Package ‘plotly’

June 18, 2021

Title  Create Interactive Web Graphics via 'plotly.js'
Version  4.9.4.1
License  MIT + file LICENSE
Description  Create interactive web graphics from 'ggplot2' graphs and/or a custom interface to the (MIT-licensed) JavaScript library 'plotly.js' inspired by the grammar of graphics.

BugReports  https://github.com/ropensci/plotly/issues

Depends  R (>= 3.2.0), ggplot2 (>= 3.0.0)
Imports  tools, scales, httr (>= 1.3.0), jsonlite (>= 1.6), magrittr, digest, viridisLite, base64enc, htmltools (>= 0.3.6), htmlwidgets (>= 1.5.2.9001), tidyr (>= 1.0.0), RColorBrewer, dplyr, vctrs, tibble, lazyeval (>= 0.2.0), rlang (>= 0.4.10), crosstalk, purrr, data.table, promises

Suggests  MASS, maps, hexbin, gghthemes, GGally, testthat, knitr, devtools, shiny (>= 1.1.0), shinytest (>= 1.3.0), curl, markdown, vdiffir, Cairo, broom, webshot, listviewer, dendextend, sf, maptools, rgeos, png, IRdisplay, processx, plotlyGeoAssets, forcats, palmerpenguins

LazyData  true
RoxygenNote  7.1.1
Encoding  UTF-8
NeedsCompilation  no

add_annotations

Add an annotation(s) to a plot

Description

Add an annotation(s) to a plot

Usage

add_annotations(p, text = NULL, ..., data = NULL, inherit = TRUE)
Arguments

- `p` : a plotly object
- `text` : annotation text (required).
- `data` : a data frame.
- `inherit` : inherit attributes from `plot_ly()`?

Author(s)

Carson Sievert

---

`add_data`  
*Add data to a plotly visualization*

Description

Add data to a plotly visualization

Usage

```r
add_data(p, data = NULL)
```

Arguments

- `p` : a plotly visualization
- `data` : a data frame.

Examples

```r
plot_ly() %>% add_data(economics) %>% add_trace(x = ~date, y = ~pce)
```
add_fun

**Apply function to plot, without modifying data**

**Description**

Useful when you need two or more layers that apply a summary statistic to the original data.

**Usage**

```
add_fun(p, fun, ...)
```

**Arguments**

- `p`: a plotly object.
- `fun`: a function. Should take a plotly object as input and return a modified plotly object.
- `...`: arguments passed to `fun`.

add_trace

**Add trace(s) to a plotly visualization**

**Description**

Add trace(s) to a plotly visualization

**Usage**

```
add_trace(p, ..., data = NULL, inherit = TRUE)
add_markers(p, x = NULL, y = NULL, z = NULL, ..., data = NULL, inherit = TRUE)
add_text(
  p,
  x = NULL,
  y = NULL,
  z = NULL,
  text = NULL,
  ..., data = NULL,
  inherit = TRUE
)
add_paths(p, x = NULL, y = NULL, z = NULL, ..., data = NULL, inherit = TRUE)
add_lines(p, x = NULL, y = NULL, z = NULL, ..., data = NULL, inherit = TRUE)
```
add_segments(
  p,
  x = NULL,
  y = NULL,
  xend = NULL,
  yend = NULL,
  ..., 
  data = NULL,
  inherit = TRUE
)

add_polygons(p, x = NULL, y = NULL, ..., data = NULL, inherit = TRUE)

add_sf(p, ..., x = ~x, y = ~y, data = NULL, inherit = TRUE)

add_table(p, ..., rownames = TRUE, data = NULL, inherit = TRUE)

add_ribbons(
  p,
  x = NULL,
  ymin = NULL,
  ymax = NULL,
  ..., 
  data = NULL,
  inherit = TRUE
)

add_image(p, z = NULL, colormodel = NULL, ..., data = NULL, inherit = TRUE)

add_area(p, r = NULL, t = NULL, ..., data = NULL, inherit = TRUE)

add_pie(p, values = NULL, labels = NULL, ..., data = NULL, inherit = TRUE)

add_bars(p, x = NULL, y = NULL, ..., data = NULL, inherit = TRUE)

add_histogram(p, x = NULL, y = NULL, ..., data = NULL, inherit = TRUE)

add_histogram2d(
  p,
  x = NULL,
  y = NULL,
  z = NULL,
  ..., 
  data = NULL,
  inherit = TRUE
)
add_trace

```r
add_histogram2dcontour(
p, 
x = NULL, 
y = NULL, 
z = NULL,
..., 
data = NULL, 
inherit = TRUE
)
```

```r
add_heatmap(p, x = NULL, y = NULL, z = NULL, ..., data = NULL, inherit = TRUE)
```

```r
add_contour(p, z = NULL, ..., data = NULL, inherit = TRUE)
```

```r
add_boxplot(p, x = NULL, y = NULL, ..., data = NULL, inherit = TRUE)
```

```r
add_surface(p, z = NULL, ..., data = NULL, inherit = TRUE)
```

```r
add_mesh(p, x = NULL, y = NULL, z = NULL, ..., data = NULL, inherit = TRUE)
```

```r
add_scattergeo(p, ...)
```

```r
add_choropleth(p, z = NULL, ..., data = NULL, inherit = TRUE)
```

### Arguments

- **p**: a plotly object
- **...**: Arguments (i.e., attributes) passed along to the trace type. See `schema()` for a list of acceptable attributes for a given trace type (by going to traces -> type -> attributes). Note that attributes provided at this level may override other arguments (e.g. `plot_ly(x = 1:10, y = 1:10, color = I("red"), marker = list(color = "blue")))
- **data**: A data frame (optional) or `crosstalk::SharedData` object.
- **inherit**: inherit attributes from `plot_ly()`?
- **x**: the x variable.
- **y**: the y variable.
- **z**: a numeric matrix (unless `add_image()`, which wants a raster object, see `as.raster()`).
- **text**: textual labels.
- **xend**: "final" x position (in this context, x represents "start")
- **yend**: "final" y position (in this context, y represents "start")
- **rownames**: whether or not to display the rownames of data.
- **ymin**: a variable used to define the lower boundary of a polygon.
- **ymax**: a variable used to define the upper boundary of a polygon.
- **colormodel**: Sets the colormodel for image traces if z is not a raster object. If z is a raster object (see `as.raster()`), the 'rgba' colormodel is always used.
For polar chart only. Sets the radial coordinates.
values
the value to associated with each slice of the pie.
lables
the labels (categories) corresponding to values.

plot_ly()

Examples

```r
# the `plot_ly()` function initiates an object, and if no trace type
# is specified, it sets a sensible default
p <- plot_ly(economics, x = ~date, y = ~uempmed)
p

# some `add_*()` functions are a specific case of a trace type
# for example, `add_markers()` is a scatter trace with mode of markers
add_markers(p)

# scatter trace with mode of text
add_text(p, text = "%")

# scatter trace with mode of lines
add_paths(p)

# like `add_paths()`, but ensures points are connected according to `x`
add_lines(p)

# if you prefer to work with plotly.js more directly, can always
# use `add_trace()` and specify the type yourself
add_trace(p, type = "scatter", mode = "markers+lines")

# mappings provided to `plot_ly()` are "global", but can be overwritten
plot_ly(economics, x = ~date, y = ~uempmed, color = I("red"), showlegend = FALSE) %>%
  add_lines() %>%
  add_markers(color = ~pop)

# a number of `add_*()` functions are special cases of the scatter trace
```
add_trace

plot_ly(economics, x = ~date) %>%
  add_ribbons(ymin = ~pce - 1e3, ymax = ~pce + 1e3)

# use `group_by()` (or `group2NA()`)
# once per group (e.g. one line per group)
txhousing %>%
  group_by(city) %>%
  plot_ly(x = ~date, y = ~median) %>
  add_lines(color = I("black"))

## Not run:
# use `add_sf()` or `add_polygons()` to create geo-spatial maps
if (requireNamespace("sf", quietly = TRUE)) {
  nc <- sf::st_read(system.file("shape/nc.shp", package = "sf"), quiet = TRUE)
  plot_ly() %>% add_sf(data = nc)
}

# univariate summary statistics
plot_ly(mtcars, x = ~factor(vs), y = ~mpg) %>%
  add_boxplot()
plot_ly(mtcars, x = ~factor(vs), y = ~mpg) %>
  add_trace(type = "violin")

# `add_histogram()` does binning for you...
mtcars %>
  plot_ly(x = ~factor(vs)) %>
  add_histogram()

# ...but you can 'pre-compute' bar heights in R
mtcars %>
  dplyr::count(vs) %>
  plot_ly(x = ~vs, y = ~n) %>
  add_bars()

# the 2d analogy of add_histogram() is add_histogram2d()/add_histogram2dcontour()
library(MASS)
(p <- plot_ly(geyser, x = ~waiting, y = ~duration))
add_histogram2d(p)
add_histogram2dcontour(p)

# the 2d analogy of add_bars() is add_heatmap()/add_contour()
# (i.e., bin counts must be pre-specified)
den <- kde2d(geyser$waiting, geyser$duration)
(p <- plot_ly(x = den$x, y = den$y, z = den$z))
add_heatmap(p)
add_contour(p)

# `add_table()` makes it easy to map a data frame to the table trace type
plot_ly(economics) %>
  add_table()

# pie charts!
```
ds <- data.frame(labels = c("A", "B", "C"), values = c(10, 40, 60))
plot_ly(ds, labels = ~labels, values = ~values) %>%
  add_pie() %>%
  layout(title = "Basic Pie Chart using Plotly")

data(wind)
plot_ly(wind, r = ~r, t = ~t) %>%
  add_area(color = ~nms) %>%
  layout(radialaxis = list(ticksuffix = ",", orientation = 270))

# 3D chart types
# -------------------------------------------------------------
plot_ly(z = ~volcano) %>%
  add_surface()
plot_ly(x = c(0, 0, 1), y = c(0, 1, 0), z = c(0, 0, 0)) %>%
  add_mesh()

## End(Not run)

---

**animation_opts**

*Animation configuration options*

**Description**

Animations can be created by either using the `frame` argument in `plot_ly()` or the (unofficial) frame ggplot2 aesthetic in `ggplotly()`. By default, animations populate a play button and slider component for controlling the state of the animation (to pause an animation, click on a relevant location on the slider bar). Both the play button and slider component transition between frames according rules specified by `animation_opts()`.

**Usage**

```r
animation_opts(
  p,
  frame = 500,
  transition = frame,
  easing = "linear",
  redraw = TRUE,
  mode = "immediate"
)
```

```r
animation_slider(p, hide = FALSE, ...)
```

```r
animation_button(p, ..., label)
```
animation_opts

Arguments

- `p` a plotly object.
- `frame` The amount of time between frames (in milliseconds). Note that this amount should include the transition.
- `transition` The duration of the smooth transition between frames (in milliseconds).
- `easing` The type of transition easing. See the list of options here: https://github.com/plotly/plotly.js/blob/master/src/plots/animation_attributes.js
- `redraw` Trigger a redraw of the plot at completion of the transition? A redraw may significantly impact performance, but may be necessary to update graphical elements that can’t be transitioned.
- `mode` Describes how a new animate call interacts with currently-running animations. If `immediate`, current animations are interrupted and the new animation is started. If `next`, the current frame is allowed to complete, after which the new animation is started. If `afterall` all existing frames are animated to completion before the new animation is started.
- `hide` remove the animation slider?

... for `animation_slider`, attributes are passed to a special layout.sliders object tied to the animation frames. The definition of these attributes may be found here: https://github.com/plotly/plotly.js/blob/master/src/components/sliders/attributes.js For `animation_button`, arguments are passed to a special layout.updatemenus button object tied to the animation https://github.com/plotly/plotly.js/blob/master/src/components/updatemenus/attributes.js

- `label` a character string used for the animation button’s label

Carson Sievert

Examples

df <- data.frame(x = c(1, 2, 2, 1, 1, 2), y = c(1, 2, 2, 1, 1, 2), z = c(1, 1, 2, 2, 3, 3))
plot_ly(df) %>%
  add_markers(x = 1.5, y = 1.5) %>%
  add_markers(x = ~x, y = ~y, frame = ~z)

# it's a good idea to remove smooth transitions when there is
# no relationship between objects in each view
plot_ly(mtcars, x = ~wt, y = ~mpg, frame = ~cyl) %>%
  animation_opts(transition = 0)

# works the same way with ggplotly
if (interactive()) {
  p <- ggplot(txhousing, aes(month, median)) +
  geom_line(aes(group = year), alpha = 0.3) +
  geom_smooth() +
  geom_line(aes(frame = year, ids = month), color = "red") +
  facet_wrap(~ city)

  ggplotly(p, width = 1200, height = 900) %>%
  animation_opts(1000)
}

#' # for more, see https://plotly.com/r/animating-views.html

---

api_create

Tools for working with plotly's REST API (v2)

Description

Convenience functions for working with version 2 of plotly's REST API. Upload R objects to a plotly account via api_create() and download plotly objects via api_download_plot()/api_download_grid(). For anything else, use api().

Usage

api_create(
  x = last_plot(),
  filename = NULL,
  fileopt = c("overwrite", "new"),
  sharing = c("public", "private", "secret"),
  ...
)

## S3 method for class 'plotly'
api_create(
  x = last_plot(),
  filename = NULL,
  fileopt = "overwrite",
  sharing = "public",
  ...
)

## S3 method for class 'ggplot'
api_create(
  x = last_plot(),
  filename = NULL,
  fileopt = "overwrite",
  ...
sharing = "public",
...
)

## S3 method for class 'data.frame'
api_create(x, filename = NULL, fileopt = "overwrite", sharing = "public", ...)

api_download_plot(id, username)

api_download_grid(id, username)

api(endpoint = "/", verb = "GET", body = NULL, ...)

Arguments

x
An R object to hosted on plotly’s web platform. Can be a plotly/ggplot2 object or a data.frame.

filename
character vector naming file(s). If x is a plot, can be a vector of length 2 naming both the plot AND the underlying grid.

fileopt
character string describing whether to "overwrite" existing files or ensure "new" file(s) are always created.

sharing
If 'public', anyone can view this graph. It will appear in your profile and can appear in search engines. You do not need to be logged in to Plotly to view this chart. If 'private', only you can view this plot. It will not appear in the Plotly feed, your profile, or search engines. You must be logged in to Plotly to view this graph. You can privately share this graph with other Plotly users in your online Plotly account and they will need to be logged in to view this plot. If 'secret', anyone with this secret link can view this chart. It will not appear in the Plotly feed, your profile, or search engines. If it is embedded inside a webpage or an IPython notebook, anybody who is viewing that page will be able to view the graph. You do not need to be logged in to view this plot.

... For api(), these arguments are passed onto http::RETRY(). For api_create(), these arguments are included in the body of the HTTP request.

id
a filename id.

username
a plotly username.

dataframe
the endpoint (i.e., location) for the request. To see a list of all available endpoints, call api(). Any relevant query parameters should be included here (see examples).

verb
name of the HTTP verb to use (as in, http::RETRY()).

body
body of the HTTP request (as in, http::RETRY()). If this value is not already converted to JSON (via jsonlite::toJSON()), it uses the internal to_JSON() to ensure values are "automatically unboxed" (i.e., vec.

signup()

### Examples

```r
# Not run:

# api_create() makes it easy to upload ggplot2/plotly objects
# and/or data frames to your plotly account
# A data frame creates a plotly "grid". Printing one will take you
# to the it's web address so you can start creating!
(m <- api_create(mtcars))

# A plotly/ggplot2 object create a plotly "plot".
p <- plot_ly(mtcars, x = ~factor(vs))
(r <- api_create(p))

# api_create() returns metadata about the remote "file". Here is
# one way you could use that metadata to download a plot for local use:
fileID <- strsplit(r$file$fid, ":")[[1]]
layout(
    api_download_plot(fileID[2], fileID[1]),
    title = sprintf("Local version of <a href='%s'>this</a> plot", r$file$web_url)
)

------------------------------------------------------------
# The api() function provides a low-level interface for performing
# any action at any endpoint! It always returns a list.
# list all the endpoints
api()

# search the entire platform!
# see https://api.plot.ly/v2/search
api("search?q=overdose")
api("search?q=plottype:pie trump fake")

# these examples will require a user account
usr <- Sys.getenv("plotly_username", NA)
if (!is.na(usr)) {
    # your account info https://api.plot.ly/v2/#users
    api(sprintf("users/%s", usr))
    # your folders/files https://api.plot.ly/v2/folders#user
```
as.widget

as.widget(x, ...)

Arguments

x a plotly object.

... other options passed onto htmlwidgets::createWidget

as_widget

Convert a list to a plotly htmlwidget object

Description

Convert a list to a plotly htmlwidget object

Usage

as_widget(x, ...)

---

as.widget

Convert a plotly object to an htmlwidget object

Description

This function was deprecated in 4.0.0, as plotly objects are now htmlwidget objects, so there is no need to convert them.

Usage

as.widget(x, ...)

Arguments

x a plotly object.

... other options passed onto htmlwidgets::createWidget
Arguments

x a plotly object.

... other options passed onto htmlwidgets::createWidget

Examples

```
trace <- list(x = 1, y = 1)
obj <- list(data = list(trace), layout = list(title = "my plot"))
as_widget(obj)
```

---

`attrs_selected` Specify attributes of selection traces

**Description**

By default the name of the selection trace derives from the selected values.

**Usage**

```
attrs_selected(opacity = 1, ...)
```

**Arguments**

opacity a number between 0 and 1 specifying the overall opacity of the selected trace

... other trace attributes attached to the selection trace.

**Author(s)**

Carson Sievert

---

`bbox` Estimate bounding box of a rotated string

**Description**

Estimate bounding box of a rotated string

**Usage**

```
bbox(txt = "foo", angle = 0, size = 12)
```
colorbar

Arguments

txt a character string of length 1
angle sets the angle of the tick labels with respect to the horizontal (e.g., tickangle of -90 draws the tick labels vertically)
size vertical size of a character

References

https://www.dropbox.com/s/nc6968prgw8ne4w/bbox.pdf?dl=0

colorbar Modify the colorbar

Description

Modify the colorbar

Usage

colorbar(p, ..., limits = NULL, which = 1)

Arguments

p a plotly object
... arguments are documented here https://plotly.com/r/reference/#scatter-marker-colorbar.
limits numeric vector of length 2. Set the extent of the colorbar scale.
which colorbar to modify? Should only be relevant for subplots with multiple colorbars.

Author(s)

Carson Sievert

Examples

p <- plot_ly(mtcars, x = ~wt, y = ~mpg, color = ~cyl)

# pass any colorbar attribute --
# https://plotly.com/r/reference/#scatter-marker-colorbar
colorbar(p, len = 0.5)

# Expand the limits of the colorbar
colorbar(p, limits = c(0, 20))
# values outside the colorbar limits are considered "missing"
colorbar(p, limits = c(5, 6))
# also works on colorbars generated via a z value
corr <- cor(diamonds[vapply(diamonds, is.numeric, logical(1))])
plot_ly(x = rownames(corr), y = colnames(corr), z = corr) %>%
  add_heatmap() %>%
colorbar(limits = c(-1, 1))

---

**config**

*Set the default configuration for plotly*

**Description**

Set the default configuration for plotly

**Usage**

```r
config(
p,
  ..., 
  cloud = FALSE,
  showSendToCloud = cloud,
  locale = NULL,
  mathjax = NULL
  )
```

**Arguments**

- **p**
  
  a plotly object

- **...**
  
  these arguments are documented at [https://github.com/plotly/plotly.js/blob/master/src/plot_api/plot_config.js](https://github.com/plotly/plotly.js/blob/master/src/plot_api/plot_config.js)

- **cloud**
  
  deprecated. Use showSendToCloud instead.

- **showSendToCloud**
  
  include the send data to cloud button?

- **locale**
  
  locale to use. See here for more info.

- **mathjax**
  
  add MathJax rendering support. If "cdn", mathjax is loaded externally (meaning an internet connection is needed for TeX rendering). If "local", the PLOTLY_MATHJAX_PATH environment variable must be set to the location (a local file path) of MathJax. IMPORTANT: plotly uses SVG-based mathjax rendering which doesn’t play nicely with HTML-based rendering (e.g., rmarkdown documents and shiny apps). To leverage both types of rendering, you must <iframe> your plotly graph(s) into the larger document (see here for an rmarkdown example and here for a shiny example).

**Author(s)**

Carson Sievert
**Examples**

```r
# remove the plotly logo and collaborate button from modebar
config(plot_ly(), displaylogo = FALSE, collaborate = FALSE)

# enable mathjax
# see more examples at https://plotly.com/r/TeX/
plot_ly(x = c(1, 2, 3, 4), y = c(1, 4, 9, 16)) %>%
  layout(title = TeX("\text{Some mathjax: }\alpha+\beta x")) %>%
  config(mathjax = "cdn")

# change the language used to render date axes and on-graph text
# (e.g., modebar buttons)
today <- Sys.Date()
x <- seq.Date(today, today + 360, by = "day")
p <- plot_ly(x = x, y = rnorm(length(x))) %>%
  add_lines()

# japanese
config(p, locale = "ja")
# german
config(p, locale = "de")
# spanish
config(p, locale = "es")
# chinese
config(p, locale = "zh-CN")
```

---

**embed_notebook**

**Embed a plot as an iframe into a Jupyter Notebook**

**Description**

Embed a plot as an iframe into a Jupyter Notebook

**Usage**

```r
embed_notebook(x, width = NULL, height = NULL, file = NULL)
```

**Arguments**

- **x**
  - a plotly object
- **width**
  - attribute of the iframe. If NULL, the width in plot_ly is used. If that is also NULL, ’100%’ is the default.
- **height**
  - attribute of the iframe. If NULL, the height in plot_ly is used. If that is also NULL, ’400px’ is the default.
- **file**
  - deprecated.
event_data

Access plotly user input event data in shiny

Description

This function must be called within a reactive shiny context.

Usage

event_data(
  event = c("plotly_hover", "plotly_unhover", "plotly_click", "plotly_doubleclick",
            "plotly_selected", "plotly_selecting", "plotly_brushed", "plotly_brushing",
            "plotly_deselect", "plotly_relayout", "plotly_restyle", "plotly_legendclick",
            "plotly_legendedclick", "plotly_clickannotation", "plotly_afterplot",
            "plotly_sunburstclick"),
  source = "A",
  session = shiny::getDefaultReactiveDomain(),
  priority = c("input", "event")
)

Arguments

event The type of plotly event. All supported events are listed in the function signature above (i.e., the usage section).

source a character string of length 1. Match the value of this string with the source argument in plot_ly() (or ggplotly()) to respond to events emitted from that specific plot.

session a shiny session object (the default should almost always be used).

priority the priority of the corresponding shiny input value. If equal to "event", then event_data() always triggers re-execution, instead of re-executing only when the relevant shiny input value changes (the default).

event_register, event_unregister
**event_register**

Register a shiny input value

**Description**

Register a shiny input value

**Usage**

```r
event_register(p, event = NULL)
```

**Arguments**

- `p`  
a plotly object.
- `event`  
The type of plotly event. All supported events are listed in the function signature above (i.e., the usage section).

**event_unregister**

Un-register a shiny input value

**Description**

Un-register a shiny input value

**Usage**

```r
event_unregister(p, event = NULL)
```

**Arguments**

- `p`  
a plotly object.
- `event`  
The type of plotly event. All supported events are listed in the function signature above (i.e., the usage section).

event_data

---

**export**

*Export a plotly graph to a static file*

Description

This function is in the process of being deprecated (use orca instead).

Usage

```r
export(p = last_plot(), file = "plotly.png", selenium = NULL, ...)
```

Arguments

- `p` a plotly or ggplot object.
- `file` a filename. The file type is inferred from the file extension. Valid extensions include `"jpeg" | "png" | "webp" | "svg" | "pdf``
- `selenium` used only when `p` is a WebGL plot or the output format is `"webp"` or `"svg"`. Should be an object of class "rsClientServer" returned by RSelenium::rsDriver.
- `...` if `p` is non-WebGL and the output file format is jpeg/png/pdf arguments are passed along to webshot::webshot(). Otherwise, they are ignored.

Details

For SVG plots, a screenshot is taken via webshot::webshot(). Since phantomjs (and hence webshot) does not support WebGL, the RSelenium package is used for exporting WebGL plots.

Author(s)

Carson Sievert
**geom2trace**

*Convert a "basic" geoms to a plotly.js trace.*

**Description**

This function makes it possible to convert ggplot2 geoms that are not included with ggplot2 itself. Users shouldn’t need to use this function. It exists purely to allow other package authors to write their own conversion method(s).

**Usage**

```r
geom2trace(data, params, p)
```

**Arguments**

- `data`: the data returned by `plotly::to_basic`.
- `params`: parameters for the geom, statistic, and 'constant' aesthetics
- `p`: a ggplot2 object (the conversion may depend on scales, for instance).

---

**get_figure**

*Request a figure object*

**Description**

Deprecated: see `api_download_plot()`.

**Usage**

```r
get_figure(username, id)
```

**Arguments**

- `username`: corresponding username for the figure.
- `id`: of the Plotly figure.
gg2list

Convert a ggplot to a list.

Description

Convert a ggplot to a list.

Usage

gg2list(
  p,
  width = NULL,
  height = NULL,
  tooltip = "all",
  dynamicTicks = FALSE,
  layerData = 1,
  originalData = TRUE,
  source = "A",
  ...
)

Arguments

- **p**: ggplot2 plot.
- **width**: Width of the plot in pixels (optional, defaults to automatic sizing).
- **height**: Height of the plot in pixels (optional, defaults to automatic sizing).
- **tooltip**: a character vector specifying which aesthetic tooltips to show in the tooltip. The default, "all", means show all the aesthetic tooltips (including the unofficial "text" aesthetic).
- **dynamicTicks**: accepts the following values: FALSE, TRUE, "x", or "y". Dynamic ticks are useful for updating ticks in response to zoom/pan/filter interactions; however, there is no guarantee they reproduce axis tick text as they would appear in the static ggplot2 image.
- **layerData**: data from which layer should be returned?
- **originalData**: should the "original" or "scaled" data be returned?
- **source**: a character string of length 1. Match the value of this string with the source argument in event_data() to retrieve the event data corresponding to a specific plot (shiny apps can have multiple plots).
- **...**: currently not used

Value

a 'built' plotly object (list with names "data" and "layout").
**Description**

This function converts a `ggplot2::ggplot()` object to a plotly object.

**Usage**

```r
ggplotly(
  p = ggplot2::last_plot(),
  width = NULL,
  height = NULL,
  tooltip = "all",
  dynamicTicks = FALSE,
  layerData = 1,
  originalData = TRUE,
  source = "A",
  ...
)
```

**Arguments**

- `p` a `ggplot` object.
- `width` Width of the plot in pixels (optional, defaults to automatic sizing).
- `height` Height of the plot in pixels (optional, defaults to automatic sizing).
- `tooltip` a character vector specifying which aesthetic mappings to show in the tooltip. The default, "all", means show all the aesthetic mappings (including the unofficial "text" aesthetic). The order of variables here will also control the order they appear. For example, use `tooltip = c("y","x","colour")` if you want y first, x second, and colour last.
- `dynamicTicks` should plotly.js dynamically generate axis tick labels? Dynamic ticks are useful for updating ticks in response to zoom/pan interactions; however, they can not always reproduce labels as they would appear in the static ggplot2 image.
- `layerData` data from which layer should be returned?
- `originalData` should the "original" or "scaled" data be returned?
- `source` a character string of length 1. Match the value of this string with the source argument in `event_data()` to retrieve the event data corresponding to a specific plot (shiny apps can have multiple plots).
- `...` arguments passed onto methods.
Details

Conversion of relative sizes depends on the size of the current graphics device (if no device is open, width/height of a new (off-screen) device defaults to 640/480). In other words, height and width must be specified at runtime to ensure sizing is correct. For examples on how to specify the output container's height/width in a shiny app, see plotly_example("shiny","ggplotly_sizing").

  ggplotly(tooltip = c("x", "y", "colour")) %>%  
  highlight("plotly_selected")

## End(Not run)
group2NA  

Separate groups with missing values

Description

This function is used internally by plotly, but may also be useful to some power users. The details section explains when and why this function is useful.

Usage

```r
group2NA(
  data,
  groupNames = "group",
  nested = NULL,
  ordered = NULL,
  retrace.first = inherits(data, "GeomPolygon")
)
```

Arguments

- `data` a data frame.
- `groupNames` character vector of grouping variable(s)
- `nested` other variables that group should be nested (i.e., ordered) within.
- `ordered` a variable to arrange by (within nested & groupNames). This is useful primarily for ordering by x
- `retrace.first` should the first row of each group be appended to the last row? This is useful for enclosing polygons with lines.

Details

If a group of scatter traces share the same non-positional characteristics (i.e., color, fill, etc), it is more efficient to draw them as a single trace with missing values that separate the groups (instead of multiple traces), In this case, one should also take care to make sure `connectgaps` is set to `FALSE`.

Value

a data frame with rows ordered by: nested, then groupNames, then ordered. As long as `groupNames` contains valid variable names, new rows will also be inserted to separate the groups.

Examples

```r
# note the insertion of new rows with missing values
group2NA(mtcars, "vs", "cyl")

# need to group lines by city somehow!
plot_ly(txhousing, x = ~date, y = ~median) %>% add_lines()
```
# instead of using group_by(), you could use group2NA()
tx <- group2NA(txhousing, "city")
plot_ly(tx, x = ~date, y = ~median) %>% add_lines()

# add_lines() will ensure paths are sorted by x, but this is equivalent
tx <- group2NA(txhousing, "city", ordered = "date")
plot_ly(tx, x = ~date, y = ~median) %>% add_paths()

**hide_colorbar**

*Hide color bar(s)*

**Description**

Hide color bar(s)

**Usage**

`hide_colorbar(p)`

**Arguments**

- `p` a plotly object.

**See Also**

`hide_legend()`

**Examples**

```r
p <- plot_ly(mtcars, x = ~wt, y = ~cyl, color = ~cyl)
hide_colorbar(p)
```

---

**hide_guides**

*Hide guides (legends and colorbars)*

**Description**

Hide guides (legends and colorbars)

**Usage**

`hide_guides(p)`
hide_legend

Arguments

p a plotly object.

See Also

hide_legend(), hide_colorbar()

---

highlight

Query graphical elements in multiple linked views

---

Description

This function sets a variety of options for brushing (i.e., highlighting) multiple plots. These options
are primarily designed for linking multiple plotly graphs, and may not behave as expected when
linking plotly to another htmlwidget package via crosstalk. In some cases, other htmlwidgets will
respect these options, such as persistent selection in leaflet (see demo("highlight-leaflet", package
= "plotly")).
highlight

Usage

highlight(
  p,
  on = "plotly_click",
  off,
  persistent = getOption("persistent", FALSE),
  dynamic = FALSE,
  color = NULL,
  selectize = FALSE,
  defaultValues = NULL,
  opacityDim = getOption("opacityDim", 0.2),
  selected = attrs_selected(),
  debounce = 0,
  ...
)

Arguments

p

A plotly visualization.

on

turn on a selection on which event(s)? To disable on events altogether, use NULL. Currently the following are supported:

• 'plotly_click'
• 'plotly_hover'
• 'plotly_selected': triggered through rectangular (layout.dragmode = 'select') or lasso (layout.dragmode = 'lasso') brush.

off

turn off a selection on which event(s)? To disable off events altogether, use NULL. Currently the following are supported:

• 'plotly_doubleclick': triggered on a double mouse click while (layout.dragmode = 'zoom') or (layout.dragmode = 'pan')
• 'plotly_deselect': triggered on a double mouse click while (layout.dragmode = 'select') or (layout.dragmode = 'lasso')
• 'plotly_relayout': triggered whenever axes are rescaled (i.e., clicking the home button in the modebar) or whenever the height/width of the plot changes.

persistent

should selections persist (i.e., accumulate)? We often refer to the default (FALSE) as a 'transient' selection mode; which is recommended, because one may switch from 'transient' to 'persistent' selection by holding the shift key.

dynamic

should a widget for changing selection colors be included?

color

character string of color(s) to use for highlighting selections. See toRGB() for valid color specifications. If NULL (the default), the color of selected marks are not altered.

selectize

provide a selectize.js widget for selecting keys? Note that the label used for this widget derives from the groupName of the SharedData object.

defaultValues

a vector of values for setting a "default selection". These values should match the key attribute.
highlight

opacityDim  a number between 0 and 1 used to reduce the opacity of non-selected traces (by multiplying with the existing opacity).

selected   attributes of the selection, see `attrs_selected()`.

debounce   amount of time to wait before firing an event (in milliseconds). The default of 0 means do not debounce at all. Debouncing is mainly useful when `on = "plotly_hover"` to avoid firing too many events when users clickily move the mouse over relevant graphical marks.

... currently not supported.

`attrs_selected()`

Examples

# These examples are designed to show you how to highlight/brush a *single* view. For examples of multiple linked views, see `demo(package = "plotly")`

d <- highlight_key(txhousing, ~city)
p <- ggplot(d, aes(date, median, group = city)) + geom_line()
gg <- ggplotly(p, tooltip = "city")
highlight(gg, dynamic = TRUE)

# supply custom colors to the brush
cols <- toRGB(RColorBrewer::brewer.pal(3, "Dark2"), 0.5)
highlight(gg, on = "plotly_hover", color = cols, dynamic = TRUE)

# Use `attrs_selected()` for complete control over the selection appearance
# note any relevant colors you specify here should override the color argument
s <- attrs_selected(
  showlegend = TRUE,
  mode = "lines+markers",
  marker = list(symbol = "x")
)

highlight(layout(gg, showlegend = TRUE), selected = s)
**highlight_key**  
*Highlight/query data based on primary key*

**Description**

This function simply creates an object of class `crosstalk::SharedData`. The reason it exists is to make it easier to teach others how to leverage its functionality in plotly. It also makes it more discoverable if one is already aware of `highlight`.

**Usage**

```r
highlight_key(x, ...)
```

**Arguments**

- `x`: a plotly visualization or a `data.frame`.
- `...`: arguments passed to `crosstalk::SharedData$new()`

**Value**

An object of class `crosstalk::SharedData`

**Author(s)**

Carson Sievert

---

**mic**

*Mic data*

**Description**

Description TBD.

**Usage**

```r
mic
```

**Format**

A data frame with three variables: `r`, `t`, `nms`.
**offline**  
*Plotly Offline*

**Description**

Deprecated in version 2.0 (offline plots are now the default)

**Usage**

```r
offline(p, height, width, out_dir, open_browser)
```

**Arguments**

- `p`: a plotly object
- `height`: A valid CSS unit. (like "100" which will be coerced to a string and have "px" appended.
- `width`: A valid CSS unit. (like "100" which will be coerced to a string and have "px" appended.
- `out_dir`: a directory to place the visualization. If NULL, a temporary directory is used when the offline object is printed.
- `open_browser`: open the visualization after creating it?

**Value**

a plotly object of class "offline"

**Author(s)**

Carson Sievert

---

**orca**  
*Static image exporting*

**Description**

Export plotly objects to static images (e.g., pdf, png, jpeg, svg, etc) via the orca command-line utility.
Usage

orca(
  p,
  file = "plot.png",
  format = tools::file_ext(file),
  scale = NULL,
  width = NULL,
  height = NULL,
  mathjax = FALSE,
  parallel_limit = NULL,
  verbose = FALSE,
  debug = FALSE,
  safe = FALSE,
  more_args = NULL,
...
)

orca_serve(
  port = 5151,
  mathjax = FALSE,
  safe = FALSE,
  request_limit = NULL,
  keep_alive = TRUE,
  window_max_number = NULL,
  quiet = FALSE,
  debug = FALSE,
  more_args = NULL,
...
)

Arguments

p                       a plotly object.
file                    output filename.
format                  the output format (png, jpeg, webp, svg, pdf, eps).
scale                   Sets the image scale. Applies to all output images.
width                   Sets the image width. If not set, defaults to layout.width value. Applies to all output images.
height                  Sets the image height. If not set, defaults to layout.height value. Applies to all output images.
mathjax                 whether or not to include MathJax (required to render TeX). If TRUE, the PLOTLY_MATHJAX_PATH environment variable must be set and point to the location of MathJax (this variable is also used to render TeX in interactive graphs, see config).
parallel_limit          Sets the limit of parallel tasks run.
verbose                 Turn on verbose logging on stdout.
debug                   Starts app in debug mode and turn on verbose logs on stdout.
safe  Turns on safe mode: where figures likely to make browser window hang during image generating are skipped.
more_args  additional arguments to pass along to system command. This is useful for specifying display and/or electron options, such as `--enable-webgl` or `--disable-gpu`.
...  for `orca()`. additional arguments passed along to `processx::run`. For `orca_serve()`, additional arguments passed along to `processx::process`.
port  Sets the server’s port number.
request_limit  Sets a request limit that makes orca exit when reached.
keep_alive  Turn on keep alive mode where orca will (try to) relaunch server if process unexpectedly exits.
window_max_number  Sets maximum number of browser windows the server can keep open at a given time.
quiet  Suppress all logging info.

Details

The `orca()` function is designed for exporting one plotly graph whereas `orca_serve()` is meant for exporting many graphs at once. The former starts and stops an external (nodejs) process everytime it is called whereas the latter starts up a process when called, then returns an `export()` method for exporting graphs as well as a `close()` method for stopping the external (background) process.

Methods

The `orca_serve()` function returns an object with two methods:

`export(p, file = "plot.png", format = tools::file_ext(file), scale = NULL, width = NULL, height = NULL)`  
Export a static image of a plotly graph. Arguments found here are the same as those found in `orca()`

`close()`  Close down the orca server and kill the underlying node process.

Fields

The `orca_serve()` function returns an object with two fields:

`port`  The port number that the server is listening to.
`process`  An R6 class for controlling and querying the underlying node process.

Author(s)

Carson Sievert
Examples

```r
# Not run:
# NOTE: in a headless environment, you may need to set `more_args="--enable-webgl"` to export webgl correctly
p <- plot_ly(z = ~volcano) %>% add_surface()
orca(p, "surface-plot.svg")

#' # launch the server
server <- orca_server()

# export as many graphs as you'd like
server$export(qplot(1:10), "test1.pdf")
server$export(plot_ly(x = 1:10, y = 1:10), "test2.pdf")

# the underlying process is exposed as a field, so you
# have full control over the external process
server$process$is_alive()

# convenience method for closing down the server
server$close()

# remove the exported files from disk
unlink("test1.pdf")
unlink("test2.pdf")

## End(Not run)
```

---

**partial_bundle**  
*Use a partial bundle of plotly.js*

**Description**

Leveraging plotly.js’ partial bundles can lead to smaller file sizes and faster rendering. The full list of available bundles, and the trace types that they support, are available [here](#).

**Usage**

```r
partial_bundle(p, type = "auto", local = TRUE, minified = TRUE)
```

**Arguments**

- `p` a plotly object.
- `type` name of the (partial) bundle. The default, 'auto', attempts to find the smallest single bundle that can render `p`. If no single partial bundle can render `p`, then the full bundle is used.
- `local` whether or not to download the partial bundle so that it can be viewed later without an internet connection.
whether or not to use a minified js file (non-minified file can be useful for debugging plotly.js)

Details

WARNING: use this function with caution when rendering multiple plotly graphs on a single website. That’s because, if multiple plotly.js bundles are used, the most recent bundle will override the other bundles. See the examples section for an example.

Author(s)

Carson Sievert

Examples

```r
# This function is always safe to use when rendering a single plotly graph. In this case, we get a 3x file reduction.

## Not run:
library(plotly)
p <- plot_ly(x = 1:10, y = 1:10) %>% add_markers()
save_widget <- function(p, f) {
  owd <- setwd(dirname(f))
on.exit(setwd(owd))
  htmlwidgets::saveWidget(p, f)
  mb <- round(file.info(f)$size / 1e6, 3)
  message("File is: ", mb, " MB")
}
f1 <- tempfile(fileext = ".html")
f2 <- tempfile(fileext = ".html")
save_widget(p, f1)
save_widget(partial_bundle(p), f2)

# But, since plotly.js bundles override one another,
# be careful when putting multiple graphs in a larger document!
# Note how the surface (part of the gl3d bundle) renders, but the heatmap (part of the cartesian bundle) doesn't...

library(htmltools)
p1 <- plot_ly(z = ~volcano) %>%
  add_heatmap()%>
  partial_bundle()
p2 <- plot_ly(z = ~volcano) %>%
  add_surface()%>
  partial_bundle()
browsable(tagList(p1, p2))
```
plotly-shiny  

Shiny bindings for plotly

Description

Output and render functions for using plotly within Shiny applications and interactive Rmd documents.

Usage

plotlyOutput(
  outputId,
  width = "100%",
  height = "400px",
  inline = FALSE,
  reportTheme = TRUE
)

renderPlotly(expr, env = parent.frame(), quoted = FALSE)

Arguments

outputId  
output variable to read from

width, height  
Must be a valid CSS unit (like "100%", "400px", "auto") or a number, which will be coerced to a string and have "px" appended. Note that, for height, using "auto" or "100%" generally will not work as expected, because of how height is computed with HTML/CSS.

inline  
use an inline (span()) or block container (div()) for the output

reportTheme  
whether or not to report CSS styles (if a sufficient version of shiny and htmlwidgets is available).

expr  
An expression that generates a plotly

eval  
The environment in which to evaluate expr.

quoted  
Is expr a quoted expression (with quote())? This is useful if you want to save an expression in a variable.
plotlyProxy Modify a plotly object inside a shiny app

Description
Modify a plotly object inside a shiny app

Usage
plotlyProxy(
  outputId,  
  session = shiny::getDefaultReactiveDomain(),
  deferUntilFlush = TRUE
)

plotlyProxyInvoke(p, method, ...)

Arguments
outputId single-element character vector indicating the output ID map to modify (if invoked from a Shiny module, the namespace will be added automatically)

session the Shiny session object to which the map belongs; usually the default value will suffice.

deferUntilFlush indicates whether actions performed against this instance should be carried out right away, or whether they should be held until after the next time all of the outputs are updated.

p a plotly proxy object (created with plotlyProxy)

method a plotlyjs method to invoke. For a list of options, visit https://plotly.com/javascript/plotlyjs-function-reference/

... unnamed arguments passed onto the plotly.js method

Examples

if (require("shiny") & interactive()) {
  plotly_example("shiny", "proxy_relayout")
  plotly_example("shiny", "proxy_mapbox")
}
plotly_build

'Build' (i.e., evaluate) a plotly object

Description

This generic function creates the list object sent to plotly.js for rendering. Using this function can be useful for overriding defaults provided by ggplotly/plot_ly or for debugging rendering errors.

Usage

plotly_build(p, registerFrames = TRUE)

Arguments

p  a ggplot object, or a plotly object, or a list.
registerFrames  should a frame trace attribute be interpreted as frames in an animation?

Examples

p <- plot_ly(economics, x = ~date, y = ~pce)
# the unevaluated plotly object
str(p)
# the evaluated data
str(plotly_build(p)$x$data)

plotly_data

Obtain data associated with a plotly graph

Description

plotly_data() returns data associated with a plotly visualization (if there are multiple data frames, by default, it returns the most recent one).

Usage

plotly_data(p, id = p$x$cur_data)

## S3 method for class 'plotly'
groups(x)

## S3 method for class 'plotly'
rename_(.data, ...)

## S3 method for class 'plotly'
transmute_(.data, ...)

**Arguments**

- **p**: a plotly visualization.
- **id**: a character string or number referencing an "attribute layer".
- **x**: a plotly visualization.
- **...**: arguments passed onto the relevant method.
- **.data**: a plotly visualization.

**Examples**

# use group_by() to define groups of visual markings
p <- txhousing %>%
  group_by(city) %>%
  plot_ly(x = ~date, y = ~sales)

# plotly objects preserve data groupings
groups(p)
plotly_data(p)

# dplyr verbs operate on plotly objects as if they were data frames
p <- economics %>%
  plot_ly(x = ~date, y = ~unemploy / pop) %>%
  add_lines() %>%
  mutate(rate = unemploy / pop) %>%
  filter(rate == max(rate))
plotly_data(p)
add_markers(p)
layout(p, annotations = list(x = ~date, y = ~rate, text = "peak"))

# use group_by() + do() + subplot() for trellis displays
d <- group_by(mpg, drv)
```r
plots <- do(d, p = plot_ly(., x = ~cty, name = ~drv))
subplot(plots[["p"]], nrows = 3, shareX = TRUE)

# arrange displays by their mean
means <- summarise(d, mn = mean(cty, na.rm = TRUE))
means %>%
  dplyr::left_join(plots) %>%
  arrange(mn) %>%
  subplot(nrows = NROW(.), shareX = TRUE)

# more dplyr verbs applied to plotly objects
p <- mtcars %>%
  plot_ly(x = ~wt, y = ~mpg, name = "scatter trace") %>%
  add_markers()

plotly_example(type = c("demo", "shiny", "rmd"), name, edit = TRUE, ...)
```

---

**plotly_empty**

Create a complete empty plotly graph.

**Description**

Useful when used with `subplot()`

**Usage**

`plotly_empty(...)`

**Arguments**

`...` arguments passed onto `plot_ly()`

---

**plotly_example**

Run a plotly example(s)

**Description**

Provides a unified interface for running demos, shiny apps, and Rmd documents which are bundled with the package.

**Usage**

`plotly_example(type = c("demo", "shiny", "rmd"), name, edit = TRUE, ...)`
Arguments

- **type**: the type of example
- **name**: the name of the example (valid names depend on type).
- **edit**: whether to open the relevant source files using `file.edit`. Only relevant if type is "shiny" or "rmd".
- ... arguments passed onto the suitable method.

Author(s)

Carson Sievert

---

**plotly_IMAGE**

Create a static image

---

Description

The images endpoint turns a plot (which may be given in multiple forms) into an image of the desired format.

Usage

```r
plotly_IMAGE(
  x,
  width = 1000,
  height = 500,
  format = "png",
  scale = 1,
  out_file,
  ...
)
```

Arguments

- **x**: either a plotly object or a list.
- **width**: Image width in pixels
- **height**: Image height in pixels
- **format**: The desired image format: "png", "jpeg", "svg", "pdf", "eps", or "webp"
- **scale**: Both png and jpeg formats will be scaled beyond the specified width and height by this number.
- **out_file**: A filename for writing the image to a file.
- ... arguments passed onto `httr::RETRY`
Examples

```r
## Not run:
p <- plot_ly(x = 1:10)
Png <- plotly_IMAGE(p, out_file = "plotly-test-image.png")
Jpeg <- plotly_IMAGE(p, format = "jpeg", out_file = "plotly-test-image.jpeg")
Svg <- plotly_IMAGE(p, format = "svg", out_file = "plotly-test-image.svg")
Pdf <- plotly_IMAGE(p, format = "pdf", out_file = "plotly-test-image.pdf")

## End(Not run)
```

---

plotly_json

*Inspect JSON sent to plotly.js*

Description

This function is useful for obtaining/viewing/debugging JSON sent to plotly.js.

Usage

```r
plotly_json(p = last_plot(), jsonedit = interactive(), pretty = TRUE, ...)
```

Arguments

- `p` a plotly or ggplot object.
- `jsonedit` use `listviewer::jsonedit` to view the JSON?
- `pretty` adds indentation whitespace to JSON output. Can be TRUE/FALSE or a number specifying the number of spaces to indent. See `jsonlite::prettify`.
- `...` other options passed onto `listviewer::jsonedit`

Examples

```r
plotly_json(plot_ly())
plotly_json(plot_ly(), FALSE)
```
plotly_POST

Create/Modify plotly graphs

Description

Deprecated: see api_create().

Usage

plotly_POST(
  x = last_plot(),
  filename = NULL,
  fileopt = "overwrite",
  sharing = c("public", "private", "secret"),
  ...
)

Arguments

x             either a ggplot object, a plotly object, or a list.
filename      character string describing the name of the plot in your plotly account. Use / to specify directories. If a directory path does not exist it will be created. If this argument is not specified and the title of the plot exists, that will be used for the filename.
fileopt       character string describing whether to create a "new" plotly, "overwrite" an existing plotly, "append" data to existing plotly, or "extend" it.
sharing       If 'public', anyone can view this graph. It will appear in your profile and can appear in search engines. You do not need to be logged in to Plotly to view this chart. If 'private', only you can view this plot. It will not appear in the Plotly feed, your profile, or search engines. You must be logged in to Plotly to view this graph. You can privately share this graph with other Plotly users in your online Plotly account and they will need to be logged in to view this plot. If 'secret', anyone with this secret link can view this chart. It will not appear in the Plotly feed, your profile, or search engines. If it is embedded inside a webpage or an IPython notebook, anybody who is viewing that page will be able to view the graph. You do not need to be logged in to view this plot.

plot_ly(), signup()
Description

This function takes advantage of nested key selections to implement an interactive dendrogram. Selecting a node selects all the labels (i.e. leaves) under that node.

Usage

plot_dendro(d, set = "A", xmin = -50, height = 500, width = 500, ...)

Arguments

d                   a dendrogram object
set                 defines a crosstalk group
xmin                minimum of the range of the x-scale
height              height
width                width
...                  arguments supplied to subplot()

Author(s)

Carson Sievert

## Not run:
hc <- hclust(dist(USArrests), "ave")
dend1 <- as.dendrogram(hc)
plot_dendro(dend1, height = 600) >>%
  hide_legend() >>%
  highlight(persistent = TRUE, dynamic = TRUE)

## End(Not run)
plot_geo

Initiate a plotly-geo object

Description

Use this function instead of plot_ly() to initialize a plotly-geo object. This enforces the entire plot so use the scattergeo trace type, and enables higher level geometries like add_polygons() to work.

Usage

plot_geo(data = data.frame(), ..., offline = FALSE)

Arguments

data A data frame (optional).

... arguments passed along to plot_ly().

offline whether or not to include geo assets so that the map can be viewed with or without an internet connection. The plotlyGeoAssets package is required for this functionality.

plot_ly(), plot_mapbox(), ggplotly()

Examples

map_data("world", "canada") %>%
group_by(group) %>%
plot_geo(x = ~long, y = ~lat) %>%
add_markers(size = I(1)))
plot_ly  
Initiate a plotly visualization

Description

This function maps R objects to plotly.js, an (MIT licensed) web-based interactive charting library. It provides abstractions for doing common things (e.g. mapping data values to fill colors (via color) or creating animations (via frame)) and sets some different defaults to make the interface feel more 'R-like' (i.e., closer to plot() and ggplot2::qplot()).

Usage

plot_ly(
  data = data.frame(),
  ..., 
  type = NULL,
  name,
  color,
  colors = NULL,
  alpha = NULL,
  stroke,
  strokes = NULL,
  alpha_stroke = 1,
  size,
  sizes = c(10, 100),
  span,
  spans = c(1, 20),
  symbol,
  symbols = NULL,
  linetype,
  linetypes = NULL,
  split,
  frame,
  width = NULL,
  height = NULL,
  source = "A"
)

Arguments

data          A data frame (optional) or crosstalk::SharedData object.
...           Arguments (i.e., attributes) passed along to the trace type. See schema() for a list of acceptable attributes for a given trace type (by going to traces -> type -> attributes). Note that attributes provided at this level may override other arguments (e.g. plot_ly(x = 1:10, y = 1:10, color = I("red"), marker = list(color = "blue"))).
type A character string specifying the trace type (e.g. "scatter", "bar", "box", etc). If specified, it always creates a trace, otherwise.

name Values mapped to the trace’s name attribute. Since a trace can only have one name, this argument acts very much like split in that it creates one trace for every unique value.

color Values mapped to relevant 'fill-color' attribute(s) (e.g. fillcolor, marker.color, textfont.color, etc.). The mapping from data values to color codes may be controlled using colors and alpha, or avoided altogether via I() (e.g., color = I("red")). Any color understood by grDevices::col2rgb() may be used in this way.

colors Either a colorbrewer2.org palette name (e.g. "YlOrRd" or "Blues"), or a vector of colors to interpolate in hexadecimal "#RRGGBB" format, or a color interpolation function like colorRamp().

alpha A number between 0 and 1 specifying the alpha channel applied to color. Defaults to 0.5 when mapping to fillcolor and 1 otherwise.

stroke Similar to color, but values are mapped to relevant 'stroke-color' attribute(s) (e.g., marker.line.color and line.color for filled polygons). If not specified, stroke inherits from color.

strokes Similar to colors, but controls the stroke mapping.

alpha_stroke Similar to alpha, but applied to stroke.

size (Numeric) values mapped to relevant 'fill-size' attribute(s) (e.g., marker.size, textfont.size, and error_x.width). The mapping from data values to symbols may be controlled using sizes, or avoided altogether via I() (e.g., size = I(30)).

sizes A numeric vector of length 2 used to scale size to pixels.

span (Numeric) values mapped to relevant 'stroke-size' attribute(s) (e.g., marker.line.width, line.width for filled polygons, and error_x.thickness) The mapping from data values to symbols may be controlled using spans, or avoided altogether via I() (e.g., span = I(30)).

spans A numeric vector of length 2 used to scale span to pixels.

symbol (Discrete) values mapped to marker.symbol. The mapping from data values to symbols may be controlled using symbols, or avoided altogether via I() (e.g., symbol = I("pentagon")). Any pch value or symbol name may be used in this way.

symbols A character vector of pch values or symbol names.

linetype (Discrete) values mapped to line.dash. The mapping from data values to symbols may be controlled using linetypes, or avoided altogether via I() (e.g., linetype = I("dash")). Any lty (see par) value or dash name may be used in this way.

linetypes A character vector of lty values or dash names

split (Discrete) values used to create multiple traces (one trace per value).

frame (Discrete) values used to create animation frames.

width Width in pixels (optional, defaults to automatic sizing).

height Height in pixels (optional, defaults to automatic sizing).
source

source is a character string of length 1. Match the value of this string with the source argument in event_data() to retrieve the event data corresponding to a specific plot (shiny apps can have multiple plots).

Details

Unless type is specified, this function just initiates a plotly object with 'global' attributes that are passed onto downstream uses of add_trace() (or similar). A formula must always be used when referencing column name(s) in data (e.g. plot_ly(mtcars,x = ~wt)). Formulas are optional when supplying values directly, but they do help inform default axis/scale titles (e.g., plot_ly(x = mtcars$wt) vs plot_ly(x = ~mtcars$wt))

Examples

## Not run:

# plot_ly() tries to create a sensible plot based on the information you
# give it. If you don't provide a trace type, plot_ly() will infer one.
plot_ly(economics, x = ~pop)
plot_ly(economics, x = ~date, y = ~pop)
# plot_ly() doesn't require data frame(s), which allows one to take
# advantage of trace type(s) designed specifically for numeric matrices
plot_ly(z = ~volcano)
plot_ly(z = ~volcano, type = "surface")

# plotly has a functional interface: every plotly function takes a plotly
# object as its first input argument and returns a modified plotly object
add_lines(plot_ly(economics, x = ~date, y = ~unemploy/pop))

# To make code more readable, plotly imports the pipe operator from magrittr
economics %>% plot_ly(x = ~date, y = ~unemploy/pop) %>% add_lines()

# Attributes defined via plot_ly() set 'global' attributes that
# are carried onto subsequent traces, but those may be over-written
plot_ly(economics, x = ~date, color = I("black")) %>%
  add_lines(y = ~uempmed) %>%
  add_lines(y = ~psavert, color = I("red"))

# Attributes are documented in the figure reference -> https://plotly.com/r/reference
# You might notice plot_ly() has named arguments that aren't in this figure
# reference. These arguments make it easier to map abstract data values to
# visual attributes.
p <- plot_ly(palmerpenguins::penguins, x = ~bill_length_mm, y = ~body_mass_g)
add_markers(p, color = ~bill_depth_mm, size = ~bill_depth_mm)
add_markers(p, color = ~species)
add_markers(p, color = ~species, colors = "Set1")
add_markers(p, symbol = ~species)
add_paths(p, linetype = ~species)

## End(Not run)

---

**plot_mapbox**

*Initiate a plotly-mapbox object*

**Description**

Use this function instead of `plot_ly()` to initialize a plotly-mapbox object. This enforces the entire plot so use the scattermapbox trace type, and enables higher level geometries like `add_polygons()` to work.

**Usage**

```r
plot_mapbox(data = data.frame(), ...)
```

**Arguments**

- `data`  
  A data frame (optional).
- `...` 
  arguments passed along to `plot_ly()`. They should be valid scattermapbox attributes - [https://plotly.com/r/reference/#scattermapbox](https://plotly.com/r/reference/#scattermapbox). Note that x/y can also be used in place of lat/lon.

**Author(s)**

Carson Sievert

**See Also**

- `plot_ly()`, `plot_geo()`, `ggplotly()`
print.api_grid

Examples

## Not run:

plot_mapbox(res_mn)
plot_mapbox(res_mn, color = ~INDRESNAME)

map_data("world", "canada") %>%
  group_by(group) %>%
  plot_mapbox(x = ~long, y = ~lat) %>%
  add_polygons() %>%
  layout(
    mapbox = list(
      center = list(lat = ~median(lat), lon = ~median(long))
    )
  )

## End(Not run)

print.api

Print method for a 'generic' API response

Description

Print method for a 'generic' API response

Usage

## S3 method for class 'api'
print(x, ...)

Arguments

x a list.
...
additional arguments (currently ignored)

print.api_grid

Print a plotly grid object

Description

Print a plotly grid object

Usage

## S3 method for class 'api_grid'
print(x, ...
print.api_grid_local

Arguments

- `x` a plotly grid object
- `...` additional arguments (currently ignored)

Description

Print a plotly grid object

Usage

```r
## S3 method for class 'api_grid_local'
print(x, ...)
```

Arguments

- `x` a plotly grid object
- `...` additional arguments (currently ignored)

print.api_plot

Print a plot on plotly's platform

Description

Print a plot on plotly's platform

Usage

```r
## S3 method for class 'api_plot'
print(x, ...)
```

Arguments

- `x` a plotly figure object
- `...` additional arguments (currently ignored)
rangeslider

Add a range slider to the x-axis

Description

Add a range slider to the x-axis

Usage

rangeslider(p, start = NULL, end = NULL, ...)

Arguments

- **p**: plotly object.
- **start**: a start date/value.
- **end**: an end date/value.

Author(s)

Carson Sievert

Examples

```r
plot_ly(x = time(USAccDeaths), y = USAccDeaths) %>%
  add_lines() %>%
  rangeslider()

d <- tibble::tibble(
  time = seq(as.Date("2016-01-01"), as.Date("2016-08-31"), by = "days"),
  y = rnorm(seq_along(time))
)

plot_ly(d, x = ~time, y = ~y) %>%
  add_lines() %>%
  rangeslider(d$time[5], d$time[50])
```
raster2uri

Encode a raster object as a data URI

Description

Encode a raster object as a data URI, which is suitable for use with layout() images. This is especially convenient for embedding raster images on a plot in a self-contained fashion (i.e., so they don’t depend on external URL links).

Usage

raster2uri(r, ...)

Arguments

r  
an object coercable to a raster object via as.raster()

...  
arguments passed onto as.raster().

Author(s)

Carson Sievert

References

https://plotly-r.com/embedding-images.html

Examples

# a red gradient (from ?as.raster)
r <- as.raster(matrix(hcl(0, 80, seq(50, 80, 10)), nrow = 4, ncol = 5))
plot(r)

# embed the raster as an image
plot_ly(x = 1, y = 1) %>%
  layout(
    images = list(list(
      source = raster2uri(r),
      xref = "paper",
      yref = "paper",
      x = 0, y = 0,
      sizex = 0.5, sizey = 0.5,
      xanchor = "left", yanchor = "bottom"
    )
  )
)
remove_typedarray_polyfill

Remove TypedArray polyfill

Description

By default, plotly.js' TypedArray polyfill is included as a dependency, so printing "just works" in any context. Many users won't need this polyfill, so this function may be used to remove it and thus reduce the size of the page.

Usage

remove_typedarray_polyfill(p)

Arguments

p a plotly object

Details

The polyfill seems to be only relevant for those rendering plots via phantomjs and RStudio on some Windows platforms.

Examples

## Not run:
pl <- plot_ly()
p2 <- remove_typedarray_polyfill(pl)
t1 <- tempfile(fileext = ".html")
htmlwidgets::saveWidget(pl, t1)
file.info(t1)$size
htmlwidgets::saveWidget(p2, t1)
file.info(t1)$size
## End(Not run)

res_mn

Minnesotan Indian Reservation Lands

Description

Minnesotan Indian Reservation Lands

Usage

res_mn
Format

An sf data frame with 13 features and 5 fields

References

https://www.dot.state.mn.us/maps/gdma/gis-data.html

---

**schema**

*Acquire (and optionally display) plotly’s plot schema*

---

**Description**

The schema contains valid attributes names, their value type, default values (if any), and min/max values (if applicable).

**Usage**

```
schema(jsonedit = interactive(), ...)
```

**Arguments**

- `jsonedit`:
  - use `listviewer::jsonedit` to view the JSON?
- `...`:
  - other options passed onto `listviewer::jsonedit`

**Examples**

```
s <- schema()

# retrieve acceptable 'layout.mapbox.style' values
if (!is.na(Sys.getenv('MAPBOX_TOKEN', NA))) {
  styles <- s$layout$layoutAttributes$mapbox$style$values
  subplot(
    plot_mapbox() %>% layout(mapbox = list(style = styles[3])),
    plot_mapbox() %>% layout(mapbox = list(style = styles[5]))
  )
}
```
**showRGB**

View colors already formatted by `toRGB()`

**Description**

Useful for viewing colors after they've been converted to plotly.js' color format – "rgba(255, 255, 255, 1)"

**Usage**

```
showRGB(x, ...)
```

**Arguments**

- `x` character string specifying color(s).
- `...` arguments passed along to `scales::show_col`.

**Author(s)**

Carson Sievert

**Examples**

```
showRGB(toRGB(colors()), labels = FALSE)
```

---

**signup**

Create a new plotly account.

**Description**

A sign up interface to plotly through the R Console.

**Usage**

```
signup(username, email, save = TRUE)
```

**Arguments**

- `username` Desired username.
- `email` Desired email.
- `save` If request is successful, should the username & API key be automatically stored as an environment variable in a `.Rprofile`?
style

Value

- api_key key to use with the api
- tmp_pw temporary password to access your plotly account

References

https://plotly.com/rest/

Examples

```r
## Not run:
# You need a plotly username and API key to communicate with the plotly API.
# If you don't already have an API key, you can obtain one with a valid
# username and email via signup().
s <- signup('anna.lyst', 'anna.lyst@plot.ly')

# If you already have a username and API key, please create the following
# environment variables:
Sys.setenv("plotly_username" = "me")
Sys.setenv("plotly_api_key" = "mykey")
# You can also change the default domain if you have a plotly server.
Sys.setenv("plotly_domain" = "http://mydomain.com")

# If you want to automatically load these environment variables when you
# start R, you can put them inside your ~/.Rprofile
# (see help(.Rprofile) for more details)

## End(Not run)
```

---

**style**

*Modify trace(s)*

**Description**

Modify trace(s) of an existing plotly visualization. Useful when used in conjunction with `get_figure()`.

**Usage**

```r
style(p, ..., traces = NULL)
```

**Arguments**

- `p` A plotly visualization.
- `...` Visual properties.
- `traces` numeric vector. Which traces should be modified? By default, attributes place in ... will be applied to every trace.
Author(s)

Carson Sievert

See Also

api_download_plot()

Examples

# style() is especially useful in conjunction with ggplotly()
# It allows you to leverage the underlying plotly.js library to change
# the return result of ggplotly()
(p <- ggplotly(qplot(data = mtcars, wt, mpg, geom = c("point", "smooth"))))

# removes hoverinfo for the line/ribbon traces (use 'plotly_json()' to verify!)
style(p, hoverinfo = "none", traces = c(2, 3))

# another example with plot_ly() instead of ggplotly()
marker <- list(
  color = "red",
  line = list(
    width = 20,
    color = "black"
  )
)
(p <- plot_ly(x = 1:10, y = 1:10, marker = marker))

# note how the entire (marker) object is replaced if a list is provided
style(p, marker = list(line = list(color = "blue")))

# similar to plotly.js, you can update a particular attribute like so
# https://github.com/plotly/plotly.js/issues/1866#issuecomment-314115744
style(p, marker.line.color = "blue")
# this clobbers the previously supplied marker.line.color
style(p, marker.line = list(width = 2.5), marker.size = 10)

| subplot | View multiple plots in a single view |

Description

View multiple plots in a single view
Usage

```r
subplot(
  ..., 
  nrows = 1,
  widths = NULL,
  heights = NULL,
  margin = 0.02,
  shareX = FALSE,
  shareY = FALSE,
  titleX = shareX,
  titleY = shareY,
  which_layout = "merge"
)
```

Arguments

... One of the following

- any number of plotly/ggplot2 objects.
- a list of plotly/ggplot2 objects.
- a tibble with one list-column of plotly/ggplot2 objects.

nrows number of rows for laying out plots in a grid-like structure. Only used if no domain is already specified.

widths relative width of each column on a 0-1 scale. By default all columns have an equal relative width.

heights relative height of each row on a 0-1 scale. By default all rows have an equal relative height.

margin either a single value or four values (all between 0 and 1). If four values are provided, the first is used as the left margin, the second is used as the right margin, the third is used as the top margin, and the fourth is used as the bottom margin. If a single value is provided, it will be used as all four margins.

shareX should the x-axis be shared amongst the subplots?

shareY should the y-axis be shared amongst the subplots?

titleX should x-axis titles be retained?

titleY should y-axis titles be retained?

which_layout adopt the layout of which plot? If the default value of "merge" is used, layout options found later in the sequence of plots will override options found earlier in the sequence. This argument also accepts a numeric vector specifying which plots to consider when merging.

Value

A plotly object

Author(s)

Carson Sievert
Examples

```r
# pass any number of plotly objects to subplot()
p1 <- plot_ly(economics, x = ~date, y = ~uempmed)
p2 <- plot_ly(economics, x = ~date, y = ~unemploy)
subplot(p1, p2, p1, p2, nrows = 2, margin = 0.05)

# anchor multiple traces on the same legend entry
p1 <- add_lines(p1, color = I("black"), name = "1st", legendgroup = "1st")
p2 <- add_lines(p2, color = I("red"), name = "2nd", legendgroup = "2nd")

subplot(  
  p1, style(p1, showlegend = FALSE),  
  p2, style(p2, showlegend = FALSE),  
  nrows = 2, margin = 0.05
)

# or pass a list
economics_long %>%
  split(.\$variable) %>%
lapply(function(d) plot_ly(d, x = ~date, y = ~value)) %>%
  subplot(nrows = NROW(.), shareX = TRUE)

# or pass a tibble with a list-column of plotly objects
economics_long %>%
  group_by(variable) %>%
do(p = plot_ly(., x = ~date, y = ~value)) %>%
  subplot(nrows = NROW(.), shareX = TRUE)

# learn more at https://plotly.com/r/subplot.html
```

**TeX**

*Render TeX in a plotly graph using MathJax*

**Description**

This function makes it slightly easier to render TeX in a plotly graph – it ensures that MathJax is included with the final result and also ensures the provided string is surrounded with $ (this is what plotly.js uses to declare a string as TeX).

**Usage**

`TeX(x)`

**Arguments**

- `x` a character vector
toRGB

See Also

config

Examples

```r
plot_ly(x = c(1, 2, 3, 4), y = c(1, 4, 9, 16)) %>%
  layout(title = TeX("\text{Some mathjax: }\alpha+\beta x")) %>%
  config(mathjax = "cdn")
```

---

toRGB

Convert R colours to RGBA hexadecimal colour values

Description

Convert R colours to RGBA hexadecimal colour values

Usage

```r
toRGB(x, alpha = 1)
```

Arguments

- **x**: see the `col` argument in `col2rgb` for valid specifications
- **alpha**: alpha channel on 0-1 scale

Value

hexadecimal colour value (if is.na(x), return "transparent" for compatibility with Plotly)

See Also

showRGB()

Examples

```r
toRGB("steelblue")
# [1] "rgba(70,130,180,1)"

m <- list(
  color = toRGB("red"),
  line = list(
    color = toRGB("black"),
    width = 19
  )
)

plot_ly(x = 1, y = 1, marker = m)
```
toWebGL  

*Convert trace types to WebGL*

**Description**

Convert trace types to WebGL.

**Usage**

```r
toWebGL(p)
```

**Arguments**

- `p` a plotly or ggplot object.

**Examples**

```r
# currently no bargl trace type
toWebGL(ggplot() + geom_bar(aes(1:10)))
toWebGL(qplot(1:10, 1:10))
```

to_basic  

*Convert a geom to a "basic" geom.*

**Description**

This function makes it possible to convert ggplot2 geoms that are not included with ggplot2 itself. Users shouldn’t need to use this function. It exists purely to allow other package authors to write their own conversion method(s).

**Usage**

```r
to_basic(data, prestats_data, layout, params, p, ...)
```

**Arguments**

- `data` the data returned by `ggplot2::ggplot_build()`.
- `prestats_data` the data before statistics are computed.
- `layout` the panel layout.
- `params` parameters for the geom, statistic, and 'constant' aesthetics
- `p` a ggplot2 object (the conversion may depend on scales, for instance).
- `...` currently ignored
Description

Description TBD.

Usage

wind

Format

A data frame with three variables: \( r \), \( t \), \( nms \).
