Package ‘psychTools’

October 14, 2022

Version 2.2.9
Date 2022-09-18
Title Tools to Accompany the ‘psych’ Package for Psychological Research
Description Support functions, data sets, and vignettes for the ‘psych’ package. Contains several of the biggest data sets for the ‘psych’ package as well as one vignette. A few helper functions for file manipulation are included as well. For more information, see the <https://personality-project.org/r/> web page.

16 multiple choice ability items 1525 subjects taken from the Synthetic Aperture Personality Assessment (SAPA) web based personality assessment project are saved as iqitems. Those data are shown as examples of how to score multiple choice tests and analyses of response alternatives. When scored correct or incorrect, the data are useful for demonstrations of tetrachoric based factor analysis irt.fa and finding tetrachoric correlations.
Usage

.data(iqitems)

Format

A data frame with 1525 observations on the following 16 variables. The number following the name is the item number from SAPA.

reason.4  Basic reasoning questions
reason.16 Basic reasoning question
reason.17 Basic reasoning question
reason.19 Basic reasoning question
letter.7  In the following alphanumeric series, what letter comes next?
letter.33 In the following alphanumeric series, what letter comes next?
letter.34 In the following alphanumeric series, what letter comes next
letter.58 In the following alphanumeric series, what letter comes next?
matrix.45 A matrix reasoning task
matrix.46 A matrix reasoning task
matrix.47 A matrix reasoning task
matrix.55 A matrix reasoning task
rotate.3  Spatial Rotation of type 1.2
rotate.4  Spatial Rotation of type 1.2
rotate.6  Spatial Rotation of type 1.1
rotate.8  Spatial Rotation of type 2.3

Details

16 items were sampled from 80 items given as part of the SAPA (https://www.sapa-project.org/) project (Revelle, Wilt and Rosenthal, 2009; Condon and Revelle, 2014) to develop online measures of ability. These 16 items reflect four lower order factors (verbal reasoning, letter series, matrix reasoning, and spatial rotations. These lower level factors all share a higher level factor (‘g’). This data set may be used to demonstrate item response functions, tetrachoric correlations, or irt.fa as well as omega estimates of of reliability and hierarchical structure.

In addition, the data set is a good example of doing item analysis to examine the empirical response probabilities of each item alternative as a function of the underlying latent trait. When doing this, it appears that two of the matrix reasoning problems do not have monotonically increasing trace lines for the probability correct. At moderately high ability (theta = 1) there is a decrease in the probability correct from theta = 0 and theta = 2.

Source

The example data set is taken from the Synthetic Aperture Personality Assessment personality and ability test at https://www.sapa-project.org/. The data were collected with David Condon from 8/08/12 to 8/31/12.

Similar data are available from the International Cognitive Ability Resource at https://www.icar-project.org/.

affect Two data sets of affect and arousal scores as a function of personality and movie conditions
Description

A recurring question in the study of affect is the proper dimensionality and the relationship to various personality dimensions. Here is a data set taken from two studies of mood and arousal using movies to induce affective states.

Usage

data(affect)

Details

These are data from two studies conducted in the Personality, Motivation and Cognition Laboratory at Northwestern University. Both studies used a similar methodology:

Collection of pretest data using 5 scales from the Eysenck Personality Inventory and items taken from the Motivational State Questionnaire (see msq. In addition, state and trait anxiety measures were given. In the “maps” study, the Beck Depression Inventory was given also.

Then subjects were randomly assigned to one of four movie conditions: 1: Frontline. A documentary about the liberation of the Bergen-Belsen concentration camp. 2: Halloween. A horror film. 3: National Geographic, a nature film about the Serengeti plain. 4: Parenthood. A comedy. Each film clip was shown for 9 minutes. Following this the MSQ was given again.

Data from the MSQ were scored for Energetic and Tense Arousal (EA and TA) as well as Positive and Negative Affect (PA and NA).

Study flat had 170 participants, study maps had 160.

These studies are described in more detail in various publications from the PMC lab. In particular, Revelle and Anderson, 1997 and Rafaeli and Revelle (2006). An analysis of these data has also appeared in Smillie et al. (2012).

For a much more complete data set involving film, caffeine, and time of day manipulations, see the msqR data set.

Source

Data collected at the Personality, Motivation, and Cognition Laboratory, Northwestern University.

Athenstaedt  Gender Role Self Concept data from Athenstaedt (2003)

Description

Athenstaedt (2003) examined Gender Role Self-Concept. She reports two independent dimensions of Male and Female behaviors. While there are large gender/sex differences on both of these dimensions, the two represent independent factors. Eagly and Revelle (2022) have used these data to explore the power of aggregation when examining sex differences. This data set is also useful to show various graphical display procedures.

Usage

data("Athenstaedt")

Format

A data frame with 576 observations on the following 117 variables.

STUDIE  a numeric vector
gender  Male =1, Female= 2
V1 - V74  self report items (see Athenstaedt.dictionary)
V1  Gender (Male = 1, Female =2)
V2  To pay attention to ones appearance in the office
V3  Offer fire to somebody
V4  Paint an Apartment
V5  Mow the Lawn
V6  Make the Bed
V7  Hold the Door Open for your Partner
V8  Do the Dishes
V9  Do Extreme Sports
V10  Tinker with the Car
V11  Talk about Sports
V12 Assemble Prefabricated Furniture
V13 Drive a Car in a Risky Way
V14 Listen Attentively to Others
V15 Tell your Partner about Problems at Work
V16 Play on a Computer
V17 Set the Table
V18 Watch ones Weight
V19 Care for a Partner if he/she is Ill
V20 Play Chess
V21 Meet with friends at a Regulars Table
V22 Watch Soap Operas
V23 Take a Friends Arm
V24 Wrap Presents Beautifully
V25 In case of Vacation with Partner Packing the Luggage for Both
V26 To admit own Occupational Weekness
V27 Work Overtime
V28 Openly Show Vulnerability
V29 Babysit
V30 Change Fuses
V31 Clean a Drain
V32 Take Care of Somebody
V33 Do Repair Work
V34 Change Light Bulbs
V35 Wash the Car
V36 Ride a Motorcycle
V37 Cook Meat on the Grill
V38 Thump Carpets
V39 Dust the Furniture
V40 Buy Electric Appliances
V41 Go Dancing
V42 Go for a Walk through Town
V43 Go to the Ballet
V44 Hug a Friend
V45 Do Handiwork (e.g. Knitting)
V46 Change Bed Sheets
V47 Sew on a Button
V48 Do Aerobics
V49 Watch Sports on Television
V50 Talk about Problems
V51 Play Parlor Games
V52 Talk about Politics
V53 Take Care of Flowers
V54 Make Coffee in the Office
V55 Shovel Snow
V56 Read non-Fiction Books
V57 Organize Company Parties
V58 Do Home Improvement Jobs
V59 Plead for the Socially Disadvantaged
V60 Buy a Present for a Colleague
V61 To Talk with Colleagues about Family Matters
V62 Make Jam
V63 Frequently Ask Colleagues Questions
V64 Decorate the Office with Flowers
V65 Pick up the Dinner Bill
V66 Shop for the Family
V67 Have Problem using Technical Devices
V68 Care for Family Besides a Job
V69 Watch Action Movies
V70 Cook
V71 Help your Partner Put on His or Her Coat
V72 Wash Windows
V73 Do the Ironing
V74 Do the Laundry
V75 Put on Make-up
V76 Femininity Scale
V77 Masculinity Scale
V78 Femininity Scale
V79 Masculinity Scale
V80 Pooled Scale

MMINUS1 - MPLUS see the original Athenstaedt paper
FBEHAV a numeric vector
MBEHAV a numeric vector
Femininity a numeric vector
Masculinity a numeric vector
MF a numeric vector
Details

Ursala Athenstaedt (2003) reported several analyses of items and scales measuring Gender Role Self-Concept. Eagly and Revelle (2022) have used these data in an analysis of the power of aggregation. Here are the original items as well as the three scales Eagly and Revelle (2022). The accompanying Athenstaedt.dictionary may be used to see the items.

See the Geras data set for a related example.

Source

Ursala Athenstaedt, personal communication, 2022, provided a SPSS sav file with the original data from which the complete cases in this set were selected.

bfi

25 Personality items representing 5 factors

Description

25 personality self report items taken from the International Personality Item Pool (ipip.ori.org) were included as part of the Synthetic Aperture Personality Assessment (SAPA) web based personality assessment project. The data from 2800 subjects are included here as a demonstration set for scale construction, factor analysis, and Item Response Theory analysis. Three additional demographic variables (sex, education, and age) are also included.
Usage

data(bfi)
data(bfi.dictionary)

Format

A data frame with 2800 observations on the following 28 variables. (The q numbers are the SAPA item numbers).

A1 Am indifferent to the feelings of others. (q_146)
A2 Inquire about others’ well-being. (q_1162)
A3 Know how to comfort others. (q_1206)
A4 Love children. (q_1364)
A5 Make people feel at ease. (q_1419)
C1 Am exacting in my work. (q_124)
C2 Continue until everything is perfect. (q_530)
C3 Do things according to a plan. (q_619)
C4 Do things in a half-way manner. (q_626)
C5 Waste my time. (q_1949)
E1 Don’t talk a lot. (q_712)
E2 Find it difficult to approach others. (q_901)
E3 Know how to captivate people. (q_1205)
E4 Make friends easily. (q_1410)
E5 Take charge. (q_1768)
N1 Get angry easily. (q_952)
N2 Get irritated easily. (q_974)
N3 Have frequent mood swings. (q_1099)
N4 Often feel blue. (q_1479)
N5 Panic easily. (q_1505)
O1 Am full of ideas. (q_128)
O2 Avoid difficult reading material. (q_316)
O3 Carry the conversation to a higher level. (q_492)
O4 Spend time reflecting on things. (q_1738)
O5 Will not probe deeply into a subject. (q_1964)
gender Males = 1, Females = 2
education 1 = HS, 2 = finished HS, 3 = some college, 4 = college graduate 5 = graduate degree
age age in years
The first 25 items are organized by five putative factors: Agreeableness, Conscientiousness, Extraversion, Neuroticism, and Openness. The scoring key is created using `make.keys`, the scores are found using `score.items`.

These five factors are a useful example of using `irt.fa` to do Item Response Theory based latent factor analysis of the polychoric correlation matrix. The endorsement plots for each item, as well as the item information functions reveal that the items differ in their quality.

The item data were collected using a 6 point response scale: 1 Very Inaccurate 2 Moderately Inaccurate 3 Slightly Inaccurate 4 Slightly Accurate 5 Moderately Accurate 6 Very Accurate as part of the Synthetic Aperture Personality Assessment (SAPA https://www.sapa-project.org/) project. To see an example of the data collection technique, visit https://www.SAPA-project.org/ or the International Cognitive Ability Resource at https://icar-project.org. The items given were sampled from the International Personality Item Pool of Lewis Goldberg using the sampling technique of SAPA. This is a sample data set taken from the much larger SAPA data bank.

The items are from the ipip (Goldberg, 1999). The data are from the SAPA project (Revelle, Wilt and Rosenthal, 2010), collected Spring, 2010 (https://www.sapa-project.org/).

`bi.bars` to show the data by age and gender, `irt.fa` for item factor analysis applying the irt model.
Examples

data(bfi)
psych::describe(bfi)
# create the bfi.keys (actually already saved in the data file)
bfi.keys <-
  list(agree=c("-A1","A2","A3","A4","A5"), conscientious=c("C1","C2","C3","-C4","-C5"),
       extraversion=c("-E1","-E2","E3","E4","E5"), neuroticism=c("N1","N2","N3","N4","N5"),
       openness = c("O1","-O2","O3","O4","-O5"))

scores <- psych::scoreItems(bfi.keys,bfi,min=1,max=6) #specify the minimum and maximum values
scores
#show the use of the keys.lookup with a dictionary
psych::keys.lookup(bfi.keys,bfi.dictionary[,1:4])

BFI.adjectives.dictionary

Dictionary for the 100 Big Five Adjectives

Description

Lew Goldberg organized 100 adjectives to measure 5 factors of personality (The Big5). 500 hundred participants were given these adjectives along with other personality measures. This dictionary allows for easy item labeling of the results. ~

Usage

data("BFI.adjectives.dictionary")

Format

A data frame with 100 observations on the following 2 variables.

numer  a character vector of the item label
Item   a character vector of the actual adjectives

Details

Keying information for the 100 adjectives:

Source

Data collected at the Personality, Motivation, and Cognition Laboratory, Northwestern University.

References

See Also

`big5.100.adjectives` for examples of the data. `msqR` for 3896 participants with scores on five scales of the EPI. `affect` for an example of the use of some of these adjectives in a mood manipulation study.

Examples

```r
data(BFI.adjectives.dictionary) #this includes the bfi.adjectives.keys
bfi.adjectives.keys <- list(
  Agreeableness = psych::cs(V2,-V11, V14, V15, -V19,-V21, V29,-V31, V32,V48, V55,-V61,-V63,
                         V69, V70, -V78,-V79, -V90,-V94,V99),
  Conscientiousness = psych::cs(V9,-V10,V13, -V20,V22, -V30, -V37, -V38, -V39,
                         V50, -V51, V53, V56, V57, -V67,V68, V70, V73, -V82, -V95),
  Extraversion = psych::cs(V1,V5,-V6,V7, V17, V24, V26, -V40,-V45, -V58,-V60,-V65,
                         V71, -V74,-V77,V92, -V96, V97, V98, -V100),
  Neuroticism= psych::cs(V3, V23, V25, V27,V28, V33,-V36, V42, V46,V47, V49, V52,-V59,V62,
                         V72, V75, -V81,-V83,-V84, -V85),
  Openness = psych::cs(V4,V8,V12, V16, V18,V34, -V35,V41, V43, V44, V54,-V64,-V66, -V80,
                         -V86, -V87, -V88, -V89, -V91, -V93)
)
psych::lookupFromKeys(bfi.adjectives.keys,bfi.adjectives.dictionary,20)
```

---

`big5.100.adjectives` 100 adjectives describing the "big 5" for 502 subjects

Description

Lew Goldberg organized 100 adjectives to measure 5 factors of personality (The Big5). 500 hundred participants were given these adjectives along with other personality measures in the Personality, Motivation and Cognition (PMC) lab. This data set is for demonstrations of factor and cluster analysis.

Usage

```r
data("big5.100.adjectives")
```

Format

A data frame with 554 observations on the following 102 variables.

- `study` a character vector
- `id` a numeric vector
- `V1` numeric vector (see big5.adjectives.dictionary)
- `V100` A numeric vector. (see big5.adjectives.dictionary)

`bfi.adjectives.keys` a key list
Details

Procedure. The data were collected over nine years in the Personality, Motivation and Cognition laboratory at Northwestern, as part of a series of studies examining the effects of personality and situational factors on motivational state and subsequent cognitive performance. In each of 38 studies, prior to any manipulation of motivational state, participants signed a consent form and in some studies, consumed 0 or 4mg/kg of caffeine. In caffeine studies, they waited 30 minutes and then filled out the MSQ as well as other personality trait measures (e.g. the Big 5 adjectives).

Source

Data collected at the Personality, Motivation, and Cognition Laboratory, Northwestern University.

blant A 29 x 29 matrix that produces weird factor analytic results

Description

Normally, min.res factor analysis and maximum likelihood produce very similar results. This data set (from Alexandra Blant) does not. Warnings are given for the min.res solution, the pa solution, but not the old.min nor the mle solution. Included as a test case for the factor analysis function.

Usage

data("blant")

Format

The format is: num [1:29, 1:29] 1 0.77 0.813 0.68 0.717 ... - attr(*, "dimnames")=List of 2 ..$ : NULL ..$ : chr [1:29] "V1" "V2" "V3" "V4" ...
Details

This data matrix was sent by Alexandra Blant as an example of a problem with the minres solution in the \texttt{fa} function. The default solution, using \texttt{fm="minres"} issues a warning that the solution has improper factor score weights. This is not the case for the \texttt{fm="old.min"} and \texttt{fm="mle"} options, but is for \texttt{fm="pa"}, \texttt{fm="ols"}.

The residuals are indeed smaller for \texttt{fm="minres"} than for \texttt{fm="old.min"} or \texttt{fm="mle"}.

"old.min" attempts to find the minimum residual but uses the gradient for mle. This was the approach until version 1.7.5 but was changed (see the help page for \texttt{fa}) following extensive communication with Hao Wu.

The problem with this matrix is probably that it is almost singular, with some smcs approaching 1 and the smallest three eigenvalues of .006, .004 and .001.

This problem matrix was provided by Alexandra Blant.

Source

Alexandra Blant, personal communication

Examples

data(blant)
#compare
f5 <- psych::fa(blant,5,rotate="none") #the default minres
f5.old <- psych::fa(blant,5, fm="old.min",rotate="none") #old version of minres
f5.mle <- psych::fa(blant,5,fm="mle",rotate = "none") #maximum likelihood
#compare solutions
psych::factor.congruence(list(f5,f5.old,f5.mle))
#compare sums of squared residuals
sum(residuals(f5,diag=FALSE)^2,na.rm=TRUE) # 1.355489
sum(residuals(f5.old,diag=FALSE)^2,na.rm=TRUE) # 1.539757
sum(residuals(f5.mle,diag=FALSE)^2,na.rm=TRUE) # 2.402892

#but, when we divide the squared residuals by the original (squared) correlations, we find
#a different ordering of fit
f5$fit    # 0.9748177
f5.old$fit # 0.9752774
f5.mle$fit # 0.9603324

Description

35 items for 150 subjects from Bond’s Logical Operations Test. A good example of Item Response Theory analysis using the Rasch model. One parameter (Rasch) analysis and two parameter IRT analyses produce somewhat different results.
Usage

data(blot)

Format

A data frame with 150 observations on 35 variables. The BLOT was developed as a paper and pencil test for children to measure Logical Thinking as discussed by Piaget and Inhelder.

Details

Bond and Fox apply Rasch modeling to a variety of data sets. This one, Bond’s Logical Operations Test, is used as an example of Rasch modeling for dichotomous items. In their text (p 56), Bond and Fox report the results using WINSTEPS. Those results are consistent (up to a scaling parameter) with those found by the rasch function in the ltm package. The WINSTEPS seem to produce difficulty estimates with a mean item difficulty of 0, whereas rasch from ltm has a mean difficulty of -1.52. In addition, rasch seems to reverse the signs of the difficulty estimates when reporting the coefficients and is effectively reporting “easiness”.

However, when using a two parameter model, one of the items (V12) behaves very differently.

This data set is useful when comparing 1PL, 2PL and 2PN IRT models.

Source

The data are taken (with kind permission from Trevor Bond) from the webpage https://www.winsteps.com/BF3/bondfox3.htm and read using read.fwf.

References

See also the irt.fa and associated plot functions.

Examples

data(blot)

# ltm is not required by psychTools, but if available, may be run to show a Rasch model

# do the same thing with functions in psych
blot.fa <- psych::irt.fa(blot) # a 2PN model
plot(blot.fa)
Cyril Burt reported an early factor analysis with a circumplex structure of 11 emotional variables in 1915. 8 of these were subsequently used by Harman in his text on factor analysis. Unfortunately, it seems as if Burt made a mistake for the matrix is not positive definite. With one change from .87 to .81 the matrix is positive definite.

```
Usage
data(burt)
```

A correlation matrix based upon 172 "normal school age children aged 9-12".

- **Sociality**  Sociality
- **Sorrow**  Sorrow
- **Tenderness**  Tenderness
- **Joy**  Joy
- **Wonder**  Wonder
- **Elation**  Elation
- **Disgust**  Disgust
- **Anger**  Anger
- **Sex**  Sex
- **Fear**  Fear
- **Subjection**  Subjection

The Burt data set is interesting for several reasons. It seems to be an early example of the organization of emotions into an affective circumplex, a subset of it has been used for factor analysis examples (see Harman.Burt, and it is an example of how typos affect data. The original data matrix has one negative eigenvalue. With the replacement of the correlation between Sorrow and Tenderness from .87 to .81, the matrix is positive definite.

Alternatively, using cor.smooth, the matrix can be made positive definite as well, although cor.smooth makes more (but smaller) changes.

(retrieved from the web at https://www.biodiversitylibrary.org/item/95822#790) Following a suggestion by Jan DeLeeuw.

round(burt.new - bs,3)

---

cities

Distances between 11 US cities

Description

Airline distances between 11 US cities may be used as an example for multidimensional scaling or cluster analysis.

Usage

data(cities)

Format

A data frame with 11 observations on the following 11 variables.

ATL  Atlanta, Georgia
BOS  Boston, Massachusetts
ORD  Chicago, Illinois
DCA  Washington, District of Columbia
DEN  Denver, Colorado
LAX  Los Angeles, California
MIA  Miami, Florida
JFK  New York, New York
SEA  Seattle, Washington
SFO  San Francisco, California
MSY  New Orleans, Lousianna
Details

An 11 x11 matrix of distances between major US airports. This is a useful demonstration of multiple dimensional scaling.

city.location is a dataframe of longitude and latitude for those cities.

Note that the 2 dimensional MDS solution does not perfectly capture the data from these city distances. Boston, New York and Washington, D.C. are located slightly too far west, and Seattle and LA are slightly too far south.

Source

https://www.timeanddate.com/worldclock/distance.html

Examples

data(cities)
city.location[,1] <- -city.location[,1] # included in the cities data set
plot(city.location, xlab="Dimension 1", ylab="Dimension 2",
     main ="Multidimensional scaling of US cities")
# do the mds
city.loc <- cmdscale(cities, k=2) # ask for a 2 dimensional solution  round(city.loc,0)
city.loc <- -city.loc  # flip the axes
city.loc <- psych::rescale(city.loc,apply(city.location,2,mean),apply(city.location,2,sd))
points(city.loc,type="n") # add the date point to the map
text(city.loc,labels=names(cities))

cubits

Galton’s example of the relationship between height and ‘cubit’ or forearm length

Description

Francis Galton introduced the ‘co-relation’ in 1888 with a paper discussing how to measure the relationship between two variables. His primary example was the relationship between height and forearm length. The data table (cubits) is taken from Galton (1888). Unfortunately, there seem to be some errors in the original data table in that the marginal totals do not match the table.

The data frame, heights, is converted from this table.
Usage

data(cubits)

Format

A data frame with 9 observations on the following 8 variables.

16.5 Cubit length < 16.5
16.75 16.5 <= Cubit length < 17.0
17.25 17.0 <= Cubit length < 17.5
17.75 17.5 <= Cubit length < 18.0
18.25 18.0 <= Cubit length < 18.5
18.75 18.5 <= Cubit length < 19.0
19.25 19.0 <= Cubit length < 19.5
19.75 19.5 <= Cubit length

Details

Sir Francis Galton (1888) published the first demonstration of the correlation coefficient. The regression (or reversion to mediocrity) of the height to the length of the left forearm (a cubit) was found to .8. There seem to be some errors in the table as published in that the row sums do not agree with the actual row sums. These data are used to create a matrix using `table2matrix` for demonstrations of analysis and displays of the data.

Source

Galton (1888)

psych::ellipses(jitter(heights$height,3),jitter(heights$cubit,3),pch=".",main="Galton's co-relation data set",xlab="height",ylab="Forearm (cubit)") #add in some noise to see the points
psych::pairs.panels(heights,jiggle=TRUE,main="Galton's cubits data set")
A data set from Cushny and Peebles (1905) on the effect of three drugs on hours of sleep, used by Student (1908)

Description

The classic data set used by Gossett (publishing as Student) for the introduction of the t-test. The design was a within subjects study with hours of sleep in a control condition compared to those in 3 drug conditions. Drug1 was 06mg of L Hscyamine, Drug 2L and Drug2R were said to be .6 mg of Left and Right isomers of Hyoscine. As discussed by Zabell (2008) these were not optical isomers. The delta1, delta2L and delta2R are changes from the baseline control.

Usage

```r
data(cushny)
```

Format

A data frame with 10 observations on the following 7 variables.

- `Control`: Hours of sleep in a control condition
- `drug1`: Hours of sleep in Drug condition 1
- `drug2L`: Hours of sleep in Drug condition 2
- `drug2R`: Hours of sleep in Drug condition 3 (an isomer of the drug in condition 2)
- `delta1`: Change from control, drug 1
- `delta2L`: Change from control, drug 2L
- `delta2R`: Change from control, drug 2R

Details

The original analysis by Student is used as an example for the t-test function, both as a paired t-test and a two group t-test. The data are also useful for a repeated measures analysis of variance.

```

---

**df2latex**

*Convert a data frame, correlation matrix, or factor analysis output to a LaTeX table*

**Description**

A set of handy helper functions to convert data frames or matrices to LaTeX tables. Although Sweave is the preferred means of converting R output to LaTeX, it is sometimes useful to go directly from a data.frame or matrix to a LaTeX table. cor2latex will find the correlations and then create a lower (or upper) triangular matrix for latex output. fa2latex will create the latex commands for showing the loadings and factor intercorrelations. As the default option, tables are prepared in an approximation of APA format.

**Usage**

```r
df2latex(x, digits=2, rowlabels=TRUE, apa=TRUE, short.names=TRUE, font.size="scriptsize", big.mark=NULL, drop.na=TRUE, heading="A table from the psych package in R", caption="df2latex", label="default", char=FALSE, stars=FALSE, silent=FALSE, file=NULL, append=FALSE, cut=0, big=0, abbrev=NULL)
cor2latex(x, use = "pairwise", method="pearson", adjust="holm", stars=FALSE, digits=2, rowlabels=TRUE, lower=TRUE, apa=TRUE, short.names=TRUE, font.size="scriptsize", heading="A correlation table from the psych package in R.", caption="cor2latex", label="default", silent=FALSE, file=NULL, append=FALSE, cut=0, big=0)
fa2latex(f, digits=2, rowlabels=TRUE, apa=TRUE, short.names=FALSE, cumvar=FALSE, cut=0, big=.3, alpha=.05, font.size = "scriptsize", long=FALSE, heading="A factor analysis table from the psych package in R.", caption="fa2latex", label="default", silent=FALSE, file=NULL, append=FALSE)
omega2latex(f, digits=2, rowlabels=TRUE, apa=TRUE, short.names=FALSE, cumvar=FALSE, cut=.2, big=.3, font.size = "scriptsize", heading="An omega analysis table from the psych package in R.", caption="omega2latex", label="default", silent=FALSE, file=NULL, append=FALSE)
irt2latex(f, digits=2, rowlabels=TRUE, apa=TRUE, short.names=FALSE, font.size = "scriptsize", heading="An IRT factor analysis table from R", caption="fa2latex", label="default", silent=FALSE, file=NULL, append=FALSE)
```
Arguments

x  A data frame or matrix to convert to LaTeX. If non-square, then correlations will be found prior to printing in cor2latex

digits  Round the output to digits of accuracy. NULL for formatting character data

abbrev  How many characters should be used in column names – defaults to digits + 3

rowlabels  If TRUE, use the row names from the matrix or data.frame

short.names  Name the columns with abbreviated rownames to save space

apa  If TRUE formats table in APA style

cumvar  For factor analyses, should we show the cumulative variance accounted for?

font.size  e.g., "scriptsize", "tiny" or any other acceptable LaTeX font size.

heading  The label appearing at the top of the table

caption  The table caption

lower  in cor2latex, just show the lower triangular matrix

f  The object returned from a factor analysis using fa or irt.fa.

label  The label for the table

big.mark  Comma separate numbers large numbers (big.mark=",")

drop.na  Do not print NA values

method  When finding correlations, which method should be used (pearson)

use  use="pairwise" is the default when finding correlations in cor2latex

adjust  If showing probabilities, which adjustment should be used (holm)

stars  Should probability ‘magic astericks’ be displayed in cor2latex (FALSE)

char  char=TRUE allows printing tables with character information, but does not allow for putting in commas into numbers

cut  In omega2latex, df2latex and fa2latex, do not print abs(values) < cut

big  In fa2latex and df2latex boldface those abs(values) > big

alpha  If fa has returned confidence intervals, then what values of loadings should be boldfaced?

icc  Either the output of an ICC, or the data to be analyzed.

ci  Should confidence intervals of the ICC be displayed

silent  If TRUE, do not print any output, just return silently – useful if using Sweave

file  If specified, write the output to this file

append  If file is specified, then should we append (append=TRUE) or just write to the file

long  if TRUE, then do long tables. (requires the longtables package in latex)

Value

A LaTeX table. Note that if showing "stars" for correlations, then one needs to use the siunitx package in LaTeX. The entire LaTeX output is also returned invisibly. If using Sweave to create tables, then the silent option should be set to TRUE and the returned object saved as a file. See the last example.

Finally, some users have asked for the ability to convert these output tables into HTML. This may be done using the tth package.
dfOrder

Sort (order) a dataframe or matrix by multiple columns

Author(s)

William Revelle with suggestions from Jason French and David Condon and Davide Morselli

See Also

The many LaTeX conversion routines in Hmisc.
To convert these LaTeX objects to HTML, you should install the tth package.
Consider the last example

Examples

df2latex(psych::Thurstone,rowlabels=FALSE,apa=FALSE,short.names=FALSE, caption="Thurstone Correlation matrix")
df2latex(psych::Thurstone,heading="Thurstone Correlation matrix in APA style")
df2latex(psych::describe(psych::sat.act)[2:10],short.names=FALSE)
cor2latex(psych::Thurstone)
cor2latex(psych::sat.act,short.names=FALSE)
fa2latex(psych::fa(psych::Thurstone,3),heading="Factor analysis from R in quasi APA style")

#To convert these latex tables to HTML

#f3.lat <- fa2latex(psych::fa(psych::Thurstone,3),
#   heading="Factor analysis from R in quasi APA style")
#library(tth)
#f3.ht <- tth(f3.lat)
#print(as.data.frame(f3.ht),row.names=FALSE)

###

#If using Sweave to create a LateX table as a separate file then set silent=TRUE
#e.g.,
#LaTeX preamble
#. . . .
##<<print=FALSE,echo=FALSE>>=
#f3 <- fa(Thurstone,3)
#fa2latex(f3,silent=TRUE,file='testoutput.tex')
##
#
#\input{testoutput.tex}
dfOrder

Description

Although order will order a vector, and it is possible to order several columns of a data.frame by specifying each column individually in the call to order, dfOrder will order a dataframe or matrix by as many columns as desired. The default is to sort by columns in lexicographic order. If the object is a correlation matrix, then the selected columns are sorted by the (abs) max value across the columns (similar to fa.lookup in psych). If object is a correlation matrix, rows and columns are sorted.

Usage

dfOrder(object, columns, absolute=FALSE, ascending=TRUE)

Arguments

object
The data.frame or matrix to be sorted

columns
Column numbers or names to use for sorting. If positive, then they will be sorted in increasing order. If negative, then in decreasing order

absolute
If TRUE, then sort the absolute values

ascending
By default, order from smallest to largest.

Details

This is just a simple helper function to reorder data.frames and correlation matrices. Originally developed to organize IRT output from the ltm package. It is a basic add on to the order function. (Completely rewritten for version 1.8.1. and then again for 2.2.1 to allow sorting correlation matrices by numeric values.)

Value

The original data frame is now in sorted order. If the input is a correlation matrix, the output is sorted by rows and columns.

Author(s)

William Revelle

See Also

Other useful file manipulation functions include read.file to read in data from a file or read.clipboard from the clipboard, fileScan, filesList, filesInfo, and fileCreate

dfOrder code is used in the test.irt function to combine ltm and sim.irt output.

Examples

#create a data frame and then sort it in lexicographic order
set.seed(42)
x <- matrix(sample(1:4,64,replace=TRUE),ncol=4)
dfOrder(x) # sort by all columns
dfOrder(x,c(1,4))  # sort by the first and 4th column
x.df <- data.frame(x)
dfOrder(x.df,c(1,-2))  # sort by the first in increasing order,  
# the second in decreasing order

# now show sorting correlation matrices
r <- cor(sat.act,use="pairwise")
r.ord <- dfOrder(r,columns=c("education","ACT"),ascending=FALSE)  
psych::corPlot(r.ord)

eminence

Eminence of 69 American Psychologists

Description

Marco Del Giudice criticized an earlier study by Simonton for using partial regression weights to  
estimate the importance of various predictors of rated eminence. This is a nice example of the  
(mis)interpretation of beta weights of highly correlated predictors.

Usage

data("eminence")

Format

A data frame with 69 observations on the following 9 variables.

- name  a character vector
- reputation  Log of rated reputation
- birth.year  Year of birth
- first.year  Year of first cited publication
- last.year  Year of last cited publication
- works  Log of number of publications
- citations  Log of number of citations
- composite  A composite index of publications
- h  The 'h' index of citations

Details

Simonton (1997, 2014) discusses various estimates of eminence among 69 psychologists born be- 
tween 1842 and 1912 and reports that the regression weights are small and interprets this as mean- 
ing number of publications and citations are not very important. Del Giudice (2020) points out  
that citations and the number of publications are highly collinear and thus while their independent  
contributions are small, their joint effect is quite large (R= .69 ). These data are given here as an  
example of multiple correlation and partial correlation.
**Source**

Del Giudice (2020) links to a web page with the data.

**References**

**Examples**

```r
data(eminence)
psych::lowerCor(eminence)
cs <- psych::cs
psych::partial.r(eminence, x = cs(reputation, works, citations), y = cs(birth.year))
psych::setCor(reputation ~ works + h + first.year, data = eminence)
```

**Description**

The EPI is and has been a very frequently administered personality test with 57 measuring two broad dimensions, Extraversion-Introversion and Stability-Neuroticism, with an additional Lie scale. Developed by Eysenck and Eysenck, 1964. Eventually replaced with the EPQ which measures three broad dimensions. This data set represents 3570 observations collected in the early 1990s at the Personality, Motivation and Cognition lab at Northwestern. An additional data set (epiR) has test and retest information for 474 participants. The data are included here as demonstration of scale construction and test-retest reliability.

**Usage**

```r
data(epi)
data(epi.dictionary)
data(epiR)
```

**Format**

A data frame with 3570 observations on the following 57 variables.

- **id** The identification number within the study
- **time** First (group testing) or 2nd time (before a lab experiment) for the epiR data set.
- **study** Four lab based studies and their pretest data

The original data were collected in a group testing framework for screening participants for subsequent studies. The participants were enrolled in an introductory psychology class between Fall, 1991 and Spring, 1995.

The actual items may be found in the epi.dictionary.

The structure of the E scale has been shown by Rocklin and Revelle (1981) to have two subcomponents, Impulsivity and Sociability. These were subsequently used by Revelle, Humphreys, Simon, and Gilliland (1980) to examine the relationship between personality, caffeine induced arousal, and cognitive performance.

The epiR data include the original group testing data and matched data for 474 participants collected several weeks later. This is useful for showing that internal consistency estimates (e.g. alpha or omega) can be low even though the test is stable across time. For more demonstrations of the distinction between immediate internal consistency and delayed test-retest reliability see the msqR and sai data sets and testRetest.

epi.bfi  
13 personality scales from the Eysenck Personality Inventory and Big 5 inventory

Description

A small data set of 5 scales from the Eysenck Personality Inventory, 5 from a Big 5 inventory, a Beck Depression Inventory, and State and Trait Anxiety measures. Used for demonstrations of correlations, regressions, graphic displays.

Usage

data(epi.bfi)
Format

A data frame with 231 observations on the following 13 variables.

- `epiE` EPI Extraversion
- `epiS` EPI Sociability (a subset of Extraversion items)
- `epiImp` EPI Impulsivity (a subset of Extraversion items)
- `epilie` EPI Lie scale
- `epiNeur` EPI neuroticism
- `bfagree` Big 5 inventory (from the IPIP) measure of Agreeableness
- `bfcon` Big 5 Conscientiousness
- `bfext` Big 5 Extraversion
- `bfneur` Big 5 Neuroticism
- `bfopen` Big 5 Openness
- `bdi` Beck Depression scale
- `traitanx` Trait Anxiety
- `stateanx` State Anxiety

Details

Self report personality scales tend to measure the “Giant 2” of Extraversion and Neuroticism or the “Big 5” of Extraversion, Neuroticism, Agreeableness, Conscientiousness, and Openness. Here is a small data set from Northwestern University undergraduates with scores on the Eysenck Personality Inventory (EPI) and a Big 5 inventory taken from the International Personality Item Pool.

gender gender (M=1 F=2)

Details

These 50 items (+ gender) may be formed into scales using the GERAS.keys. The first 10 items are Male Personality, the next 10 are Female Personality, then 7 and 7 M and F Cognition, then 8 and 8 M and F Activity items. The Pers, Cog and Act scales are formed from the M-F scales for the three domains. M and F are the composites of the Male and then the Female scales. MF.all is the composite of the M - F scales. See the GERAS.keys object for scoring directions.

"M.pers" "F.pers" "M.cog" "F.cog" "M.act" "F.act" "Pers" "Cog" "Act" "M" "F" "MF.all" "gender"

See the Athenstaedt data set for a related data set.

---

**Description**

Francis Galton introduced the 'co-relation' in 1888 with a paper discussing how to measure the relationship between two variables. His primary example was the relationship between height and forearm length. The data table (`cubits`) is taken from Galton (1888). Unfortunately, there seem to be some errors in the original data table in that the marginal totals do not match the table.

The data frame, `heights`, is converted from this table using `table2df`.

**Usage**

```r
data(heights)
```

**Format**

A data frame with 348 observations on the following 2 variables.

- `height` Height in inches
- `cubit` Forearm length in inches

**Details**

Sir Francis Galton (1888) published the first demonstration of the correlation coefficient. The regression (or reversion to mediocrity) of the height to the length of the left forearm (a cubit) was found to .8. The original table `cubits` is taken from Galton (1888). There seem to be some errors in the table as published in that the row sums do not agree with the actual row sums. These data are used to create a matrix using `table2matrix` for demonstrations of analysis and displays of the data.

holzinger.swineford  
*The raw and transformed data from Holzinger and Swineford, 1939*

Description

A classic data set in psychometrics is that from Holzinger and Swineford (1939). A 4 and 5 factor solution to 24 of these variables problem is presented by Harman (1976), and 9 of these are used by the lavaan package. The two data sets were supplied by Keith Widaman.

Usage

```r
data(holzinger.swineford)
data(holzinger.raw)
data(holzinger.dictionary)
```

Format

A data frame with 301 observations on the following 33 variables. Longer descriptions taken from Thompson, (1998).

- **case**: a numeric vector
- **school**: School Pasteur or Grant-White
- **grade**: Grade (7 or 8)
- **female**: male = 1, female = 2
- **ageyr**: age in years
- **mo**: months over year
- **agemo**: Age in months
- **t01_visperc**: Visual perception test from Spearman VPT Part I
- **t02_cubes**: Cubes, Simplification of Brighams Spatial Relations Test
- **t03_frmbord**: Paper formboard-Shapes that can be combined to form a target
- **t04_lozenges**: Lozenges from Thorndike-Shapes flipped over then identify target
- **t05_geninfo**: General Information Verbal Test
- **t06_paracomp**: Paragraph Comprehension Test
- **t07_sentcomp**: Sentence Completion Test
- **t08_wordclas**: Word clasification-Which word not belong in set
- **t09_wordmean**: Word Meaning Test
t10_addition Speeded addition test

Details

The following commentary was provided by Keith Widaman:

“The Holzinger and Swineford (1939) data have been used as a model data set by many investigators. For example, Harman (1976) used the “24 Psychological Variables” example prominently in his authoritative text on multiple factor analysis, and the data presented under this rubric consisted of 24 of the variables from the Grant-White school (N = 145). Meredith (1964a, 1964b) used several variables from the Holzinger and Swineford study in his work on factorial invariance under selection. Joreskog (1971) based his work on multiple-group confirmatory factor analysis using the Holzinger and Swineford data, subsetting the data into four groups.

Rosseel, who developed the ‘lavaan’ package for R, included 9 of the manifest variables from Holzinger and Swineford (1939) as a “resident” data set when one downloads the ‘lavaan’ package. Several background variables are included in this “resident” data set in addition to 9 of the psychological tests (which are named x1 – x9 in the data set). When analyzing these data, I found the distributions of the variables (means, SDs) did not match the sample statistics from the original article. For example, in the “resident” data set in ‘lavaan’, scores on all manifest variables ranged between 0 and 10, sample means varied between 3 and 6, and sample SDs varied between 1.0 and 1.5. In the original data set, scores ranges were rather different across tests, with some variables having scores that ranged between 0 and 20, but other manifest variables having scores ranging from 50 to over 300 – with obvious attendant differences in sample means and SDs.

After a bit of snooping (i.e., data analysis), I discovered that the 9 variables in the “resident” data set in ‘lavaan’ had been rescored through ratio transformations. The ratio transformations involved dividing the raw score for each person on a given test by a particular constant for that test that transformed scores on the test to have the desired range.
I decided to perform transformations of all 26 variables so that two data sets could be available to interested researchers:

holzinger.raw are the raws scores on all variables from Holzinger & Swineford (1939)
holzinger.swineford are rescaled scores on all variables from Holzinger & Swineford.
holzinger.dictionary is a list of the variable names in short and long form.

... Widaman continues:

“As several persons have noted, Harman (1976) used data only from the Grant-White school (N = 145) for his 24 Psychological Variables data set. In doing so, Harman replaced t03_frmbord and t04_lozenges with t25_frmbord2 and t26_flags, because the latter two tests were experimental tests that were designed to be more appropriate for this age level. This substitution is fine, as long as one analyzes data from only the Grant-White school. If one wishes to perform multiple-group analyses and uses school as a grouping variable (as Meredith, 1964a, 1964b, and Joreskog, 1971, did), then tests 25 and 26 should not be used.”

“As have others, Gorsuch (1983) mentioned that analyses based on the raw data reported by Holzinger and Swineford (1939) will not produce statistics (means, SDs, correlations) that match precisely the values reported by Holzinger and Swineford or Harman (1976). Following Gorsuch, I have assumed that the raw data are correct. Applying factor analytic techniques to the raw data from the Grant-White school and to the summary data reported by Harman (1976) will produce slightly different results, but results that differ in only minor, unimportant details.”

These data are interesting not just for the historical completeness of having the original data, but also as an example of suppressor variables. Age and grade are positively correlated, and scores are higher in the 8th grade than in the 7th grade. But age (particularly in months) is negatively correlated with many of the cognitive tasks, and when grade and age are both entered into regression, this negative correlation is enhanced. That is, although increasing grade increases cognitive performance, younger children in both grades do better than the older children.

**Note**

As discussed by Widaman, the descriptive values reported in Harman (1967) (p 124) do not quite match the descriptive statistics in holzinger.raw. Further note that the correlation matrix and factor loadings are trivially different from the Harman.24 factor loadings in the GPA rotation package.

The purpose behind presenting both the raw and transformed data is to show that the fit statistics from factor analysis are identical for these two data sets.

The variables v1 ... v9 in the lavaan package correspond to tests 1, 2, 4, 6, 7, 9, 10, 12 and 13.

Description

US census data on family income from 2008

Usage

data(income)

Format

A data frame with 44 observations on the following 4 variables.

- value: lower boundary of the income group
- count: Number of families within that income group
- mean: Mean of the category
- prop: proportion of families

Details

The distribution of income is a nice example of a log normal distribution. It is also an interesting example of the power of graphics. It is quite clear when graphing the data that income statistics are bunched to the nearest 5K. That is, there is a clear sawtooth pattern in the data.

The all.income set is interpolates intervening values for 100-150K, 150-200K and 200-250K

matrix.55 A matrix reasoning task
rotate.3 Spatial Rotation of type 1.2
rotate.4 Spatial Rotation of type 1.2
rotate.6 Spatial Rotation of type 1.1
rotate.8 Spatial Rotation of type 2.3
Details

16 items were sampled from 80 items given as part of the SAPA (https://www.sapa-project.org/) project (Revelle, Wilt and Rosenthal, 2009; Condon and Revelle, 2014) to develop online measures of ability. These 16 items reflect four lower order factors (verbal reasoning, letter series, matrix reasoning, and spatial rotations. These lower level factors all share a higher level factor (’g’). Similar data are available from the International Cognitive Ability Resource at https://www.icar-project.org/.

This data set and the associated data set (ability based upon scoring these multiple choice items and converting them to correct/incorrect may be used to demonstrate item response functions, tetrachoric correlations, or irt.fa as well as omega estimates of of reliability and hierarchical structure.

In addition, the data set is a good example of doing item analysis to examine the empirical response probabilities of each item alternative as a function of the underlying latent trait. When doing this, it appears that two of the matrix reasoning problems do not have monotonically increasing trace lines for the probability correct. At moderately high ability (theta = 1) there is a decrease in the probability correct from theta = 0 and theta = 2.

Source

The example data set is taken from the Synthetic Aperture Personality Assessment personality and ability test at https://www.sapa-project.org/. The data were collected with David Condon from 8/08/12 to 8/31/12.

msq  
75 mood items from the Motivational State Questionnaire for 3896 participants

Description

Emotions may be described either as discrete emotions or in dimensional terms. The Motivational State Questionnaire (MSQ) was developed to study emotions in laboratory and field settings. The data can be well described in terms of a two dimensional solution of energy vs tiredness and tension versus calmness. Additional items include what time of day the data were collected and a few personality questionnaire scores.

Usage

data(msq)

Neuroticism Neuroticism from the Eysenck Personality Inventory
Lie Lie from the EPI
Sociability The sociability subset of the Extraversion Scale
Impulsivity The impulsivity subset of the Extraversions Scale
The Motivational States Questionnaire (MSQ) is composed of 72 items, which represent the full affective space (Revelle & Anderson, 1998). The MSQ consists of 20 items taken from the Activation-Deactivation Adjective Check List (Thayer, 1986), 18 from the Positive and Negative Affect Schedule (PANAS, Watson, Clark, & Tellegen, 1988) along with the items used by Larsen and Diener (1992). The response format was a four-point scale that corresponds to Russell and Carroll’s (1999) “ambiguous–likely-unipolar format” and that asks the respondents to indicate their current standing (“at this moment”) with the following rating scale:

0 ———— 1 ———— 2 ———— 3
Not at all A little Moderately Very much

The original version of the MSQ included 70 items. Intermediate analyses (done with 1840 subjects) demonstrated a concentration of items in some sections of the two dimensional space, and a paucity of items in others. To begin correcting this, 3 items from redundantly measured sections (alone, kindly, scornful) were removed, and 5 new ones (anxious, cheerful, idle, inactive, and tranquil) were added. Thus, the correlation matrix is missing the correlations between items anxious, cheerful, idle, inactive, and tranquil with alone, kindly, and scornful.

Procedure. The data were collected over nine years, as part of a series of studies examining the effects of personality and situational factors on motivational state and subsequent cognitive performance. In each of 38 studies, prior to any manipulation of motivational state, participants signed a consent form and filled out the MSQ. (The procedures of the individual studies are irrelevant to this data set and could not affect the responses to the MSQ, since this instrument was completed before any further instructions or tasks). Some MSQ post test (after manipulations) is available in affect.

The EA and TA scales are from Thayer, the PA and NA scales are from Watson et al. (1988). Scales and items:

Energetic Arousal: active, energetic, vigorous, wakeful, wide.awake, full.of.pep, lively, -sleepy, -tired, - drowsy (ADACL)

Tense Arousal: Intense, Jittery, fearful, tense, clutched up, -quiet, -still, - placid, - calm, -at rest (ADACL)

Positive Affect: active, alert, attentive, determined, enthusiastic, excited, inspired, interested, proud, strong (PANAS)
Negative Affect: afraid, ashamed, distressed, guilty, hostile, irritable, jittery, nervous, scared, upset (PANAS)

The PA and NA scales can in turn be thought of as having subscales: (See the PANAS-X) Fear: afraid, scared, nervous, jittery (not included frightened, shaky) Hostility: angry, hostile, irritable, (not included: scornful, disgusted, loathing guilt: ashamed, guilty, (not included: blameworthy, angry at self, disgusted with self, dissatisfied with self) sadness: alone, blue, lonely, sad, (not included: downhearted) joviality: cheerful, delighted, energetic, enthusiastic, excited, happy, lively, (not included: joyful) self-assurance: proud, strong, confident, (not included: bold, daring, fearless) attentiveness: alert, attentive, determined (not included: concentrating)

The next set of circumplex scales were taken (I think) from Larsen and Diener (1992). High activation: active, aroused, surprised, intense, astonished Activated PA: elated, excited, enthusiastic, lively Unactivated NA: calm, serene, relaxed, at rest, content, at ease PA: happy, warmhearted, pleased, cheerful, delighted Low Activation: quiet, inactive, idle, still, tranquil Unactivated PA: dull, bored, sluggish, tired, drowsy NA: sad, blue, unhappy, gloomy, grouchy Activated NA: jittery, anxious, nervous, fearful, distressed.

Keys for these separate scales are shown in the examples.

In addition to the MSQ, there are 5 scales from the Eysenck Personality Inventory (Extraversion, Impulsivity, Sociability, Neuroticism, Lie). The Imp and Soc are subsets of the the total extraversion scale.

id  a numeric vector
form  msq versus msqR
study  a character vector of the experiment name

Details

The Motivational States Questionnaire (MSQ) is composed of 75 items, which represent the full affective space (Revelle & Anderson, 1998). The MSQ consists of 20 items taken from the Activation-Deactivation Adjective Check List (Thayer, 1986), 18 from the Positive and Negative Affect Schedule (PANAS, Watson, Clark, & Tellegen, 1988) along with the affective circumplex items used by Larsen and Diener (1992). The response format was a four-point scale that corresponds to Russell and Carroll’s (1999) “ambiguous–likely-unipolar format” and that asks the respondents to indicate their current standing (“at this moment”) with the following rating scale:

0 ————-1 ————-2 ————-3
Not at all  A little  Moderately  Very much

The original version of the MSQ included 70 items. Intermediate analyses (done with 1840 subjects) demonstrated a concentration of items in some sections of the two dimensional space, and a paucity of items in others. To begin correcting this, 3 items from redundantly measured sections (alone, kindly, scornful) were removed, and 5 new ones (anxious, cheerful, idle, inactive, and tranquil) were added. Thus, the correlation matrix is missing the correlations between items anxious, cheerful, idle, inactive, and tranquil with alone, kindly, and scornful.

2605 individuals took Form 1 version, 3806 the Form 2 version. 3032 people (1218 form 1, 1814 form 2) took the MSQ at least once. 2086 at least twice, 1112 three times, and 181 four times.

To see the relative frequencies by time and form, see the first example.

Procedure. The data were collected over nine years in the Personality, Motivation and Cognition laboratory at Northwestern, as part of a series of studies examining the effects of personality and situational factors on motivational state and subsequent cognitive performance. In each of 38 studies, prior to any manipulation of motivational state, participants signed a consent form and in some studies, consumed 0 or 4mg/kg of caffeine. In caffeine studies, they waited 30 minutes and then filled out the MSQ. (Normally, the procedures of the individual studies are irrelevant to this data set and could not affect the responses to the MSQ at time 1, since this instrument was completed before any further instructions or tasks. However, caffeine does have an effect.) The MSQ post test following a movie manipulation) is available in affect as well as here.

The XRAY study crossed four movie conditions with caffeine. The first MSQ measures are showing the effects of the movies and caffeine, but after an additional 30 minutes, the second MSQ seems
to mainly show the caffeine effects. The movies were 9 minute clips from 1) a BBC documentary on British troops arriving at the Bergen-Belsen concentration camp (sad); 2) an early scene from Halloween in which the heroine runs around shutting doors and windows (terror); 3) a documentary about lions on the Serengeti plain, and 4) the "birthday party" scene from Parenthood.

The FLAT study measured affect before, immediately after, and then after 30 minutes following a movie manipulation. See the affect data set.

To see which studies used which conditions, see the second and third examples.

The EA and TA scales are from Thayer, the PA and NA scales are from Watson et al. (1988). Scales and items:

**Energetic Arousal:** active, energetic, vigorous, wakeful, wide.awake, full.of.pep, lively, -sleepy, -tired, - drowsy (ADACL)

**Tense Arousal:** Intense, Jittery, fearful, tense, clutched up, -quiet, -still, - placid, - calm, -at rest (ADACL)

**Positive Affect:** active, alert, attentive, determined, enthusiastic, excited, inspired, interested, proud, strong (PANAS)

**Negative Affect:** afraid, ashamed, distressed, guilty, hostile, irritable, jittery, nervous, scared, upset (PANAS)

The PA and NA scales can in turn can be thought of as having subscales: (See the PANAS-X) Fear: afraid, scared, nervous, jittery (not included frightened, shaky) Hostility: angry, hostile, irritable, (not included: scornful, disgusted, loathing guilt: ashamed, guilty, (not included: blameworthy, angry at self, disgusted with self, dissatisfied with self) sadness: alone, blue, lonely, sad, (not included: downhearted) joviality: cheerful, delighted, energetic, enthusiastic, excited, happy, lively, (not included: joyful) self-assurance: proud, strong, confident, (not included: bold, daring, fearless) attentiveness: alert, attentive, determined (not included: concentrating)

Keys for these separate scales are shown in the examples.

In addition to the MSQ, there are 5 scales from the Eysenck Personality Inventory (Extraversion, Impulsivity, Sociability, Neuroticism, Lie). The Imp and Soc are subsets of the the total extraversion scale based upon a reanalysis of the EPI by Rocklin and Revelle (1983). This information is in the msq data set as well.

**Note**

In December, 2018 the caffeine, film and personality conditions were added. In the process of doing so, it was discovered that the EMIT data had been incorrectly entered. This has been fixed.

**Source**

Data collected at the Personality, Motivation, and Cognition Laboratory, Northwestern University.

Description

The NEO.PI.R is a widely used personality test to assess 5 broad factors (Neuroticism, Extraversion, Openness, Agreeableness and Conscientiousness) with six facet scales for each factor. The correlation matrix of the facets is reported in the NEO.PI.R manual for 1000 subjects.

Usage

data(neo)

Format

A data frame of a 30 x 30 correlation matrix with the following 30 variables.

N1 Anxiety
N2 AngryHostility
N3 Depression
N4 Self-Consciousness
N5 Impulsiveness
N6 Vulnerability
E1 Warmth
E2 Gregariousness
E3 Assertiveness
E4 Activity
E5 Excitement-Seeking
E6 PositiveEmotions
O1 Fantasy
O2 Aesthetics
O3 Feelings
O4 Ideas
O5 Actions
O6 Values
A1 Trust
A2 Straightforwardness
A3 Altruism
The past thirty years of personality research has led to a general consensus on the identification of major dimensions of personality. Variously known as the “Big 5” or the “Five Factor Model”, the general solution represents 5 broad domains of personal and interpersonal experience. Neuroticism and Extraversion are thought to reflect sensitivity to negative and positive cues from the environment and the tendency to withdraw or approach. Openness is sometimes labeled as Intellect and reflects an interest in new ideas and experiences. Agreeableness and Conscientiousness reflect tendencies to get along with others and to want to get ahead.

The factor structure of the NEO suggests five correlated factors as well as two higher level factors. The NEO was constructed with 6 “facets” for each of the five broad factors.

For a contrasting structure, examine the items of the link{spi} data set (Condon, 2017).

**Description**

Francis Galton introduced the correlation coefficient with an analysis of the similarities of the parent and child generation of 700 sweet peas.

**Usage**

data(peas)

**Format**

A data frame with 700 observations on the following 2 variables.

- `parent` The mean diameter of the mother pea for 700 peas
- `child` The mean diameter of the daughter pea for 700 sweet peas

**Details**

Galton’s introduction of the correlation coefficient was perhaps the most important contribution to the study of individual differences. This data set allows a graphical analysis of the data set. There are two different graphic examples. One shows the regression lines for both relationships, the other finds the correlation as well.

**Source**

reproduces the table from Galton, 1894, Table 2.

The data were generated from this table.

**References**

Galton, Francis (1877) Typical laws of heredity. paper presented to the weekly evening meeting of the Royal Institution, London. Volume VIII (66) is the first reference to this data set. The data appear in

Pollack et al (2012) correlation matrix for mediation example

Description

A correlation matrix taken from Pollack (2012) with 9 variables. Primarily used as an example for setCor and mediation.

Usage

data("Pollack")

Format

A correlation matrix based upon 262 participants.

sex  Male = 1, Female = 0, 62% male
age  mean =33
tenure length of employment, mean = 5.9 years
self.efficacy self ratings
competence self rating of competence
social.ties Contact with business-related social ties
economic.stress mean of two items on economic stress
depression 6 items from MAACL measuring depression
withdrawal Withdrawal intentions in domain of entrepreneurship

Details

This is the correlation matrix from Pollack et al. (2012) p 797. The raw data are available from the processR package (Keon-Woong Moon, 2020). The data set is used by Hayes in example p 179 in example 3.

psychTools: datasets and utility functions to accompany the psych package

Description

PsychTools includes the larger data sets used by the psych package and also includes a few general utility functions such as the read.file and read.clipboard functions. The data sets are made available for demonstrations of a variety of psychometric functions.

Details

See the various helpfiles listed in the index or as links from here. Also see the main functions in the psych package 00.psych-package.

Data sets from the SAPA/ICAR project:

ability 16 ICAR ability items scored as correct or incorrect for 1525 participants.
iqitems multiple choice IQ items (raw responses)
affect Two data sets of affect and arousal scores as a function of personality and movie conditions
bfi 25 Personality items representing 5 factors from the SAPA project for 2800 participants
bfi.dictionary Dictionary of the bfi
epi Eysenck Personality Inventory (EPI) data for 3570 participants
epi.dictionary The items for the epi
epi.bfi 13 personality scales from the Eysenck Personality Inventory and Big 5 inventory
epiR 474 participants took the epi twice
msq 75 mood items from the Motivational State Questionnaire for 3896 participants
msqR 75 mood items from the Motivational State Questionnaire for 3032 unique participants
tai Trait Anxiety data from the PMC lab matching the sai sample. 3032 unique subjects
sai State Anxiety data from the PMC lab over multiple occasions. 3032 unique subjects.
sai.dictionary items used in the sai
spi 4000 cases from the SAPA Personality Inventory including an item dictionary and scoring keys.
spi.dictionary The items for the spi
spi.keys Scoring keys for the spi

Examples

psych::describe(ability)

Description

Input from a variety of sources may be read. data.frames may be read from files with suffixes of .txt, .text, .TXT, .dat, .DATA, .data, .csv, .rds, .xpt, XPT, or .sav (i.e., data from SPSS sav files may be read as can files saved by SAS using the .xpt option). Data exported by JMP or EXCEL in the csv format are also able to be read. Fixed Width Files saved in .txt mode may be read if the widths parameter is specified. Files saved with writeRDS have suffixes of .rds or Rds, and are read using readRDS. Files associated with objects with suffixes .rda and .Rda are loaded (following a security prompt). The default values for read.spss are adjusted for more standard input from SPSS files. Input from the clipboard is easy but a bit obscure, particularly for Mac users. read.clipboard and its variations are just an easier way to do so. Data may be copied to the clipboard from Excel spreadsheets, csv files, or fixed width formatted files and then into a data.frame. Data may also be read from lower (or upper) triangular matrices and filled out to square matrices. Writing text files may be done using write.file which will prompt for a file name (if not given) and then write or save to that file depending upon the suffix (text, txt, or csv will call write.table, R, or r will dput, rda, Rda will save, Rds, rds will saveRDS).

Usage

read.file(file=NULL, header=TRUE, use.value.labels=FALSE, to.data.frame=TRUE, sep="", quote="\"", widths=NULL, f=NULL, filetype=NULL, ...)
# for .txt, .text, TXT, .csv, .sav, .xpt, XPT, R, r, Rds, .rds, or .rda,
# .Rda, .RData, .Rdata, .dat and .DAT files

read.clipboard(header = TRUE, ...) # assumes headers and tab or space delimited
read.clipboard.csv(header=TRUE, sep=',', ...) # assumes headers and comma delimited
read.clipboard.tab(header=TRUE, sep='\t', ...) # assumes headers and tab delimited
# read in a matrix given the lower off diagonal
read.clipboard.lower(diag=TRUE, names=FALSE, ...)  
read.clipboard.upper(diag=TRUE, names=FALSE, ...)  

# read in data using a fixed format width (see read.fwf for instructions)  
read.clipboard.fwf(header=FALSE, widths=rep(1, 10), ...)  

read.https(filename, header=TRUE)  
read.file.csv(file=NULL, header=TRUE, f= NULL, ...)  

# For output:  
write.file(x, file=NULL, row.names=FALSE, f= NULL, ...)  
write.file.csv(x, file=NULL, row.names=FALSE, f= NULL, ...)  

**Arguments**  

- **header** Does the first row have variable labels (generally assumed to be TRUE).  
- **sep** What is the designated separator between data fields? For typical csv files, this will be a comma, but if commas designate decimals, then a ; can be used to designate different records.  
- **quote** Specified to  
- **diag** for upper or lower triangular matrices, is the diagonal specified or not  
- **names** for read.clipboard.lower or upper, are colnames in the the first column  
- **widths** how wide are the columns in fixed width input. The default is to read 10 columns of size 1.  
- **filename** Name or address of remote https file to read.  
- **...** Other parameters to pass to read  
- **f** A file name to read from or write to. If omitted, file.choose is called to dynamically get the file name.  
- **file** A file name to read from or write to. (same as f, but perhaps more intuitive) If omitted and if f is omitted, then file.choose is called to dynamically get the file name.  
- **x** The data frame or matrix to write to f  
- **row.names** Should the output file include the rownames? By default, no.  
- **to.data.frame** Should the spss input be converted to a data frame?  
- **use.value.labels** Should the SPSS input values be converted to numeric?  
- **filetype** If specified the reading will use this term rather than the suffix.  

**Details**  

A typical session of R might involve data stored in text files, generated online, etc. Although it is easy to just read from a file (particularly if using read.file, an alternative is to use one’s local system to copy from the file to the clipboard and then read from the clipboard read.clipboard. This
is very convenient (and somewhat more intuitive to the naive user). This is particularly convenient when copying from a text book or article and just moving a section of text into R.) However, copying from a file and then reading the clipboard is hard to automate in a script. Thus, coderead.file will read from a file.

The `read.file` function combines the `file.choose` and either `read.table`, `read.fwf`, `read.spss` or `read.xport` (from foreign) or `load` or `readRDS` commands. By examining the file suffix, it chooses the appropriate way to read the file. For more complicated file structures, see the foreign package. For even more complicated file structures, see the rio or haven packages.

Note that `read.file` assumes by default that the first row has column labels (header = TRUE). If this is not true, then make sure to specify header = FALSE. If the file is fixed width, the assumption is that it does not have a header field. In the unlikely case that a fwf file does have a header, then you probably should try `fn <- file.choose()` and then `my.data <- read.fwf(fn, header=TRUE, widths=widths)`

Further note: If the file is a .Rda, .rda, etc. file, the read.file command will return the name and location of the file. It will prompt the user to load this file. In this case, it is necessary to either assign the output (the file name) to an object that has a different name than any of the objects in the file, or to call `read.file()` without any specification. Notice that loading an .Rda file can overwrite existing objects. Thus the warning and the need to do the second step.

If the file has no suffix the default action is to quit with a warning. However, if the filetype is specified, it will use that type in the reading (e.g. `filetype="txt"` will read as text file, even if there is no suffix.)

If the file is specified and has a prefix of http:// https:// it will be downloaded and then read.

Currently supported input formats are

```
.sav      SPSS.sav files
.csv      A comma separated file (e.g. from Excel or Qualtrics)
.txt      A typical text file
.TXT      A typical text file
.text     A typical text file
.data     A data file
.dat      A data file
.rds      A R data file
.Rds      A R data file (created by a write)
.Rda      A R data structure (created using save)
.rda      A R data structure (created using save)
.RData    A R data structure (created using save)
.rdata    A R data structure (created using save)
.R        A R data structure created using dput
.r        A R data structure created using dput
.xpt      A SAS data file in xport format
.XPT      A SAS data file in XPORT format
```

Some data files have an extra `\` in the data (e.g. the NYT covid data base). These files can be read specifying quote ""

The foreign function `read.spss` is used to read SPSS .sav files using the most common options.
Just as `read.spss` issues various warnings, so does `read.file`. In general, these can be ignored. For more detailed information about using `read.spss`, see the help pages in the foreign package.

If you have a file written by JMP, you must first export to a csv or text file.

The `write.file` function combines the `file.choose` and either `write.table` or `saveRDS`. By examining the file suffix, it chooses the appropriate way to write. For more complicated file structures, see the foreign package, or the save function in R Base. If no suffix is added, it will write as a .txt file. `write.file.csv` will write in csv format to an arbitrary file name.

Currently supported output formats are

- `.csv` A comma separated file (e.g. for reading into Excel)
- `.txt` A typical text file
- `.text` A typical text file
- `.rds` A R data file
- `.Rds` A R data file (created by a write)
- `.Rda` A R data structure (created using save)
- `.rda` A R data structure (created using save)
- `.R` A R data structure created using dput
- `.r` A R data structure created using dput

Many Excel based files specify missing values as a blank field. When reading from the clipboard, using `read.clipboard.tab` will change these blank fields to NA.

Sometimes missing values are specified as "." or "999", or some other values. These can be converted by the `read.file` command specifying what values are missing (e.g., `na = "."`). See the example for the reading from the remote mtcars.csv file.

`read.clipboard` was based upon a suggestion by Ken Knoblauch to the R-help listserve.

If the input file that was copied into the clipboard was an Excel file with blanks for missing data, then `read.clipboard.tab()` will correctly replace the blanks with NAs. Similarly for a csv file with blank entries, `read.clipboard.csv` will replace empty fields with NA.

`read.clipboard.lower` and `read.clipboard.upper` are adapted from John Fox’s `read.moments` function in the sem package. They will read a lower (or upper) triangular matrix from the clipboard and return a full, symmetric matrix for use by `factanal`, `fa`, `ICLUST`, `pca`, `omega`, etc. If the diagonal is false, it will be replaced by 1.0s. These two function were added to allow easy reading of examples from various texts and manuscripts with just triangular output.

Many articles will report lower triangular matrices with variable labels in the first column. `read.clipboard.lower` will handle this case. Names must be in the first column if `names=TRUE` is specified.

Other articles will report upper triangular matrices with variable labels in the first row. `read.clipboard.upper` will handle this. Note that labels in the first column will not work for `read.clipboard.upper`. The names, if present, must be in the first row.

Consider the following lower triangular matrix. To read it, copy it to the clipboard and `read.clipboard.lower(names=TRUE)`

```
A1 1.00
A2 -0.34 1.00
A3 -0.27 0.49 1.00
A4 -0.15 0.34 0.36 1.00
```
A5 -0.18 0.39 0.50 0.31 1.00
C1 0.03 0.09 0.10 0.09 0.12 1.00

However, if the data are strung out e.g.,

-.34
-.27
-.15
-.18
.03
.49
.34
.39
.09
.36
.50
.10
.31
.09
.12

Then one needs to read it using the read.clipboard.upper(names=FALSE,diag=FALSE) option.
read.clipboard.fwf will read fixed format files from the clipboard. It includes a patch to read.fwf which will not read from the clipboard or from remote file. See read.fwf for documentation of how to specify the widths.

**Value**

the contents of the file to be read or of the clipboard.

sai

**State Anxiety data from the PMC lab over multiple occasions.**

**Description**

State Anxiety was measured two-three times in 11 studies at the Personality-Motivation-Cognition laboratory. Here are item responses for 11 studies (9 repeated twice, 2 repeated three times). In all studies, the first occasion was before a manipulation. In some studies, caffeine, or movies or incentives were then given to some of the participants before the second and third STAI was given. In addition, Trait measures are available and included in the tai data set (3032 subjects).

**Usage**

- data(sai)
- data(tai)
- data(sai.dictionary)

**Format**

A data frame with 3032 unique observations on the following 23 variables.

- **id** a numeric vector
- **study** a factor with levels ages cart fast fiat film flat home pat rob salt shed shop xray
- **time** 1=First, 2 = Second, 3=third administration
- **TOD** TOD (time of day 1= 8:50-9:30 am,2 = 1=3 pm, 3= 7:8pm
- **drug** drug (placebo (0) vs. caffeine (1))
Details

The standard experimental study at the Personality, Motivation and Cognition (PMC) laboratory (Revelle and Anderson, 1997) was to administer a number of personality trait and state measures (e.g. the epi, msq, msqR and sai) to participants before some experimental manipulation of arousal/effort/anxiety. Following the manipulation (with a 30 minute delay if giving caffeine/placebo), some performance task was given, followed once again by measures of state arousal/effort/anxiety.

Here are the item level data on the sai (state anxiety) and the tai (trait anxiety). Scores on these scales may be found using the scoring keys. The affect data set includes pre and post scores for two studies (flat and maps) which manipulated state by using four types of movies.

In addition to being useful for studies of motivational state, these studies provide examples of test-retest and alternate form reliabilities. Given that 10 items overlap with the msqR data, they also allow for a comparison of immediate duplication of items with 30 minute delays.

Studies CART, FAST, SHED, RAFT, and SHOP were either control groups, or did not experimentally vary arousal/effort/anxiety.

AGES, CITY, EMIT, RIM, SALT, and XRAY were caffeine manipulations between time 1 and 2 (RIM and VALE were repeated day 1 and day 2)
FIAT, FLAT, MAPS, MIXX, and THRU were 1 day studies with film manipulation between time 1 and time 2.

SAM1 and SAM2 were the first and second day of a two day study. The STAI was given once per day. MSQ not MSQR was given.

VALE and PAT were two day studies with the STAI given pre and post on both days

RIM was a two day study with the STAI and MSQ given once per day.

Usually, time of day 1 = 8:50-9am am, and 2 = 7:30 pm, however, in rob, with paid subjects, the times were 0530 and 22:30.

Source

Data collected at the Personality, Motivation, and Cognition Laboratory, Northwestern University, between 1991 and 1999.

**3 Measures of ability: SATV, SATQ, ACT**
Description
Self reported scores on the SAT Verbal, SAT Quantitative and ACT were collected as part of the Synthetic Aperture Personality Assessment (SAPA) web based personality assessment project. Age, gender, and education are also reported. The data from 700 subjects are included here as a demonstration set for correlation and analysis.

Usage
data(sat.act)

Format
A data frame with 700 observations on the following 6 variables.

- **gender**  males = 1, females = 2
- **education**  self reported education 1 = high school ... 5 = graduate work
- **age**  age
- **ACT**  ACT composite scores may range from 1 - 36. National norms have a mean of 20.
- **SATV**  SAT Verbal scores may range from 200 - 800.
- **SATQ**  SAT Quantitative scores may range from 200 - 800

Details
These items were collected as part of the SAPA project (https://www.sapa-project.org/) to develop online measures of ability (Revelle, Wilt and Rosenthal, 2009). The score means are higher than national norms suggesting both self selection for people taking on line personality and ability tests and a self reporting bias in scores.

See also the iq.items data set.

**Schutz**

**The Schutz correlation matrix example from Shapiro and ten Berge**

**Description**

Shapiro and ten Berge use the Schutz correlation matrix as an example for Minimum Rank Factor Analysis. The Schutz data set is also a nice example of how normal minres or maximum likelihood will lead to a Heywood case, but minrank factoring will not.

**Usage**

data("Schutz")

**Format**

The format is: num [1:9, 1:9] 1 0.8 0.28 0.29 0.41 0.38 0.44 0.41 0.8 ... - attr(*, "dimnames")=List of 2 ..$ : "Word meaning" "Odd Words" "Boots" "Hatchets" ... ..$ : "V1" "V2" "V3" "V4" ...

**Details**

These are 9 cognitive variables of importance mainly because they are used as an example by Shapiro and ten Berge for their paper on Minimum Rank Factor Analysis.

The solution from the `fa` function with the fm='minrank' option is very close (but not exactly equal) to their solution.

This example is used to show problems with different methods of factoring. Of the various factoring methods, fm = "minres", "uls", or "mle" produce a Heywood case. Minrank, alpha, and pa do not. See the blant data set for another example of differences across methods.

**Source**

**References**

**Examples**

data(Schutz)
psych::corPlot(Schutz,numbers=TRUE,upper=FALSE)

f4min <- psych::fa(Schutz,4,fm="minrank") # for an example of minimum rank factor Analysis
# compare to
f4 <- psych::fa(Schutz,4,fm="mle") # for the maximum likelihood solution which has a Heywood case
Project Talent data set from Marion Spengler and Rodica Damian

Description

Project Talent gave 440,000 US high school students a number of personality and ability tests. Of these, the data from 346,000 were available for followup. Subsequent followups were collected 11 and 50 years later. Marion Spengler and her colleagues Rodica Damian, and Brent Roberts reported on the stability and change across 50 years of personality and ability. Here is the correlation matrix of 25 of their variables (Spengler) as well as a slightly different set of 19 variables (Damian). This is a nice example of mediation and regression from a correlation matrix.

Usage

data("Damian")

Format

A 25 x 25 correlation matrix of demographic, personality, and ability variables, based upon 346,660 participants.

- Race/Ethnicity: 1 = other, 2 = white/caucasian
- Sex: 1 = Male, 2 = Female
- Age: Cohort = 9th grade, 10th grade, 11th grade, 12th grade
- Parental: Parental SES based upon 9 questions of home value, family income, etc.
- IQ: Standardized composite of Verbal, Spatial and Mathematical
- Sociability: 10 scales based upon prior work by Damian and Roberts
- Maturity: A higher order factor from the prior 10 scales
- Extraversion: The second higher order factor
- Interest: Self-reported interest in school
- Reading: Self-report reading skills
- Writing: Self-report writing skills
- Responsible: Self-reported responsibility scale
- Ed.11: Education level at 11 year followup
- Educ.50: Education level at 50 year followup
- OccPres.11: Occupational Prestige at 11 year followup
- OccPres.50: Occupational Prestige at 50 year followup
- Income.11: Income at 11 year followup
- Income.50: Income at 50 year followup
Details

Data from Project Talent was collected in 1960 on a representative sample of American high school students. Subsequent follow up 11 and 50 years later are reported by Spengler et al (2018) and others.

summary(mod)

Description

The SPI (SAPA Personality Inventory) is a set of 135 items primarily selected from International Personality Item Pool (ipip.ori.org). This is an example data set collected using SAPA procedures the sapa-project.org web site. This data set includes 10 demographic variables as well. The data set with 4000 observations on 145 variables may be used for examples in scale construction and validation, as well as empirical scale construction to predict multiple criteria.

Usage

data("spi")
data(spi.dictionary)
data(spi.keys)
Format

A data frame with 4000 observations on the following 145 variables. (The q numbers are the SAPA item numbers).

- **age** Age in years from 11 - 90
- **sex** Reported biological sex (coded by X chromosomes => 1=Male, 2 = Female)
- **health** Self rated health 1-5: poor, fair, good, very good, excellent
- **p1edu** Parent 1 education
- **p2edu** Parent 2 education
- **education** Respondents education: less than 12, HS grad, current univ, some univ, associate degree, college degree, in grad/prof, grad/prof degree
- **wellness** Self rated "wellness" 1-2
- **exer** Frequency of exercise: very rarely, < 1/month, < 1/wk, 1 or 2 times/week, 3-5/wk, > 5 times/week
- **smoke** never, not last year, < 1/month, <1/week, 1-3 days/week, most days, up to 5 x /day, up to 20 x /day, > 20x/day
- **ER** Emergency room visits none, 1x, 2x, 3 or more times
- **q_253** see the spi.dictionary for these items (q_253
- **q_1328** see the dictionary for all items q_1328)

Details

Using the data contributed by about 125,000 visitors to the [https://www.SAPA-project.org/](https://www.SAPA-project.org/) website, David Condon has developed a hierarchical framework for assessing personality at two levels. The higher level has the familiar five factors that have been studied extensively in personality research since the 1980s – Conscientiousness, Agreeableness, Neuroticism, Openness, and Extraversion. The lower level has 27 factors that are considerably more narrow. These were derived based on administrations of about 700 public-domain IPIP items to 3 large samples. Condon describes these scales as being "empirically-derived" because relatively little theory was used to select the number of factors in the hierarchy and the items in the scale for each factor (to be clear, he means relatively little personality theory though he relied on quite a lot of sampling and statistical theory). You can read all about the procedures used to develop this framework in his book/manual. If you would like to reproduce these analyses, you can download the data files from Dataverse (links are also provided in the manual) and compile this script in R (he used knitR). Instructions are provided in the Preface to the manual.

The content of the spi items may be seen by examining the spi.dictionary. Included in the dictionary are the item_id number from the SAPA project, the wording of the item, the source of the item, which Big 5 scale the item marks, and which "Little 27" scale the item marks.

This small subset of the data is provided for demonstration purposes.

usaf

17 anthropometric measures from the USAF showing a general factor

Description

The correlation matrix of 17 anthropometric measures from the United States Air Force survey of 2420 airmen. The data are taken from the Anthropometry package and included here as a demonstration of a hierarchical factor structure suitable for analysis by the \texttt{omega} or \texttt{omegaSem}.

Usage

data("USAF")

Format

The format is: num [1:17, 1:17] 1 0.1148 -0.0309 -0.028 -0.0908 ... - attr(*, "dimnames")=List of 2 ..$ : chr [1:17] "age" "weight" "grip" "height" ...

Details

The original data were collected by the USAF and reported in Churchill et al, 1977. They are included as a data file of 2420 participants and 202 variables (the first being an id) in the Anthropometry package. The list of variable names may be found in Churchill et al, on pages 96-99.

The three (correlated) factor structure shows a clear height, bulk, and head size structure with an overall general factor (g) which may be interpreted as body size.

The variables included (and their variable numbers in Anthropometry) are:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>age</td>
<td>V1</td>
</tr>
</tbody>
</table>
weight V2
grip strength V12
height (stature) V13
leg length V26
knee height V37
upper arm V42
thumb tip reach V47
in sleeve V49
chest breadth V52
hip breadth V55
waist circumference V71
thigh circumference V97
scye circumference V103
head circumference V141
bitragion coronal V145
head length V150
glabella to wall V181
external canthus to wall V183

Note that these numbers are equivalent to the numbers in Churchill et al. The numbers in Anthropometry are these + 1.

---

**Utility**

Useful utility functions for file/directory exploration and manipulation.
**Description**

Wrappers for dirname, file.choose, readLines, file.create, file.path to be called directly for listing directories, creating files, showing the files in a directory, and listing the content of files in a directory. **fileCreate** gives the functionality of file.choose(new=TRUE). **filesList** combines file.choose, dirname, and list.files to show the files in a directory, **fileScan** extends this and then returns the first few lines of each readable file.

**Usage**

```r
fileScan(f = NULL, nlines = 3, max = NULL, from = 1, filter = NULL)
filesList(f=NULL)
filesInfo(f=NULL, max=NULL)
fileCreate(newName="new.file")
```

**Arguments**

- **f**
  - File path to use as base path (will use file.choose() if missing. If f is a directory, will list the files in that directory, if f is a file, will find the directory for that file and then list all of those files.)

- **nlines**
  - How many lines to display

- **max**
  - Maximum number of files to display

- **from**
  - First file (number) to display

- **filter**
  - Just display files with "filter" in the name

- **newName**
  - The name of the file to be created.

**Details**

Just a collection of simple wrappers to powerful core R functions. Allows the user more direct control of what directory to list, to create a file, or to display the content of files. The functions called include file.choose, file.path, file.info, file.create, dirname, and dir.exists. All of these are very powerful functions, but not easy to call interactively.

**fileCreate** will ask to locate a file using file.choose, set the directory to that location, and then prompt to create a file with the new.name. This is a workaround for file.choose(new=TRUE) which only works for Macs not using R.studio.

**filesInfo** will interactively search for a file and then list the information (size, date, ownership) of all the files in that directory.

**filesList** will interactively search for a file and then list all the files in same directory.

**Note**

Work arounds for core-R functions for interactive file manipulation.

**Author(s)**

William Revelle
See Also

`read.file` to read in data from a file or `read.clipboard` from the clipboard. `dfOrder` to sort data.frames.

Examples

```r
if(interactive()) {
  #all of these require interactive input and thus are not given as examples
  fileCreate("my.new.file.txt")
  filesList()  #show the items in the directory where a file is displayed
  fileScan()  #show the content of the files in a directory
  #or, if you have a file in mind
  f <- file.choose()  #go find it
  filesList(f)
  filesScan(f)
}

vegetables                  Paired comparison of preferences for 9 vegetables

Description

A classic data set for demonstrating Thurstonian scaling is the preference matrix of 9 vegetables from Guilford (1954). Used by Guilford, Nunnally, and Nunnally and Bernstein, this data set allows for examples of basic scaling techniques.

Usage

data(vegetables)

Format

A data frame with 9 choices on the following 9 vegetables. The values reflect the percentage of times where the column entry was preferred over the row entry.

- Turnips
- Cabbage
- Beets
- Asparagus
- Carrots
- Spinach
- String Beans
- Peas
- Corn
Details

Louis L. Thurstone was a pioneer in psychometric theory and measurement of attitudes, interests, and abilities. Among his many contributions was a systematic analysis of the process of comparative judgment (thurstone, 1927). He considered the case of asking subjects to successively compare pairs of objects. If the same subject does this repeatedly, or if subjects act as random replicates of each other, their judgments can be thought of as sampled from a normal distribution of underlying (latent) scale scores for each object, Thurstone proposed that the comparison between the value of two objects could be represented as representing the differences of the average value for each object compared to the standard deviation of the differences between objects. The basic model is that each item has a normal distribution of response strength and that choice represents the stronger of the two response strengths. A justification for the normality assumption is that each decision represents the sum of many independent inputs and thus, through the central limit theorem, is normally distributed.

Thurstone considered five different sets of assumptions about the equality and independence of the variances for each item (Thurston, 1927). Torgerson expanded this analysis slightly by considering three classes of data collection (with individuals, between individuals and mixes of within and between) crossed with three sets of assumptions (equal covariance of decision process, equal correlations and small differences in variance, equal variances).

This vegetable data set is used by Guilford and by Nunnally to demonstrate Thurstonian scaling.

<table>
<thead>
<tr>
<th>zola</th>
<th>Correlation matrix of 135 self report and 30 peer report personality items</th>
</tr>
</thead>
</table>
Description

Zola et al., (2021) reported the validity of self report personality items from the SAPA personality inventory (SPI) (Condon, 2018) in terms of 30 peer reports on 8 dimensions. Here are the poly-choric correlations of these items. SPI items were collected using SAPA procedures for 158,631 participants (mean n/item = 18,180), 908 of whom received peer ratings.

Usage

data("zola")

Format

The format is: num [1:165, 1:165] 1 -0.242 0.282 0.65 0.223 ... - attr(*, "dimnames")=List of 2 ..$ : chr [1:165] "q_253" "q_4296" "q_1855" "q_90" ... ..$ : chr [1:165] "q_253" "q_4296" "q_1855" "q_90" ...

Details

The polychoric correlation matrix of the SPI and peer report data. To see the item labels, use the lookupFromKeys.

This data set is a nice example of a multi-trait, multi-method correlation matrix. (see the scoring example). Five dimensions of self report show high correlations with the corresponding peer report scales.
