Package ‘paws.common’

October 14, 2022

Type Package
Title Paws Low-Level Amazon Web Services API
Version 0.5.1
Description Functions for making low-level API requests to Amazon Web Services<br/>&lt;https://aws.amazon.com&gt;. The functions handle building, signing, and sending requests, and receiving responses. They are designed to help build higher-level interfaces to individual services, such as Simple Storage Service (S3).
License Apache License (>= 2.0)

get_config

Get the service configuration from the service object.

Description

Look up the service configuration from the service object, e.g. when calling svc$operation(), get_config() will look up svc, then get any configuration stored in it, as if the operation function were a method and the service object were a class instance.

Usage

get_config()

Details

get_config must be called directly by the operation function and assigned immediately, not provided as an argument to another function.

We look up the service object then fetch its data so we can both support documentation tooltips in RStudio and also have class-object-like behavior. Alternatives that do not support documentation tooltips in RStudio include reference classes (RC), R6 classes, and any modification of the functions at run-time, e.g. inserting the configuration into the function definition for each operation in a particular service object.
is_empty

Check whether an object is empty

Description

Check whether an object is empty, e.g. has no sub-elements, is NA, or is the empty string.

Usage

is_empty(x)

Arguments

x An object.

Examples

is_empty(NA) # TRUE
is_empty(""") # TRUE
is_empty(list()) # TRUE
is_empty(list(list())) # TRUE

is_empty(1) # FALSE
is_empty(list(1)) # FALSE
is_empty(list(list(1))) # FALSE

is_empty_xml

Check whether an object is empty for xml builds

Description

Check whether an object is empty, e.g. has no sub-elements, is NA

Usage

is_empty_xml(x)

Arguments

x An object.
Examples

```r
is_empty_xml(NA) # TRUE
is_empty_xml(list()) # TRUE
is_empty_xml(list(list())) # TRUE

is_empty_xml(1) # FALSE
is_empty_xml(""") # FALSE
is_empty_xml(list(1)) # FALSE
is_empty_xml(list(list(1))) # FALSE
```

new_handlers

Return request handlers for a service

Description

Return request handlers for a given protocol and request signer.

Usage

```r
new_handlers(protocol, signer)
```

Arguments

- `protocol`: Protocol: `ec2query`, `jsonrpc`, `query`, `rest`, `restjson`, or `restxml`.
- `signer`: Signer: `v2` or `v4`.

See Also

Other API request functions: `new_operation()`, `new_request()`, `new_service()`, `send_request()`

Examples

```r
# Get the handlers needed for an API using REST-JSON and AWS signature V4.
handlers <- new_handlers("restjson", "v4")
```
new_operation

Description

Return an API operation object, with information on what to request for a given API operation. For example, the S3 service's "list buckets" operation is named ListBuckets, it requires a GET request, and so on.

Usage

```r
new_operation(
  name,
  http_method,
  http_path,
  paginator,
  before_presign_fn = NULL
)
```

Arguments

- `name`: The API operation name.
- `http_method`: The HTTP method, e.g. "GET" or "POST".
- `http_path`: The HTTP path.
- `paginator`: Currently unused.
- `before_presign_fn`: Currently unused.

See Also

Other API request functions: `new_handlers()`, `new_request()`, `new_service()`, `send_request()`

Examples

```r
# Save info about the S3 ListBuckets API operation.
op <- new_operation(
  name = "ListBuckets",
  http_method = "GET",
  http_path = "/",
  paginator = list()
)
```
new_request

Return an API request object

Description

Return an API request object with everything needed to make a request.

Usage

new_request(client, operation, params, data, dest = NULL)

Arguments

client A service client, e.g. from new_service.
operation An operation, e.g. from new_operation.
params A populated input object.
data An empty output object.
dest Control where the response body is written

See Also

Other API request functions: new_handlers(), new_operation(), new_service(), send_request()

Examples

```r
## Not run:
# Make a request object for the S3 ListBuckets operation.
metadata <- list(
  endpoints = list("s" = list(endpoint = "s3.{region}.amazonaws.com", global = FALSE)),
  service_name = "s3"
)
client <- new_service(metadata, new_handlers("restxml", "s3"))
op <- new_operation("ListBuckets", "GET", "/", list())
params <- list()
data <- tag_add(list(Buckets = list()), list(type = "structure"))
req <- new_request(client, op, params, data)
## End(Not run)
```
new_service (Return an AWS API service object)

Description
Return an API service object with information and handlers needed to make API requests.

Usage
new_service(metadata, handlers, cfgs = NULL)

Arguments
metadata A named list of API metadata. It should look like:

```r
list(
  service_name = "string",
  endpoints = list("region" = list(endpoint = "endpoint", global = FALSE)),
  service_id = "string",
  api_version = "string",
  signing_name = "string"|NULL,
  json_version = "string",
  target_prefix = "string"
)
```

handlers A set of handlers, e.g. from new_handlers.

cfgs A config defined by the service. Defaults to null.

Region and credentials
new_service requires that you’ve set your AWS region in one of:

1. AWS_REGION R environment variable
2. AWS_REGION OS environment variable (Linux and macOS)
3. ~/.aws/config AWS configuration file

new_service also requires that you’ve set your AWS credentials in one of:

1. AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY R environment variables
2. AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY OS environment variables (Linux and macOS)
3. ~/.aws/credentials AWS credentials file
4. IAM role

See Also
Other API request functions: new_handlers(), new_operation(), new_request(), send_request()
Examples

## Not run:
# Metadata for the S3 API.
metadata <- list(
  service_name = "s3",
  endpoints = list("us-east-1" = list(endpoint = "s3.amazonaws.com", global = FALSE)),
  service_id = "S3",
  api_version = "2006-03-01",
  signing_name = NULL,
  json_version = ",",
  target_prefix = ""
)

# Handlers for S3.
handlers <- new_handlers("restxml", "v4")

# Build a service object for S3, containing the information necessary to
# build, send, and receive requests.
service <- new_service(metadata, handlers)

## End(Not run)

---

**populate**

*Populate a list with data from another list*

### Description

`populate` copies data from a list (e.g. input by a user) to another list with a similar shape. The second list, called the interface, will generally also contain extra metadata for making API requests, such as names or types.

### Usage

```r
populate(input, interface)
```

### Arguments

- **input**: A list with data to copy.
- **interface**: A list of a similar shape to copy data into.

### Examples

```r
# Make an interface with metadata, e.g. type.
interface <- tag_add(list(foo = c(), bar = c()), list(type = "structure"))

# Combine data and the metadata from the interface.
populate(list(foo = 1, bar = 2), interface)
```
send_request

Send a request and handle the response

Description

Send a request and handle the response. Build the HTTP request, send it to AWS, interpret the response, and throw an error if the response is not ok.

Usage

send_request(request)

Arguments

request A request, e.g. from new_request.

See Also

Other API request functions: new_handlers(), new_operation(), new_request(), new_service()

Examples

## Not run:
# Send a request and handle the response.
resp <- send_request(req)
## End(Not run)

set_config

Add configuration settings to a service object.

Description

set_config adds a given set of configuration settings in cfgs to a service object, i.e. the service object for S3. Configuration settings can include credentials, region, endpoint, etc. These configuration settings will be used whenever an operation is called from that service object.

Usage

set_config(svc, cfgs = list())

Arguments

svc A service object containing service operations.
cfgs A list of optional configuration settings.
Details

set_config explicitly makes the credentials property mutable, such that when the SDK retrieves credentials later on, it will save them in the service object. This means that credentials don’t need to be fetched on each operation, only if and when the saved credentials expire.

The optional configuration settings can include the following:

```r
list(
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string",
    ),
    profile = "string",
  ),
  endpoint = "string",
  region = "string",
)
```

Examples

```r
# Create a config object with custom credentials and endpoint.
config <- set_config(
  svc = list(),
  cfgs = list(
    credentials = list(
      creds = list(
        access_key_id = "abc",
        secret_access_key = "123"
      ),
      profile = "string",
    ),
    endpoint = "https://foo.com",
    region = "string",
  )
)
```

Tags

Get, set, and delete object tags

Description

Tags are metadata stored in an object’s attributes, used to store types and names needed to make AWS API requests.

tag_get returns the value of the given tag, or "" if the tag doesn’t exist.
tag_has returns whether the object has the given tag.
tag_add returns the object after adding the given list of tags and values.
tag_del returns the object after recursively deleting tags in tags, or all tags if NULL.
type returns broadly what type an object is, based on its type tag.
Usage

- `tag_get(object, tag)`
- `tag_get_all(object)`
- `tag_has(object, tag)`
- `tag_add(object, tags)`
- `tag_del(object, tags = NULL)`
- `type(object)`

Arguments

- `object` An object.
- `tag` A tag name.
- `tags` A list of tags.
- `tag_add`: A named vector with tag names and their values.
- `tag_del`: A character vector of tags to delete.

Examples

```r
foo <- list()
foo <- tag_add(foo, list(tag_name = "tag_value"))
tag_has(foo, "tag_name") # TRUE
tag_get(foo, "tag_name") # "tag_value"
tag_get(foo, "not_exist") # ""
foo <- tag_del(foo)
tag_has(foo, "tag_name") # FALSE
```
