Package ‘prediction’

June 17, 2019

**Type** Package

**Title** Tidy, Type-Safe ‘prediction()’ Methods

**Description** A one-function package containing ‘prediction()’, a type-safe alternative to ‘predict()’ that always returns a data frame. The ‘summary()’ method provides a data frame with average predictions, possibly over counterfactual versions of the data (a la the ‘margins’ command in ‘Stata’). Marginal effect estimation is provided by the related package, ‘margins’ <https://cran.r-project.org/package=margins>. The package currently supports common model types (e.g., `"lm", "glm") from the ‘stats’ package, as well as numerous other model classes from other add-on packages. See the README or main package documentation page for a complete listing.

**License** MIT + file LICENSE

**Version** 0.3.14

**Date** 2019-06-16

**URL** https://github.com/leeper/prediction

**BugReports** https://github.com/leeper/prediction/issues

**Depends** R (>= 3.5.0)

**Imports** utils, stats, data.table

**Suggests** datasets, methods, testthat

**Enhances** AER, aod, betareg, biglm, brglm, caret, crch, e1071, earth, ff, fibase, gam (>= 1.15), gee, glmnet, glmx, kernlab, lme4, MASS, mclorit, mda, mlogit, MNP, nlme, nnet, ordinal, plm, pscl, quantreg, rpart, sampleSelection, speedglm, survey (>= 3.31-5), survival, truncreg, VGAM

**ByteCompile** true

**Encoding** UTF-8

**RoxygenNote** 6.1.1

**NeedsCompilation** no

**Author** Thomas J. Leeper [aut, cre] (<https://orcid.org/0000-0003-4097-6326>), Carl Ganz [ctb], Vincent Arel-Bundock [ctb] (<https://orcid.org/0000-0003-2042-7063>)

**Description**

Extract predicted values via `predict` from a model object, conditional on data, and return a data frame.

**Usage**

```r
prediction(model, ...) # Default S3 method:
prediction(model, data = find_data(model,
    parent.frame()), at = NULL, type = "response",
    vcov = stats::vcov(model), calculate_se = TRUE, ...)

# S3 method for class 'Arima'
prediction(model, calculate_se = TRUE, ...)

# S3 method for class 'ar'
prediction(model, data, at = NULL, calculate_se = TRUE,
    ...) # S3 method for class 'betareg'
prediction(model, data = find_data(model,
    parent.frame()), at = NULL, type = c("response", "link", "precision",
```

prediction_summary(model, ..., level = 0.95)

Arguments

model A model object, perhaps returned by \texttt{lm} or \texttt{glm}.

... Additional arguments passed to \texttt{predict} methods.

data A data.frame over which to calculate marginal effects. If missing, \texttt{find_data} is used to specify the data frame.
at
A list of one or more named vectors, specifically values at which to calculate the predictions. These are used to modify the value of data (see build_datalist for details on use).

type
A character string indicating the type of marginal effects to estimate. Mostly relevant for non-linear models, where the reasonable options are “response” (the default) or “link” (i.e., on the scale of the linear predictor in a GLM). For models of class “polr” (from polr), possible values are “class” or “probs”; both are returned.

type
A matrix containing the variance-covariance matrix for estimated model coefficients, or a function to perform the estimation with model as its only argument.

calculate_se
A logical indicating whether to calculate standard errors for observation-specific predictions and average predictions (if possible). The output will always contain a “calculate_se” column regardless of this value; this only controls the calculation of standard errors. Setting it to FALSE may improve speed.

category
For multi-level or multi-category outcome models (e.g., ordered probit, multinomial logit, etc.), a value specifying which of the outcome levels should be used for the “fitted” column. If missing, some default is chosen automatically.

lambda
For models of class “glmnet”, a value of the penalty parameter at which predictions are required.

re.form
An argument passed forward to predict.merMod.

level
A numeric value specifying the confidence level for calculating p-values and confidence intervals.

Details
This function is simply a wrapper around predict that returns a data frame containing the value of data and the predicted values with respect to all variables specified in data.

Methods are currently implemented for the following object classes:

- “lm”, see lm
- “glm”, see glm, glm.nb, glmx, hetglm, brglm
- “ar”, see ar
- “Arima”, see arima
- “arima0”, see arima0
- “bigglm”, see bigglm (including “ffdf”-backed models provided by bigglm.ffdf)
- “betareg”, see betareg
- “bruto”, see bruto
- “clm”, see clm
- “coxph”, see coxph
- “crch”, see crch
- “earth”, see earth
- “fda”, see fda
- “Gam”, see gam
• “gausspr”, see gausspr
• “gee”, see gee
• “glmnet”, see glmnet
• “gls”, see gls
• “glimML”, see betabin, negbin
• “glimQL”, see quasibin, quasi pois
• “hurdle”, see hurdle
• “hxlr”, see hxlr
• “ivreg”, see ivreg
• “knnreg”, see knnreg
• “kqr”, see kqr
• “ksvm”, see ksvm
• “lda”, see lda
• “lme”, see lme
• “loess”, see loess
• “lqs”, see lqs
• “mars”, see mars
• “mca”, see mca
• “mclogit”, see mclogit
• “mda”, see mda
• “merMod”, see lmer, glmer
• “mnp”, see mnp
• “naiveBayes”, see naiveBayes
• “nlme”, see nlme
• “nls”, see nls
• “nnet”, see nnet
• “plm”, see plm
• “polr”, see polr
• “polyreg”, see polyreg
• “ppr”, see ppr
• “princomp”, see princomp
• “qda”, see qda
• “rlm”, see rlm
• “rpart”, see rpart
• “rq”, see rq
• “selection”, see selection
• “speedglm”, see speedglm
Where implemented, prediction also returns average predictions (and the variances thereof). Variances are implemented using the delta method, as described in http://indiana.edu/~jslsoc/stata/ci_computations/spost_deltaci.pdf.

Value

A data frame with class “prediction” that has a number of rows equal to number of rows in data, or a multiple thereof, if !is.null(at). The return value contains data (possibly modified by at using build_datalist), plus a column containing fitted/predicted values (“fitted”) and a column containing the standard errors thereof (“calculate_se”). Additional columns may be reported depending on the object class. The data frame also carries attributes used by print and summary, which will be lost during subsetting.

Examples

require("datasets")
x <- lm(Petal.Width ~ Sepal.Length * Sepal.Width * Species, data = iris)
# prediction for every case
prediction(x)

# prediction for first case
prediction(x, iris[1,])

# basic use of 'at' argument
summary(prediction(x, at = list(Species = c("setosa", "virginica"))))

# basic use of 'at' argument
prediction(x, at = list(Sepal.Length = seq_range(iris$Sepal.Length, 5)))

# prediction at means/modes of input variables
prediction(x, at = lapply(iris, mean_or_mode))

# prediction with multi-category outcome
## Not run:
library("mlogit")
data("Fishing", package = "mlogit")
Fish <- mlogit.data(Fishing, varying = c(2:9), shape = "wide", choice = "mode")
mod <- mlogit(mode ~ price + catch, data = Fish)
prediction(mod)
prediction(mod, category = 3)

## End(Not run)

---

**build_datalist**  
**Build list of data.frames**

**Description**

Construct a list of data.frames based upon an input data.frame and a list of one or more at values

**Usage**

```r
build_datalist(data, at = NULL, as.data.frame = FALSE, ...)
```

**Arguments**

- **data**  
  A data.frame containing the original data.

- **at**  
  A list of one or more named vectors of values, which will be used to specify values of variables in `data`. All possible combinations are generated. Alternatively, this can be a data frame of combination levels if only a subset of combinations are desired. See examples.

- **as.data.frame**  
  A logical indicating whether to return a single stacked data frame rather than a list of data frames

- **...**  
  Ignored.

**Value**

A list of data.frames, unless `as.data.frame = TRUE` in which case a single, stacked data frame is returned.

**Author(s)**

Thomas J. Leeper

## S3 method for class 'train'
find_data(model, ...)

## S3 method for class 'vgam'
find_data(model, env = parent.frame(), ...)

## S3 method for class 'vglm'
find_data(model, env = parent.frame(), ...)

### Arguments

- **model**: The model object.
- **...**: Additional arguments passed to methods.
- **env**: An environment in which to look for the data argument to the modelling call.

### Details

This is a convenience function and, as such, carries no guarantees. To behave well, it typically requires that a model object be specified using a formula interface and an explicit data argument. Models that can be specified using variables from the .GlobalEnv or with a non-formula interface (e.g., a matrix of data) will tend to generate errors. `find_data` is an S3 generic so it is possible to expand it with new methods.

### Value

A data frame containing the original data used in a modelling call, modified according to the original model’s ‘subset’ and ‘na.action’ arguments, if appropriate.

### See Also

- prediction
- build_datalist
- mean_or_mode
- seq_range

### Examples

```r
require("datasets")
x <- lm(mpg ~ cyl * hp + wt, data = head(mtcars))
find_data(x)
```
margex

Artificial data for margins, copied from Stata

Description

The dataset is identical to the one provided by Stata and available from `webuse::webuse("margex")` with categorical variables explicitly encoded as factors.

Usage

margex

Format

A data frame with 3000 observations on the following 11 variables.

- `y` A numeric vector
- `outcome` A binary numeric vector with values (0,1)
- `sex` A factor with two levels
- `group` A factor with three levels
- `age` A numeric vector
- `distance` A numeric vector
- `ycn` A numeric vector
- `yc` A numeric vector
- `treatment` A factor with two levels
- `agegroup` A factor with three levels
- `arm` A factor with three levels

# Also available from: webuse::webuse("margex")
data("margex")

# A simple case after regress
```
# . regress y i.sex i.group
# . margins sex
m1 <- lm(y ~ factor(sex) + factor(group), data = margex)
prediction(m1, at = list(sex = c("male", "female")))

# A simple case after logistic
# . logistic outcome i.sex i.group
# . margins sex
m2 <- glm(outcome ~ sex + group, binomial(), data = margex)
prediction(m2, at = list(sex = c("male", "female")))

# Average response versus response at average
# . margins sex
prediction(m2, at = list(sex = c("male", "female")))
# . margins sex, atmeans
## TODO

# Multiple margins from one margins command
# . margins sex group
prediction(m2, at = list(sex = c("male", "female")))
prediction(m2, at = list(group = c("1", "2", "3")))

# Margins with interaction terms
# . logistic outcome i.sex i.group sex#group
# . margins sex group
m3 <- glm(outcome ~ sex * group, binomial(), data = margex)
prediction(m3, at = list(sex = c("male", "female")))
prediction(m3, at = list(group = c("1", "2", "3")))

# Margins with continuous variables
# . logistic outcome i.sex i.group sex#group age
# . margins sex group
m4 <- glm(outcome ~ sex * group + age, binomial(), data = margex)
prediction(m4, at = list(sex = c("male", "female")))
prediction(m4, at = list(group = c("1", "2", "3")))

# Margins of continuous variables
# . margins, at(age=40)
prediction(m4, at = list(age = 40))
# . margins, at(age=(30 35 40 45 50))
prediction(m4, at = list(age = c(30, 35, 40, 45, 50)))

# Margins of interactions
# . margins sex#group
prediction(m4, at = list(sex = c("male", "female"), group = c("1", "2", "3")))
Description

Summarize a vector/variable into a single number, either a mean (median) for numeric vectors or the mode for categorical (character, factor, ordered, or logical) vectors. Useful for aggregation.

Usage

mean_or_mode(x)

## Default S3 method:
mean_or_mode(x)

## S3 method for class 'numeric'
mean_or_mode(x)

## S3 method for class 'data.frame'
mean_or_mode(x)

median_or_mode(x)

## Default S3 method:
median_or_mode(x)

## S3 method for class 'numeric'
median_or_mode(x)

## S3 method for class 'data.frame'
median_or_mode(x)

Arguments

x

A vector.

Value

A numeric or factor vector of length 1.

See Also

prediction, build_datalist, seq_range

Examples

require("datasets")
# mean for numerics
mean_or_mode(iris)
mean_or_mode(iris["Sepal.Length"])
mean_or_mode(iris["Species"])

# median for numerics
median_or_mode(iris)
seq_range

Create a sequence over the range of a vector

Description

Define a sequence of evenly spaced values from the minimum to the maximum of a vector

Usage

seq_range(x, n = 2)

Arguments

x  A numeric vector
n  An integer specifying the length of sequence (i.e., number of points across the range of x)

Value

A vector of length n.

See Also

mean_or_mode, build_datalist

Examples

identical(range(1:5), seq_range(1:5, n = 2))
seq_range(1:5, n = 3)
