  vox_offset<object> <- value
```

```r
double S4 replacement method for signature 'nifti'
  vox_offset<object> <- value

## S4 replacement method for signature 'anlz'
  vox_offset<object> <- value
```
**Arguments**

object is an object of class nifti or anlz.

value is the value to assign to the voxel_offset field.

**Details**

See documentation on the ANALYZE and/or NIfTI data standards for more details.

img = RNifti::readNifti(file)
vox_offset(img)
img = RNifti::readNifti(file)
vox_offset(img)
```
**Description**

Methods that act on the `vox_units` field in the NIfTI/ANALYZE header.

**Usage**

```r
vox_units(object)
```

```r
## S4 method for signature 'anlz'
 vox_units(object)

 vox_units(object) <- value
```

```r
## S4 replacement method for signature 'anlz'
 vox_units(object) <- value

 vox.units(object)
```

```r
## S4 method for signature 'anlz'
 vox.units(object)

 vox.units(object) <- value
```

```r
## S4 replacement method for signature 'anlz'
 vox.units(object) <- value
```

**Arguments**

- `object` is an object of class `nifti` or `anlz`.
- `value` is the value to assign to the `vox_units` field.

**Details**

See documentation on the ANALYZE and/or NIfTI data standards for more details.

writeAFNI-methods  writeAFNI

Description

This function saves a afni-class object to HEAD/BRIK pair in AFNI format.

Usage

writeAFNI(nim, ...)

## S4 method for signature 'afni'
writeAFNI(nim, fname, verbose = FALSE, warn = -1)

Arguments

nim is an object of class afni.
...
... Additional variables defined by the method.
fname is the path and file name to save the AFNI file (.HEAD/BRIK) without the suffix.
verbose is a logical variable (default = FALSE) that allows text-based feedback during execution of the function.
warm is a number to regulate the display of warnings (default = -1). See options for more details.

Details

The writeAFNI function utilizes the internal writeBin and writeLines command to write information to header/binary file pair.

Current acceptable data types include

INT16" DT SIGNED SHORT (16 bits per voxel)
FLOAT32" DT FLOAT (32 bits per voxel)
"COMPLEX128" DT COMPLEX (128 bits per voxel)

Value

Nothing.
Methods

nim = "afni" Write AFNI volume to disk.
nim = "ANY" Not implemented.

Author(s)

Karsten Tabelow <karsten.tabelow@wias-berlin.de>

References

AFNI

See Also

writeANALYZE,writeNIfTI

Examples

## Taken from the AFNI Matlab Library
## http://afni.nimh.nih.gov/pub/dist/data/afni_matlab_data.tgz
afni.path <- system.file("afni", package="oro.nifti")
orig <- readAFNI(file.path(afni.path, "ARzs_CW_avvr.DEL+orig"))
fname = file.path(tempdir(), "test-afni-image")
writeAFNI(orig, fname, verbose=TRUE)

data <- readAFNI(fname, verbose=TRUE)
image(orig, zlim=c(0.5,256), oma=rep(2,4), bg="white")
image(data, zlim=c(0.5,256), oma=rep(2,4), bg="white")
abs.err <- abs(data - orig)
image(as(abs.err, "nifti"), zlim=range(0,1), oma=rep(2,4),
      bg="white")

Description

This function saves an Analyze-class object to a single binary file in Analyze format.

Usage

## S4 method for signature 'anlz'
writeANALYZE(
  aim,
  filename,
  gzipped = TRUE,
Arguments

- **aim**: is an object of class `anlz`.
- **filename**: is the path and file name to save the Analyze file pair (.hdr,.img) **without** the suffixes.
- **gzipped**: is a character string that enables exportation of compressed (.gz) files (default = `TRUE`).
- **verbose**: is a logical variable (default = `FALSE`) that allows text-based feedback during execution of the function.
- **warn**: is a number to regulate the display of warnings (default = `-1`). See options for more details.
- **compression**: The amount of compression to be applied when writing a file when `gzipped = TRUE`.

Details

The `writeANALYZE` function utilizes the internal `writeBin` and `writeChar` command to write information to a binary file.

Value

Nothing.

Methods

- **object = "anlz"**: Write ANALYZE volume to disk.

writeNIfTI-methods

Description

This function saves a NIfTI-class object to a single binary file in NIfTI format.

Usage

```r
## S4 method for signature 'nifti'
writeNIfTI(}
```
Arguments

nim is an object of class nifti or anlz.
filename is the path and file name to save the NIfTI file (.nii) **without** the suffix.
onefile is a logical value that allows the scanning of single-file (.nii) or dual-file format (.hdr and .img) NIfTI files (default = TRUE).
gzipped is a character string that enables exportation of compressed (.gz) files (default = TRUE).

verbose is a logical variable (default = FALSE) that allows text-based feedback during execution of the function.

warn is a number to regulate the display of warnings (default = -1). See options for more details.

compression The amount of compression to be applied when writing a file when gzipped = TRUE

Details

The writeNIfTI function utilizes the internal writeBin and writeChar command to write information to a binary file.

Current acceptable data types include

- `list("UINT8")` DT BINARY (1 bit per voxel)
- `list("INT16")` DT SIGNED SHORT (16 bits per voxel)
- `list("INT32")` DT SIGNED INT (32 bits per voxel)
- `list("FLOAT32")` DT FLOAT (32 bits per voxel)
- `list("DOUBLE64")` DT DOUBLE (64 bits per voxel)
- `list("UINT16")` DT UNSIGNED SHORT (16 bits per voxel)

Value

Nothing.

Methods

- `object = "anlz"` Convert ANALYZE object to class nifti and write the NIfTI volume to disk.
- `object = "array"` Convert array to class nifti and write the NIfTI volume to disk.
- `object = "nifti"` Write NIfTI volume to disk.

---

Bitwise Conversion Subroutines

**Description**

Units of spatial and temporal dimensions, and MRI-specific spatial and temporal information.

**Usage**

```r
xyz2space(xyzt)
```
xyzt2time(xyzt)

space.time2xyzt(ss, tt)

dim2freq(di)

dim2phase(di)

dim2slice(di)

Arguments

xyzt represents the units of pixdim[1..4] in the NIfTI header.

ss is the character string of spatial units. Valid strings are: “Unknown”, “meter”, “mm” and “micron”.

tt is the character string of temporal units. Valid strings are: “sec”, “msec”, “usec”, “Hz”, “ppm” and “rads”.

di represents MRI slice ordering in the NIfTI header.

Details

The functions xyzt2space and xyzt2time can be used to mask off the undesired bits from the
xyzt_units fields, leaving “pure” space and time codes.

xyzt_units.html

The functions dim2freq, dim2phase, and dim2slice can be used to extract values from the dim_info
byte.

dim_info.html

Value

For diminfo: the frequency, phase and slice dimensions encode which spatial dimension (1,2, or 3)
corresponds to which acquisition dimension for MRI data. For xyzt_units: the codes are used to
indicate the units of pixdim. Dimensions 1,2,3 are for x,y,z; dimension 4 is for time (t).

convert.units, convert.slice
Description

Methods that act on the `xyzt_units` field in the NIfTI/ANALYZE header.

Usage

```r
xyz_units(object)

## S4 method for signature 'nifti'
xyz_units(object)

xyz_units(object) <- value

## S4 replacement method for signature 'nifti'
xyz_units(object) <- value

xyz.units(object)

## S4 method for signature 'nifti'
xyz.units(object)

xyz.units(object) <- value

## S4 replacement method for signature 'nifti'
xyz.units(object) <- value

## S4 method for signature 'niftiImage'
xyz_units(object)

## S4 replacement method for signature 'niftiImage'
xyz_units(object) <- value
```

Arguments

- `object` is an object of class `nifti` or `anlz`.
- `value` is the value to assign to the `xyzt_units` field.
