Package ‘plotly’

July 20, 2018

Title Create Interactive Web Graphics via 'plotly.js'
Version 4.8.0
License MIT + file LICENSE
Description Easily translate 'ggplot2' graphs to an interactive web-based version and/or create custom web-based visualizations directly from R. Once uploaded to a 'plotly' account, 'plotly' graphs (and the data behind them) can be viewed and modified in a web browser.
BugReports https://github.com/ropensci/plotly/issues
Depends R (>= 3.2.0), ggplot2 (>= 3.0.0)
Imports tools, scales, htr, jsonlite, magrittr, digest, viridisLite, base64enc, htmltools, htmlwidgets (>= 1.2), tidyr, hexbin, RColorBrewer, dplyr, tibble, lazyeval (>= 0.2.0), rlang, crosstalk, purrr, data.table, promises
Suggests MASS, maps, ggthemes, GGally, testthat, knitr, devtools, shiny (>= 1.1.0), curl, rmarkdown, Rserve, RSclient, Cairo, broom, webshot, listviewer, dendextend, sf, maptools, rgeos, png, IRdisplay, processx, plotlyGeoAssets, forcats
LazyData true
RoxygenNote 6.0.1.9000
Encoding UTF-8
NeedsCompilation no

**add_annotations**

Add an annotation(s) to a plot

**Description**

Add an annotation(s) to a plot

**Usage**

```
add_annotations(p, text = NULL, ..., data = NULL, inherit = TRUE)
```

**Arguments**

- `p`  
  a plotly object

- `text`  
  annotation text (required).

- `...`  
  these arguments are documented at [https://github.com/plotly/plotly.js/blob/master/src/components/annotations/attributes.js](https://github.com/plotly/plotly.js/blob/master/src/components/annotations/attributes.js)

- `data`  
  a data frame.

- `inherit`  
  inherit attributes from `plot_ly()`?
add_data  

Add data to a plotly visualization

Description

Add data to a plotly visualization

Usage

add_data(p, data = NULL)

Arguments

- p: a plotly visualization
- data: a data frame.

Examples

plot_ly() %>% add_data(economics) %>% add_trace(x = ~date, y = ~pce)

add_fun  

Apply function to plot, without modifying data

Description

Useful when you need two or more layers that apply a summary statistic to the original data.

Usage

add_fun(p, fun, ...)

Arguments

- p: a plotly object.
- fun: a function. Should take a plotly object as input and return a modified plotly object.
- ...: arguments passed to fun.
**add_trace**

*Add trace(s) to a plotly visualization*

**Description**

Add trace(s) to a plotly visualization

**Usage**

```r
add_trace(p, ..., data = NULL, inherit = TRUE)

add_markers(p, x = NULL, y = NULL, z = NULL, ..., data = NULL,
inherit = TRUE)

add_text(p, x = NULL, y = NULL, z = NULL, text = NULL, ...,
data = NULL, inherit = TRUE)

add_paths(p, x = NULL, y = NULL, z = NULL, ..., data = NULL,
inherit = TRUE)

add_lines(p, x = NULL, y = NULL, z = NULL, ..., data = NULL,
inherit = TRUE)

add_segments(p, x = NULL, y = NULL, xend = NULL, yend = NULL, ...,
data = NULL, inherit = TRUE)

add_polygons(p, x = NULL, y = NULL, ..., data = NULL, inherit = TRUE)

add_sf(p, ..., x = ~x, y = ~y, data = NULL, inherit = TRUE)

add_table(p, ..., rownames = TRUE, data = NULL, inherit = TRUE)

add_ribbons(p, x = NULL, ymin = NULL, ymax = NULL, ..., data = NULL,
inherit = TRUE)

add_area(p, r = NULL, t = NULL, ..., data = NULL, inherit = TRUE)

add_pie(p, values = NULL, labels = NULL, ..., data = NULL,
inherit = TRUE)

add_bars(p, x = NULL, y = NULL, ..., data = NULL, inherit = TRUE)

add_histogram(p, x = NULL, y = NULL, ..., data = NULL, inherit = TRUE)

add_histogram2d(p, x = NULL, y = NULL, z = NULL, ..., data = NULL,
inherit = TRUE)
```
add_trace

add_histogram2dcontour(p, x = NULL, y = NULL, z = NULL, ..., data = NULL, inherit = TRUE)

add_heatmap(p, x = NULL, y = NULL, z = NULL, ..., data = NULL, inherit = TRUE)

add_contour(p, z = NULL, ..., data = NULL, inherit = TRUE)

add_boxplot(p, x = NULL, y = NULL, ..., data = NULL, inherit = TRUE)

add_surface(p, z = NULL, ..., data = NULL, inherit = TRUE)

add_mesh(p, x = NULL, y = NULL, z = NULL, ..., data = NULL, inherit = TRUE)

add_scattergeo(p, ...)

add_choropleth(p, z = NULL, ..., data = NULL, inherit = TRUE)

Arguments

p a plotly object

... Arguments (i.e., attributes) passed along to the trace type. See schema() for a list of acceptable attributes for a given trace type (by going to traces -> type -> attributes). Note that attributes provided at this level may override other arguments (e.g. plot_ly(x = 1:10, y = 1:10, color = I("red"), marker = list(color = "blue"))).

data A data frame (optional) or crosstalk::SharedData object.

inherit inherit attributes from plot_ly()?

x the x variable.

y the y variable.

z a numeric matrix

text textual labels.

xend "final" x position (in this context, x represents "start")

yend "final" y position (in this context, y represents "start")

rownames whether or not to display the rownames of data.

ymin a variable used to define the lower boundary of a polygon.

ymax a variable used to define the upper boundary of a polygon.

r For polar chart only. Sets the radial coordinates.

t For polar chart only. Sets the radial coordinates.

values the value to associated with each slice of the pie.

labels the labels (categories) corresponding to values.

plot_ly()

Examples

# the `plot_ly()` function initiates an object, and if no trace type
# is specified, it sets a sensible default
p <- plot_ly(economics, x = ~date, y = ~uempmed)
p

# some `add_*()` functions are a specific case of a trace type
# for example, `add_markers()` is a scatter trace with mode of markers
add_markers(p)

# scatter trace with mode of text
add_text(p, text = "")

# scatter trace with mode of lines
add_paths(p)

# like `add_paths()`, but ensures points are connected according to `x`
add_lines(p)

# if you prefer to work with plotly.js more directly, can always
# use `add_trace()` and specify the type yourself
add_trace(p, type = "scatter", mode = "markers+lines")

# mappings provided to `plot_ly()` are "global", but can be overwritten
plot_ly(economics, x = ~date, y = ~uempmed, color = I("red"), showlegend = FALSE) %>%
  add_lines() %>%
  add_markers(color = ~pop)

# a number of `add_*()` functions are special cases of the scatter trace
plot_ly(economics, x = ~date) %>%
  add_ribbons(ymin = ~pce - 1e3, ymax = ~pce + 1e3)

# use `group_by()` (or `group2NA()`) to apply visual mapping
# once per group (e.g. one line per group)
txhousing %>%
  group_by(city) %>%
  plot_ly(x = ~date, y = ~median) %>%
  add_lines(color = I("black"))

## Not run:
# use 'add_sf()' or 'add_polygons()' to create geo-spatial maps
if (requireNamespace("sf", quietly = TRUE)) {
    nc <- sf::st_read(system.file("shape/nc.shp", package = "sf"), quiet = TRUE)
    plot_ly() %>% add_sf(data = nc)
}

# univariate summary statistics
plot_ly(mtcars, x = ~factor(vs), y = ~mpg) %>%
    add_boxplot()
plot_ly(mtcars, x = ~factor(vs), y = ~mpg) %>%
    add_trace(type = "violin")

# `add_histogram()` does binning for you...
mtcars %>%
    plot_ly(x = ~vs, y = ~n) %>%
    add_histogram()

# ...but you can 'pre-compute' bar heights in R
mtcars %>%
    dplyr::count(vs) %>%
    plot_ly(x = ~vs, y = ~n) %>%
    add_bars()

# the 2d analogy of add_histogram() is add_histogram2d()/add_histogram2dcontour()
library(MASS)
(p <- plot_ly(geyser, x = ~waiting, y = ~duration))
add_histogram2d(p)
add_histogram2dcontour(p)

# the 2d analogy of add_bars() is add_heatmap()/add_contour()
# (i.e., bin counts must be pre-specified)
den <- kde2d(geyser$waiting, geyser$duration)
p <- plot_ly(x = den$x, y = den$y, z = den$z)
add_heatmap(p)
add_contour(p)

# `add_table()` makes it easy to map a data frame to the table trace type
plot_ly(economics) %>%
    add_table()

# pie charts!
ds <- data.frame(labels = c("A", "B", "C"), values = c(10, 40, 60))
plot_ly(ds, labels = ~labels, values = ~values) %>%
    add_pie() %>%
    layout(title = "Basic Pie Chart using Plotly")

data(wind)
plot_ly(wind, r = ~r, t = ~t) %>%
    add_area(color = ~mms) %>%
    layout(radialaxis = list(ticksuffix = ","), orientation = 270)

# -----------------------------------------------
animation_opts

# 3D chart types
# -----------------------------------------------
plot_ly(z = ~volcano) %>%
  add_surface()
plot_ly(x = c(0, 0, 1), y = c(0, 1, 0), z = c(0, 0, 0)) %>%
  add_mesh()

## End(Not run)

---

**animation_opts**  
*Animation configuration options*

**Description**

Animations can be created by either using the `frame` argument in `plot_ly()` or the (unofficial) `frame` ggplot2 aesthetic in `ggplotly()`. By default, animations populate a play button and slider component for controlling the state of the animation (to pause an animation, click on a relevant location on the slider bar). Both the play button and slider component transition between frames according rules specified by `animation_opts()`.

**Usage**

```r
animation_opts(p, frame = 500, transition = frame, easing = "linear",
               redraw = TRUE, mode = "immediate")

animation_slider(p, hide = FALSE, ...)

animation_button(p, ..., label)
```

**Arguments**

- `p`  
  A plotly object.

- `frame`  
  The amount of time between frames (in milliseconds). Note that this amount should include the transition.

- `transition`  
  The duration of the smooth transition between frames (in milliseconds).

- `easing`  
  The type of transition easing. See the list of options here [https://github.com/plotly/plotly.js/blob/master/src/plots/animation_attributes.js](https://github.com/plotly/plotly.js/blob/master/src/plots/animation_attributes.js)

- `redraw`  
  Trigger a redraw of the plot at completion of the transition? A redraw may significantly impact performance, but may be necessary to update graphical elements that can’t be transitioned.

- `mode`  
  Describes how a new animate call interacts with currently-running animations. If `immediate`, current animations are interrupted and the new animation is started. If `next`, the current frame is allowed to complete, after which the new animation is started. If `afterall` all existing frames are animated to completion before the new animation is started.
animation_opts

hide

... for animation_slider, attributes are passed to a special layout.sliders object tied to the animation frames. The definition of these attributes may be found here https://github.com/plotly/plotly.js/blob/master/src/components/sliders/attributes.js For animation_button, arguments are passed to a special layout.updatemenus button object tied to the animation https://github.com/plotly/plotly.js/blob/master/src/components/updatemenus/attributes.js

label

a character string used for the animation button’s label

Author(s)

Carson Sievert

Examples

df <- data.frame(
  x = c(1, 2, 2, 1, 1, 2),
  y = c(1, 2, 2, 1, 1, 2),
  z = c(1, 1, 2, 2, 3, 3)
)
plot_ly(df, hide)
  add_markers(x = 1.5, y = 1.5)
  add_markers(x = ~x, y = ~y, frame = ~z)

# it's a good idea to remove smooth transitions when there is
# no relationship between objects in each view
plot_ly(mtcars, x = ~wt, y = ~mpg, frame = ~cyl)
animation_opts(transition = 0)

# works the same way with ggplotly
if (interactive()) {
  p <- ggplot(txhousing, aes(month, median)) +
    geom_line(aes(group = year), alpha = 0.3) +
    geom_smooth() +
    geom_line(aes(frame = year, ids = month), color = "red") +
    facet_wrap(~ city)

  ggplotly(p, width = 1200, height = 900)
  animation_opts(1000)
}

# for more, see https://cpsievert.github.io/plotly_book/key-frame-animations.html
Description

Convenience functions for working with version 2 of plotly’s REST API. Upload R objects to a
plotly account via api_create() and download plotly objects via api_download_plot()/api_download_grid().
For anything else, use api().

Usage

api_create(x = last_plot(), filename = NULL, fileopt = c("overwrite", "new"), sharing = c("public", "private", "secret"), ...)

## S3 method for class 'plotly'
api_create(x = last_plot(), filename = NULL, 
  fileopt = "overwrite", sharing = "public", ...)

## S3 method for class 'ggplot'
api_create(x = last_plot(), filename = NULL, 
  fileopt = "overwrite", sharing = "public", ...)

## S3 method for class 'data.frame'
api_create(x, filename = NULL, fileopt = "overwrite", 
  sharing = "public", ...)

api_download_plot(id, username)

api_download_grid(id, username)

api(endpoint = "/", verb = "GET", body = NULL, ...)

Arguments

x    An R object to hosted on plotly’s web platform. Can be a plotly/ggplot2 object or a data.frame.
filename character vector naming file(s). If x is a plot, can be a vector of length 2 naming both the plot AND the underlying grid.
fileopt character string describing whether to "overwrite" existing files or ensure "new" file(s) are always created.
sharing If 'public', anyone can view this graph. It will appear in your profile and can appear in search engines. You do not need to be logged in to Plotly to view this chart. If 'private', only you can view this plot. It will not appear in the Plotly feed, your profile, or search engines. You must be logged in to Plotly to view this graph. You can privately share this graph with other Plotly users in your online Plotly account and they will need to be logged in to view this plot. If
'secret', anyone with this secret link can view this chart. It will not appear in the
Plotly feed, your profile, or search engines. If it is embedded inside a webpage
or an IPython notebook, anybody who is viewing that page will be able to view
the graph. You do not need to be logged in to view this plot.

... For api(), these arguments are passed onto http::VERB(). For api_create(),
these arguments are included in the body of the HTTP request.

id a filename id.
username a plotly username.
endpoint the endpoint (i.e., location) for the request. To see a list of all available end-
points, call api(). Any relevant query parameters should be included here (see
examples).
verb name of the HTTP verb to use (as in, http::VERB()).
body body of the HTTP request (as in, http::VERB()). If this value is not already
converted to JSON (via jsonlite::toJSON()), it uses the internal to_JSON() to ensure values are "automatically unboxed" (i.e., vec.

# change the filename https://api.plot.ly/v2/files#update
# (note: this won't work unless you have proper credentials to the relevant account)
api("files/cpsievert:14681", "PATCH", list(filename = "toy file"))

# Copy a file https://api.plot.ly/v2/files#lookup
api("files/cpsievert:14681/copy", "POST")

# Create a folder https://api.plot.ly/v2/folders#create
api("folders", "POST", list(path = "/starts/at/root/and/ends/here"))

## End(Not run)

---

**as.widget**

*Convert a plotly object to an htmlwidget object*

**Description**

This function was deprecated in 4.0.0, as plotly objects are now htmlwidget objects, so there is no need to convert them.
**Usage**

```r
as.widget(x, ...)
```

**Arguments**

- `x`: a plotly object.
- `...`: other options passed onto `htmlwidgets::createWidget`

---

**Description**

Convert a list to a plotly htmlwidget object

**Usage**

```r
as.widget(x, ...)
```

**Arguments**

- `x`: a plotly object.
- `...`: other options passed onto `htmlwidgets::createWidget`

**Examples**

```r
trace <- list(x = 1, y = 1)
obj <- list(data = list(trace), layout = list(title = "my plot"))
as_widget(obj)
```

---

**attrs_selected**

**Description**

Specify attributes of selection traces

By default the name of the selection trace derives from the selected values.

**Usage**

```r
attrs_selected(opacity = 1, ...)
```
bbox

Arguments

opacity 
  a number between 0 and 1 specifying the overall opacity of the selected trace
  other trace attributes attached to the selection trace.

Author(s)

Carson Sievert

bbox

Estimate bounding box of a rotated string

Description

Estimate bounding box of a rotated string

Usage

bbox(txt = “foo”, angle = 0, size = 12)

Arguments

txt 
  a character string of length 1
angle 
  sets the angle of the tick labels with respect to the horizontal (e.g., tickangle 
  of -90 draws the tick labels vertically)
size 
  vertical size of a character

References

https://www.dropbox.com/s/nc6968prgw8ne4w/bbox.pdf?dl=0

colorbar

Modify the colorbar

Description

Modify the colorbar

Usage

colorbar(p, ..., limits = NULL, which = 1)
Arguments

- **p**: a plotly object
- **limits**: numeric vector of length 2. Set the extent of the colorbar scale.
- **which**: colorbar to modify? Should only be relevant for subplots with multiple colorbars.

Author(s)

Carson Sievert

Examples

```r
p <- plot_ly(mtcars, x = ~wt, y = ~mpg, color = ~cyl)

# pass any colorbar attribute --
# https://plot.ly/r/reference/#scatter-marker-colorbar
colorbar(p, len = 0.5)

# Expand the limits of the colorbar
colorbar(p, limits = c(0, 20))
# values outside the colorbar limits are considered "missing"
colorbar(p, limits = c(5, 6))

# also works on colorbars generated via a z value
corr <- cor(diamonds[vapply(diamonds, is.numeric, logical(1))])
plot_ly(x = rownames(corr), y = colnames(corr), z = corr) %>%
  add_heatmap() %>%
colorbar(limits = c(-1, 1))
```

---

**config**

Set the default configuration for plotly

Description

Set the default configuration for plotly

Usage

```r
config(p, ..., collaborate = TRUE, cloud = FALSE, locale = NULL, mathjax = NULL)
```
Arguments

- **p**: a plotly object
- **collaborate**: include the collaborate mode bar button (unique to the R pkg)?
- **cloud**: include the send data to cloud button?
- **locale**: locale to use. See here for more info.
- **mathjax**: add MathJax rendering support. If "cdn", mathjax is loaded externally (meaning an internet connection is needed for TeX rendering). If "local", the PLOTLY_MATHJAX_PATH environment variable must be set to the location (a local file path) of MathJax. IMPORTANT: plotly uses SVG-based mathjax rendering which doesn't play nicely with HTML-based rendering (e.g., rmarkdown documents and shiny apps). To leverage both types of rendering, you must <iframe> your plotly graph(s) into the larger document (see here for an rmarkdown example and here for a shiny example).

Author(s)

Carson Sievert

Examples

```r
# remove the plotly logo and collaborate button from modebar
config(plot_ly(), displaylogo = FALSE, collaborate = FALSE)

# enable mathjax
# see more examples at https://plot.ly/r/TeX/
plot_ly(x = c(1, 2, 3, 4), y = c(1, 4, 9, 16)) %>%
  layout(title = TeX("\text{Some mathjax: }\alpha, \beta\ x") ) %>%
  config(mathjax = "cdn")

# change the language used to render date axes and on-graph text
# (e.g., modebar buttons)
today <- Sys.Date()
x <- seq.Date(today, today + 360, by = "day")
p <- plot_ly(x = x, y = rnorm(length(x))) %>%
  add_lines()

# japanese
config(p, locale = "ja")
# german
config(p, locale = "de")
# spanish
config(p, locale = "es")
# chinese
config(p, locale = "zh-CN")
```
**embed_notebook**

**Embed a plot as an iframe into a Jupyter Notebook**

**Description**

Embed a plot as an iframe into a Jupyter Notebook

**Usage**

```r
embed_notebook(x, width = NULL, height = NULL, file = NULL)
```

**Arguments**

- **x**: a plotly object
- **width**: attribute of the iframe. If NULL, the width in `plot_ly` is used. If that is also NULL, '100%' is the default.
- **height**: attribute of the iframe. If NULL, the height in `plot_ly` is used. If that is also NULL, '400px' is the default.
- **file**: deprecated.

**Author(s)**

Carson Sievert

**event_data**

**Access plotly user input event data in shiny**

**Description**

This function must be called within a reactive shiny context.

**Usage**

```r
event_data(event = c("plotly_hover", "plotly_click", "plotly_selected", "plotly_relayout"), source = "A",
            session = shiny::getDefaultReactiveDomain())
```

**Arguments**

- **event**: The type of plotly event. Currently 'plotly_hover', 'plotly_click', 'plotly_selected', and 'plotly_relayout' are supported.
- **source**: a character string of length 1. Match the value of this string with the source argument in `plot_ly()` to retrieve the event data corresponding to a specific plot (shiny apps can have multiple plots).
- **session**: a shiny session object (the default should almost always be used).
Author(s)

Carson Sievert

Examples

```r
## Not run:
plotly_example("shiny", "event_data")
## End(Not run)
```

---

**Description**

This function is in the process of being deprecated (use orca instead).

**Usage**

```r
export(p = last_plot(), file = "plotly.png", selenium = NULL, ...)
```

**Arguments**

- `p` a plotly or ggplot object.
- `file` a filename. The file type is inferred from the file extension. Valid extensions include 'jpeg' | 'png' | 'webp' | 'svg' | 'pdf'
- `selenium` used only when `p` is a WebGL plot or the output format is 'webp' or 'svg'. Should be an object of class "rsClientServer" returned by RSelenium::rsDriver.
- `...` if `p` is non-WebGL and the output file format is jpeg/png/pdf arguments are passed along to webshot::webshot(). Otherwise, they are ignored.

**Details**

For SVG plots, a screenshot is taken via webshot::webshot(). Since phantomjs (and hence webshot) does not support WebGL, the RSelenium package is used for exporting WebGL plots.

Carson Sievert
geomtrace

*Convert a "basic" geoms to a plotly.js trace.*

**Description**

This function makes it possible to convert ggplot2 geoms that are not included with ggplot2 itself. Users shouldn’t need to use this function. It exists purely to allow other package authors to write their own conversion method(s).

**Usage**

```r
gemtrace(data, params, p)
```

**Arguments**

- `data`: the data returned by `plotly::to_basic`.
- `params`: parameters for the geom, statistic, and 'constant' aesthetics
- `p`: a ggplot2 object (the conversion may depend on scales, for instance).

---

get_figure

*Request a figure object*

**Description**

Deprecated: see `api_download_plot()`.

**Usage**

```r
get_figure(username, id)
```

**Arguments**

- `username`: corresponding username for the figure.
- `id`: of the Plotly figure.
**gg2list**

Convert a ggplot to a list.

**Description**

Convert a ggplot to a list.

**Usage**

```r
gg2list(p, width = NULL, height = NULL, tooltip = "all",
        dynamicTicks = FALSE, layerData = 1, originalData = TRUE,
        source = "A", ...)
```

**Arguments**

- `p` ggplot2 plot.
- `width` Width of the plot in pixels (optional, defaults to automatic sizing).
- `height` Height of the plot in pixels (optional, defaults to automatic sizing).
- `tooltip` a character vector specifying which aesthetic tooltips to show in the tooltip. The default, "all", means show all the aesthetic tooltips (including the unofficial "text" aesthetic).
- `dynamicTicks` accepts the following values: FALSE, TRUE, "x", or "y". Dynamic ticks are useful for updating ticks in response to zoom/pan/filter interactions; however, there is no guarantee they reproduce axis tick text as they would appear in the static ggplot2 image.
- `layerData` data from which layer should be returned?
- `originalData` should the "original" or "scaled" data be returned?
- `source` a character string of length 1. Match the value of this string with the source argument in `event_data()` to retrieve the event data corresponding to a specific plot (shiny apps can have multiple plots).
- `...` currently not used

**Value**

a 'built' plotly object (list with names "data" and "layout").
ggplotly

Convert ggplot2 to plotly

Description

This function converts a \texttt{ggplot2::ggplot()} object to a plotly object.

Usage

\begin{verbatim}
ggplotly(p = ggplot2::last_plot(), width = NULL, height = NULL, tooltip = "all", dynamicTicks = FALSE, layerData = 1, originalData = TRUE, source = "A", ...)\end{verbatim}

Arguments

- \texttt{p} a ggplot object.
- \texttt{width} Width of the plot in pixels (optional, defaults to automatic sizing).
- \texttt{height} Height of the plot in pixels (optional, defaults to automatic sizing).
- \texttt{tooltip} a character vector specifying which aesthetic mappings to show in the tooltip. The default, "all", means show all the aesthetic mappings (including the unofficial "text" aesthetic). The order of variables here will also control the order they appear. For example, use \texttt{tooltip = c("y", "x", "colour")} if you want y first, x second, and colour last.
- \texttt{dynamicTicks} should plotly.js dynamically generate axis tick labels? Dynamic ticks are useful for updating ticks in response to zoom/pan interactions; however, they can not always reproduce labels as they would appear in the static ggplot2 image.
- \texttt{layerData} data from which layer should be returned?
- \texttt{originalData} should the "original" or "scaled" data be returned?
- \texttt{source} a character string of length 1. Match the value of this string with the source argument in \texttt{event_data()} to retrieve the event data corresponding to a specific plot (shiny apps can have multiple plots).
- \ldots arguments passed onto methods.

Details

Conversion of relative sizes depends on the size of the current graphics device (if no device is open, width/height of a new (off-screen) device defaults to 640/480). In other words, height and width must be specified at runtime to ensure sizing is correct. For examples on how to specify the output container's height/width in a shiny app, see \texttt{plotly_example("shiny", "ggplotly_sizing")}.

## Not run:
# simple example
ggiris <- ggplot(Petal.Width, Sepal.Length, data = iris, color = Species)
ggplotly(ggiris)

data(canada.cities, package = "maps")
viz <- ggplot(canada.cities, aes(long, lat)) +
  borders(regions = "canada") +
  coord_equal() +
  geom_point(aes(text = name, size = pop), colour = "red", alpha = 1/2)
ggplotly(viz, tooltip = c("text", "size"))

# linked scatterplot brushing
d <- highlight_key(mtcars)
qplot(data = d, x = mpg, y = wt) %>%
  subplot(qplot(data = d, x = mpg, y = vs)) %>%
  layout(title = "Click and drag to select points") %>%
  highlight("plotly_selected")

# more brushing (i.e. highlighting) examples
demo("crosstalk-highlight-ggplotly", package = "plotly")

# client-side linked brushing in a scatterplot matrix
highlight_key(iris) %>%
  GGally::ggpairs(aes(colour = Species), columns = 1:4) %>%
  ggplotly(tooltip = c("x", "y", "colour")) %>%
  highlight("plotly_selected")

## End(Not run)
```

---

### group2NA

#### Separate groups with missing values

**Description**

This function is used internally by plotly, but may also be useful to some power users. The details section explains when and why this function is useful.
Usage

```r
group2NA(data, groupNames = "group", nested = NULL, ordered = NULL,
retrace.first = inherits(data, "GeomPolygon"))
```

Arguments

data  
a data frame.

`groupNames`  
character vector of grouping variable(s)

`nested`  
other variables that group should be nested (i.e., ordered) within.

`ordered`  
a variable to arrange by (within nested & groupNames). This is useful primarily for ordering by x

`retrace.first`  
should the first row of each group be appended to the last row? This is useful for enclosing polygons with lines.

Details

If a group of scatter traces share the same non-positional characteristics (i.e., color, fill, etc), it is more efficient to draw them as a single trace with missing values that separate the groups (instead of multiple traces). In this case, one should also take care to make sure `connectgaps` is set to `FALSE`.

Value

a data frame with rows ordered by: nested, then `groupNames`, then `ordered`. As long as `groupNames` contains valid variable names, new rows will also be inserted to separate the groups.

Examples

```r
# note the insertion of new rows with missing values
group2NA(mtcars, "vs", "cyl")

# need to group lines by city somehow!
plot_ly(txhousing, x = ~date, y = ~median) %>% add_lines()

# instead of using `group_by()`, you could use `group2NA()`
tx <- group2NA(txhousing, "city")
plot_ly(tx, x = ~date, y = ~median) %>% add_lines()

# `add_lines()` will ensure paths are sorted by x, but this is equivalent
tx <- group2NA(txhousing, "city", ordered = "date")
plot_ly(tx, x = ~date, y = ~median) %>% add_paths()
```
### hide_colorbar

**Hide color bar(s)**

**Description**

Hide color bar(s)

**Usage**

```r
hide_colorbar(p)
```

**Arguments**

- `p`: a plotly object.

**See Also**

- `hide_legend()`

**Examples**

```r
p <- plot_ly(mtcars, x = ~wt, y = ~cyl, color = ~cyl)
hide_colorbar(p)
```

---

### hide_guides

**Hide guides (legends and colorbars)**

**Description**

Hide guides (legends and colorbars)

**Usage**

```r
hide_guides(p)
```

**Arguments**

- `p`: a plotly object.

**See Also**

- `hide_legend()`, `hide_colorbar()`
highlight

Description
Hide legend

Usage
hide_legend(p)

Arguments
p a plotly object.

See Also
hide_colorbar()

Examples
p <- plot_ly(mtcars, x = ~wt, y = ~cyl, color = ~factor(cyl))
hide_legend(p)

highlight
Query graphical elements in multiple linked views

Description
This function sets a variety of options for brushing (i.e., highlighting) multiple plots. These options are primarily designed for linking multiple plotly graphs, and may not behave as expected when linking plotly to another htmlwidget package via crosstalk. In some cases, other htmlwidgets will respect these options, such as persistent selection in leaflet (see demo("highlight-leaflet", package = "plotly").

Usage
highlight(p, on = "plotly_click", off, persistent = getOption("persistent", FALSE), dynamic = FALSE, color = NULL, selectize = FALSE, defaultValues = NULL, opacityDim = getOption("opacityDim", 0.2), selected = attrs_selected(), debounce = 0, ...)

hide_legend
Hide legend

Description
Hide legend

Usage
hide_legend(p)

Arguments
p a plotly object.

See Also
hide_colorbar()

Examples
p <- plot_ly(mtcars, x = ~wt, y = ~cyl, color = ~factor(cyl))
hide_legend(p)
**Arguments**

- **on**
  - turn on a selection on which event(s)? To disable on events altogether, use `NULL`. Currently the following are supported:
    - `'plotly_click'`
    - `'plotly_hover'`
    - `'plotly_selected'`: triggered through rectangular (layout.dragmode = 'select') or lasso (layout.dragmode = 'lasso') brush.

- **off**
  - turn off a selection on which event(s)? To disable off events altogether, use `NULL`. Currently the following are supported:
    - `'plotly_doubleclick'`: triggered on a double mouse click while (layout.dragmode = 'zoom') or (layout.dragmode = 'pan')
    - `'plotly_deselect'`: triggered on a double mouse click while (layout.dragmode = 'select') or (layout.dragmode = 'lasso')
    - `'plotly_relayout'`: triggered whenever axes are rescaled (i.e., clicking the home button in the modebar) or whenever the height/width of the plot changes.

- **persistent**
  - should selections persist (i.e., accumulate)? We often refer to the default (`FALSE`) as a 'transient' selection mode; which is recommended, because one may switch from 'transient' to 'persistent' selection by holding the shift key.

- **dynamic**
  - should a widget for changing selection colors be included?

- **color**
  - character string of color(s) to use for highlighting selections. See `toRGB()` for valid color specifications. If `NULL` (the default), the color of selected marks are not altered.

- **selectize**
  - provide a selectize.js widget for selecting keys? Note that the label used for this widget derives from the `groupName` of the `SharedData` object.

- **defaultValues**
  - a vector of values for setting a "default selection". These values should match the key attribute.

- **opacityDim**
  - a number between 0 and 1 used to reduce the opacity of non-selected traces (by multiplying with the existing opacity).

- **selected**
  - attributes of the selection, see `attrs_selected()`.

- **debounce**
  - amount of time to wait before firing an event (in milliseconds). The default of 0 means do not debounce at all. Debouncing is mainly useful when `on = "plotly_hover"` to avoid firing too many events when users clickly move the mouse over relevant graphical marks.

... currently not supported.

`attrs_selected()`

Examples

```r
# These examples are designed to show you how to highlight/brush a *single*
# view. For examples of multiple linked views, see `demo(package = "plotly")`

library(crosstalk)
d <- highlight_key(txhousing, ~city)
p <- ggplot(d, aes(date, median, group = city)) + geom_line()
gg <- ggplotly(p, tooltip = "city")
highlight(gg, dynamic = TRUE)

# supply custom colors to the brush
cols <- toRGB(RColorBrewer::brewer.pal(3, "Dark2"), 0.5)
highlight(gg, on = "plotly_hover", color = cols, dynamic = TRUE)

# Use `attrs_selected()` for complete control over the selection appearance
# note any relevant colors you specify here should override the color argument
s <- attrs_selected(
    showlegend = TRUE,
    mode = "lines+markers",
    marker = list(symbol = "x")
)
highlight(layout(gg, showlegend = TRUE), selected = s)
```

highlight_key

*Highlight/query data based on primary key*

Description

This function simply creates an object of class `crosstalk::SharedData`. The reason it exists is to make it easier to teach others how to leverage it’s functionality in plotly. It also makes it more discoverable if one is already aware of `highlight`.

Usage

`highlight_key(...)`

Arguments

... arguments passed to `crosstalk::SharedData$new()`

Value

An object of class `crosstalk::SharedData`
**hobbs**

A data frame with three variables: `r`, `t`, `nms`.

---

**knit_print.api_grid**
*Embed a plotly grid as an iframe in a knitr doc*

---

**Description**
Embed a plotly grid as an iframe in a knitr doc

**Usage**
```
knit_print.api_grid(x, options, ...)
```

**Arguments**
- `x` a plotly figure object
- `options` knitr options.
- `...` placeholder.

**References**
knit_print.api_grid_local

  Embed a plotly grid as an iframe in a knitr doc

Description

Embed a plotly grid as an iframe in a knitr doc

Usage

knit_print.api_grid_local(x, options, ...)

Arguments

- x: a plotly figure object
- options: knitr options.
- ...: placeholder.

References

knit_print.api_plot

  Embed a plotly figure as an iframe in a knitr doc

Description

Embed a plotly figure as an iframe in a knitr doc

Usage

knit_print.api_plot(x, options, ...)

Arguments

- x: a plotly figure object
- options: knitr options.
- ...: placeholder.

References

last_plot

Retrieve the last plot to be modified or created.

Description

Retrieve the last plot to be modified or created.

Usage

last_plot()

See Also

ggplot2::last_plot()

layout

Modify the layout of a plotly visualization

Description

Modify the layout of a plotly visualization

Usage

layout(p, ..., data = NULL)

Arguments

p
A plotly object.

...   Arguments to the layout object. For documentation, see https://plot.ly/r/reference/#Layout_and_layout_style_objects

data   A data frame to associate with this layout (optional). If not provided, arguments are evaluated using the data frame in plot_ly().

Carson Sievert
mic

Mic data

Description

Description TBD.

Usage

mic

Format

A data frame with three variables: r, t, nms.

offline

Plotly Offline

Description

Deprecated in version 2.0 (offline plots are now the default)

Usage

offline(p, height, width, out_dir, open_browser)

Arguments

p

a plotly object

height

A valid CSS unit. (like "100%", "600px", "auto") or a number, which will be coerced to a string and have "px" appended.

width

A valid CSS unit. (like "100%", "600px", "auto") or a number, which will be coerced to a string and have "px" appended.

out_dir

a directory to place the visualization. If NULL, a temporary directory is used when the offline object is printed.

open_browser

open the visualization after creating it?

Value

a plotly object of class "offline"

Author(s)

Carson Sievert
orca  

Static image export via orca

Description

The function makes a system call to the orca command-line utility, see the installation instructions here.

Usage

```r
orca(p, file = "plot.png", format = tools::file_ext(file), scale = NULL,
width = NULL, height = NULL, mathjax = FALSE, parallel_limit = NULL,
verbose = FALSE, debug = FALSE, safe = FALSE)
```

Arguments

- `p` a plotly object.
- `file` output filename.
- `format` the output format (png, jpeg, webp, svg, pdf, eps).
- `scale` Sets the image scale. Applies to all output images.
- `width` Sets the image width. If not set, defaults to `layout.width` value. Applies to all output images.
- `height` Sets the image height. If not set, defaults to `layout.height` value. Applies to all output images.
- `mathjax` whether or not to include MathJax (required to render TeX). If TRUE, the PLOTLY_MATHJAX_PATH environment variable must be set and point to the location of MathJax (this variable is also used to render TeX in interactive graphs, see config).
- `parallel_limit` Sets the limit of parallel tasks run.
- `verbose` Turn on verbose logging on stdout.
- `debug` Starts app in debug mode and turn on verbose logs on stdout.
- `safe` Turns on safe mode: where figures likely to make browser window hang during image generating are skipped.

Author(s)

Carson Sievert

Examples

```r
## Not run:
p <- plot_ly(z = ~volcano) %>% add_surface()
orca(p, "surface-plot.svg")

## End(Not run)
```
**Description**

Leveraging plotly.js' partial bundles can lead to smaller file sizes and faster rendering. The full list of available bundles, and the trace types that they support, are available [here](#).

**Usage**

```r
partial_bundle(p, type = "auto", local = TRUE, minified = TRUE)
```

**Arguments**

- `p`: a plotly object.
- `type`: name of the (partial) bundle. The default, `auto`, attempts to find the smallest single bundle that can render `p`. If no single partial bundle can render `p`, then the full bundle is used.
- `local`: whether or not to download the partial bundle so that it can be viewed later without an internet connection.
- `minified`: whether or not to use a minified js file (non-minified file can be useful for debugging plotly.js)

**Details**

WARNING: use this function with caution when rendering multiple plotly graphs on a single web-site. That's because, if multiple plotly.js bundles are used, the most recent bundle will override the other bundles. See the examples section for an example.

**Author(s)**

Carson Sievert

**Examples**

```r
# This function is always safe to use when rendering a single
# plotly graph. In this case, we get a 3x file reduction.

library(plotly)
p <- plot_ly(x = 1:10, y = 1:10) %>% add_markers()
save_widget <- function(p, f) {
  owd <- setwd(dirname(f))
on.exit(setwd(owd))
  htmlwidgets::saveWidget(p, f)
  mb <- round(file.info(f)$size / 1e6, 3)
```
plotly-shiny

Shiny bindings for plotly

Description

Output and render functions for using plotly within Shiny applications and interactive Rmd documents.

Usage

plotlyOutput(outputId, width = "100\%", height = "400px", inline = FALSE)

renderPlotly(expr, env = parent.frame(), quoted = FALSE)

Arguments

- **outputId**: output variable to read from
- **width, height**: Must be a valid CSS unit (like "100\%", "400px", "auto") or a number, which will be coerced to a string and have "px" appended.
- **inline**: use an inline (\texttt{span()}) or block container (\texttt{div()}) for the output
- **expr**: An expression that generates a plotly
env The environment in which to evaluate expr.
quoted Is expr a quoted expression (with quote())? This is useful if you want to save an expression in a variable.

plotlyProxy Modify a plotly object inside a shiny app

Description
Modify a plotly object inside a shiny app

Usage
plotlyProxy(outputId, session = shiny::getDefaultReactiveDomain(), deferUntilFlush = TRUE)
plotlyProxyInvoke(p, method, ...)

Arguments
outputId single-element character vector indicating the output ID map to modify (if invoked from a Shiny module, the namespace will be added automatically)
session the Shiny session object to which the map belongs; usually the default value will suffice.
deferUntilFlush indicates whether actions performed against this instance should be carried out right away, or whether they should be held until after the next time all of the outputs are updated.
p a plotly proxy object (created with plotlyProxy)
method a plotlyjs method to invoke. For a list of options, visit the plotlyjs function reference
... unnamed arguments passed onto the plotly.js method

Examples

if (require("shiny") && interactive()) {
  plotly_example("shiny", "proxy_relayout")
  plotly_example("shiny", "proxy_mapbox")
}
plotly_build

'Build' (i.e., evaluate) a plotly object

Description
This generic function creates the list object sent to plotly.js for rendering. Using this function can be useful for overriding defaults provided by ggplotly/plot_ly or for debugging rendering errors.

Usage
plotly_build(p, registerFrames = TRUE)

Arguments
p a ggplot object, or a plotly object, or a list.
registerFrames should a frame trace attribute be interpreted as frames in an animation?

Examples
p <- plot_ly(economics, x = ~date, y = ~pce)
# the unevaluated plotly object
str(p)
# the evaluated data
str(plotly_build(p)$x$data)

plotly_data
Obtain data associated with a plotly graph

Description
plotly_data() returns data associated with a plotly visualization (if there are multiple data frames, by default, it returns the most recent one).

Usage
plotly_data(p, id = p$x$cur_data)

## S3 method for class 'plotly'
groups(x)

## S3 method for class 'plotly'
ungroup(x, ...)

## S3 method for class 'plotly'
group_by_(.data, ..., .dots, add = FALSE)

## S3 method for class 'plotly'
summarise_(.data, ..., .dots)

## S3 method for class 'plotly'
mutate_(.data, ..., .dots)

## S3 method for class 'plotly'
do_(.data, ..., .dots)

## S3 method for class 'plotly'
arrange_(.data, ..., .dots)

## S3 method for class 'plotly'
select_(.data, ..., .dots)

## S3 method for class 'plotly'
filter_(.data, ..., .dots)

## S3 method for class 'plotly'
distinct_(.data, ..., .dots)

## S3 method for class 'plotly'
slice_(.data, ..., .dots)

## S3 method for class 'plotly'
rename_(.data, ..., .dots)

## S3 method for class 'plotly'
transmute_(.data, ..., .dots)

**Arguments**

- `p` a plotly visualization
- `id` a character string or number referencing an "attribute layer".
- `x` a plotly visualization
- `...` stuff passed onto the relevant method
- `data` a plotly visualization
- `dots` Used to work around non-standard evaluation. See vignette("nse") for details
- `add` By default, when add = FALSE, group_by will override existing groups. To instead add to the existing groups, use add = TRUE

**Examples**

# use group_by() to define groups of visual markings
p <- txhousing %>%
group_by(city) %>%
plot_ly(x = ~date, y = ~sales)
p

# plotly objects preserve data groupings
groups(p)
plotly_data(p)

# dplyr verbs operate on plotly objects as if they were data frames
p <- economics %>%
plot_ly(x = ~date, y = ~unemploy / pop) %>%
add_lines() %>%
mutate(rate = unemploy / pop) %>%
filter(rate == max(rate))
plotly_data(p)
add_markers(p)
layout(p, annotations = list(x = ~date, y = ~rate, text = "peak"))

# use group_by() + do() + subplot() for trellis displays
d <- group_by(mpg, drv)
plots <- do(d, p = plot_ly(.x = ~cty, name = ~drv))
subplot(plots[["p"]], nrow = 3, sharex = TRUE)

# arrange displays by their mean
means <- summarise(d, mn = mean(cty, na.rm = TRUE))
means %>%
dplyr::left_join(plots) %>%
arrange(mn) %>%
subplot(nrows = NROW(.), shareX = TRUE)

# more dplyr verbs applied to plotly objects
p <- mtcars %>%
plot_ly(x = ~wt, y = ~mpg, name = "scatter trace") %>%
add_markers() p %>% slice(1) %>% plotly_data()
p %>% slice(1) %>% add_markers(name = "first observation")
p %>% filter(cyl == 4) %>% plotly_data()
p %>% filter(cyl == 4) %>% add_markers(name = "four cylinders")

---

**plotly_empty**

Create a complete empty plotly graph.

**Description**

Useful when used with subplot()
Usage

plotly_empty(...)

Arguments

... arguments passed onto plot_ly()

plotly_example Run a plot example(s)

Description

Provides a unified interface for running demos, shiny apps, and Rmd documents which are bundled with the package.

Usage

plotly_example(type = c("demo", "shiny", "rmd"), name, ...)

Arguments

type the type of example
name the name of the example (valid names depend on type).
... arguments passed onto the suitable method.

Author(s)

Carson Sievert

plotly_IMAGE Create a static image

Description

The images endpoint turns a plot (which may be given in multiple forms) into an image of the desired format.

Usage

plotly_IMAGE(x, width = 1000, height = 500, format = "png", scale = 1, out_file, ...)
**Arguments**

- **x**: either a plotly object or a list.
- **width**: Image width in pixels
- **height**: Image height in pixels
- **format**: The desired image format 'png', 'jpeg', 'svg', 'pdf', 'eps', or 'webp'
- **scale**: Both png and jpeg formats will be scaled beyond the specified width and height by this number.
- **out_file**: A filename for writing the image to a file.
- **...**: arguments passed onto `httr::POST`

**Examples**

```r
## Not run:
p <- plot_ly(x = 1:10)
png <- plotly_image(p, out_file = "plotly-test-image.png")
jpeg <- plotly_image(p, format = "jpeg", out_file = "plotly-test-image.jpeg")
svg <- plotly_image(p, format = "svg", out_file = "plotly-test-image.svg")
pdf <- plotly_image(p, format = "pdf", out_file = "plotly-test-image.pdf")

## End(Not run)
```

---

**plotly_json**

*Inspect JSON sent to plotly.js*

**Description**

This function is useful for obtaining/viewing/debugging JSON sent to plotly.js.

**Usage**

```r
plotly_json(p = last_plot(), jsonedit = interactive(), pretty = TRUE, ...)
```

**Arguments**

- **p**: a plotly or ggplot object.
- **jsonedit**: use `listviewer::jsonedit` to view the JSON?
- **pretty**: adds indentation whitespace to JSON output. Can be TRUE/FALSE or a number specifying the number of spaces to indent. See `jsonlite::prettify`.
- **...**: other options passed onto `listviewer::jsonedit`

**Examples**

```r
plotly_json(plot_ly())
plotly_json(plot_ly(), FALSE)
```
**plotly_POST**

*Create/Modify plotly graphs*

**Description**

Deprecated: see `api_create()`.

**Usage**

```r
plotly_POST(x = last_plot(), filename = NULL, fileopt = "overwrite", sharing = c("public", "private", "secret"), ...)
```

**Arguments**

- `x` either a ggplot object, a plotly object, or a list.
- `filename` character string describing the name of the plot in your plotly account. Use `/` to specify directories. If a directory path does not exist it will be created. If this argument is not specified and the title of the plot exists, that will be used for the filename.
- `fileopt` character string describing whether to create a "new" plotly, "overwrite" an existing plotly, "append" data to existing plotly, or "extend" it.
- `sharing` If 'public', anyone can view this graph. It will appear in your profile and can appear in search engines. You do not need to be logged in to Plotly to view this chart. If 'private', only you can view this plot. It will not appear in the Plotly feed, your profile, or search engines. You must be logged in to Plotly to view this graph. You can privately share this graph with other Plotly users in your online Plotly account and they will need to be logged in to view this plot. If 'secret', anyone with this secret link can view this chart. It will not appear in the Plotly feed, your profile, or search engines. If it is embedded inside a webpage or an IPython notebook, anybody who is viewing that page will be able to view the graph. You do not need to be logged in to view this plot.

- `...` not used

**See Also**

`plot_ly()`, `signup()`
**plot_dendro**

Plot an interactive dendrogram

Description

This function takes advantage of nested key selections to implement an interactive dendrogram. Selecting a node selects all the labels (i.e. leaves) under that node.

Usage

```r
plot_dendro(d, set = "A", xmin = -50, height = 500, width = 500, ...)
```

Arguments

- `d`: a dendrogram object
- `set`: defines a crosstalk group
- `xmin`: minimum of the range of the x-scale
- `height`: height
- `width`: width
- `...`: arguments supplied to `subplot()`

Examples

```r
hc <- hclust(dist(USArrests), "ave")
dend1 <- as.dendrogram(hc)
plot_dendro(dend1, height = 600) %>%
  hide_legends() %>%
  highlight(persistent = TRUE, dynamic = TRUE)
```
plot_geo  

Initiate a plotly-geo object

Description

Use this function instead of plot_ly() to initialize a plotly-geo object. This enforces the entire plot so use the scattergeo trace type, and enables higher level geometries like add_polygons() to work.

Usage

plot_geo(data = data.frame(), ..., offline = FALSE)

Arguments

data      A data frame (optional).
...     arguments passed along to plot_ly().
offline  whether or not to include geo assets so that the map can be viewed with or without an internet connection. The plotlyGeoAssets package is required for this functionality.

Carson Sievert

See Also

plot_ly(), plot_mapbox(), ggplotly()

Examples

map_data("world", "canada") %>%
group_by(group) %>%
plot_geo(x = -long, y = -lat) %>%
  add_markers(size = I(1))
**Description**

This function maps R objects to plotly.js, an (MIT licensed) web-based interactive charting library. It provides abstractions for doing common things (e.g. mapping data values to fill colors (via `color`) or creating animations (via `frame`)) and sets some different defaults to make the interface feel more 'R-like' (i.e., closer to `plot()` and `ggplot2::qplot()`).

**Usage**

```r
plot_ly(data = data.frame(), ..., type = NULL, name, color, colors = NULL, alpha = NULL, stroke, strokes = NULL, alpha_stroke = 1, size, sizes = c(10, 100), span, spans = c(1, 20), symbol, symbols = NULL, linetype, linetypes = NULL, split, frame, width = NULL, height = NULL, source = "A")
```

**Arguments**

- `data` A data frame (optional) or `crosstalk::SharedData` object.
- `...` Arguments (i.e., attributes) passed along to the trace type. See `schema()` for a list of acceptable attributes for a given trace type (by going to `traces` -> `type` -> attributes). Note that attributes provided at this level may override other arguments (e.g., `plot_ly(x = 1:10, y = 1:10, color = "red", marker = list(color = "blue")))
- `type` A character string specifying the trace type (e.g. "scatter", "bar", "box", etc). If specified, it always creates a trace, otherwise
- `name` Values mapped to the trace's name attribute. Since a trace can only have one name, this argument acts very much like `split` in that it creates one trace for every unique value.
- `color` Values mapped to relevant 'fill-color' attribute(s) (e.g. `fillcolor`, `marker.color`, `textfont.color`, etc.). The mapping from data values to color codes may be controlled using `colors` and `alpha`, or avoided altogether via `I()` (e.g., `color = I("red")`). Any color understood by `grDevices::col2rgb()` may be used in this way.
- `colors` Either a colorbrewer2.org palette name (e.g. "YlOrRd" or "Blues"), or a vector of colors to interpolate in hexadecimal "#RRGGBB" format, or a color interpolation function like `colorRamp()`.
- `alpha` A number between 0 and 1 specifying the alpha channel applied to `color`. Defaults to 0.5 when mapping to `fillcolor` and 1 otherwise.
- `stroke` Similar to `color`, but values are mapped to relevant 'stroke-color' attribute(s) (e.g., `marker.line.color` and `line.color` for filled polygons). If not specified, stroke inherits from `color`.
- `strokes` Similar to `colors`, but controls the stroke mapping.
- `alpha_stroke` Similar to `alpha`, but applied to `stroke`.
size  (Numeric) values mapped to relevant 'fill-size' attribute(s) (e.g., marker.size, textfont.size, and error_x.width). The mapping from data values to symbols may be controlled using sizes, or avoided altogether via $I()$ (e.g., size = I(30)).

sizes A numeric vector of length 2 used to scale size to pixels.

span  (Numeric) values mapped to relevant 'stroke-size' attribute(s) (e.g., marker.line.width, line.width for filled polygons, and error_x.thickness). The mapping from data values to symbols may be controlled using spans, or avoided altogether via $I()$ (e.g., span = I(30)).

spans A numeric vector of length 2 used to scale span to pixels.

symbol  (Discrete) values mapped to marker.symbol. The mapping from data values to symbols may be controlled using symbols, or avoided altogether via $I()$ (e.g., symbol = I("pentagon")). Any pch value or symbol name may be used in this way.

symbols A character vector of pch values or symbol names.

linetype  (Discrete) values mapped to line.dash. The mapping from data values to symbols may be controlled using linetypes, or avoided altogether via $I()$ (e.g., linetype = I("dash")). Any lty (see par) value or dash name may be used in this way.

linetypes A character vector of lty values or dash names.

split  (Discrete) values used to create multiple traces (one trace per value).

frame  (Discrete) values used to create animation frames.

width  Width in pixels (optional, defaults to automatic sizing).

height  Height in pixels (optional, defaults to automatic sizing).

source  a character string of length 1. Match the value of this string with the source argument in event_data() to retrieve the event data corresponding to a specific plot (shiny apps can have multiple plots).

Details

Unless type is specified, this function just initiates a plotly object with 'global' attributes that are passed onto downstream uses of add_trace() (or similar). A formula must always be used when referencing column name(s) in data (e.g. plot_ly(mtcars, x = ~wt)). Formulas are optional when supplying values directly, but they do help inform default axis/scale titles (e.g., plot_ly(x = mtcars$wt) vs plot_ly(x = ~mtcars$wt))

- For quick, accurate, and searchable plotly.js reference: `schema()`

Examples

```r
## Not run:

# plot_ly() tries to create a sensible plot based on the information you
give it. If you don't provide a trace type, plot_ly() will infer one.
plot_ly(economics, x = ~pop)
plot_ly(economics, x = ~date, y = ~pop)
# plot_ly() doesn't require data frame(s), which allows one to take
# advantage of trace type(s) designed specifically for numeric matrices
plot_ly(z = ~volcano)
plot_ly(z = ~volcano, type = "surface")

# plotly has a functional interface: every plotly function takes a plotly
# object as its first input argument and returns a modified plotly object
add_lines(plot_ly(economics, x = ~date, y = ~unemploy/pop))

# To make code more readable, plotly imports the pipe operator from magrittr

# Attributes defined via plot_ly() set 'global' attributes that
# are carried onto subsequent traces, but those may be over-written
plot_ly(economics, x = ~date, color = I("black")) %>%
  add_lines(y = ~unempmed) %>%
  add_lines(y = ~psavert, color = I("red"))

# Attributes are documented in the figure reference -> https://plot.ly/r/reference
# You might notice plot_ly() has named arguments that aren't in this figure
# reference. These arguments make it easier to map abstract data values to
# visual attributes.
p <- plot_ly(iris, x = ~Sepal.Width, y = ~Sepal.Length)
add_markers(p, color = ~Petal.Length, size = ~Petal.Length)
add_markers(p, color = ~Species)
add_markers(p, color = ~Species, colors = "Set1")
add_markers(p, symbol = ~Species)
add_paths(p, linetype = ~Species)

## End(Not run)
```
plot_mapbox  
*Initiate a plotly-mapbox object*

**Description**

Use this function instead of `plot_ly()` to initialize a plotly-mapbox object. This enforces the entire plot so use the scattermapbox trace type, and enables higher level geometries like `add_polygons()` to work.

**Usage**

```r
plot_mapbox(data = data.frame(), ...)
```

**Arguments**

- `data`  
  A data frame (optional).
- `...`  
  `arguments` passed along to `plot_ly()`. They should be valid `scattermapbox` attributes - [https://plot.ly/r/reference/#scattermapbox](https://plot.ly/r/reference/#scattermapbox). Note that `x/y` can also be used in place of `lat/lon`.

**Author(s)**

Carson Sievert

**See Also**

`plot_ly()`, `plot_geo()`, `ggplotly()`

**Examples**

```r
## Not run:

plot_mapbox(res_mn)
plot_mapbox(res_mn, color = ~INDRESNAME)

map_data("world", "canada") %>%
  group_by(group) %>%
  plot_mapbox(x = ~long, y = ~lat) %>%
  add_polygons() %>%
  layout(
    mapbox = list(
      center = list(lat = ~median(lat), lon = ~median(long))
    )
  )

## End(Not run)
```
print.api  

Print method for a 'generic' API response

Description

Print method for a 'generic' API response

Usage

```r
## S3 method for class 'api'
print(x, ...)
```

Arguments

- `x`  a list.
- `...` additional arguments (currently ignored)

---

print.api_grid  

Print a plotly grid object

Description

Print a plotly grid object

Usage

```r
## S3 method for class 'api_grid'
print(x, ...)
```

Arguments

- `x`  a plotly grid object
- `...` additional arguments (currently ignored)
print.api_grid_local  |  Print a plotly grid object

Description

Print a plotly grid object

Usage

```r
## S3 method for class 'api_grid_local'
print(x, ...)
```

Arguments

- `x`: a plotly grid object
- `...`: additional arguments (currently ignored)

print.api_plot  |  Print a plot on plotly's platform

Description

Print a plot on plotly's platform

Usage

```r
## S3 method for class 'api_plot'
print(x, ...)
```

Arguments

- `x`: a plotly figure object
- `...`: additional arguments (currently ignored)
rangeslider

Add a range slider to the x-axis

Description

Add a range slider to the x-axis

Usage

rangeslider(p, start = NULL, end = NULL, ...)

Arguments

p
plotly object.

start
a start date/value.

end
an end date/value.

... these arguments are documented here https://plot.ly/r/reference/#layout-xaxis-rangeslider

Author(s)

Carson Sievert

Examples

plot_ly(x = time(USAccDeaths), y = USAccDeaths) %>%
  add_lines() %>%
  rangeslider()

d <- tibble::tibble(
  time = seq(as.Date("2016-01-01"), as.Date("2016-08-31"), by = "days"),
  y = rnorm(seq_along(time))
)

plot_ly(d, x = ~time, y = ~y) %>%
  add_lines() %>%
  rangeslider(d$time[5], d$time[50])
raster2uri

Convert a raster object to a data URI

Description

Usage

raster2uri(r, ...)

Arguments

r an object coercable to a raster object via as.raster()

... arguments passed onto as.raster().

Author(s)

Carson Sievert

Examples

# a red gradient (from ?as.raster)
r <- as.raster(matrix(hcl(0, 80, seq(50, 80, 10)), nrow = 4, ncol = 5))
plot(r)

# embed the raster as an image
plot_ly(x = 1, y = 1) %>%
  layout(
    images = list(list(
      source = raster2uri(r),
      xref = "paper",
      yref = "paper",
      x = 0, y = 0,
      sizex = 0.5, sizey = 0.5,
      xanchor = "left", yanchor = "bottom"
    )))
Description

By default, plotly.js' TypedArray polyfill is included as a dependency, so printing "just works" in any context. Many users won’t need this polyfill, so this function may be used to remove it and thus reduce the size of the page.

Usage

remove_typedarray_polyfill(p)

Arguments

p a plotly object

Details

The polyfill seems to be only relevant for those rendering plots via phantomjs and RStudio on some Windows platforms.

Examples

## Not run:
p1 <- plot_ly()
p2 <- remove_typedarray_polyfill(p1)
t1 <- tempfile(fileext = "html")
htmlwidgets::saveWidget(p1, t1)
file.info(t1)$size
htmlwidgets::saveWidget(p2, t1)
file.info(t1)$size

## End(Not run)

---

res_mn Minnesotan Indian Reservation Lands

Description

Minnesotan Indian Reservation Lands

Usage

res_mn
Format

An sf data frame with 13 features and 5 fields

References

https://www.dot.state.mn.us/maps/gdma/gis-data.html

---

schema

Acquire (and optionally display) plotly’s plot schema

Description

The schema contains valid attributes names, their value type, default values (if any), and min/max values (if applicable).

Usage

schema(jsonedit = interactive(), ...)

Arguments

jsonedit  use listviewer::jsonedit to view the JSON?
...
other options passed onto listviewer::jsonedit

Examples

s <- schema()

# retrieve acceptable 'layout.mapbox.style' values
if (!is.null(Sys.getenv('MAPBOX_TOKEN', NA))) {
  styles <- s$layout$layoutAttributes$mapbox$style$values
  subplot(
    plot_mapbox() %>% layout(mapbox = list(style = styles[3])),
    plot_mapbox() %>% layout(mapbox = list(style = styles[5]))
  )
}

showRGB

View colors already formatted by toRGB()

Description

Useful for viewing colors after they’ve been converted to plotly.js’ color format – "rgba(255, 255, 255, 1)"

Usage

showRGB(x, ...)

Arguments

x character string specifying color(s).
... arguments passed along to scales::show_col.

Author(s)

Carson Sievert

Examples

showRGB(toRGB(colors()), labels = FALSE)

signup

Create a new plotly account.

Description

A sign up interface to plotly through the R Console.

Usage

signup(username, email, save = TRUE)

Arguments

username Desired username.
email Desired email.
save If request is successful, should the username & API key be automatically stored as an environment variable in a .Rprofile?
Value

- api_key key to use with the api
- tmp_pw temporary password to access your plotly account

References

https://plot.ly/rest/

Examples

```r
## Not run:
# You need a plotly username and API key to communicate with the plotly API.

# If you don't already have an API key, you can obtain one with a valid
# username and email via signup().
s <- signup('anna.lyst', 'anna.lyst@plot.ly')

# If you already have a username and API key, please create the following
# environment variables:
Sys.setenv("plotly_username" = "me")
Sys.setenv("plotly_api_key" = "mykey")
# You can also change the default domain if you have a plotly server.
Sys.setenv("plotly_domain" = "http://mydomain.com")

# If you want to automatically load these environment variables when you
# start R, you can put them inside your ~/.Rprofile
# (see help(.Rprofile) for more details)

## End(Not run)
```

---

**style**

*Modify trace(s)*

Description

Modify trace(s) of an existing plotly visualization. Useful when used in conjunction with `get_figure()`.

Usage

`style(p, ..., traces = NULL)`

Arguments

- `p` A plotly visualization.
- `...` Visual properties.
- `traces` numeric vector. Which traces should be modified? By default, attributes place
  in `...` will be applied to every trace.
Author(s)

Carson Sievert

See Also

api_download_plot()

Examples

```r
p <- qplot(data = mtcars, wt, mpg, geom = c("point", "smooth"))
# keep the hover info for points, but remove it for the line/ribbon
style(p, hoverinfo = "none", traces = c(2, 3))
```

---

**subplot**

*View multiple plots in a single view*

Description

View multiple plots in a single view

Usage

```r
subplot(..., nrows = 1, widths = NULL, heights = NULL, margin = 0.02,
shareX = FALSE, shareY = FALSE, titleX = shareX, titleY = shareY,
which_layout = "merge")
```

Arguments

- `...` One of the following
  - any number of plotly/ggplot2 objects.
  - a list of plotly/ggplot2 objects.
  - a tibble with one list-column of plotly/ggplot2 objects.
- `nrows` number of rows for laying out plots in a grid-like structure. Only used if no domain is already specified.
- `widths` relative width of each column on a 0-1 scale. By default all columns have an equal relative width.
- `heights` relative height of each row on a 0-1 scale. By default all rows have an equal relative height.
- `margin` either a single value or four values (all between 0 and 1). If four values are provided, the first is used as the left margin, the second is used as the right margin, the third is used as the top margin, and the fourth is used as the bottom margin. If a single value is provided, it will be used as all four margins.
- `shareX` should the x-axis be shared amongst the subplots?
shareY should the y-axis be shared amongst the subplots?
titleX should x-axis titles be retained?
titleY should y-axis titles be retained?
which_layout adopt the layout of which plot? If the default value of “merge” is used, layout options found later in the sequence of plots will override options found earlier in the sequence. This argument also accepts a numeric vector specifying which plots to consider when merging.

Value
A plotly object

Author(s)
Carson Sievert

Examples

# pass any number of plotly objects to subplot()
p1 <- plot_ly(economics, x = ~date, y = ~uempmed)
p2 <- plot_ly(economics, x = ~date, y = ~unemploy)
subplot(p1, p2, p1, p2, nrows = 2, margin = 0.05)

' # anchor multiple traces on the same legend entry
p1 <- add_lines(p1, color = I("black"), name = "1st", legendgroup = "1st")
p2 <- add_lines(p2, color = I("red"), name = "2nd", legendgroup = "2nd")

subplot(
  p1, style(p1, showlegend = FALSE),
  p2, style(p2, showlegend = FALSE),
  nrows = 2, margin = 0.05
)

# or pass a list
economics_long %>%
  split(.\$variable) %>%
  lapply(function(d) plot_ly(d, x = ~date, y = ~value)) %>%
  subplot(nrows = NROW(.), shareX = TRUE)

# or pass a tibble with a list-column of plotly objects
economics_long %>%
group_by(variable) %>%
do(p = plot_ly(.., x = ~date, y = ~value)) %>%
  subplot(nrows = NROW(.), shareX = TRUE)

# learn more at https://cpsievert.github.io/plotly_book/subplot.html
Render TeX in a plotly graph using MathJax

Description
This function makes it slightly easier to render TeX in a plotly graph – it ensures that MathJax is included with the final result and also ensures the provided string is surrounded with $ (this is what plotly.js uses to declare a string as TeX).

Usage
TeX(x)

Arguments
x a character vector

See Also
config

description
Convert R colours to RGBA hexadecimal colour values

Description
Convert R colours to RGBA hexadecimal colour values

Usage
toRGB(x, alpha = 1)

Arguments
x see the col argument in col2rgb for valid specifications
alpha alpha channel on 0-1 scale

Value
hexadecimal colour value (if is.na(x), return "transparent" for compatibility with Plotly)
See Also

showRGB()

Examples

toRGB("steelblue")
# [1] "rgba(70,130,180,1)"

m <- list(
  color = toRGB("red"),
  line = list(
    color = toRGB("black"),
    width = 19
  )
)

plot_ly(x = 1, y = 1, marker = m)

toWebGL(p)

Arguments

p a plotly or ggplot object.

Examples

# currently no bargl trace type
toWebGL(ggplot() + geom_bar(aes(1:10)))
toWebGL(qplot(1:10, 1:10))
to_basic

Convert a geom to a "basic" geom.

Description

This function makes it possible to convert ggplot2 geoms that are not included with ggplot2 itself. Users shouldn’t need to use this function. It exists purely to allow other package authors to write their own conversion method(s).

Usage

```r
to_basic(data, prestats_data, layout, params, p, ...)
```

Arguments

- **data**: the data returned by `ggplot2::ggplot_build()`.
- **prestats_data**: the data before statistics are computed.
- **layout**: the panel layout.
- **params**: parameters for the geom, statistic, and 'constant' aesthetics
- **p**: a ggplot2 object (the conversion may depend on scales, for instance).
- **...**: currently ignored

---

wind

Wind data

Description

Description TBD.

Usage

```r
wind
```
