Package ‘qdap’

January 2, 2019

Type Package

Title Bridging the Gap Between Qualitative Data and Quantitative Analysis

Version 2.3.2

Maintainer Tyler Rinker <tyler.rinker@gmail.com>

Depends R (>= 3.1.0), qdapDictionaries (>= 1.0.2), qdapRegex (>= 0.1.2), qdapTools (>= 1.3.1), RColorBrewer

Imports chron, dplyr (>= 0.3), gdata, gender (>= 0.5.1), ggplot2 (>= 2.1.0), grid, gridExtra, igraph, methods, NLP, openNLP (>= 0.2-1), parallel, plotrix, RCurl, reports, reshape2, scales, stringdist, tidyr, tm (>= 0.7-6), tools, venneuler, wordcloud, xlsx, XML

Suggests koRpus, knitr, lda, proxy, stringi, SnowballC, testthat

LazyData TRUE

VignetteBuilder knitr

Description Automates many of the tasks associated with quantitative discourse analysis of transcripts containing discourse including frequency counts of sentence types, words, sentences, turns of talk, syllables and other assorted analysis tasks. The package provides parsing tools for preparing transcript data. Many functions enable the user to aggregate data by any number of grouping variables, providing analysis and seamless integration with other R packages that undertake higher level analysis and visualization of text. This affords the user a more efficient and targeted analysis. ‘qdap’ is designed for transcript analysis, however, many functions are applicable to other areas of Text Mining/ Natural Language Processing.

License GPL-2

Index 416
**.Network

Add themes to a Network object.

---

**Description**

This operator allows you to add themes to a Network object.

**Usage**

```r
## S3 method for class 'Network'
Network.obj + x
```

**Arguments**

- `Network.obj`: An object of class `Network`.
- `x`: A component to add to `Network.obj`

---

**add_incomplete**

Detect Incomplete Sentences; Add | Endmark

---

**Description**

Automatically detect missing endmarks and replace with the | endmark symbol to indicate an incomplete sentence.

**Usage**

```r
add_incomplete(text.var, endmarks = "[.?!]+$", silent = FALSE)
```

**Arguments**

- `text.var`: The text variable.
- `endmarks`: A regular expression to check for endmarks.
- `silent`: logical. If TRUE messages are not printed out.

**Value**

Returns a vector with missing endmarks replaced with |.
Examples

```r
add_incomplete(
  c(
    "This in a",
    "I am funny!",
    "An ending of sorts",
    "What do you want?"
  )
)
```

---

**add_s**

*Make Plural (or Verb to Singular) Versions of Words*

**Description**

Add -s, -es, or -ies to words.

**Usage**

```r
add_s(x, keep.original = TRUE)
```

**Arguments**

- `x` A vector of words to make plural.
- `keep.original` logical. If TRUE the original words are kept in the return vector.

**Value**

Returns a vector of plural words.

**Examples**

```r
set.seed(10)
add_s(sample(GradyAugmented, 10))
set.seed(10)
add_s(sample(GradyAugmented, 10), FALSE)
```
adjacency_matrix

Description
Takes a matrix (wfm) or termco object and generates an adjacency matrix for use with the igraph package.

Usage
adjacency_matrix(matrix.obj)
adjmat(matrix.obj)

Arguments
matrix.obj A matrix object, preferably, of the class "termco" generated from termco, termco_d or termco_c.

Value
Returns list:
boolean A Boolean matrix
adjacency An adjacency matrix. Diagonals are the total (sum) number of occurrences a variable had
shared An adjacency matrix with no diagonal and the upper triangle replaced with NA
sum The diagonal of the adjacency matrix; the total (sum) number of occurrences a variable had

See Also
dist

Examples
## Not run:
words <- c("you", "the", "it", "oo")
Terms <- with(DATA, termco(state, list(sex, adult), words))
Terms
adjacency_matrix(Terms)

wordLIST <- c("montague", "capulet", "court", "marry")
raj.termco <- with(raj.act.1, termco(dialogue, person, wordLIST))
raj.adjmat <- adjmat(raj.termco)
names(raj.adjmat) #see what's available from the adjacency_matrix object
library(igraph)
g <- graph.adjacency(raj.adjmat$adjacency, weighted=TRUE, mode ="undirected")
Description

A convenience function to find words that begin with or contain a letter chunk and returns the frequency counts of the number of occurrences of each word.

Usage

all_words(text.var, begins.with = NULL, contains = NULL, 
apphabetical = TRUE, apostrophe.remove = FALSE, 
char.keep = char2space, char2space = "~~", ...)

Arguments

text.var The text variable.
begins.with This argument takes a word chunk. Default is NULL. Use this if searching for a word beginning with the word chunk.
contains This argument takes a word chunk. Default is NULL. Use this if searching for a word containing the word chunk.
apphabetical logical. If TRUE orders rows alphabetically, if FALSE orders the rows by descending frequency.
apostrophe.remove logical. If TRUE removes apostrophes from the text before examining.
char.keep A character vector of symbol character (i.e., punctuation) that strip should keep. The default is to strip everything except apostrophes. This enables the use of special characters to be turned into spaces or for characters to be retained.
char2space A vector of characters to be turned into spaces.
... Other argument supplied to strip.

Value

Returns a dataframe with frequency counts of words that begin with or contain the provided word chunk.

Note

Cannot provide both begins.with and contains arguments at once. If both begins.with and contains are NULL, all_words returns a frequency count for all words.
Animate

Description
Animate select qdap objects.

Usage
Animate(x, ...)

Arguments
x An animatable qdap object (e.g., discourse_map).
... Arguments passed to Animate method of other classes.

Value
Returns a plot object.

See Also
scores, counts, preprocessed, proportions
Description

Animate.character - Animate a character object. Typically this function is useful in conjunction with other Animate objects to create complex animations with accompanying text.

Usage

```r
## S3 method for class 'character'
Animate(x, wc.time = TRUE, time.constant = 2,
       width = 65, coord = c(0, 0.5), just = c(0, 0.5), size = 5,
       color = "black", border.color = NA, ...)
```

Arguments

- **x**
  A character object.
- **wc.time**
  logical. If TRUE weights duration of frame by word count.
- **time.constant**
  A constant to divide the maximum word count by. Time is calculated by \('round(exp(WORD COUNT)/(max(WORD COUNT)/time.constant)))'. Therefore a larger constant will make the difference between the large and small word counts greater.
- **width**
  The width to break text at if type = "text".
- **coord**
  The x/y coordinate to plot the text.
- **just**
  The hjust and vjust values to use for the text.
- **size**
  The size to print the text. Can be a vector of length 1 or equal to the length of x.
- **color**
  The color to print the text. Can be a vector of length 1 or equal to the length of x.
- **border.color**
  The panel.border color (see theme).
- **...**
  Other arguments passed to annotate.

Details

character Method for Animate

See Also

theme
Examples

```r
## Not run:
Animate(DATA[["state"]])
Animate(DATA[["state"], color="red")
Animate(DATA[["state"], color=RCOLORBrewer::brewer.pal(11, "Set3"), size=10)
c3s <- DATA[["person"]]
%1% data.frame(levels(DATA[["person"],
                 RColorBrewer::brewer.pal(5, "Set3")
Animate(DATA[["state"], color=c3s, size=10, width=30)
c3ls2 <- DATA[["sex"]]
%1% data.frame(c("m", "f"), c("lightblue", "pink"))
Animate(DATA[["state"], color=c3ls2, just=c(.5, .5), coord = c(.5, .5))
## Print method
print(Animate(DATA[["state"]], color=c3ls2, just=c(.5, .5), coord = c(.5, .5),
              pause=.25)
Animate(DATA[["state"], color=sample(colors(), nrow(DATA)),
              size=sample(4:13, nrow(DATA), TRUE), width=30, just=c(.5, .5), coord = c(.5, .5))
## End(Not run)
```

Description

Animate.discourse_map - Animate a discourse discourse_map.

Usage

```r
## S3 method for class 'discourse_map'
Animate(x, edge.constant, sep = ",",
        current.color = "red", previous.color = "grey50", wc.time = TRUE,
        time.constant = 2, title = NULL, ...)
```

Arguments

- `x` The discourse_map object.
- `edge.constant` A constant to multiple edge width by.
- `sep` The separator character to use between grouping variables.
- `current.color` The color to make the vector edge as it moves.
- `previous.color` The color to make the already plotted edges.
- `wc.time` logical. If TRUE weights duration of frame by word count.
- `time.constant` A constant to divide the maximum word count by. Time is calculated by `round(exp(WORD COUNT/(max(WORD COUNT)/time.constant)))`. Therefore a larger constant will make the difference between the large and small word counts greater.
- `title` The title to apply to the animated image(s).
- `...` ignored
Details

discourse_map Method for Animate

Note

The width of edges is based on words counts on that edge until that moment divided by total number of words used until that moment. Thicker edges tend to thin as time passes. The actual duration the current edge stays as the current.color is based on word counts for that particular flow of dialogue divided by total dialogue (words) used.

Animate.formality  Animate Formality

Description

Animate.formality - Animate a formality object.

Usage

```r
## S3 method for class 'formality'
Animate(x, contextual = "yellow", formal = "red",
edge.constant, wc.time = TRUE, time.constant = 2, title = NULL,
digits = 3, current.color = "black", current.speaker.color = NULL,
non.speaker.color = NA, missing.color = "purple",
all.color.line = "red", plus.300.color = "grey40",
under.300.color = "grey88", type = "network", width = 65,
coord = c(0, 0.5), just = c(0, 0.5), ...)  
```

Arguments

- `x` A formality object.
- `contextual` The color to use for 0% formality (purely contextual).
- `formal` The color to use for 100% formality (purely formal).
- `edge.constant` A constant to multiple edge width by.
- `wc.time` logical. If TRUE weights duration of frame by word count.
- `time.constant` A constant to divide the maximum word count by. Time is calculated by ‘round(exp(WORD COUNT/(max(WORD COUNT)/time.constant)))’. Therefore a larger constant will make the difference between the large and small word counts greater.
- `title` The title to apply to the animated image(s).
- `digits` The number of digits to use in the current turn of talk formality.
- `current.color` The color to use for the current turn of talk formality.
- `current.speaker.color` The color for the current speaker.
non.speaker.color
  The color for the speakers not currently speaking.
missing.color
  The color to use in a network plot for edges corresponding to missing text data. Use na.omit before hand to remove the missing values all together.
all.color.line
  The color to use for the total discourse formality color line if network = FALSE.
plus.300.color
  The bar color to use for grouping variables exceeding 299 words per Heylighen & Dewaele's (2002) minimum word recommendations.
under.300.color
  The bar color to use for grouping variables less than 300 words per Heylighen & Dewaele's (2002) minimum word recommendations.
type
  Character string of either "network" (as a network plot), "bar" (as a bar plot), or "text" (as a simple colored text plot).
width
  The width to break text at if type = "text".
coord
  The x/y coordinate to plot the text if type = "text".
just
  The hjust and vjust values to use for the text if type = "text".
... other arguments passed to discourse_map or annotate if type = "text".

Details

formality Method for Animate

Note

The width of edges is based on words counts on that edge until that moment divided by total number of words used until that moment. Thicker edges tend to thin as time passes. The actual duration the current edge stays as the current.color is based on word counts for that particular flow of dialogue divided by total dialogue (words) used. The edge label is the current formality for that turn of talk (an aggregation of the sub sentences of the current turn of talk). The coloring of the current edge formality is produced at th sentence level, therefor a label may indicate a positive current turn of talk, while the coloring may indicate a negative sentences. Coloring is based on percentage of formal parts of speech (i.e., noun, adjective, preposition, article).

Animate.gantt

Gantt Durations

Description

gantt - Animate discourse from gantt.

Usage

## S3 method for class 'gantt'
Animate(x, wc.time = TRUE, time.constant = 2,
       colors = NULL, ...)

Arguments

x  The gantt object.

wc.time  logical. If TRUE weights duration of frame by word count.

time.constant  A constant to divide the maximum word count by. Time is calculated by \( \text{round}(\exp(\text{WORD COUNT}/(\max(\text{WORD COUNT})/\text{time.constant}))) \). Therefore a larger constant will make the difference between the large and small word counts greater.

colors  An optional character vector of colors to color the Gantt bars. Must be length 1 (repeats the same color) or equal to the levels of the grouping variable.

...  Other arguments passed to \textit{gantt.wrap}.

Details

gantt Method for Animate

Description

gantt_plot - Animate discourse from \textit{gantt_wrap}, \textit{gantt_plot}, or any other Gantt plotting method.

Usage

```r
## S3 method for class 'gantt_plot'
Animate(x, wc.time = TRUE, time.constant = 2,
        colors = NULL, ...)
```

Arguments

x  The gantt_plot object.

wc.time  logical. If TRUE weights duration of frame by word count.

time.constant  A constant to divide the maximum word count by. Time is calculated by \( \text{round}(\exp(\text{WORD COUNT}/(\max(\text{WORD COUNT})/\text{time.constant}))) \). Therefore a larger constant will make the difference between the large and small word counts greater.

colors  An optional character vector of colors to color the Gantt bars. Must be length 1 (repeats the same color) or equal to the levels of the grouping variable.

...  ignored

Details

gantt_plot Method for Animate
Animate.lexical_classification

Animate Formality

Description

Animate.lexical_classification - Animate a lexical_classification object.

Usage

```r
## S3 method for class 'lexical_classification'
Animate(x, type = "network",
    content = "red", functional = "yellow", edge.constant,
    wc.time = TRUE, time.constant = 2, title = NULL, digits = 2,
    current.color = "black", current.speaker.color = NULL,
    non.speaker.color = NA, missing.color = "purple",
    all.color.line = "red", width = 65,
    function.words = qdapDictionaries::function.words, left = "<<",
    right = ">>", coord = c(0, 0.5), just = c(0, 0.5), ...)  
```

Arguments

- `x`: A lexical_classification object.
- `type`: Character string of either "network" (as a network plot), "bar" (as a bar plot), or "text" (as a simple colored text plot).
- `content`: The color to use for 100% lexical_classification (purely content).
- `functional`: The color to use for 0% lexical_classification (purely functional).
- `edge.constant`: A constant to multiple edge width by.
- `wc.time`: logical. If TRUE weights duration of frame by word count.
- `time.constant`: A constant to divide the maximum word count by. Time is calculated by `round(exp(WORD COUNT/max(WORD COUNT)/time.constant)))`. Therefore a larger constant will make the difference between the large and small word counts greater.
- `title`: The title to apply to the animated image(s).
- `digits`: The number of digits to use in the current turn of talk’s content rate.
- `current.color`: The color to use for the current turn of talk’s content rate.
- `current.speaker.color`: The color for the current speaker.
- `non.speaker.color`: The color for the speakers not currently speaking.
- `missing.color`: The color to use in a network plot for edges corresponding to missing text data. Use na.omit before hand to remove the missing values all together.
- `all.color.line`: The color to use for the total average discourse content rate.
- `width`: The width to break text at if type = "text".
function.words  A vector of function words. Default is `function.words`.
left  A left bound to wrap content words with if `type = "text"`.
right  A right bound to wrap content words with if `type = "text"`.
coord  The x/y coordinate to plot the text if `type = "text"`.
just  The `hjust` and `vjust` values to use for the text if `type = "text"`.
...  Other arguments passed to `discourse_map` or `annotate` if `type = "text"`.

Details

lexical_classification Method for Animate

Note

The width of edges is based on words counts on that edge until that moment divided by total number of words used until that moment. Thicker edges tend to thin as time passes. The actual duration the current edge stays as the `current.color` is based on word counts for that particular flow of dialogue divided by total dialogue (words) used. The edge label is the current content rate for that turn of talk (an aggregation of the sub sentences of the current turn of talk). The coloring of the current edge content rate is produced at th sentence level, therefor a label may indicate a more content laden current turn of talk, while the coloring may indicate a functional laden average of sentences. Coloring is based on percentage of conent words.

animate.polarity

Description

Animate.polarity - Animate a `polarity` object.

Usage

```r
# S3 method for class 'polarity'
Animate(x, negative = "blue", positive = "red",
        neutral = "yellow", edge.constant, wc.time = TRUE,
        time.constant = 2, title = NULL, digits = 3, width = 65,
        current.color = "black", current.speaker.color = NULL,
        non.speaker.color = NA, ave.color.line = "red", type = "network",
        coord = c(0, 0.5), just = c(0, 0.5), ...)  
```

Arguments

- `x`  A `polarity` object.
- `negative`  The color to use for negative polarity.
- `positive`  The color to use for positive polarity.
- `neutral`  The color to use for neutral polarity.
edge.constant A constant to multiple edge width by.
wc.time logical. If TRUE weights duration of frame by word count.
time.constant A constant to divide the maximum word count by. Time is calculated by ‘round(exp(WORD COUNT)/(max(WORD COUNT)/time.constant)))’. Therefore a larger constant will make the difference between the large and small word counts greater.
title The title to apply to the animated image(s).
digits The number of digits to use in the current turn of talk polarity.
width The width to break text at if type = "text".
current.color The color to use for the current turn of talk polarity.
current.speaker.color The color for the current speaker.
non.speaker.color The color for the speakers not currently speaking.
ave.color.line The color to use for the average color line if type = "network".
type Character string of either "network" (as a network plot), "bar" (as a bar plot), or "text" (as a simple colored text plot).
coord The x/y coordinate to plot the test if type = "text".
just The hjust and vjust values to use for the text if type = "text".
... Other arguments passed to discourse_map or annotate if type = "text".

details polarity Method for Animate

Note

The width of edges is based on words counts on that edge until that moment divided by total number of words used until that moment. Thicker edges tend to thin as time passes. The actual duration the current edge stays as the current.color is based on word counts for that particular flow of dialogue divided by total dialogue (words) used. The edge label is the current polarity for that turn of talk (an aggregation of the sub sentences of the current turn of talk). The coloring of the current edge polarity is produced at th sentence level, therefor a label may indicate a positive current turn of talk, while the coloring may indicate a negative sentences.

tm Package Compatibility Tools: Apply to or Convert to/from Term Document Matrix or Document Term Matrix
Description

as.tdm - Create term document matrices from raw text or wfm for use with other text analysis packages.

as.TermDocumentMatrix - Create document term matrices from raw text or wfm for use with other text analysis packages.

as.dtm - Create document term matrices from raw text or wfm for use with other text analysis packages.

as.DocumentTermMatrix - Create document term matrices from raw text or wfm for use with other text analysis packages.

as.data.frame - Convert a tm package Corpus to a qdap data.frame.

as.Corpus - Attempts to convert its argument into a tm package Corpus.

apply_as_tm - Apply functions intended to be used on the tm package's TermDocumentMatrix to a wfm object.

apply_as_df - Apply a tm Corpus as a qdap dataframe.

apply_as_df - Apply functions intended to be used on the qdap package's data.frame + sentSplit to a tm Corpus object.

Usage

as.tdm(text.var, grouping.var = NULL, vowel.check = TRUE, ...)

as.TermDocumentMatrix(text.var, grouping.var = NULL, vowel.check = TRUE, ...)

as.dtm(text.var, grouping.var = NULL, vowel.check = TRUE, ...)

as.DocumentTermMatrix(text.var, grouping.var = NULL, vowel.check = TRUE, ...)

## S3 method for class 'Corpus'

as.tdm(text.var, grouping.var = NULL, vowel.check = TRUE, ...)

## Default S3 method:

as.tdm(text.var, grouping.var = NULL, vowel.check = TRUE, ...)

## S3 method for class 'character'

as.tdm(text.var, grouping.var = NULL, vowel.check = TRUE, ...)

## S3 method for class 'Corpus'

as.dtm(text.var, grouping.var = NULL, vowel.check = TRUE, ...)

## Default S3 method:

as.dtm(text.var, grouping.var = NULL,
as.tdm

text.var The text variable or a wfm object.
grouping.var The grouping variables. Default NULL generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.
vowel.check logical. Should terms without vowels be remove?
x A Corpus object.
row.names NULL or a character vector giving the row names for the data frame. Not used in qdap; for base generic consistency.
optional logical. If TRUE, setting row names and converting column names is optional. Not used in qdap; for base generic consistency.
doc Name for Corpus documents.
text Name for Corpus text.
sent.split logical. If TRUE the text variable sentences will be split into individual rows.
demographic.vars Additional demographic information about the grouping variables. This is a data.frame, list of equal length vectors, or a single vector corresponding to the grouping variable/text variable. This information will be mapped to the DMetaData in the Corpus.
wfm.obj A wfm object.
tmfun A function applied to a TermDocumentMatrix object.
to.qdap logical. If TRUE should wfm try to coerce the output back to a qdap object.
tm.corpus A Corpus object.
qdapfun A qdap function that is usually used on text.variable ~ grouping variable.
stopwords A character vector of words to remove from the text. qdap has a number of data sets that can be used as stop words including: Top200Words, Top100Words, Top25Words. For the tm package’s traditional English stop words use tm::stopwords(“english”).
min Minimum word length.
max Maximum word length.
count.apostrophe logical. If TRUE apostrophes are counted as characters.
ignore.case logical. If TRUE stop words will be removed regardless of case.
... Function dependant:
  • as.tdm or as.dtm - Other arguments passed to wfm
  • apply.as_tm - Other arguments passed to functions used on a tm TermDocumentMatrix
  • as.data.frame - Other arguments passed to sentSplit
  • as.Corpus - Other arguments passed to tm’s Corpus

Details

Produces output that is identical to the tm package’s TermDocumentMatrix, DocumentTermMatrix, Corpus or allows convenient interface between the qdap and tm packages.

Value

as.tdm - Returns a TermDocumentMatrix.
as.TermDocumentMatrix - Returns a TermDocumentMatrix.
as.dtm - Returns a DocumentTermMatrix.
**as.tdm**

as.data.frame - Converts a `Corpus` and returns a `qdap` oriented `data.frame`.
as.Corpus - Converts a qdap oriented dataframe and returns a `Corpus`.

apply_as_tm - Applies a tm oriented function to a `wfm` and attempts to simplify back to a `wfm` or weight format.
apply_as_df - Returns the output typical of the applied `qdap` function.

**Note**

apply_as_df coerces to a dataframe with columns named ‘docs’ and the other named ‘text’.

**See Also**

`DocumentTermMatrix`, `Corpus`, `TermDocumentMatrix`, `as.wfm`  
Filter

**Examples**

```r
## Not run:
as.dtm(DATA$state, DATA$person)  
as.tdm(DATA$state, DATA$person)

x <- wfm(DATA$state, DATA$person)  
as.tdm(x)  
as.dtm(x)  
library(tm)  
plot(as.tdm(x))

pres <- as.tdm(pres_debates2012$dialogue, pres_debates2012$person)  
plot(pres, corThreshold = 0.8)

automated_readability_index

Readability Measures

Description

automated_readability_index - Apply Automated Readability Index to transcript(s) by zero or more grouping variable(s).
coleman_liau - Apply Coleman Liau Index to transcript(s) by zero or more grouping variable(s).
SMOG - Apply SMOG Readability to transcript(s) by zero or more grouping variable(s).
flesch_kincaid - Flesch-Kincaid Readability to transcript(s) by zero or more grouping variable(s).
fry - Apply Fry Readability to transcript(s) by zero or more grouping variable(s).
linsear_write - Apply Linsear Write Readability to transcript(s) by zero or more grouping variable(s).

Usage

automated_readability_index(text.var, grouping.var = NULL, 
    rm.incomplete = FALSE, ...)
coleman_liau(text.var, grouping.var = NULL, rm.incomplete = FALSE, ...)
SMOG(text.var, grouping.var = NULL, output = "valid", 
    rm.incomplete = FALSE, ...)
flesch_kincaid(text.var, grouping.var = NULL, rm.incomplete = FALSE, 
    ...)
fry(text.var, grouping.var = NULL, rm.incomplete = FALSE, 
    auto.label = TRUE, grid = FALSE, div.col = "grey85", plot = TRUE, 
    ...)
linsear_write(text.var, grouping.var = NULL, rm.incomplete = FALSE, 
    ...)

Arguments

text.var The text variable.
grouping.var The grouping variables. Default NULL generates one output for all text. Also 
takes a single grouping variable or a list of 1 or more grouping variables.
rm.incomplete logical. If TRUE removes incomplete sentences from the analysis.
output A character vector character string indicating output type. One of "valid" (de-
    fault and congruent with McLaughlin’s intent) or "all".
auto.label logical. If TRUE labels automatically added. If FALSE the user clicks interac-
    tively.
grid logical. If TRUE a micro grid is displayed, similar to Fry’s original depiction, 
    though this may make visualizing more difficult.
div.col The color of the grade level division lines.
plot logical. If TRUE a graph is plotted corresponding to Fry’s graphic representation.
... Other arguments passed to end_inc.
Value

Returns a list of 2 dataframes: (1) Counts and (2) Readability. Counts are the raw scores used to calculate readability score and can be accessed via `counts`. Readability is the dataframe with the selected readability statistic by grouping variable(s) and can be access via `scores`. The `fry` function returns a graphic representation of the readability as the `scores` returns the information for graphing but not a readability score.

Warning

Many of the indices (e.g., Automated Readability Index) are derived from word difficulty (letters per word) and sentence difficulty (words per sentence). If you have not run the `sentSplit` function on your data the results may not be accurate.

Fry

The `fry` function is based on Fry’s formula that randomly samples 3 100 word length passages. If a group(s) in does not contain 300+ words they will not be included in the output.

### bag_o_words

Bag of Words

**Description**

- **bag_o_words** - Reduces a text column to a bag of words.
- **unbag** - Wrapper for `paste(collapse=" ")` to glue words back into strings.
- **breaker** - Reduces a text column to a bag of words and qdap recognized end marks.
- **word_split** - Reduces a text column to a list of vectors of bag of words and qdap recognized end marks (i.e., `.`, `!`, `?`, `*`, `-`).

**Usage**

```r
bag_o_words(text_var, apostrophe.remove = FALSE, ...) unbag(text_var, na.rm = TRUE) breaker(text_var) word_split(text_var)
```

**Arguments**

- `text_var` - The text variable.
- `apostrophe.remove` - logical. If TRUE removes apostrophe’s from the output.
- `na.rm` - logical. If TRUE NAs are removed before pasting.
- `...` - Additional arguments passed to strip.

**Value**

- Returns a vector of stripped words.
- `unbag` - Returns a string.
- `breaker` - Returns a vector of striped words and qdap recognized endmarks (i.e., `.`, `!`, `?`, `*`, `-`).
### Examples

```r
## Not run:
bag_o_words("I'm going home!")
bag_o_words("I'm going home!", apostrophe.remove = TRUE)
unbag(bag_o_words("I'm going home!"))

bag_o_words(DATA$state)
by(DATA$state, DATA$person, bag_o_words)
apply(DATA$state, bag_o_words)

breaker(DATA$state)
by(DATA$state, DATA$person, breaker)
apply(DATA$state, breaker)
unbag(breaker(DATA$state))

word_split(c(NA, DATA$state))
unbag(word_split(c(NA, DATA$state)))

## End(Not run)
```

---

**beg2char**

Grab Begin/End of String to Character

---

**Description**

beg2char - Grab from beginning of string to a character(s).
char2end - Grab from character(s) to end of string.

**Usage**

```
beg2char(text.var, char = " ", noc = 1, include = FALSE)
char2end(text.var, char = " ", noc = 1, include = FALSE)
```

**Arguments**

<table>
<thead>
<tr>
<th>text.var,</th>
<th>A character string</th>
</tr>
</thead>
<tbody>
<tr>
<td>char</td>
<td>The character from which to grab until/from.</td>
</tr>
<tr>
<td>noc</td>
<td>Number of times the character appears before the grab.</td>
</tr>
<tr>
<td>include</td>
<td>logical. If TRUE includes the character in the grab.</td>
</tr>
</tbody>
</table>

**Value**

returns a vector of text with char on/forward removed.

**Author(s)**

Josh O'Brien, Justin Haynes and Tyler Rinker <tyler.rinker@gmail.com>.

beg2char(x3, "\^", 2)

# End(Not run)
```

---

**blank2NA**

*Replace Blanks in a dataframe*

**Description**

Replaces blank (empty) cells in a dataframe. Generally, for internal use.

**Usage**

`blank2NA(dataframe, missing = NA)`

**Arguments**

- `dataframe`: A dataframe with blank (empty) cells.
- `missing`: Value to replace empty cells with.

**Value**

Returns a data frame with blank spaces replaced.
Description

`bracketX` - Apply bracket removal to character vectors.
`bracketXtract` - Apply bracket extraction to character vectors.
`genX` - Apply general chunk removal to character vectors. A generalized version of `bracketX`.
`genXtract` - Apply general chunk extraction to character vectors. A generalized version of `bracketXtract`.

Usage

```r
bracketX(text.var, bracket = "all", missing = NULL, names = FALSE, 
          fix.space = TRUE, scrub = fix.space)
```

```r
bracketXtract(text.var, bracket = "all", with = FALSE, merge = TRUE)
```

```r
genX(text.var, left, right, missing = NULL, names = FALSE, 
     fix.space = TRUE, scrub = TRUE)
```

```r
genXtract(text.var, left, right, with = FALSE, merge = TRUE)
```

Arguments

- `text.var` : The text variable
- `bracket` : The type of bracket (and encased text) to remove. This is one or more of the strings "curly", "square", "round", "angle" and "all". These strings correspond to: {, [, (, < or all four types.
- `missing` : Value to assign to empty cells.
- `names` : logical. If TRUE the sentences are given as the names of the counts.
fix.space  logical. If TRUE extra spaces left behind from an extraction will be eliminated. Additionally, non-space (e.g., "text(no space between text and parenthesis)") is replaced with a single space (e.g., "text (space between text and parenthesis)").

scrub  logical. If TRUE scrubber will clean the text.

merge  logical. If TRUE the results of each bracket type will be merged by sentence. FALSE returns a named list of lists of vectors of bracketed text per bracket type.

left  A vector of character or numeric symbols as the left edge to extract.

right  A vector of character or numeric symbols as the right edge to extract.

Value

bracketX - returns a vector of text with brackets removed.
bracketXtract - returns a list of vectors of bracketed text.
genXtract - returns a vector of text with chunks removed.
genX - returns a list of vectors of removed text.

## End(Not run)

---

build_qdap_vignette

*Replace Temporary Introduction to qdap Vignette*

**Description**

Replaces the temporary (place holder) *Introduction to qdap Vignette* with the actual vignette.

**Usage**

build_qdap_vignette(download.html = FALSE)

**Arguments**

- `download.html` logical. If TRUE the file will be downloaded from: [http://trinker.github.io/qdap/vignettes/qdap_vignette.html](http://trinker.github.io/qdap/vignettes/qdap_vignette.html). This

**Value**

Places the (1) HTML, (2) source, & (3) R code for the *Introduction to qdap Vignette* in the user's `'R-VERSION/library/qdap/doc'`.

**Note**

The *knitr* built HTML approach above takes about 4 minutes. The user may choose the faster approach (< 30 seconds) that downloads the HTML file directly from the Internet (this is for the latest CRAN release of *qdap*). This choice is controlled via the `download.html` argument. The function will ask for the user's permission before writing the documents. Once the user has run this function `browseVignettes(package = 'qdap')` will allow access to the new vignette files.
capitalizer  

*Capitalize Select Words*

**Description**

A helper function for `word_list` that allows the user to supply vectors of words to be capitalized.

**Usage**

```r
capitalizer(text, caps.list = NULL, I.list = TRUE, apostrophe.remove = FALSE)
```

**Arguments**

- `text` A vector of words (generally from `bag_o_words` or `breaker`).
- `caps.list` A list of words to capitalize.
- `I.list` logical. If TRUE capitalizes I words and contractions.
- `apostrophe.remove` logical, asking if apostrophes have been removed. If TRUE will try to insert apostrophe's back into words appropriately.

**Value**

Returns a vector of capitalized words based on supplied capitalization arguments.

**Note**

Not intended for general use. Acts as a helper function to several qdap functions.

**Examples**

```r
## Not run:
capitalizer(bag_o_words("i like it but i'm not certain"), "like")
capitalizer(bag_o_words("i like it but i'm not certain"), "like", FALSE)

## End(Not run)
```
check_spelling

Description

check_spelling - Check the spelling for an vector of strings. The function use the following technique:

- Separate the words from a string into a bag of words.
- Look those words up in a dictionary to find words not recognized/found (considered possibly misspelled).
- These misses (possible misspellings) will be what is looked up for suggested replacements.
- Optionally, reduce dictionary by assuming the first letter of the misspelled word is correct (dictionary for this letter only).
- Reduce dictionary by eliminating words outside of the range of number of characters of the misspelled word.
- Use stringdist to find string distances between possible replacements and the misspelled term.
- Select \( n \) (\( n \) suggests) terms from dictionary that are closest to the misspelled term.

which_misspelled - Check the spelling for a string.

check_spelling_interactive - Interactively check spelling.

correct - Access the spell corrector function from a "check_spelling_interactive" object for subsequent text character vector spelling corrections.

Usage

check_spelling(text.var, range = 2, assume.first.correct = TRUE,
method = "jw", dictionary = qdapDictionaries::GradyAugmented,
parallel = TRUE, cores = parallel::detectCores()/2, n.suggests = 8)

which_misspelled(x, suggest = FALSE, range = 2,
assume.first.correct = TRUE,
dictionary = qdapDictionaries::GradyAugmented, method = "jw",
nchar.dictionary = nchar(dictionary),
first.char.dictionary = substring(dictionary, 1, 1), n.suggests = 8)

check_spelling_interactive(text.var, range = 2,
assume.first.correct = TRUE, click = TRUE, method = "jw",
dictionary = qdapDictionaries::GradyAugmented, parallel = TRUE,
cores = parallel::detectCores()/2, n.suggests = 8, ...)

correct(x, ...)

Arguments

text.var  The text variable.

range  An integer of length 1 to use as a range for number of characters, beyond the
number of characters of a word not found in the dictionary, to initially limit
dictionary size and thus time to find a suggested replacement term. This may
be expanded if no suitable suggestion is returned.

assume.first.correct  logical. If TRUE it is assumed that the first letter of the misspelled word is correct.
This reduces the dictionary size, thus speeding up computation.

method  Method for distance calculation. The default is "jaccard". It is assumed that
smaller measures indicate closer distance. Measures that do not adhere to this
assumption will result in incorrect output (see stringdist for details).

dictionary  A character vector of terms to search for. To reduce overhead it is expected that
this dictionary is lower case, unique terms.

parallel  logical. If TRUE attempts to run the function on multiple cores. Note that this
may not mean a speed boost if you have one core or if the data set is smaller as
the cluster takes time to create.

cores  The number of cores to use if parallel = TRUE. Default is half the number of
available cores.

n.suggests  The number of terms to suggest. In the case of a tie (multiple terms have the
same distance from misspelled word) all will be provided. Dictionary reduction
may result in less than n.suggests suggested terms.

x  If which_misspelled - A character string. If correct - An object from check_spelling_interactive.
suggest  logical. If TRUE returns a data.frame with possible suggestions for misspelled
words (words not found in the dictionary).

nchar.dictionary  A vector that corresponds in length and content to dictionary with elements
that are the precalculated number of characters for each word in the dictionary.

first.char.dictionary  A vector that corresponds in length and content to dictionary with elements
that are the pre-allotted first characters of each word in the dictionary.

click  logical. If TRUE the interface is a point and click GUI. If FALSE the interface is
command line driven.

...  ignored

Value

check_spelling - Returns a data.frame with row (row number), not.found word.no (number
of misspelled word), not.found (a word not found in the dictionary), suggestion (the most likely
replacement for the word), and more.suggestions (A list of vectors of up to 10 most likely re-
placements).

which_misspelled - Returns either a named vector (names are the word number) of possible mis-
spelled words (if suggestions = FALSE) or a data.frame with word.no (number of misspelled
word), not.found (a word not found in the dictionary), suggestion (the most likely replacement for the word), and more.suggestions (A list of vectors of up to 10 most likely replacements).

check_spelling_interactive - Returns a character vector with the corrected text, the replacement list (via an attribute to the character vector), and a function to correct the same spelling errors in subsequent text character vectors.

correct - Returns a function for correcting spelling errors.

Note

A possible misspelled word is defined as not found in the dictionary.

check_spelling_interactive - The user may go back (undo) by pressing "TYPE MY OWN" entering either "1" (not) or "0" (similar to a phone system). The second choice in the "SELECT REPLACEMENT:" will be the original word and is prefixed with "IGNORE:". Press this to keep the original word.

**check_text**

*Check Text For Potential Problems*

Description

Uncleaned text may result in errors, warnings, and incorrect results in subsequent analysis. check_text checks text for potential problems and suggests possible fixes. Potential text anomalies that are detected include: factors, missing ending punctuation, empty cells, double punctuation, non-space after comma, no alphabetic characters, non-ascii, missing value, and potentially misspelled words.

Usage

check_text(text.var, file = NULL)
Arguments

text.var  The text variable.
file     A connection, or a character string naming the file to print to. If NULL prints to the console. Note that this is assigned as an attribute and passed to print.

Value

Returns a list with the following potential text faults reports:

- non_character- Text that is non-character.
- missing_ending_punctuation- Text with no endmark at the end of the string.
- empty- Text that contains an empty element (i.e., "").
- double_punctuation- Text that contains two qdap punctuation marks in the same string.
- non_space_after_comma- Text that contains commas with no space after them.
- no_alpha- Text that contains string elements with no alphabetic characters.
- non_ascii- Text that contains non-ASCII characters.
- missing_value- Text that contains missing values (i.e., NA).
- containing_escaped- Text that contains escaped (see ?Quotes).
- containing_digits- Text that contains digits.
- indicating_incomplete- Text that contains endmarks that are indicative of incomplete/trailing sentences (e.g., . . .).
- potentially_misspelled- Text that contains potentially misspelled words.

Note

The output is a list but prints as a pretty formatted output with potential problem elements, the accompanying text, and possible suggestions to fix the text.

## Not run:

```r
x <- c("i like", "i want. thet them .", "I am ! that!", ",", NA, "they,were there", ".", ",", ",?", ",3"); "I like goud eggs!";
"i 4like...", "\tgreat", "She said \"yes\"")
check_text(x)
print(check_text(x), include.text=FALSE)

y <- c("A valid sentence.", "yet another!")
check_text(y)

## End(Not run)```
**chunker**

*Break Text Into Ordered Word Chunks*

**Description**

Some visualizations and algorithms require text to be broken into chunks of ordered words. chunker breaks text, optionally by grouping variables, into equal chunks. The chunk size can be specified by giving number of words to be in each chunk or the number of chunks.

**Usage**

```r
cunker(text.var, grouping.var = NULL, n.words, n.chunks,
       as.string = TRUE, rm.unequal = FALSE)
```

**Arguments**

- `text.var` The text variable
- `grouping.var` The grouping variables. Default NULL generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.
- `n.words` An integer specifying the number of words in each chunk (must specify n.chunks or n.words).
- `n.chunks` An integer specifying the number of chunks (must specify n.chunks or n.words).
- `as.string` logical. If TRUE the chunks are returned as a single string. If FALSE the chunks are returned as a vector of single words.
- `rm.unequal` logical. If TRUE final chunks that are unequal in length to the other chunks are removed.

**Value**

Returns a list of text chunks.

**Examples**

```r
with(DATA, chunker(state, n.chunks = 10))
with(DATA, chunker(state, n.words = 10))
with(DATA, chunker(state, n.chunks = 10, as.string=FALSE))
with(DATA, chunker(state, n.chunks = 10, rm.unequal=TRUE))
with(DATA, chunker(state, person, n.chunks = 10))
with(DATA, chunker(state, list(sex, adult), n.words = 10))
with(DATA, chunker(state, person, n.words = 10, rm.unequal=TRUE))

## Bigger data
with(hamlet, chunker(dialogue, person, n.chunks = 10))
with(hamlet, chunker(dialogue, person, n.words = 300))

## Not run:
## with polarity hedonmetrics
```
```r
dat <- with(pres.debates2012[pres.debates2012$person %in% qcv(Obama, Romney), ],
        chunker(dialogue, list(person, time), n.words = 300))

dat2 <- colsplit2df(list2df(dat, "dialogue", "person&time")[, 2:1])

dat3 <- split(dat2[, -2], dat2$time)

ltruncdf(dat3, 10, 50)

poldat <- lapply(dat3, function(x) with(x, polarity(dialogue, person, constrain = TRUE)))

m <- lapply(poldat, function(x) plot(cumulative(x)))

m <- Map(function(w, x, y, z) {
        w + ggtitle(x) + xlab(y) + ylab(z)
    },
    m,
    paste("Debate", 1:3),
    list(NULL, NULL, "Duration (300 Word Segment)",
    list(NULL, "Cumulative Average Polarity", NULL))
)

library(gridExtra)
do.call(grid.arrange, m)

## By person

library(gridExtra)
do.call(grid.arrange, unlist(poldat2, recursive=FALSE))

## End(Not run)
```
**clean**

*Remove Escaped Characters*

**Description**

Preprocess data to remove escaped characters

**Usage**

clean(text.var)

**Arguments**

text.var  The text variable

**Value**

Returns a vector of character strings with escaped characters removed.

**Examples**

```r
## Not run:
x <- "I go \n
to the \ntnext line"
x

clean(x)

## End(Not run)
```

---

**cm_2long**

*A Generic to Long Function*

**Description**

A wrapper for cm_df2long, cm_range2long, and cm_time2long that automatically detects the objects being read and outputs the correct form and class.

**Usage**

cm_2long(..., v.name = "variable", list.var = TRUE, debug = TRUE)
Arguments

- **v.name**: An optional name for the column created for the list.var argument.
- **list.var**: logical. If TRUE creates a column for the data frame created by each time.list passed to `cm_tRl`.
- **debug**: logical. If TRUE debugging mode is on. `cm_time2long` will return possible errors in time span inputs.
- ... list object(s) in the form generated by `cm_df.temp, cm_range.temp, or cm_time.temp`.

Value

Returns a long data.frame of the correct `cm_XXX` classes.

See Also

`cm_df2long, cm_range2long, cm_time2long`

Examples

```r
## Not run:
## cm_range2long use:
foo <- list(
  person_greg = qcv(terms='7:11, 20:24, 30:33, 49:56'),
  person_researcher = qcv(terms='42:48'),
  person_sally = qcv(terms='25:29, 37:41'),
  person_sam = qcv(terms='1:6, 16:19, 34:36'),
  person_teacher = qcv(terms='12:15'),
  adult_0 = qcv(terms='1:11, 16:41, 49:56'),
  adult_1 = qcv(terms='12:15, 42:48'),
  AA = qcv(terms="1"),
  BB = qcv(terms="1:2, 3:10, 19"),
  CC = qcv(terms="1:9, 100:150")
)

foo2 <- list(
  person_greg = qcv(terms='7:11, 20:24, 30:33, 49:56'),
  person_researcher = qcv(terms='42:48'),
  person_sally = qcv(terms='25:29, 37:41'),
  person_sam = qcv(terms='1:6, 16:19, 34:36'),
  person_teacher = qcv(terms='12:15'),
  adult_0 = qcv(terms='1:11, 16:41, 49:56'),
  adult_1 = qcv(terms='12:15, 42:48'),
  AA = qcv(terms="40"),
  BB = qcv(terms="50:90"),
  CC = qcv(terms="60:90, 100:120, 150"),
  DD = qcv(terms="")
)

cm_2long(foo, foo2, v.name = "time")

## cm_time2long use:
```
cm_code.blank

Description

Transform codes with any binary operator combination.

Usage

```r
cm_code.blank(x2long.obj, combine.code.list, rm.var = NULL,
               overlap = TRUE)
```

Arguments

- `x2long.obj` An object from `cm_range2long`, `cm_time2long` or `cm_df2long`.
- `combine.code.list` A list of named character vectors of at least two code column names to combine.
- `rm.var` Name of the repeated measures column.
- `overlap` logical, integer or character of binary operator + integer. If TRUE finds the overlap. If FALSE finds anywhere any of the codes occur. If integer finds that exact combination of overlaps. If character must be a logical vector c(>, <, <=, >=, !=) followed by an integer and wrapped with quotes.

Value

Returns a dataframe with transformed occurrences of supplied overlapping codes added.
Note

For most jobs \texttt{cm\_code\_transform} will work. This adds a bit of flexibility in exclusion and partial matching. The code column must be named "code" and your start and end columns must be named "start" and "end".

See Also

\texttt{cm\_rangeRlong}, \texttt{cm\_timeRlong}, \texttt{cm\_df2long}, \texttt{cm\_code\_overlap}, \texttt{cm\_code\_combine}, \texttt{cm\_code\_exclude}, \texttt{cm\_code\_transform}

Examples

\begin{verbatim}
## Not run:
foo <- list(
  AA = qcv(terms="1:10"),
  BB = qcv(terms="1:2, 3:10, 19"),
  CC = qcv(terms="1:3, 5:6")
)

foo2 <- list(
  AA = qcv(terms="4:8"),
  BB = qcv(terms="1:4, 10:12"),
  CC = qcv(terms="1, 11, 15:20"),
  DD = qcv(terms="")
)

## Single occurrence version
(x <- cm\_range2long(foo))

cm\_code\_blank(x, combine.code.list = list(ABC=qcv(AA, BB, CC)),
  overlap = "+=1")

## Repeated measures version
(z <- cm\_range2long(foo, foo2, v.name="time"))

cm\_code\_blank(z, combine.code.list = list(ABC=qcv(AA, BB, CC)),
  rm.var = "time", overlap = "+=1")

cm\_code\_blank(z, combine.code.list = list(AB=qcv(AA, BB)),
  rm.var = "time", overlap = TRUE)

cm\_code\_blank(z, combine.code.list = list(AB=qcv(AA, BB)),
  rm.var = "time", overlap = FALSE)

cm\_code\_blank(z, combine.code.list = list(AB=qcv(AA, BB)),
  rm.var = "time", overlap = ">1")

cm\_code\_blank(z, combine.code.list = list(AB=qcv(AA, BB)),
  rm.var = "time", overlap = ">=2")

## Notice `overlap = "+=2"` above is identical to `cm\_code\_overlap`

\texttt{cm\_code\_overlap(z, overlap.code.list = list(AB=qcv(AA, BB))}
\end{verbatim}
cm_code.combine

Combine Codes

Description

Combine all occurrences of codes into a new code.

Usage

cm_code.combine(x2long.obj, combine.code.list, rm.var = NULL)

Arguments

x2long.obj An object from cm_range2long, cm_time2long or cm_df2long.
combine.code.list A list of named character vectors of at least two code column names to combine
rm.var Name of the repeated measures column.
Value

Returns a dataframe with combined occurrences of supplied overlapping codes added.

Note

The code column must be named "code" and your start and end columns must be named "start" and "end".

## End(Not run)

cm_code.exclude          Exclude Codes

Description

Find the occurrences of n codes excluding the nth code. For example you have times/words coded for a teacher and you also have times/words coded for happiness. You can find all the happiness times excluding the teacher times or vice versa.

Usage

cm_code.exclude(x2long.obj, exclude.code.list, rm.var = NULL)

Arguments

x2long.obj                An object from cm_range2long, cm_time2long or cm_df2long.
exclude.code.list         A list of named character vectors of at least two code column names to compare and exclude. The last column name is the one that will be excluded.
rm.var                    Name of the repeated measures column.

Value

Returns a dataframe with n codes excluding the nth code.

Note

The code column must be named "code" and your start and end columns must be named "start" and "end".

## End(Not run)
**Description**

Combine co-occurrences of codes into a new code.

**Usage**

\[ \text{cm\_code\_overlap}(x2\text{long}\_\text{obj}, \text{overlap}\_\text{code}\_\text{list}, \text{rm}\_\text{var} = \text{NULL}) \]

**Arguments**

- **x2\text{long}\_\text{obj}**
  
  An object from \text{cm\_range2long}, \text{cm\_time2long} or \text{cm\_df2long}.

- **overlap\_code\_list**

  A list of named character vectors of at least two code column names to aggregate co-occurrences.

- **rm\_var**

  Name of the repeated measures column.

**Value**

Returns a dataframe with co-occurrences of supplied overlapping codes added.

**Note**

The code column must be named \text{code} and your start and end columns must be named \text{"start"} and \text{"end"}.

**See Also**

\text{cm\_range2long}, \text{cm\_time2long}, \text{cm\_df2long}, \text{cm\_code\_combine}, \text{cm\_code\_transform}

**Examples**

```r
## Not run:
foo <- list(
  AA = qcv(terms="1:10"),
  BB = qcv(terms="1:2, 3:10, 19"),
  CC = qcv(terms="1:3, 5:6")
)

foo2 <- list(
  AA = qcv(terms="4:8"),
  BB = qcv(terms="1:4, 10:12"),
  CC = qcv(terms="1, 11, 15:20"),
  DD = qcv(terms=""))

(x <- cm_range2long(foo))
(z <- cm_range2long(foo, foo2, v.name="time"))
cm_code.overlap(x, list(AB=qcv(AA, BB)))
cm_code.overlap(x, list(ALL=qcv(AA, BB, CC)))
combines <- list(AB=qcv(AA, BB), ABC=qcv(AA, BB, CC))
```
cm_code.transform

Transform Codes

Description

Transform co-occurrences and/or combinations of codes into a new code(s).

Usage

```
cm_code.transform(x2long.obj, overlap.code.list = NULL,
                  combine.code.list = NULL, exclude.code.list = NULL, rm.var = NULL)
```

Arguments

- `x2long.obj`: An object from `cm_range2long`, `cm_time2long` or `cm_df2long`.
- `overlap.code.list`: A list of named character vectors of at least two code column names to aggregate co-occurrences.
- `combine.code.list`: A list of named character vectors of at least two code column names to combine
cm_code.transform

exclude.code.list
   A list of named character vectors of at least two code column names to compare and exclude. The last column name is the one that will be excluded.

rm.var
   Name of the repeated measures column.

Value
   Returns a dataframe with overlapping, combined occurrences, and/or exclusion of supplied overlapping codes added.

Note
   The code column must be named "code" and your start and end columns must be named "start" and "end".

      combine.code.list = list(oABC=qcv(AA, BB, CC)),
      exclude.code.list = list(ABnoC=qcv(AA, BB, CC))
**cm_combine.dummy**

Find Co-occurrence Between Dummy Codes

**Description**

Combine code columns where they co-occur.

**Usage**

```r
cm_combine.dummy(cm.l2d.obj, combine.code, rm.var = "time", overlap = TRUE)
```

**Arguments**

- **cm.l2d.obj**
  - An object from `cm_long2dummy`.
- **combine.code**
  - A list of named character vectors of at least two code column names to combine.
- **rm.var**
  - Name of the repeated measures column. Default is "time".
- **overlap**
  - logical, integer or character of binary operator + integer. If TRUE finds the overlap. If FALSE finds anywhere any of the codes occur. If integer finds that exact combination of overlaps. If character must be a logical vector c(>, <, <=, ->, ==, !=) followed by an integer and wrapped with quotes.

**Value**

Returns a dataframe with co-occurrences of provided code columns.

**See Also**

`cm_long2dummy`
Examples

```r
## Not run:
foo <- list(
  AA = qcv(terms="1:10"),
  BB = qcv(terms="1:2, 3:10, 19"),
  CC = qcv(terms="1:3, 5:6")
)

foo2 <- list(
  AA = qcv(terms="4:8"),
  BB = qcv(terms="1:4, 10:12"),
  CC = qcv(terms="1, 11, 15:20"),
  DD = qcv(terms="")
)

(x <- cm_range2long(foo))
(D1 <- cm_long2dummy(x))

(z <- cm_range2long(foo, foo2, v.name="time"))
(D2 <- cm_long2dummy(z, "time"))

cm_combine_dummy(D1, combine.code = list(AB=qcv(AA, BB)))
cm_combine_dummy(D1, combine.code = list(AB=qcv(AA, BB), overlap="==1"))
cm_combine_dummy(D1, combine.code = list(AB=qcv(AA, BB), overlap="=!1"))
D1 <- cm_combine_dummy(D1, combine.code = list(AB=qcv(AA, BB), overlap=0))
D1 <- cm_combine_dummy(D1, combine.code = list(CAB=qcv(AB, CC), overlap=FALSE))

combines <- list(AB=qcv(AA, BB), ABC=qcv(AA, BB, CC))

## End(Not run)
```

---

**cm_df.fill**  
**Range Coding**

**Description**

Allows range coding of words for efficient coding.

**Usage**

```r
cm_df.fill(dataframe, ranges, value = 1, text.var = NULL, code.vars = NULL, transform = FALSE)
```

**Arguments**

- **dataframe**  
  A dataframe containing a text variable.

- **ranges**  
  A named list of ranges to recode. Names correspond to code names in dataframe.
value: The recode value. Takes a vector of length one or a vector of length equal to the number of code columns.

text.var: The name of the text variable.

code.vars: Optional vector of codes.

transform: logical. If TRUE the words are located across the top of dataframe.

Details

After ranging coding transcripts via `cm_df.temp` or the blank code matrix via `cm_df.transcript`, `cm_df.fill` is used to create a matrix of what codes occurred at what words (a filled code matrix). A list of range codes (word number spans) is fed to `cm_df.fill`. A single number indicates a single word with that coding scheme whereas the colon is used as a separator that indicates the range of words from x to y are that particular code.

Value

Generates a dummy coded dataframe.

Examples

```r
## Not run:
codes <- qcv(dc, sf, wes, pol, rejk, lk, azx, mmm)
X <- cm_df.temp(DATA, "state", codes)
head(X, 10)

#recommended structure
cds1 <- list(
  dc=c(1:3, 5),
  sf=c(4, 6:9, 11),
  wes=0,
  pol=0,
  rejk=0,
  lk=0,
  azx=1:30,
  mmm=5
)

out1 <- cm_df.fill(X, cds1)
head(out1)

#recommended structure
```
cm_df.temp

```r
cds2 <- list(
  sf=c(4, 6:9, 11),
  dc=c(1:3, 5),
  azx=1:30,
  mmm=5
)
out2 <- cm_df.fill(X, cds2)
head(out2)

## End(Not run)
```

### Break Transcript Dialogue into Blank Code Matrix

#### Description
Breaks transcript dialogue into words while retaining the demographic factors associate with each word. The codes argument provides a matrix of zeros that can serve as a dummy coded matrix of codes per word.

#### Usage

```r
cm_df.temp(dataframe, text.var, codes = NULL, file = NULL,
  transpose = FALSE, strip = FALSE, ...)
```

#### Arguments
- **dataframe**: A dataframe containing a text variable.
- **text.var**: The name of the text variable.
- **codes**: Optional list of codes.
- **file**: The name of the file (csv is recommended file type). If NULL no file is written.
- **transpose**: Logical. If TRUE transposes the dataframe so that the text is across the top.
- **strip**: Logical. If TRUE all punctuation is removed.
- **...**: Other arguments passed to strip.

#### Value
Generates a dataframe, and optional csv file, of individual words while maintaining demographic information. If a vector of codes is provided the outcome is a matrix of words used by codes filled with zeros. This dataframe is useful for dummy coded (1=yes code exists; 0-no it does not) representation of data and can be used for visualizations and statistical analysis.

head(out1, 15)
out2 <- cm_df.temp(DATA, "state", codes, transpose = TRUE)
out2[, 1:10]
out3 <- cm_df.temp(raj.act.1, "dialogue", codes)
head(out3, 15)
out4 <- cm_df.temp(raj.act.1, "dialogue", codes, transpose = TRUE)
out4 [, 1:8]

## End(Not run)
```

---

**cm_df.transcript**

*Transcript With Word Number*

Description

Output a transcript with word number/index above for easy input back into qdap after coding.

Usage

```r
cm_df.transcript(text.var, grouping.var, file = NULL, indent = 4,
width = 70, space = 2, ...)
```

Arguments

- `text.var` The text variable.
- `grouping.var` The grouping variables. Default NULL generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.
- `file` A connection, or a character string naming the file to print to (e.g., .doc, .txt).
- `indent` Number of spaces to indent.
- `width` Width to output the file (defaults to 70; this is generally a good width and indent for a .docx file).
- `space` An integer value denoting the vertical spacing between the grouping.var and the numbered text (allow more space for more coding room) in the output of a text file.
- `...` Other arguments passed to strip.
**Value**

Returns a transcript by grouping variable with word number above each word. This makes use with `cm_df2long` transfer/usage easier because the researcher has coded on a transcript with the numeric word index already.

**Note**

It is recommended that the researcher actually codes on the output from this file. The codes can then be transferred to via a list. If a file already exists `cm_df.transcript` will append to that file.

```

---

**Description**

Transforms the range coding structure(s) from `cm_df.temp` (in list format) into a data frame of start and end durations in long format.
Usage

```r
cm_df2long(df.temp.obj, v.name = "variable", list.var = TRUE,
code.vars = NULL, no.code = NA, add.start.end = TRUE,
repeat.vars = NULL, rev.code = FALSE)
```

Arguments

- `df.temp.obj`: A character vector of names of object(s) created by `cm_df.temp`, a list of `cm_df.temp` created objects or a data frame created by `cm_df.temp`.
- `v.name`: An optional name for the column created for the list.var argument.
- `list.var`: logical. If TRUE creates a column for the data frame created by each time.list.
- `code.vars`: A character vector of code variables. If NULL uses all variables from the first column after the column named word.num.
- `no.code`: The value to assign to no code; default is NA.
- `add.start.end`: logical. If TRUE adds a column for start and end times.
- `repeat.vars`: A character vector of repeated/stacked variables. If NULL uses all non code.vars variables.
- `rev.code`: logical. If TRUE reverses the order of code.vars and no.code variables.

Value

Generates a data frame of start and end times for each code.

`cm_time2long`, `cm_range2long`, `cm_df.temp`

Examples

```r
## Not run:
codes <- qcv(dc, sf, wes, pol, rejk, lk, azx, mmm)
x1 <- cm_df.temp(DATA, "state", codes)
head(x1)

#empty code matrix
out1 <- cm_df2long(x1, code.vars = codes)
head(out1, 15)

#fill it randomly
x1[, 7:14] <- lapply(7:14, function(i) sample(0:1, nrow(x1), TRUE))
out2 <- cm_df2long(x1, code.vars = codes)
head(out2, 15)
plot(out2)
```
cm_distance

Distance Matrix Between Codes

Description

Generate distance measures to ascertain a mean distance measure between codes.

Usage

```r
cm_distance(dataframe, pvals = c(TRUE, FALSE), replications = 1000,
parallel = TRUE, extended.output = TRUE, time.var = TRUE,
code.var = "code", causal = FALSE, start.var = "start",
end.var = "end", cores = detectCores()/2)
```

Arguments

- `dataframe`: A data frame from the cm_x2long family (cm_range2long; cm_df2long; cm_time2long).
- `pvals`: A logical vector of length 1 or 2. If element 2 is blank element 1 will be recycled. If the first element is TRUE pvalues will be calculated for the combined (main) output for all repeated measures from simulated resampling of the data. If the second element is TRUE pvalues will be calculated for the individual (extended) repeated measures output from simulated resampling of the data. Default is to calculate pvalues for the main output but not for the extended output. This process involves multiple resampling of the data and is a time consuming process. It may take from a few minutes to days to calculate the pvalues depending on the number of all codes use, number of different codes and number of replications.
- `replications`: An integer value for the number of replications used in resampling the data if any pvals is TRUE. It is recommended that this value be no lower than 1000. Failure to use enough replications may result in unreliable pvalues.
- `parallel`: logical. If TRUE runs the cm_distance on multiple cores (if available). This will generally be effective with most data sets, given there are repeated measures, because of the large number of simulations. Default uses 1/2 of the available cores.
- `extended.output`: logical. If TRUE the information on individual repeated measures is calculated in addition to the aggregated repeated measures results for the main output.
- `time.var`: An optional variable to split the dataframe by (if you have data that is by various times this must be supplied).
- `code.var`: The name of the code variable column. Defaults to "codes" as out putted by x2long family.
causal logical. If TRUE measures the distance between x and y given that x must precede y. That is, only those y_i that begin after the x_i has begun will be considered, as it is assumed that x precedes y. If FALSE x is not assumed to precede y. The closest y_i (either its beginning or end) is calculated to x_i (either its beginning or end).

start.var The name of the start variable column. Defaults to "start" as outputted by x2long family.

dist.var The name of the end variable column. Defaults to "end" as outputted by x2long family.

cores An integer value describing the number of cores to use if parallel = TRUE. Default is to use half of the available cores.

Details
Note that row names are the first code and column names are the second comparison code. The values for Code A compared to Code B will not be the same as Code B compared to Code A. This is because, unlike a true distance measure, cm_distance’s matrix is asymmetrical. cm_distance computes the distance by taking each span (start and end) for Code A and comparing it to the nearest start or end for Code B.

Value
An object of the class "cm_distance". This is a list with the following components:

pvals A logical indication of whether pvalues were calculated
replications Integer value of number of replications used
extended.output An optional list of individual repeated measures information
main.output A list of aggregated repeated measures information
adj.alpha An adjusted alpha level (based on $\alpha = .05$) for the estimated p-values using the upper end of the confidence interval around the p-values

Within the lists of extended.output and list of the main.output are the following items:

mean A distance matrix of average distances between codes
sd A matrix of standard deviations of distances between codes
n A matrix of counts of distances between codes
stan.mean A matrix of standardized values of distances between codes. The closer a value is to zero the closer two codes relate.
pvalue A n optional matrix of simulated pvalues associated with the mean distances

Warning
p-values are estimated and thus subject to error. More replications decreases the error. Use:

$$p \pm \left( 1.96 \cdot \sqrt{\frac{\alpha(1 - \alpha)}{n}} \right)$$

to adjust the confidence in the estimated p-values based on the number of replications.

```
cm_dummy2long

Convert cm_combine.dummy Back to Long

Description

cm_combine.dummy back to long.

Usage

cm_dummy2long(cm_long2dummy_obj, rm.var = "time")

Arguments

- **cm_long2dummy_obj**
  An object from cm_combine.dummy

- **rm.var**
  Name of the repeated measures column. Default is "time".

Value

Returns a dataframe with co-occurrences of provided code columns.

## End(Not run)

---

cm_long2dummy  **Stretch and Dummy Code cm_xxx2long**

Description

Stretches and dummy codes a cm_xxx2long dataframe to allow for combining columns.

Usage

```r
cm_long2dummy(dataframe, rm.var = NULL, code = "code",
               start = "start", end = "end")
```
Arguments

dataframe  A dataframe that contains the person variable.
rmNvar  An optional character argument of the name of a repeated measures column.
code  A character argument of the name of a repeated measures column. Default is "code".
start  A character argument of the name of a repeated measures column. Default is "start".
end  A character argument of the name of a repeated measures column. Default is "end".

Value

Returns a dataframe or a list of stretched and dummy coded dataframe(s).

  CC = qcv(terms="1, 11, 15:20"),
  DD = qcv(terms=""))

(x <- cm_range2long(foo))
cm_long2dummy(x)

(z <- cm_range2long(foo, foo2, v.name="time"))
out <- cm_long2dummy(z, "time")
ltruncdf(out)

## End(Not run)
```
cm_range.temp  Range Code Sheet

Description
Generates a range coding sheet for coding words.

Usage
```
cm_range.temp(codes, text.var = NULL, grouping.var = NULL, file = NULL)
```

Arguments
- codes  Character vector of codes.
- text.var  The text variable.
- grouping.var  The grouping variables. Also takes a single grouping variable or a list of 1 or more grouping variables.
- file  A connection, or a character string naming the file to print to (.txt or .doc is recommended).

References

See Also
- cm_time.temp

Examples
```
## Not run:
cm_range.temp(qcv(AA, BB, CC))
with(DATA, cm_range.temp(qcv(AA, BB, CC), state, list(person, adult)))
## cm_range.temp(qcv(AA, BB, CC), file = "foo.txt")
## library(reports); delete("foo.txt")
## End(Not run)
```
cm_range2long  Transform Codes to Start-End Durations

Description

Transforms the range coding structure(s) from cm_range.temp (in list format) into a data frame of start and end durations in long format.

Usage

```r
cm_range2long(..., v.name = "variable", list.var = TRUE,
               debug = TRUE, object = NULL)
```

Arguments

- `v.name` An optional name for the column created for the list.var argument.
- `list.var` logical. If TRUE creates a column for the data frame created by each time.list passed to cm_t2l.
- `debug` logical. If TRUE debugging mode is on. `cm_time2long` will return possible errors in time span inputs.
- `object` A list of list object(s) generated by `cm_time.temp`.
- `...` list object(s) in the form generated by `cm_time.temp`.

Value

Generates a data frame of start and end spans for each code.

References

See Also

`cm_df2long`, `cm_time.temp`, `cm_df.transcript`

Examples

```r
## Not run:
foo <- list(
  person_greg = qcv(terms='7:11, 20:24, 30:33, 49:56'),
  person_researcher = qcv(terms='42:48'),
  person_sally = qcv(terms='25:29, 37:41'),
  person_sam = qcv(terms='1:6, 16:19, 34:36'),
  person_teacher = qcv(terms='12:15'),
  adult_0 = qcv(terms='1:11, 16:41, 49:56'),
  adult_1 = qcv(terms='12:15, 42:48'),
)```
Description
Generates a time span coding sheet and coding format sheet.

Usage
```r
cm_time.temp(codes, grouping.var = NULL, start = "00:00", end = NULL, 
file = NULL, coding = FALSE, print = TRUE)
```

Arguments
- `codes` List of codes.
- `grouping.var` The grouping variables. Also takes a single grouping variable or a list of 1 or more grouping variables.
- `start` A character string in the form of "00:00" indicating start time (default is ":00").
- `end` A character string in the form of "00:00" indicating end time.
cm_time2long

Transform Codes to Start-End Times

Description

Transforms the range coding structure(s) from `cm_time.temp` (in list format) into a data frame of start and end times in long format.

Usage

```r
cm_time2long(..., v.name = "variable", list.var = TRUE, debug = TRUE, object = NULL)
```
Arguments

v.name An optional name for the column created for the list.var argument
list.var logical. If TRUE creates a column for the data frame created by each time.list passed to cm_t2l.
debug logical. If TRUE debugging mode is on. cm_time2long will return possible errors in time span inputs.
object A list of list object(s) generated by cm_time.temp.
... List object(s) in the form generated by cm_time.temp.

Value
Generates a dataframe of start and end times for each code.

)
```

```
## colcomb2class

**Combine Columns to Class**

### Description

Combine columns from qdap classes or a data.frame.

### Usage

```r
colcomb2class(dataframe, combined.columns, class = "list", percent = TRUE, digits = 2, elim.old = TRUE, zero.replace = 0, override = FALSE)
```

### Arguments

- **dataframe**: A dataframe or qdap class (e.g., termco, question_type, pos_by, character_table).
- **combined.columns**: A list of named vectors of the colnames/indexes of the numeric columns to be combined (summed). If a vector is unnamed a name will be assigned.
- **class**: The class to assign to the output.
- **percent**: logical. If TRUE output given as percent. If FALSE the output is proportion.
- **digits**: Integer; number of decimal places to round when printing.
- **elim.old**: logical. If TRUE eliminates the columns that are combined together by the named match.list. TRUE outputs the table proportionally (see `prop`).
- **zero.replace**: Value to replace 0 values with.
- **override**: logical. If TRUE the printing options (e.g., percent, digits, etc.) of the dataframe argument are overrode.

### Value

Returns a list with raw counts, percents and combined raw and percents.
Examples

## Not run:
## 'termco' example
ml <- list(
  cat1 = c(" the ", " a ", " an "),
  cat2 = c(" I" ),
  "good",
  the = c("the", " the ", " the", "the")
)
dat1 <- with(raj.act.1, termco(dialogue, person, ml))
colcomb2class(dat1, list(cats = c("cat1", "cat2")))

## 'question_type' example
dat2 <- question_type(DATA.SPLIT$state, DATA.SPLIT$person)
combs <- list(
  'wh/how' = c("what", "how"),
  oth = c("shall", "implied_do/does/did")
)
colcomb2class(dat2, combs)

## 'pos_by' example
dat3 <- with(DATA, pos_by(state, list(adult, sex)))
colcomb2class(dat3, qcv(DT, EX, FW))

## data.frame example
dat4 <- data.frame(X=LETTERS[1:5], matrix(sample(0:5, 20, TRUE), ncol = 4))
colcomb2class(dat4, list(new = c("X1", "X4")))

## End(Not run)

colSplit

Separate a Column Pasted by paste2

Description

Separates a paste2 column into separate columns.

Usage

colSplit(column, col.sep = ".", name.sep = "+")

Arguments

column The pasted vector.

col.sep The column separator used in paste2.

name.sep Name separator used in the column (generally for internal use with colsplit2df).
Value

Returns a dataframe of split columns.

See Also

colsplit2df, paste2

Examples

```r
## Not run:
foo1 <- paste2(CO2[, 1:3])
head(foo1, 12)
bar1 <- colSplit(foo1)
head(bar1, 10)

foo2 <- paste2(mtcars[, 1:3], sep="|")
head(foo2, 12)
bar2 <- colSplit(foo2, col.sep = "|")
head(bar2, 10)

## End(Not run)
```

---

colsplit2df

Wrapper for colSplit that Returns Dataframe(s)

description

colsplit2df - Wrapper for colSplit that returns a dataframe.
colsplit2df - Wrapper for colsplit2df designed for qdap lists that returns a list dataframes.

Usage

colsplit2df(dataframe, splitcols = 1, new.names = NULL, sep = ".", keep.orig = FALSE, name.sep = "&", index.names = FALSE)
colsplit2df(qdap.list, keep.orig = FALSE)

Arguments

dataframe A dataframe with a column that has been pasted together.
splitcols The name/index of the column(s) that has been pasted together.
new.names A character vector of new names to assign to the columns (or list of names if multiple columns are being split). Default attempts to extract the original names before the paste.
sep The character(s) that was used in paste2 to paste the columns.
keep.orig logical. If TRUE the original pasted column will be retained as well.
name.sep The character(s) that was used to paste the column names.
index.names logical. If TRUE names of columns that are duplicated are indexed with c("name.1", "name.2", ... "name.n").
qdap.list A qdap list object that contains dataframes with a leading paste2 column.

Value
colsplit2df - returns a dataframe with the paste2 column split into new columns.
lcolsplith2df - returns a list of dataframes with the paste2 column split into new columns.

Warning
This will strip the class of the qdap object.

Note
lcolsplith2df is a convenience function that is less flexible than colsplit2df but operates on multiple dataframes at once.

See Also
colSplt, colpaste2df paste2

Examples

```r
## Not run:
CO2$'Plant&Type&Treatment' <- paste2(CO2[, 1:3])
CO2 <- CO2[, -c(1:3)]
head(CO2)
head(colsplit2df(CO2, 3))
head(colsplit2df(CO2, 3, qcv(A, B, C)))
head(colsplit2df(CO2, 3, qcv(A, B, C), keep.orig=TRUE))
head(colsplit2df(CO2, "Plant&Type&Treatment"))
CO2 <- datasets::CO

(dat <- colpaste2df(head(mtcars), list(1:3), sep = "|"))
colsplit2df(dat, 12, sep = "|"

## Multiple split example
E <- list(
  c(1, 2, 3, 4, 5),
  qcv(mpg, hp),
  c("disp", "am")
)

(dat2 <- colpaste2df(head(mtcars), E, sep ="|"))
cols <- c("mpg&cyl&disp&hp&drat", "mpg&hp", "disp&am")
colsplit2df(dat2, cols, sep = "|")

## lcolsplith2df example
(x <- with(DATA.SPLIT, question_type(state, list(sex, adult))))
```
comma_spacer  Ensure Space After Comma

Description

Adds a space after a comma as strip and many other functions may consider a comma separated string as one word (i.e., "one, two, three" becomes "onetwothree" rather than "one two three").

Usage

comma_spacer(text.var)

Arguments

text.var  The text variable.

Value

Returns a vector of strings with commas that have a space after them.

Examples

## Not run:
x <- c("the, dog,went", "I,like, it", "where are you", NA, "why", ",", ",f")
comma_spacer(x)

## End(Not run)

common  Find Common Words Between Groups

Description

Find common words between grouping variables (e.g., people).

Usage

common(word.list, overlap = "all", equal.or = "more", ...)
common.list

Arguments

- **word.list**: A list of named character vectors.
- **overlap**: Minimum/exact amount of overlap.
- **equal.or**: A character vector of c("equal","greater","more","less").
- **...**: In lieu of `word.list` the user may input n number of character vectors.

Value

Returns a dataframe of all words that match the criteria set by `overlap` and `equal.or`.

commom.list

Description

list Method for common

Usage

```r
## S3 method for class 'list'
common(word.list, overlap = "all", equal.or = "more",
        ...)  
```

Arguments

- **word.list**: A list of names character vectors.
- **overlap**: Minimum/exact amount of overlap.
- **equal.or**: A character vector of c("equal","greater","more","less").
- **...**: In lieu of `word.list` the user may input n number of character vectors.

condense

Condense Dataframe Columns

Description

Condense dataframe columns that are a list of vectors to a single vector of strings.

Usage

```r
condense(dataframe, sep = ",")  
```
counts

Arguments

dataframe A dataframe with a column(s) that are a list of vectors.
sep A character string to separate the terms.

Value

Returns a dataframe with condensed columns that can be wrote to csv/xlsx.

See Also

mcsv_w

Examples

## Not run:
library(qdap)
poldat <- with(DATA.SPLIT, polarity(state, person))
write.csv(x = condense(counts(poldat)), file = "foo.csv")

## End(Not run)

counts  Generic Counts Method

Description

Access the count dataframes from select qdap outputs.

Usage

counts(x, ...)

Arguments

x A qdap object (list) with a count dataframe (e.g., fry).
... Arguments passed to counts method of other classes.

Value

Returns a data.frame of counts.

See Also

scores, proportions, preprocessed, visual
counts.automated_readability_index

Readability Measures

Description

counts.automated_readability_index - View counts from automated_readability_index.

Usage

## S3 method for class 'automated_readability_index'
counts(x, ...)

Arguments

x The automated_readability_index object.
... ignored automated_readability_index Method for counts.

counts.character_table

Term Counts

Description

View character_table counts.

Usage

## S3 method for class 'character_table'
counts(x, ...)

Arguments

x The character_table object.
... ignored

Details

character_table Method for counts
counts.coleman_liau  Readability Measures

Description

counts.coleman_liau - View counts from coleman_liau.

Usage

```r
## S3 method for class 'coleman_liau'
counts(x, ...)
```

Arguments

- `x` The coleman_liau object.
- `...` ignored

Details

coleman_liau Method for counts.

counts.end_mark_by  Question Counts

Description

View end_mark_by counts.

Usage

```r
## S3 method for class 'end_mark_by'
counts(x, ...)
```

Arguments

- `x` The end_mark_by object.
- `...` ignored

Details

date_method Method for counts
counts.flesch_kincaid  Readability Measures

Description

counts.flesch_kincaid - View counts from flesch_kincaid.

Usage

```r
## S3 method for class 'flesch_kincaid'
counts(x, ...)
```

Arguments

- `x` The flesch_kincaid object.
- `...` ignored

Details

flesch_kincaid Method for counts.

counts.formality  Formality

Description

View formality counts.

Usage

```r
## S3 method for class 'formality'
counts(x, ...)
```

Arguments

- `x` The formality object.
- `...` ignored

Details

formality Method for counts
counts.fry  

*Readability Measures*

**Description**

`counts.fry` - View counts from `fry`.

**Usage**

```r
## S3 method for class 'fry'
counts(x, ...)
```

**Arguments**

- `x` The `fry` object.
- `...` ignored

**Details**

`fry` Method for `counts`.

counts.linsear_write  

*Readability Measures*

**Description**

`counts.linsear_write` - View counts from `linsear_write`.

**Usage**

```r
## S3 method for class 'linsear_write'
counts(x, ...)
```

**Arguments**

- `x` The `linsear_write` object.
- `...` ignored

**Details**

`linsear_write` Method for `counts`.
counts.object_pronoun_type

**Question Counts**

**Description**

View object_pronoun_type counts.

**Usage**

```r
## S3 method for class 'object_pronoun_type'
counts(x, ...)
```

**Arguments**

- `x`: The object_pronoun_type object.
- `...`: ignored

**Details**

object_pronoun_type Method for counts

---------

counts.polarity

**Polarity**

**Description**

counts.polarity - View counts from polarity.

**Usage**

```r
## S3 method for class 'polarity'
counts(x, ...)
```

**Arguments**

- `x`: The polarity object.
- `...`: ignored

**Details**

polarity Method for counts.
## counts.pos

<table>
<thead>
<tr>
<th>Description</th>
<th>View pos counts.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Usage</td>
<td><code>\# S3 method for class 'pos'\n  counts(x, ...)</code></td>
</tr>
</tbody>
</table>
| Arguments   | `x` The `pos` object. 
|             | `...` ignored |
| Details     | pos Method for counts |

## counts.pos_by

<table>
<thead>
<tr>
<th>Description</th>
<th>View pos_by counts.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Usage</td>
<td><code>\# S3 method for class 'pos_by'\n  counts(x, ...)</code></td>
</tr>
</tbody>
</table>
| Arguments   | `x` The `pos_by` object. 
|             | `...` ignored |
| Details     | pos_by Method for counts |
counts.pronoun_type  Question Counts

Description
View pronoun_type counts.

Usage
```r
## S3 method for class 'pronoun_type'
counts(x, ...)
```

Arguments
- `x` The `pronoun_type` object.
- `...` ignored

Details
`pronoun_type` Method for counts

counts.question_type  Question Counts

Description
View question_type counts.

Usage
```r
## S3 method for class 'question_type'
counts(x, ...)
```

Arguments
- `x` The `question_type` object.
- `...` ignored

Details
`question_type` Method for counts
counts.SMOG  

*Readability Measures*

**Description**

counts.SMOG - View counts from SMOG.

**Usage**

```r
## S3 method for class 'SMOG'
counts(x, ...)
```

**Arguments**

- `x` The SMOG object.
- `...` ignored

**Details**

SMOG Method for counts.

counts.subject_pronoun_type  

*Question Counts*

**Description**

View subject_pronoun_type counts.

**Usage**

```r
## S3 method for class 'subject_pronoun_type'
counts(x, ...)
```

**Arguments**

- `x` The subject_pronoun_type object.
- `...` ignored

**Details**

subject_pronoun_type Method for counts
counts.termco

 counts.termco  Term Counts

Description

View termco counts.

Usage

```r
## S3 method for class 'termco'
counts(x, ...)
```

Arguments

- `x` The `termco` object.
- `...` ignored

Details

termco Method for counts

counts.word_length  Word Length Counts

Description

View word_length counts.

Usage

```r
## S3 method for class 'word_length'
counts(x, ...)
```

Arguments

- `x` The `word_length` object.
- `...` ignored

Details

word_length Method for counts
counts.word_position  Word Position

Description

View word_position counts.

Usage

## S3 method for class 'word_position'
counts(x, ...)

Arguments

x The word_position object.

... ignored

Details

word_position Method for counts

counts.word_stats  Word Stats

Description

View word_stats counts.

Usage

## S3 method for class 'word_stats'
counts(x, ...)

Arguments

x The word_stats object.

... ignored

Details

word_stats Method for counts
cumulative

Cumulative Scores

Description

cumulative - Generate rolling/cumulative scores for select qdap objects.

Usage

cumulative(x, ...)

## S3 method for class 'end_mark'
cumulative(x, ...)

## S3 method for class 'formality'
cumulative(x, ...)

## S3 method for class 'pos'
cumulative(x, ...)

## S3 method for class 'pos_by'
cumulative(x, ...)

## S3 method for class 'animated_formality'
cumulative(x, ...)

## S3 method for class 'lexical_classification'
cumulative(x, ...)

## S3 method for class 'animated_lexical_classification'
cumulative(x, ...)

## S3 method for class 'polarity'
cumulative(x, ...)

## S3 method for class 'animated_polarity'
cumulative(x, ...)

## S3 method for class 'syllable_freq'
cumulative(x, ...)

## S3 method for class 'combo_syllable_sum'
cumulative(x, ...)

Arguments

x  A qdap object with an accompanying cumulative method.
**DATA**

*Fictitious Classroom Dialogue*

**Description**

A fictitious dataset useful for small demonstrations.

**Usage**

data(DATA)

**Format**

A data frame with 11 rows and 5 variables

**Details**

- person. Speaker
- sex. Gender
- adult. Dummy coded adult (0-no; 1-yes)
- state. Statement (dialogue)
- code. Dialogue coding scheme

**DATA.SPLIT**

*Fictitious Split Sentence Classroom Dialogue*

**Description**

A `sentSplit` version of the DATA dataset.

**Usage**

data(DATA.SPLIT)

**Format**

A data frame with 15 rows and 8 variables
Details

- person. Speaker
- tot. Turn of talk with sub sentences
- TOT. Turn of talk
- sex. Gender
- adult. Dummy coded adult (0-no; 1-yes)
- code. Dialogue coding scheme
- state. Statement (dialogue)
- stem.text. A stemmed version of the text.var

---

**Fictitious Repeated Measures Classroom Dialogue**

**Description**

A repeated measures version of the DATA dataset.

**Usage**

data(DATA2)

**Format**

A data frame with 74 rows and 7 variables

**Details**

- day. Day of observation
- class. Class period/subject of observation
- person. Speaker
- sex. Gender
- adult. Dummy coded adult (0-no; 1-yes)
- state. Statement (dialogue)
- code. Dialogue coding scheme
Map Transcript Files from a Directory to a Script

Description

Generate script text (and optionally output it to the clipboard and/or an external file) that can be used to individually read in every file in a directory and assign it to an object.

Usage

```r
dir_map(loc = "DATA/TRANSCRIPTS/CLEANED_TRANSCRIPTS",
        obj.prefix = "dat", use.path = TRUE, col.names = c("person",
                "dialogue"), file = NULL, copy2clip = interactive())
```

Arguments

- `loc` The path/location of the transcript data files.
- `obj.prefix` A character string that will be used as the prefix (followed by a unique digit) as the assignment object.
- `use.path` logical. If TRUE use the actual path to the `loc` argument. If FALSE, the code may be more portable in that the actual input to `loc` is supplied to the `read.transcript`.
- `col.names` Supplies a vector of column names to the transcript columns.
- `file` A connection, or a character string naming the file to print to.
- `copy2clip` logical. If TRUE attempts to copy the output to the clipboard.

Details

Generally, the researcher will want to read in and parse every transcript document separately. The task of writing the script for multiple transcript documents can be tedious. This function is designed to make the process more efficient and less prone to errors.

Value

Prints a read in script text to the console, optionally copies the wrapped text to the clipboard on a Mac or Windows machine and optionally prints to an outside file.

Note

`skip` is set to 0, however, it is likely that this value will need to be changed for each transcript.

See Also

`read.transcript`
Examples

```r
## Not run:
(DIR <- system.file("extdata/transcripts", package = "qdap"))
dir_map(DIR)

## End(Not run)
```

discourse_map  

**Discourse Mapping**

**Description**

View the flow of discourse from social actors.

**Usage**

```r
discourse_map(text.var, grouping.var, edge.constant, sep = ",", condense = TRUE, ...)
```

**Arguments**

- `text.var` The text variable or a "word_stats" object (i.e., the output of a word_stats function).
- `grouping.var` The grouping variables. Also takes a single grouping variable or a list of 1 or more grouping variables.
- `edge.constant` A constant to multiple the edges by. Defaults (if missing) to 2.5 times the number of social actors.
- `sep` The separator character to use between grouping variables.
- `condense` logical. If TRUE sentCombine is used to condense text by grouping variable.
- `...` ignored

**Details**

For an example of the video generated from the Animate output of discourse_map see: https://www.youtube.com/watch?v=7LcoFZDDXNo&feature=youtu.be. An HTML output can be viewed: http://trinker.github.io/qdap_examples/animation_dialogue.

**Value**

Returns a list:

- `raw` The dataframe with to and from columns (the edges) + word counts
- `edge_word_count` A dataframe of edges and word counts + proportional word count
- `vertex_word_count` A dataframe of vertices and word counts + proportional word count
- `plot` An igraph object
Examples

```r
## Not run:
discourse_map(DATADstate, list(DATADperson, DATADsex))
x <- with(mraja1, discourse_map(dialogue, person))
x
title(x)
library(igraph)
plot(visual(x), edge.curved=FALSE)

## Quickly add/remove a title
Title(x) <- "Act 1"
x
Title(x) <- NULL
x

## Augmenting the plot
library(qdapTools)
mygraph <- visual(x)

plot(mygraph, edge.curved=TRUE)

V(mygraph)$sex <- V(mygraph)$name %c% raj.demographics[, 1:2]
V(mygraph)$color <- ifelse(V(mygraph)$sex=="f", "pink", "lightblue")

plot(mygraph, edge.curved=TRUE)

V(mygraph)$family <- V(mygraph)$name %c% raj.demographics[, c(1, 3)]
cols <- qcv(blue, red, brown, darkgreen, grey10)
V(mygraph)$label.color <- lookup(V(mygraph)$family, cols)

plot(mygraph, edge.curved=TRUE)

## Community detection
x <- with(mraja1, discourse_map(dialogue, person))
wc <- walktrap.community(visual(x))

## Repeated Measures (BASIC EXAMPLE)

## First merge data and map to discourse per act 
## to separate networks

dat <- key_merge(raj, raj.demographics)
list_dat <- split(dat, dat$act)
plot_dat <- lapply(list_dat, function(x) with(x, discourse_map(dialogue, person)))

opar <- par()$mar
par(mfrow=c(3, 2), mar=c(0, 0, 3, 0))
```
lapply(seq_along(plot_dat), function(i){
  plot(plot_dat[[i]])
  graphics::mtext(paste("Act", names(plot_dat)[i]), side=3)
})

## Repeated Measures (EXTENDED EXAMPLE)
#-----------------------------
fam_key <- data.frame(fam=unique(raj démographics$fam.aff),

saveVideo(FUN3(), video.name = "discourse_map.avi", interval = 0.2,
  outdir = loc2)
```
dispersion_plot

Lexical Dispersion Plot

Description

Generate a lexical dispersion plot of terms.

Usage

dispersion_plot(text.var, match.terms, grouping.var = NULL,
                rm.vars = NULL, color = "blue", bg.color = "grey90",
                horiz.color = "grey85", total.color = "black", symbol = "|",
                title = "Lexical Dispersion Plot", rev.factor = TRUE, wrap = "~~",
                xlab = "Dialogue (Words)", ylab = NULL, size = 4, plot = TRUE,
                char2space = "~~", apostrophe.remove = FALSE, scales = "free",
                space = "free", ...)

Arguments

text.var The text variable.
match.terms A vector of quoted terms or a named list of quoted terms. If the latter terms
             will be combined into a single unified theme named according to the list names.
             Note that terms within the vectors of the list cannot be duplicated.

grouping.var The grouping variables. Default NULL generates one word list for all text. Also
                takes a single grouping variable or a list of 1 or more grouping variables.

rm.vars The repeated measures variables. Default NULL generates one facet for all text.  
           Also takes a single repeated measures variable or a list of 1 or more grouping variables.

color The color of the word symbols.
bg.color The background color.
horiz.color The color of the horizontal tracking stripe. Use horiz.color = bg.color to
              eliminate.
total.color The color to use for summary 'all' group. If NULL totals are dropped.
symbol The word symbol. Default is "|".
title Title of the plot
rev.factor logical. If TRUE reverses the plot order of the factors.
wrap a character to wrap around the words (enables the reader to visualize spaces).
     Default is "~~", use "" to remove.
xlab The x label.
ylab The y label.
The size of the plotting symbol.
plot
Logical. If TRUE the plot will automatically plot. The user may wish to set to FALSE for use in knitr, sweave, etc. to add additional plot layers.
char2space
A vector of characters to be turned into spaces.
apostrophe.remove
Logical. If TRUE removes apostrophes from the output.
scales
Should scales be fixed ("fixed", the default), free ("free"), or free in one dimension ("free_x", "free_y")
space
If "fixed", the default, all panels have the same size. If "free_y" their height will be proportional to the length of the y scale; if "free_x" their width will be proportional to the length of the x scale; or if "free" both height and width will vary.

Other argument supplied to strip.

Value
Plots a dispersion plot and invisibly returns the ggplot2 object.

Note
The match.terms is character sensitive. Spacing is an important way to grab specific words and requires careful thought. Using "read" will find the words "bread", "read", "reading", and "ready". If you want to search for just the word "read" you’d supply a vector of c(" read ", " reads", " reading", " reader").

" you’d ", " you’ll ", " you’re ", " you’ve ", " you ", " your ",
" he’d ", " he’ll ", " he’s ", " he ")

with(dat, dispersion_plot(dialogue, wordlist2,
bg.color = "black", grouping.var = person, rm.vars = time,
color = "yellow", total.color = NULL, horiz.color="grey20"))

wordlist3 <- list(
  I = c(" i’d ", " i’ll ", " i’m ", " i’ve ", " i ",
  we = c(" we’d ", " we’ll ", " we’re ", " we’ve ", " we "),
  you = c(" you’d ", " you’ll ", " you’re ", " you’ve ", " you ", " your ",
  he = c(" he’d ", " he’ll ", " he’s ", " he ")
)

with(dat, dispersion_plot(dialogue, wordlist3,
bg.color = "grey80", grouping.var = person, rm.vars = time,
color = "blue", total.color = "grey40", horiz.color="grey20"))
colsplit2df(scores(with(dat, termco(dialogue, list(time, person), wordlist3))))

## Extras:
## Reverse facets
x <- with(pres.debates2012, dispersion_plot(dialogue, wordlist2, rm.vars = time))
```
## Dissimilarity

### Dissimilarity Statistics

#### Description

Uses the distance function to calculate dissimilarity statistics by grouping variables.

#### Usage

```r
Dissimilarity(text.var, grouping.var = NULL, method = "prop",
             diag = FALSE, upper = FALSE, p = 2, ...)
```
Dissimilarity

Arguments

- **text.var**: A text variable or word frequency matrix object.
- **grouping.var**: The grouping variables. Default NULL generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.
- **method**: Distance methods (see `dist` function). If "prop" (the default) the result is 1 - "binary".
- **diag**: logical. If TRUE returns the diagonals of the matrix. If method = "prop" diagonals will not be returned.
- **upper**: logical. If TRUE returns the upper triangle of the matrix.
- **p**: The power of the Minkowski distance.
- **...**: Other arguments passed to `wfm`.

Value

Returns a matrix of dissimilarity values (the agreement between text).

See Also

- `dist`

Examples

```r
## Not run:
with(DATA, Dissimilarity(state, list(sex, adult)))
with(DATA, Dissimilarity(state, person, diag = TRUE))

## Fit it: 2-D
(diss <- with(pres_debates2012, Dissimilarity(dialogue, list(person, time),
method = "euclidean")))
fit <- cmdscale(diss, eig = TRUE, k = 2)
```
dist_tab

SPSS Style Frequency Tables

Description

Generates a distribution table for vectors, matrices and dataframes.

Usage

dist_tab(dataframe, breaks = NULL, digits = 2, ...)

## Plot it 2-D

points <- data.frame(x = fit$points[, 1], y = fit$points[, 2])

ggplot(points, aes(x = x, y = y)) +
  geom_point(data = points, aes(x = x, y = y, color = rownames(points))) +
  geom_text(data = points, aes(x = x, y = y - 0.2, label = rownames(points)))

## Fit it: 3-D

library(scatterplot3d)

fit <- cmdscale(diss, eig = TRUE, k = 3)

points <- data.frame(colSplit(names(fit$points[, 1])))

library(qdapTools)

points$colors <- points$X1 %>% data.frame(levels(points$X1),
  qcv(yellow, yellow, blue, yellow, red, yellow))

points$shape <- points$X2 %>% data.frame(levels(points$X2), c(15, 17, 19))

## Plot it: 3-D

scatterplot3d(fit$points[, 1], fit$points[, 2], fit$points[, 3],
  color = points$colors, pch = points$shape,
  main = "Semantic Space Scaled to 3D", xlab = "x", ylab = "y",
  zlab = "z", type = "h")

legend("bottomright", title="Person",
  qcv(Obama, Romney, Other), fill=qcv(blue, red, yellow))

legend("topleft", paste("Time", 1:3), pch=c(15, 17, 19))

## Compare to Cosine Similarity

cos_sim <- function(x, y) x * y / sqrt(x^2 * y^2)

mat <- matrix(rbinom(500, 0:1, .45), ncol=10)

v_outer(mat, cos_sim)

v_outer(with(DATA, wfm(state, person)), cos_sim)

with(DATA, Dissimilarity(state, person))

## End(Not run)
Arguments

- `dataframe`: A vector or data.frame object.
- `breaks`: Either a numeric vector of two or more cut points or a single number (greater than or equal to 2) giving the number of intervals into which x is to be cut.
- `digits`: Integer indicating the number of decimal places (round) or significant digits (signif.) to be used. Negative values are allowed.
- `...`: Other variables passed to `cut`.

Value

Returns a list of data frames (or singular data frame for a vector) of frequencies, cumulative frequencies, percentages and cumulative percentages for each interval.

See Also

cut

Examples

```r
## Not run:

```

---

**diversity**

Diversity Statistics

Description

Transcript apply diversity/richness indices.

Usage

`diversity(text.var, grouping.var = NULL)`
Arguments

text.var The text variable.
grouping.var The grouping variables. Default NULL generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.

Details

These are the formulas used to calculate the indices:

**Shannon index:**

\[ H_1(X) = - \sum_{i=1}^{R} p_i \log p_i \]

**Simpson index:**

\[ D = \frac{\sum_{i=1}^{R} p_i n_i (n_i - 1)}{N(N - 1)} \]

**Collision entropy:**

\[ H_2(X) = - \log \sum_{i=1}^{n} p_i^2 \]

**Berger Parker index:**

\[ D_{BP} = \frac{N_{max}}{N} \]

**Brillouin index:**

\[ H_B = \frac{\ln(N!) - \sum \ln(n_i)!}{N} \]

Value

Returns a dataframe of various diversity related indices for Shannon, collision, Berger Parker and Brillouin.

References

http://arxiv.org/abs/physics/0512106
**duplicates**

**Find Duplicated Words in a Text String**

**Description**

Find duplicated word/word chunks in a string. Intended for internal use.

**Usage**

```
duplicates(string, threshold = 1)
```

**Arguments**

- `string` A character string.
- `threshold` An integer of the minimal number of repeats.

**Value**

Returns a vector of all duplicated words/chunks.

**Examples**

```
## Not run:
duplicates(DATA$state)
duplicates(DATA$state[1])

## End(Not run)
```
end_inc

Description

Test for incomplete sentences and optionally remove them.

Usage

end_inc(dataframe, text.var, warning.report = TRUE, which.mode = FALSE)

Arguments

dataframe  A dataframe that contains the person and text variable.
text.var   A character string of the text variable.
warning.report  logical. If TRUE prints a warning of regarding removal of incomplete sentences.
which.mode   logical. If TRUE outputs two logical vectors: 'NOT' (logical test of not being an incomplete sentence) and 'INC' (logical test of being an incomplete sentence)

Value

Generates a dataframe with incomplete sentences removed.

Examples

## Not run:
dat <- sentSplit(DATA, "state", stem.col = FALSE)
dat$state[c(2, 5)] <- paste(strip(dat$state[c(2, 5)]), "|")
end_inc(dat, "state")
end_inc(dat, "state", warning.report = FALSE)
end_inc(dat, "state", which.mode = TRUE)

## End(Not run)

end_mark

Description

end_mark - Grab the sentence end marks for a transcript. This can be useful to categorize based on sentence type.
end_mark_by - Grab the sentence end marks for a transcript by grouping variable(s).
Usage

end_mark(text.var, missing.end.mark = " ", missing.text = NA, other.endmarks = NULL)

eend_mark_by(text.var, grouping.var, digits = 3, percent = FALSE, zero.replace = 0, ...)

Arguments

text.var The text variable.
missing.end.mark A value to use for sentences with missing endmarks.
missing.text A value to use for sentences with missing (NA) text.
other.endmarks Other 1-2 character endmarks to search for.
grouping.var The grouping variables. Default NULL generates one word list for all text. Also
takes a single grouping variable or a list of 1 or more grouping variables.
digits Integer; number of decimal places to round when printing.
percent logical. If TRUE output given as percent. If FALSE the output is proportion.
zero.replace Value to replace 0 values with.
... Other arguments passed to end_mark.

Value

Returns a character vector of qdap end marks for each sentence. End marks include:

"." Declarative sentence.
"?" Question sentence.
"!" Exclamatory sentence.
"|" Incomplete sentence.
"*." Imperative-declarative sentence.
"??" Imperative-question sentence (unlikely to occur)
"*!" Imperative-exclamatory sentence.
"*|" Imperative-incomplete sentence.
"no.em" No end mark.
"blank" Empty cell/NA.

Examples

   if (i != 2) m <- m + ylab(""")
   if (i != 3) m <- m + xlab(NULL)
   m + ggtitle(paste("Debate", i))
})

library(grid)
library(gridExtra)
do.call(grid.arrange, sentplots)

##EXAMPLE 2
sentraj <- lapply(with(rajsplit, split(dialogue, act)), function(x) {
   end_mark(x)
})
sentplots2 <- lapply(seq_along(sentraj), function(i) {
   m <- plot(cumulative(sentraj[[i]]))
   if (i != 2) m <- m + ylab(""")
   if (i != 3) m <- m + xlab(NULL)
   act <- qcv(I, II, III, IV, V)
   m + ggtitle(paste("Act", act[i]))
})

## ggplot2 function to extract legend
g_LEGEND <- function(a.gplot){
   tmp <- ggplot_gtable(ggplot_build(a.gplot))
   leg <- which(sapply(tmp[["grobs"]], function(x) x[["name"]]) == "guide-box")
   legend <- tmp[["grobs"]][[leg]]
   legend
env.syl

}  

## remove legends from plots  
sentplots3 <- lapply(sentplots2, function(x){  
  x + theme(legend.position="none") + xlab(NULL) + ylab(NULL)  
})  

sentplots3[[6]] <- g_legend(sentplots2[[1]])  
do.call(grid.arrange, sentplots3)  

## End(Not run)

---

**env.syl**  
**Syllable Lookup Environment**

### Description

A dataset containing a syllable lookup environment (see DICTIONARY).

### Usage

data(env.syl)

### Format

A environment with the DICTIONARY data set.

### Details

For internal use.

### References

UCI Machine Learning Repository website

---

**exclude**  
**Exclude Elements From a Vector**

### Description

exclude - Quickly exclude words from a word list

%ex% - Binary operator version of exclude.
Usage

```
exclude(word.list, ...)
```

```
## S3 method for class 'TermDocumentMatrix'
exclude(word.list, ...)
```

```
## S3 method for class 'DocumentTermMatrix'
exclude(word.list, ...)
```

```
## S3 method for class 'wfm'
exclude(word.list, ...)
```

```
## S3 method for class 'list'
exclude(word.list, ...)
```

```
## Default S3 method:
exclude(word.list, ...)
```

```
word.list %ex% ...
```

Arguments

- `word.list` A list/vector of words/terms, a `wfm`, `DocumentTermMatrix`, or `TermDocumentMatrix` to exclude from.
- `...` A vector (character/numeric) if element(s) to be excluded from the `word.list`.

Value

Returns a vector with the excluded terms removed.

Examples

```
## Not run:
exclude(1:10, 3, 4)
exlude(1:10, 3:4)
Top25Words
exclude(Top25Words, qcv(the, of, and))
exclude(Top25Words, "the", "of", "an")

#Using with term_match and termco
terms <- term_match(DATA$state, qcv(th), FALSE)
exlude(terms, "truth")
# all together
termco(DATA$state, DATA$person, exclude(term_match(DATA$state, qcv(th), FALSE), "truth"))

MTCH.LST <- exclude(term_match(DATA$state, qcv(th, i)), qcv(truth, stinks))
termco(DATA$state, DATA$person, MTCH.LST)
```

```
## Works with wfm
```
Filter.all_words

```
dat <- wfm(DATA$state, DATA$person)
the.no <- term_match(DATA$state, c("the", "no"))
exclude(dat, unlist(the.no))

## Works with tm's TermDocumentMatrix/DocumentTermMatrix
dat2 <- as.dtm(DATA$state, DATA$person)
out.dtm <- exclude(dat2, unlist(the.no))
tm::inspect(out.dtm)

dat3 <- as.tdm(DATA$state, DATA$person)
out.tdm <- exclude(dat3, unlist(the.no))
tm::inspect(out.tdm)

## End(Not run)
```

---

**Description**

- **Filter.all_words** - Filter words from an all_words that meet max/min word length criteria.
- **Filter.TermDocumentMatrix** - Filter words from a TermDocumentMatrix vector that meet max/min word length criteria.
- **Filter.DocumentTermMatrix** - Filter words from a DocumentTermMatrix that meet max/min word length criteria.
- **Filter** - Filter words from various objects that meet max/min word length criteria.
- **Filter.wfm** - Filter words from a wfm that meet max/min word length criteria.
- **Filter.character** - Filter words from a character vector that meet max/min word length criteria.
- **Filter.fwl** - Filter words from a fwl that meet max/min word length criteria.
- **Filter.fswl** - Filter words from a fswl that meet max/min word length criteria.
- **Filter.rfswl** - Filter words from a rfswl that meet max/min word length criteria.

**Usage**

```
## S3 method for class 'all_words'
Filter(x, min = 1, max = Inf,
      count.apostrophe = TRUE, stopwords = NULL, ignore.case = TRUE, ...)

## S3 method for class 'TermDocumentMatrix'
Filter(x, min = 1, max = Inf,
      count.apostrophe = TRUE, stopwords = NULL, ignore.case = TRUE, ...)

## S3 method for class 'DocumentTermMatrix'
Filter(x, min = 1, max = Inf,
      count.apostrophe = TRUE, stopwords = NULL, ignore.case = TRUE, ...)
```
Filter(x, min = 1, max = Inf, count.apostrophe = TRUE, stopwords = NULL, ignore.case = TRUE, ...)

## S3 method for class 'wfm'
Filter(x, min = 1, max = Inf, count.apostrophe = TRUE, stopwords = NULL, ignore.case = TRUE, ...)

## S3 method for class 'character'
Filter(x, min = 1, max = Inf, count.apostrophe = TRUE, stopwords = NULL, ignore.case = TRUE, ...)

## S3 method for class 'fwl'
Filter(x, min = 1, max = Inf, count.apostrophe = TRUE, stopwords = NULL, ignore.case = TRUE, ...)

## S3 method for class 'fswl'
Filter(x, min = 1, max = Inf, count.apostrophe = TRUE, stopwords = NULL, ignore.case = TRUE, ...)

## S3 method for class 'rfswl'
Filter(x, min = 1, max = Inf, count.apostrophe = TRUE, stopwords = NULL, ignore.case = TRUE, ...)

### Arguments

- **x**
  A filterable object (e.g., wfm, character).
- **min**
  Minimum word length.
- **max**
  Maximum word length.
- **count.apostrophe**
  logical. If TRUE apostrophes are counted as characters.
- **stopwords**
  A vector of stop words to remove.
- **ignore.case**
  logical. If TRUE stopwords will be removed regardless of case (ignored if used on a wfm).
- **...**
  Other arguments passed to specific Filter methods.

### Details

- all_words Method for Filter
- TermDocumentMatrix Method for Filter
- DocumentTermMatrix Method for Filter
- character Method for Filter
- fwl Method for Filter
- fswl Method for Filter
- rfswl Method for Filter
Filter.all_words

Value

Filter.all_words - Returns a matrix of the class "all_words".
Filter.TermDocumentMatrix - Returns a matrix of the class "TermDocumentMatrix".
Filter.DocumentTermMatrix - Returns a matrix of the class "DocumentTermMatrix".
Filter - Returns a matrix of the class "wfm".
Filter.character - Returns a vector of the class "character".
Filter.wfm - Returns a matrix of the class "wfm".
Filter.fwl - Returns a matrix of the class "fwl".
Filter.fswl - Returns a matrix of the class "fswl".
Filter.rfswl - Returns a matrix of the class "rfswl".

Note

The name and idea behind this function is inspired by the dplyr package’s filter function and has a similar meaning in that you are grabbing rows (or elements) meeting a particular criteria.

Examples

## Not run:
```
Filter(with(DATA, wfm(state, list(sex, adult))), 5)
with(DATA, wfm(state, list(sex, adult)))
```

## Filter particular words based on max/min values in wfm
```
v <- with(DATA, wfm(state, list(sex, adult)))
Filter(v, 5)
Filter(v, 5, count.apostrophe = FALSE)
Filter(v, 5, 7)
Filter(v, 4, 4)
Filter(v, 3, 4)
Filter(v, 3, 4, stopwords = Top25Words)
```

## Filter works on character strings too...
```
x <- c("Raptors don't like robots!", "I'd pay $500.00 to rid them."")
Filter(x, 3)
Filter(x, 4)
Filter(x, 4, count.apostrophe = FALSE)
Filter(x, 4, count.apostrophe = FALSE, stopwords="raptors")
Filter(x, 4, stopwords="raptors")
Filter(x, 4, stopwords="raptors", ignore.case = FALSE)
```

```
DATA[, "state"] <- Filter(DATA[, "state"], 4)
DATA <- qdap::DATA
```

## Filter `all_words`
```
head(all_words(raj$dialogue))
Filter(head(all_words(raj$dialogue)), min = 3)
```

## End(Not run)
Description

Transcript apply formality score by grouping variable(s) and optionally plot the breakdown of the model.

Usage

formality(text.var, grouping.var = NULL, order.by.formality = TRUE, digits = 2, ...)

Arguments

text.var The text variable (or an object from pos, pos_by or formality. Passing the later three object will greatly reduce run time.

grouping.var The grouping variables. Default NULL generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.

order.by.formality logical. If TRUE orders the results by formality score.

digits The number of digits displayed.

... Other arguments passed to pos_by.

Details

Heylighen & Dewaele(2002)’s formality score is calculated as:

\[ F = 50 \left( \frac{n_f - n_c}{N} + 1 \right) \]

Where:

\[ f = \{ \text{noun, adjective, preposition, article} \} \]

\[ c = \{ \text{pronoun, verb, adverb, interjection} \} \]

\[ N = \sum (f + c + \text{conjunctions}) \]

Value

A list containing at the following components:

text The text variable

POSagged Raw part of speech for every word of the text variable

POSprop Part of speech proportion for every word of the text variable

POSFreq Part of speech count for every word of the text variable
formality

pos.by.freq   The part of speech count for every word of the text variable by grouping variable(s)

pos.by.prop   The part of speech proportion for every word of the text variable by grouping variable(s)

form.freq.by  The nine broad part of speech categories count for every word of the text variable by grouping variable(s)

form.prop.by  The nine broad part of speech categories proportion for every word of the text variable by grouping variable(s)

formality     Formality scores by grouping variable(s)

pos.reshaped  An expanded formality scores output (grouping, word.count, pos & form.class) by word

Warning

Heylighen & Dewaele (2002) state, "At present, a sample would probably need to contain a few hundred words for the measure to be minimally reliable. For single sentences, the F-value should only be computed for purposes of illustration" (p. 24).

freq_terms

Find Frequent Terms

Description

Find the most frequently occurring terms in a text vector.

Usage

freq_terms(text.var, top = 20, at.least = 1, stopwords = NULL, extend = TRUE, ...)

Arguments

text.var The text variable.
top Top number of terms to show.
at.least An integer indicating at least how many letters a word must be to be included in the output.
stopwords A character vector of words to remove from the text. qdap has a number of data sets that can be used as stop words including: Top200Words, Top100Words, Top25Words. For the tm package’s traditional English stop words use tm::stopwords("english").
extend logical. If TRUE the top argument is extended to any word that has the same frequency as the top word.
...
Other arguments passed to all_words.

Value

Returns a dataframe with the top occurring words.

See Also

word_list, all_words
Examples

```r
## Not run:
freq_terms(DATA$state, 5)
freq_terms(DATA$state)
freq_terms(DATA$state, extend = FALSE)
freq_terms(DATA$state, at.least = 4)
(out <- freq_terms(pres_debates2012$dialogue, stopwords = Top200Words))
plot(out)

## All words by sentence (row)
library(qdapTools)

lapply(seq_along(out), function(i) {
    ## dev.new()
    plot(out[[i]], plot=FALSE) + ggtitle(names(out)[i])
})
de.voff()

## Keep spaces
freq_terms(space_fill(DATA$state, "are you"), 500, char.keep="--")

## End(Not run)
```

gantt

### Gantt Durations

gantt - Generates start and end times of supplied text selections (i.e., text selections are determined by any number of grouping variables).

plot_gantt_base - For internal use.

Usage

```r
gantt(text.var, grouping.var, units = "words", sums = FALSE,
    col.sep = "_")
```
plot_gantt_base(x, sums = NULL, fill.colors = NULL, box.color = "white", title = NULL)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text.var</td>
<td>The text variable</td>
</tr>
<tr>
<td>grouping.var</td>
<td>The grouping variables. Also takes a single grouping variable or a list of 1 or more grouping variables.</td>
</tr>
<tr>
<td>units</td>
<td>The unit of measurement to analyze. One of the strings &quot;character&quot;, &quot;syllable&quot;, &quot;word&quot;, or &quot;sentence&quot;.</td>

<tr>
<td>x</td>
<td>An object of the class &quot;gantt&quot;.</td>
</tr>
<tr>
<td>fill.colors</td>
<td>The colors of the Gantt plot bars. Either a single color or a length equal to the number of grouping variable(s). If NULL, rainbow is used.</td>
</tr>
<tr>
<td>box.color</td>
<td>A color to wrap the boxes with.</td>
</tr>
<tr>
<td>title</td>
<td>An optional title.</td>
</tr>
</tbody>
</table>

Value

Returns a data frame of start and end times by grouping variable(s) or optionally returns a list of two: (1) A data frame of the total units used by grouping variable(s) and (2) a data frame of start and end times by grouping variable(s).

Note

For non-repeated measures data use gantt. For more flexible plotting needs use gantt_wrap over the generic plotting method.

```

```
## Animate It
#-------------------
ani_gannt <- with(DATA.SPLIT, gantt(state, person))
Animate(ani_gannt)
Animate(plot(ani_gannt))

library(animation)
loc <- reports::folder(animation_gantt)

## Set up the plotting function
oopt <- animation::ani.options(interval = 0.1)

FUN <- function() {
  out <- Animate(ani_gannt)
  lapply(out, function(x) {
    print(x)
    animation::ani.pause()
  })
}
```
gantt_plot

```r

type <- if(.Platform$OS.type == "windows") shell else system
saveGIF(FUN(), interval = 0.1, outdir = loc, cmd.fun = type)

## End(Not run)
```

---

**Description**

A convenience function that wraps `gantt`, `gantt_rep` and `gantt_wrap` into a single plotting function.

**Usage**

```r
gantt_plot(text.var, grouping.var = NULL, rm.var = NULL,
fill.var = NULL, xlab = "duration (in words)", units = "words",
col.sep = "__", ...)
```

**Arguments**

- `text.var` The text variable.
- `grouping.var` The grouping variables. Also takes a single grouping variable or a list of 1 or more grouping variables.
- `rm.var` An optional single vector or list of 1 or 2 of repeated measures to facet by.
- `fill.var` An optional variable to fill the code strips by.
- `xlab` The name of the x-axis label.
- `units` The unit of measurement.
- `col.sep` The column separator.
- `...` Other arguments passed to `gantt_wrap`.

**Value**

Returns a Gantt style visualization. Invisibly returns the ggplot2 list object.

**Note**

For non-repeated measures data/plotting use `gantt`; for repeated measures data output use `gantt_rep`; and for a flexible gantt plot that words with code matrix functions (cm) use `gantt_wrap`.

gantt, gantt_rep, gantt_wrap

Examples

```r
## Not run:
with(rajSPLIT, gantt_plot(text.var = dialogue,
grouping.var = person, size=4))

with(rajSPLIT, gantt_plot(text.var = dialogue,
grouping.var = list(fam.aff, sex), rm.var = act,
title = "Romeo and Juliet's dialogue"))

with(rajSPLIT, gantt_plot(dialogue, list(fam.aff, sex), act,
transform=T))

rajSPLIT2 <- rajSPLIT

rajSPLIT2$newb <- as.factor(sample(LETTERS[1:2], nrow(rajSPLIT2),
replace=TRUE))

z <- with(rajSPLIT2, gantt_plot(dialogue, list(fam.aff, sex),
list(act, newb), size = 4))

library(ggplot2); library(scales); library(RColorBrewer); library(grid)
z + theme(panel.spacing = unit(1, "lines"]] + scale_colour_grey()
z + scale_colour_brewer(palette="Dark2")

## Fill Variable Example
dat <- rajSPLIT[rajSPLIT$act == 1, ]
dat$end_mark <- factor(end_mark(dat$dialogue))

with(dat, gantt_plot(text.var = dialogue, grouping.var = list(person, sex),
fill.var=end_mark))

## Repeated Measures with Fill Example
rajSPLIT$end_mark <- end_mark(rajSPLIT$dialogue)

with(rajSPLIT, gantt_plot(text.var = dialogue,
grouping.var = list(fam.aff), rm.var = list(act),
fill.var=end_mark, title = "Romeo and Juliet's dialogue"))

## Repeated Measures Sentence Type Example
with(rajSPLIT, gantt_plot(text.var = dialogue,
grouping.var = list(fam.aff, sex), rm.var = list(end_mark, act),
title = "Romeo and Juliet's dialogue"))

## Reset rajSPLIT
rajSPLIT <- qdap::rajSPLIT

## Animate It

##-----------------------------
```
```r
ani_gantt <- with(mrajal, gantt_plot(dialogue, person))

library(animation)
loc <- reports::folder(animation_gantt)

## Set up the plotting function
oopt <- animation::ani.options(interval = 0.1)

FUN <- function() {
  out <- Animate(ani_gantt)
  lapply(out, function(x) {
    print(x)
    animation::ani.pause()
  })
}

type <- if(.Platform$OS.type == "windows") shell else system
savevideo(FUN(), video.name = "animation.avi", interval = 0.1, outdir = loc)

saveLatex(FUN(), autoplay = TRUE, loop = FALSE, latex.filename = "tester.tex",
          caption = "animated dialogue", outdir = loc, ani.type = "pdf",
          ani.dev = "pdf", ani.width = 5, ani.height = 5.5, interval = 0.1)

saveHTML(FUN(), autoplay = FALSE, loop = TRUE, verbose = FALSE,
         ani.width=600, ani.height=280,
         outdir = file.path(loc, "new"), single.opts =
         "'controls': ['first', 'play', 'loop', 'speed'], 'delayMin': 0")

## End(Not run)
```

---

**gantt_rep**  
*Generate Unit Spans for Repeated Measures*

---

**Description**

Produces start and end times for occurrences for each repeated measure condition.

**Usage**

```r
gantt_rep(rm.var, text.var, grouping.var = NULL, units = "words",
          col.sep = "_", name.sep = ")`
```

**Arguments**

- **rm.var**  
  An optional single vector or list of 1 or 2 of repeated measures to facet by.

- **text.var**  
  The text variable.
gantt_rep

The grouping variables. Also takes a single grouping variable or a list of 1 or more grouping variables.

units
The unit of measurement to analyze. One of the strings "character", "syllable", "word", or "sentence".

col.sep
The character string to use to separate pasted variables in the pasted columns.

name.sep
The character string to use to separate column names of the pasted columns.

Value

Returns a data frame of start and end times by repeated measure and grouping variable(s)

Note

For non-repeated measures data use gantt. For more flexible plotting needs use gantt_wrap over the generic plotting method.

gantt, gantt_wrap, gantt_plot

Examples

```r
## Not run:
dat <- with(rajSPLIT, gantt_rep(act, dialogue, list(fam.aff, sex),
   units = "words", col.sep = "_"))
head(dat, 20)
plot(dat)

gantt_wrap(dat, "fam.aff_sex", facet.vars = "act",
   title = "Repeated Measures Gantt Plot",
   minor.line.freq = 25, major.line.freq = 100)

## Two facets variables
dat2 <- with(DATA2, gantt_rep(list(day, class), state, person,
   units = "words", col.sep = "_"))
head(dat2, 20)
plot(dat2)

## End(Not run)
```
A `ggplot2` wrapper that produces a Gantt plot.

**Usage**

```r
gantt_wrap(dataframe, plot.var, facet.vars = NULL, fill.var = NULL,
           title = NULL, ylab = plot.var, xlab = "duration.default",
           rev.factor = TRUE, transform = FALSE, ncol = NULL,
           minor.line.freq = NULL, major.line.freq = NULL,
           sig.dig.line.freq = 1, hms.scale = NULL, scale = NULL,
           space = NULL, size = 3, rm.horiz.lines = FALSE, x.ticks = TRUE,
           y.ticks = TRUE, legend.position = NULL, bar.color = NULL,
           border.color = NULL, border.size = 2, border.width = 0.1,
           constrain = TRUE, plot = TRUE)
```

**Arguments**

- `dataframe`: A data frame with plotting variable(s) and a column of start and end times.
- `plot.var`: A factor plotting variable (y axis).
- `facet.vars`: An optional single vector or list of 1 or 2 to facet by.
- `fill.var`: An optional variable to fill the code strips by.
- `title`: An optional title for the plot.
- `ylab`: An optional y label.
- `xlab`: An optional x label.
- `rev.factor`: logical. If TRUE reverse the current plotting order so the first element in the plotting variable’s levels is plotted on top.
- `transform`: logical. If TRUE the repeated facets will be transformed from stacked to side by side.
- `ncol`: if an integer value is passed to this `gantt_wrap` uses `facet_wrap` rather than `facet_grid`.
- `minor.line.freq`: A numeric value for frequency of minor grid lines.
- `major.line.freq`: A numeric value for frequency of major grid lines.
- `sig.dig.line.freq`: An internal rounding factor for minor and major line freq. Generally, default value of 1 suffices for larger range of x scale may need to be set to -2.
- `hms.scale`: logical. If TRUE converts scale to h:m:s format. Default NULL attempts to detect if object is a cm_time2long object.
scale Should scales be fixed ("fixed", the default), free ("free"), or free in one dimension ("free_x", "free_y")

space If "fixed", the default, all panels have the same size. If "free_y" their height will be proportional to the length of the y scale; if "free_x" their width will be proportional to the length of the x scale; or if "free" both height and width will vary. This setting has no effect unless the appropriate scales also vary.

size The width of the plot bars.

rm.horiz.lines logical. If TRUE the horizontal lines will be removed.

x.ticks logical. If TRUE the x ticks will be displayed.

ty.ticks logical. If TRUE the y ticks will be displayed.

legend.position The position of legends. ("left", "right", "bottom", "top", or two-element numeric vector).

bar.color Optional color to constrain all bars.

border.color The color to plot border around Gantt bars (default is NULL).

border.size An integer value for the size to plot borders around Gantt bars. Controls length (width also controlled if not specified).

border.width Controls border width around Gantt bars. Use a numeric value in addition to border size if plot borders appear disproportional.

constrain logical. If TRUE the Gantt bars touch the edge of the graph.

plot logical. If TRUE the plot will automatically plot. The user may wish to set to FALSE for use in knitr, sweave, etc. to add additional plot layers.

Value

Returns a Gantt style visualization. Invisibly returns the ggplot2 list object.

Note

For non-repeated measures data/plotting use gantt; for repeated measures data output use gantt_rep; and for a convenient wrapper that takes text and generates plots use gantt_plot.

x + scale_color_manual(values = rep("black",
                        length(levels(dat2$fam.aff.sex))))

## End(Not run)
```

---

**gradient_cloud**  
*Gradient Word Cloud*

**Description**

Produces a gradient word cloud colored by a binary grouping variable.

**Usage**

```r
gradient_cloud(text.var, bigroup.var, rev.binary = FALSE, X = "red",
               Y = "blue", stem = FALSE, stopwords = NULL, caps = TRUE,
               caps.list = NULL, I.list = TRUE, random.order = FALSE,
               rot.per = 0, min.freq = 1, max.word.size = NULL,
               min.word.size = 0.5, breaks = 10, cloud.font = NULL,
               title = NULL, title.font = NULL, title.color = "black",
               title.padj = 0.25, title.location = 3, title.cex = NULL,
               legend.cex = 0.8, legend.location = c(0.025, 0.025, 0.25, 0.04),
               char2space = "~~")
```

**Arguments**

- `text.var`: The text variable.
- `bigroup.var`: A binary grouping variable.
- `rev.binary`: logical. If TRUE the ordering of the binary levels of bigroup.var is reversed.
- `X`: The first gradient color for variable X.
gradient_cloud

Y
---
The second gradient color for variable Y.

stem
---
logical. If TRUE the text.var will be stemmed.

stopwords
---
Words to exclude from the cloud. Words will be removed after determining
proportional word usage.

caps
---
logical. If TRUE selected words will be capitalized.

caps.list
---
A vector of words to capitalize (caps must be TRUE).

I.list
---
logical. If TRUE capitalizes I words and contractions.

random.order
---
Plot words in random order. If FALSE, they will be plotted in decreasing fre-
quency.

rot.per
---
Proportion words with 90 degree rotation.

min.freq
---
An integer value indicating the minimum frequency a word must appear to be
included.

max.word.size
---
A size argument to control the minimum size of the words.

min.word.size
---
A size argument to control the maximum size of the words.

breaks
---
An integer describing the number of breaks (odd numbers will be rounded up).

cloud.font
---
The font family of the cloud text.

title
---
A character string used as the plot title.

title.font
---
The font family of the cloud title.

title.color
---
A character vector of length one corresponding to the color of the title.

title.padj
---
Adjustment for the title. For strings parallel to the axes, padj = 0 means right or
top alignment, and padj = 1 means left or bottom alignment.

title.location
---
On which side of the plot (1=bottom, 2=left, 3=top, 4=right).

title.cex
---
Character expansion factor for the title. NULL and NA are equivalent to 1.0.

legend.cex
---
Character expansion factor for the legend. NULL and NA are equivalent to 1.0.

legend.location
---
A vector of length 4 denoting the lower left (x and y left) and upper right (x and
y right) coordinates of the rectangle of colors in user coordinates.

char2space
---
A vector of characters to be turned into spaces.

Details

Breaking is done using quantile. This will ensure a certain percentage of words will be colored at
each bin.

Value

Plots a gradient word cloud and invisibly returns the dataframe used to make the cloud.

Hamlet (Complete & Split by Sentence)

**Description**

A dataset containing the complete dialogue of Hamlet with turns of talk split into sentences.

**Usage**

```r
data(hamlet)
```

**Format**

A data frame with 2007 rows and 7 variables
Details

- act. The act (akin to repeated measures)
- tot. The turn of talk
- scene. The scene (nested within an act)
- location. Location of the scene
- person. Character in the play
- died. Logical coded death variable if yes the character dies in the play
- dialogue. The spoken dialogue

References

http://www.gutenberg.org

**Description**

htruncdf - Convenience function to view the head of a truncated dataframe.
truncdf - Convenience function to view a truncated dataframe.
ltruncdf - Convenience function to view the head of a list of truncated dataframes.
qview - Convenience function to view a summary and head of a dataframe.
lview - Convenience function to view the list (list view) of qdap objects that have print methods that print a single dataframe.

**Usage**

htruncdf(dataframe, n = 10, width = 10, ...)
truncdf(dataframe, end = 10, begin = 1)
ltruncdf(dat.list, n = 6, width = 10, ...)
qview(dataframe, ...)
lview(x, print = TRUE)
**Arguments**

- **dataframe**: A data.frame object.
- **n**: Number of rows to display.
- **width**: The width of the columns to be displayed.
- **end**: The last character to be displayed (width).
- **begin**: The first character to be displayed (width).
- **dat.list**: A list of data.frame objects.
- **x**: A class qdap object that is a list which prints as a dataframe.
- **print**: logical. If TRUE prints to the console.
- **...**: Other arguments passed to `htruncdf` (qview, ltruncdf) or `head` (htruncdf).

**Value**

- `htruncdf` - returns n number of rows of a truncated dataframe.
- `truncdf` - returns a truncated dataframe.
- `ltruncdf` - returns a list of n number of rows of a truncated dataframes.
- `qview` - returns a dataframe head with summary statistics.
- `lview` - prints a list of the qdap object and invisibly returns the unclassed object.

**See Also**

- `head`

**Examples**

```r
## Not run:
thruncdf(raj[1:10,])
thruncdf(raj[1:10,], 40)
htruncdf(raj)
htruncdf(raj, 20)

ltruncdf(raj$POS, width = 4)
qview(raj)
qview(CO2)
lview(question_type(DATA.SPLIT$state, DATA.SPLIT$person))
lview(raj$POS)
lview(lm(mpg~hp, data = mtcars))

## End(Not run)
```
Intuitively Remark Sentences as Imperative

Description

Automatic imperative remarking.

Usage

```r
imperative(dataframe, person.var, text.var, lock.incomplete = FALSE,
additional.names = NULL, parallel = FALSE, warning = FALSE)
```

Arguments

- `dataframe`: A data.frame object.
- `person.var`: The person variable.
- `text.var`: The text variable.
- `lock.incomplete`: logical. If TRUE locks incomplete sentences (sentences ending with "!") from being marked as imperative.
- `additional.names`: Additional names that may be used in a command (people in the context that do not speak).
- `parallel`: logical. If TRUE attempts to run the function on multiple cores. Note that this may not mean a speed boost if you have one core or if the data set is smaller as the cluster takes time to create. With the mraja1spi data set, with an 8 core machine, `imperative` had 1/3 the running time.
- `warning`: logical. If TRUE provides comma warnings (sentences that contain numerous commas that may be handled incorrectly by the algorithm).

Value

Returns a dataframe with a text variable indicating imperative sentences. Imperative sentences are marked with * followed by the original end mark.

Warning

The algorithm used by `imperative` is sensitive to English language dialects and types. Commas can indicate a choppy sentence and may indicate a false positive. Sentences marked with ‘AAVE’ may be the use of African American Vernacular English and not an imperative sentence.
**Examples**

```r
## Not run:

dat <- data.frame(name=c("sue", rep("greg", "tyler", "phil", "sue"), 2)), statement=c("go get it!", "I hate to read.", "Stop running!", "I like it!", "You are terrible!", "Don't!", "Greg, go to the red, brick office.", "Tyler go to the gym.", "Alex don't run."), stringsAsFactors = FALSE)

imperative(dat, "name", "statement", , c("Alex"))
imperative(dat, "name", "statement", lock.incomplete = TRUE, c("Alex"))
imperative(dat, "name", "statement", , c("Alex"), warning=TRUE)
imperative(dat, "name", "statement", , c("Alex"), warning=TRUE, parallel = TRUE)

## End(Not run)
```

---

**incomplete_replace**

*Denote Incomplete End Marks With "|"*

**Description**

Replaces incomplete sentence end marks (.., ..., .?, ..?, en & em dash etc.) with "|".

**Usage**

```
incomplete_replace(text.var, scan.mode = FALSE)
incomp(text.var, scan.mode = FALSE)
```

**Arguments**

- **text.var** The text variable.
- **scan.mode** logical. If TRUE only scans and reports incomplete sentences.

**Value**

Returns a text variable (character sting) with incomplete sentence marks (.., ..., .?, ..?, en & em dash etc.) replaced with "|". If scan mode is TRUE returns a data frame with incomplete sentence location.

**Examples**

```r
## Not run:
x <- c("the...", "I.", "you.", "threw...", "we?")
incomplete_replace(x)
incomp(x)
incomp(x, scan.mode = TRUE)

## End(Not run)
```
**inspect_text**  
*Inspect Text Vectors*

**Description**

`inspect_text` - Inspect a text vector with adjustable string wrapping; creates a pretty printed named list.

**Usage**

```r
inspect_text(text.var, grouping.var = NULL, ...)
```

## Default S3 method:

```r
inspect_text(text.var, grouping.var = NULL, ...)
```

## S3 method for class 'Corpus'

```r
inspect_text(text.var, ...)
```

**Arguments**

- `text.var`  
  The text variable or a wfm object.

- `grouping.var`  
  The grouping variables. Default `NULL` generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.

- `...`  
  Ignored.

**Value**

Returns a named list (prints pretty).

**Examples**

```r
## Not run:
with(raj, inspect_text(dialogue))
with(raj, inspect_text(dialogue, person))
with(raj, inspect_text(dialogue, list(paste("Act", act), person)))
```

```r
## With a tm Corpus object
library(tm)
data(crude)
inspect_text(crude)
```

## End(Not run)
is.global  Test If Environment is Global

Description
A logical test to determine if the current environment is the global environment.

Usage
is.global(n = 1)

Arguments
n  The number of generations to go back. If used as a function argument n should be set to 2.

Value
A logical response.

key_merge

Merge Demographic Information with Person/Text Transcript

Description

Wrapper function (merge) for merging demographic information with a person/text transcript.

Usage

key_merge(transcript.df, key.df, common.column = NULL,
  default.arrange = TRUE)

Arguments

- transcript.df: The text/person transcript dataframe
- key.df: The demographic dataframe.
- common.column: The column(s) shared by transcript.df and key.df. If NULL function defaults to use any columns with the same name.
- default.arrange: logical. If TRUE will arrange the columns with text to the far right.

Value

Outputs a merged transcript dataframe with demographic information.

See Also

merge

Examples

```r
## Not run:
# First view transcript dataframe and demographics dataframe.
ltruncdf(list(raj, raj.demoographics), 10, 50)
merged.raj <- key_merge(raj, raj.demoographics)
htruncdf(merged.raj, 10, 40)

## End(Not run)
```
**kullback_leibler**

**Kullback Leibler Statistic**

Description

A proximity measure between two probability distributions applied to speech.

Usage

```
kullback_leibler(x, y = NULL)
```

Arguments

- `x`: A numeric vector, matrix or data frame.
- `y`: A second numeric vector if `x` is also a vector. Default is `NULL`.

Details

Uses Kullback & Leibler’s (1951) formula:

\[
D_{KL}(P||Q) = \sum_i \ln \left( \frac{P_i}{Q_i} \right) P_i
\]

Value

Returns a matrix of the Kullback Leibler measure between each vector of probabilities.

Note

The `kullback_leibler` function generally receives the output of either `wfm` or `wfdf` functions.

References

Examples

```r
## Not run:
p.df <- wfdf(DATA$state, DATA$person)
p.mat <- wfm(text.var = DATA$state, grouping.var = DATA$person)
kullback_leibler(p.mat)
(x <- kullback_leibler(p.df))
print(x, digits = 5)
kullback_leibler(p.df$greg, p.df$sam)

## p.df2 <- wfdf(raj$dialogue, raj$person)
## x <- kullback_leibler(p.df2)

## End(Not run)
```
**Description**

- `left_just` - Left justifies a text/character column.
- `right_just` - A means of undoing a left justification.

**Usage**

```r
left_just(dataframe, column = NULL, keep.class = FALSE)
right_just(dataframe)
```

**Arguments**

- `dataframe` - A data.frame object with the text column.
- `column` - The column to be justified. If `NULL` all columns are justified.
- `keep.class` - logical. If `TRUE` will attempt to keep the original classes of the dataframe if the justification is not altered (i.e., numeric will not be honored but factor may be).

**Value**

Returns a dataframe with selected text column left/right justified.

**Note**

`left_just` inserts spaces to achieve the justification. This could interfere with analysis and therefore the output from `left_just` should only be used for visualization purposes, not analysis.

**Examples**

```r
## Not run:
left_just(DATA)
left_just(DATA, "state")
left_just(CO2[1:15,])
right_just(left_just(CO2[1:15,]))
## End(Not run)```
**lexical_classification**

---

**Lexical Classification Score**

---

**Description**

Transcript apply lexical classification score (content to functional word proportion) by grouping variable(s) and optionally plot the breakdown of the model.

**Usage**

```r
lexical_classification(text.var, grouping.var = NULL, 
                     order.by.lexical_classification = TRUE, 
                     function.words = qdapDictionaries::function.words, bracket = "all", 
                     ...)
```

**Arguments**

- `text.var` The text variable.
- `grouping.var` The grouping variables. Default NULL generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.
- `order.by.lexical_classification` logical. If TRUE orders the results by `lexical_classification` score.
- `function.words` A vector of function words. Default is `function.words`.
- `bracket` The bracket type to remove. Use NULL to not remove bracketed substrings. See `bracket` argument in `bracketX` for bracket types.
- `...` Other arguments passed to `bracketX`.

**Details**

Content words (i.e., nouns, verbs, adjectives, and adverbs) tend to be the words speakers stresses in language use. Whereas, functional words are the "glue" that holds the content together. Speakers devote much less time and stress to these words (i.e., pronouns, articles, conjunctions, quantifiers, and prepositions).

**Value**

A list containing at the following components:

- `content` A `data.frame` of all content words used and corresponding frequencies
- `functional` A `data.frame` of all content words used and corresponding frequencies
- `raw` Sentence level descriptive statistics on content vs. functional word use (ave.content.rate is also nown as lexical density
- `lexical_classification` Summarized (grouping variable level) descriptive statistics for content vs. functional word use
References

Examples

**mcs_v_r**

**Read/Write Multiple csv Files at a Time**

**Description**

**mcs_v_r** - Read and assign multiple csv files at the same time.

**mcs_v_w** - Write multiple csv files into a file at the same time.

**Usage**

```r
mcs_v_r(files, a.names = NULL, l.name = NULL, list = TRUE, pos = 1,
  envir = as.environment(pos))

mcs_v_w(..., dir = NULL, open = FALSE, sep = "",
  dataframes = NULL, pos = 1, envir = as.environment(pos))
```
Arguments

files   csv file(s) to read.
a.names object names to assign the csv file(s) to. If NULL assigns the name(s) of the csv files in the directory, without the file extension, to the objects in the global environment.
1.name   A single character string of a name to assign to the list if dataframes created by the csv files being read in. Default (NULL) uses L1.
list   logical. If TRUE then a list of dataframes is created in the global environment in addition to the individual dataframes.
pos   where to do the removal. By default, uses the current environment.
envir   the environment to use.
...   data.frame object(s) to write to a file or a list of data.frame objects. If the objects in a list are unnamed V + digit will be assigned. Lists of dataframes (e.g., the output from termco or polarity) can be passed as well.
dir   optional directory names. If NULL a directory will be created in the working directory with the data and time stamp as the folder name.
open   logical. If TRUE opens the directory upon completion.
sep   A character string to separate the terms.
dataframes An optional character vector of dataframes in lieu of ...argument.

Details

mcsv is short for "multiple csv" and the suffix c(_r, _w) stands for "read" (r) or "write" (w).

Value

mcsv_r - reads in multiple csv files at once.
mcsv_w - creates a directory with multiple csv files. Silently returns the path of the directory.

Note

mcsv_r is useful for reading in multiple csv files from cm_df.temp for interaction with cm_range2long.

See Also

cm_range2long, cm_df.temp, condense, assign

Examples

```r
## Not run:
## mcsv_r EXAMPLE:
mtcarsb <- mtcars[1:5, ]; CO2b <- CO2[1:5, ]
(a <- mcsv_w(mtcarsb, CO2b, dir="foo"))
rm("mtcarsb", "CO2b")  #' gone from .GlobalEnv
(nms <- dir(a))
mcsv_r(file.path(a, nms))
```
mtcarsb; CO2b
rm("mtcarsb", "CO2b")  # gone from .GlobalEnv
mcsv_r(file.path(a, nms), paste0("foo.dat", 1:2))
foo.dat1; foo.dat2
rm("foo.dat1", "foo.dat2")  # gone from .GlobalEnv
library(reports); delete("foo")

## mcsv_w EXAMPLES:
(a <- mcsv_w(mtcars, CO2, dir="foo"))
delete("foo")

## Write lists of dataframes as well
poldat <- with(DATA.SPLIT, polarity(state, person))
term <- c("the", "she", "wh")
termdat <- with(raj.act.1, termco(dialogue, person, term))
mcsv_w(poldat, termdat, mtcars, CO2, dir="foo2")
delete("foo2")

## End(Not run)

---

**Romeo and Juliet: Act 1 Dialogue Merged with Demographics**

**Description**

A dataset containing act 1 of Romeo and Juliet with demographic information.

**Usage**

data(mraja1)

**Format**

A data frame with 235 rows and 5 variables

**Details**

- person. Character in the play
- sex. Gender
- fam.aff. Family affiliation of character
- died. Dummy coded death variable (0-no; 1-yes); if yes the character dies in the play
- dialogue. The spoken dialogue

**References**

http://shakespeare.mit.edu/romeo_juliet/full.html
**Description**

A dataset containing act 1 of Romeo and Juliet with demographic information and turns of talk split into sentences.

**Usage**

```r
data(mraja1spl)
```

**Format**

A data frame with 508 rows and 7 variables

**Details**

- person. Character in the play
- tot.
- sex. Gender
- fam.aff. Family affiliation of character
- died. Dummy coded death variable (0-no; 1-yes); if yes the character dies in the play
- dialogue. The spoken dialogue
- stem.text.

**References**

---

**Description**

*multigsub* - A wrapper for *gsub* that takes a vector of search terms and a vector or single value of replacements.

*sub_holder* - This function holds the place for particular character values, allowing the user to manipulate the vector and then revert the place holders back to the original values.
multigsub(pattern, replacement, text.var, leadspace = FALSE, trailspace = FALSE, fixed = TRUE, trim = TRUE, order.pattern = fixed, ...)

mgsub(pattern, replacement, text.var, leadspace = FALSE, trailspace = FALSE, fixed = TRUE, trim = TRUE, order.pattern = fixed, ...)

sub_holder(pattern, text.var, alpha.type = TRUE, ...)

Arguments

- **pattern**: Character string to be matched in the given character vector.
- **replacement**: Character string equal in length to pattern or of length one which are a replacement for matched pattern.
- **text.var**: The text variable.
- **leadspace**: logical. If TRUE inserts a leading space in the replacements.
- **trailspace**: logical. If TRUE inserts a trailing space in the replacements.
- **fixed**: logical. If TRUE, pattern is a string to be matched as is. Overrides all conflicting arguments.
- **trim**: logical. If TRUE leading and trailing white spaces are removed and multiple white spaces are reduced to a single white space.
- **order.pattern**: logical. If TRUE and fixed = TRUE, the pattern string is sorted by number of characters to prevent substrings replacing meta strings (e.g., pattern = c("the", "then") resorts to search for "then" first).
- **...**: Additional arguments passed to gsub.
- **alpha.type**: logical. If TRUE alpha (lower case letters) are used for the key. If FALSE numbers are used as the key.

Value

- **multigsub**: Returns a vector with the pattern replaced.
- **sub_holder**: Returns a list with the following:
  - **output**: keyed place holder character vector
  - **unhold**: A function used to revert back to the original values

Note

The unhold function for sub_holder will only work on keys that have not been disturbed by subsequent alterations. The key follows the pattern of `qdapplaceholder` followed by lower case letter keys followed by `qdap`. 
**multiscale**

### See Also

- `gsub`

### Examples

```r
## Not run:
## --------------------------
## `mgsub` Function
## --------------------------

multigsub(c("it's", "I'm"), c("it is", "I am"), DATA$state)
mgsub(c("it's", "I'm"), c("it is", "I am"), DATA$state)
mgsub("[:punct:]", "PUNC", DATA$state, fixed = FALSE)

## --------------------------
## `sub_holder` Function
## --------------------------

## `alpha.type` as TRUE
(fake_dat <- paste(emoticon[1:11,2], DATA$state))
(m <- sub_holder(emoticon[,2], fake_dat))
m$unhold(strip(m$output))
# With Stemming
m$unhold(stemmer(strip(m$output), capitalize = FALSE))

## `alpha.type` as FALSE (numeric keys)
vowels <- LETTERS[c(1, 5, 9, 15, 21)]
(m2 <- sub_holder(vowels, toupper(DATA$state), alpha.type = FALSE))
m2$unhold(gsub("[0-9]", "", m2$output))
m2$unhold(gsub("[^0-9]", "", m2$output), """)

## End(Not run)
```

---

**multiscale**

### Nested Standardization

**Description**

Standardize within a subgroup and then within a group.

**Usage**

```r
multiscale(numeric.var, grouping.var, original_order = TRUE,
           digits = 2)
```
Arguments

- `numeric.var` A numeric variable.
- `grouping.var` The grouping variables. Default NULL generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.
- `original_order` logical. IF TRUE orders by the original order. If FALSE orders by group.
- `digits` Integer; number of decimal places to round.

Value

Returns a list of two:

- `scaled_observations` A dataframe of scaled observations at level one and two of the nesting with possible outliers.
- `descriptives_by_group` A data frame of descriptives by group.

See Also

- `scale`

Examples

```r
## Not run:
dat <- with(mraja1spl, word_stats(dialogue, list(person, sex, fam.aff)))
htruncdf(colsplit2df(dat$ts), 4)
out1 <- with(colsplit2df(dat$ts), multiscale(word.count, person))
1truncdf(out1, 10)
out2 <- with(colsplit2df(dat$ts), multiscale(word.count,
  list(fam.aff, sex)))
ltruncdf(out2, 10)
out3 <- with(colsplit2df(dat$ts), multiscale(word.count,
  list(fam.aff, sex), original_order = FALSE))
ltruncdf(out3, 10)
## End(Not run)
```

---

**NAer**

*Replace Missing Values (NA)*

**Description**

Replace missing values (NA) in a vector or dataframe.

**Usage**

```r
NAer(x, replace = 0)
```
Arguments

- `x`: A vector or dataframe with missing values (NA).
- `replace`: The value to replace missing values (NA) with.

Value

Returns a vector or dataframe with missing values replaced.

Examples

```r
## Not run:
set.seed(10)
(x <- sample(c(rep(NA, 4), 1:10), 20, rep=T))
NAe(x)

set.seed(10)
(y <- data.frame(matrix(x, 5, 4)))
NAe(y)
NAe(y, "MISSING")

## End(Not run)
```

---

**name2sex**  
*Names to Gender*

Description

A wrapper for the `gender` function used to predict gender based on first name.

Usage

`name2sex(names.list, USE.NAMES = FALSE, ...)`

Arguments

- `names.list`: Character vector containing first names.
- `USE.NAMES`: logical. If TRUE `names.list` is used to name the gender vector.
- `...`: Other arguments passed to `gender`.

Value

Returns a vector of predicted gender (M/F) based on first name.

See Also

`gender`
Examples

```r
## Not run:
name2sex(qcv(mary, jenn, linda, JAME, GABRIEL, OLIVA,
tyler, jamie, JAMES, tyrone, cheryl, drew))
## End(Not run)
```

---

**Network**

*Generic Network Method*

---

**Description**

Create a network plot for select qdap outputs.

**Usage**

```r
Network(x, ...)
```

**Arguments**

- `x`: A select qdap object.
- `...`: Arguments passed to Network method of other classes.

**Value**

Returns a network plot.

---

**Network.formality**

*Network Formality*

---

**Description**

Network.formality - Network a `formality` object.

**Usage**

```r
## S3 method for class 'formality'
Network(x, contextual = "yellow", formal = "red",
edge.constant, title = NULL, digits = 3, plus.300.color = "grey40",
under.300.color = "grey88", missing.color = "purple", ...)
```
Arguments

- **x**: A `formality` object.
- **contextual**: The color to use for 0% formality (purely contextual).
- **formal**: The color to use for 100% formality (purely formal).
- **edge.constant**: A constant to multiple edge width by.
- **title**: The title to apply to the Networked image(s).
- **digits**: The number of digits to use in the current turn of talk formality.
- **plus.300.color**: The bar color to use for grouping variables exceeding 299 words per Heylighen & Dewaele's (2002) minimum word recommendations.
- **under.300.color**: The bar color to use for grouping variables less than 300 words per Heylighen & Dewaele's (2002) minimum word recommendations.
- **missing.color**: The color to use in a network plot for edges corresponding to missing text data. Use `na.omit` before hand to remove the missing values all together.
- **...**: Other arguments passed to `discourse_map`.

Details

formality Method for Network

---

**Network.lexical.classification**

*Network Lexical Classification*

**Description**

Network.lexical.classification - Network a `lexical.classification` object.

**Usage**

```r
## S3 method for class 'lexical.classification'
Network(x, functional = "yellow",
         content = "red", edge.constant, title = NULL, digits = 2, ...)
```

**Arguments**

- **x**: A `lexical.classification` object.
- **functional**: The color to use for 0% `lexical.classification` (purely functional).
- **content**: The color to use for 100% `lexical.classification` (purely content).
- **edge.constant**: A constant to multiple edge width by.
- **title**: The title to apply to the Networked image(s).
- **digits**: The number of digits to use in the current turn of talk `lexical.classification`.
- **...**: Other arguments passed to `discourse_map`. 
Details

lexical_classification Method for Network

<table>
<thead>
<tr>
<th>Network.polarity</th>
<th>Network Polarity</th>
</tr>
</thead>
</table>

Description

Network.polarity - Network a polarity object.

Usage

```r
## S3 method for class 'polarity'
Network(x, negative = "blue", positive = "red",
        neutral = "yellow", edge.constant, title = NULL, digits = 3, ...)
```

Arguments

- `x` A polarity object.
- `negative` The color to use for negative polarity.
- `positive` The color to use for positive polarity.
- `neutral` The color to use for neutral polarity.
- `edge.constant` A constant to multiple edge width by.
- `title` The title to apply to the Networked image(s).
- `digits` The number of digits to use in the current turn of talk polarity.
- `...` Other arguments passed to discourse_map.

Details

polarity Method for Network

<table>
<thead>
<tr>
<th>new_project</th>
<th>Project Template</th>
</tr>
</thead>
</table>

Description

Generate a project template to increase efficiency.

Usage

```r
new_project(project = "new", path = getwd(), open = is.global(2),
            github = FALSE, ...)
```
Arguments

- **project**: A character vector of the project name.
- **path**: The path to where the project should be created. Default is the current working directory.
- **open**: logical. If `TRUE` the project will be opened in RStudio. The default is to test if `new_project` is being used in the global environment, if it is then the project directory will be opened.
- **github**: logical. If `TRUE` the repo will be sent to public GitHub account.
- **...**: Other arguments passed to `new_report`.

Details

The project template includes these main directories and scripts:

- **CODEBOOK**: A directory to store coding conventions or demographics data:
  - **KEY.csv**: A blank template for demographic information
- **CORRESPONDENCE**: A directory to store correspondence and agreements with the client:
  - **CONTACT_INFO.txt**: A text file to put research team members’ contact information
- **DATA**: A directory to store data:
  - **CLEANED_TRANSCRIPTS**: A directory to store the cleaned transcripts (If the transcripts are already cleaned you may choose to not utilize the RAW_TRANSCRIPTS directory)
  - **CM_DATA**: A directory to export/import scripts for cm_xx family of functions
  - **DATA_FOR_REVIEW**: A directory to put data that may need to be altered or needs to be inspected more closely
  - **RAW_DATA**: A directory to store non-transcript data related to the project:
    - **ANALYTIC_MEMOS**: A directory to put audio files (or shortcuts)
    - **AUDIO**: A directory to put audio files (or shortcuts)
    - **FIELD_NOTES**: A directory to put audio files (or shortcuts)
    - **PAPER_ARTIFACTS**: A directory to put paper artifacts
    - **PHOTOGRAPHS**: A directory to put photographs
    - **VIDEO**: A directory to put video files (or shortcuts)
  - **TRANSCRIPTS**: A directory to put transcription data:
    - **CLEANED_TRANSCRIPTS**: A directory to store the cleaned transcripts (If the transcripts are already cleaned you may choose to not utilize the RAW_TRANSCRIPTS directory)
    - **RAW_TRANSCRIPTS**: A directory to store the raw transcripts
- **DOCUMENTATION**: A directory to store documents related to the project
- **PLOTS**: A directory to store plots
- **REPORTS**: A directory with report and presentation related tools.
- **SCRIPTS**: A directory to store scripts; already contains the following:
  - **01_clean_data.R**: initial cleaning of raw transcripts
ngrams

Generate ngrams

Description

Transcript apply ngrams.

Usage

\[ \text{ngrams(text.var, grouping.var = NULL, n = 2, ...)} \]

Arguments

text.var \hspace{1cm} The text variable

\text{grouping.var} \hspace{1cm} The grouping variables. Default NULL generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.

n \hspace{1cm} The max number of grams calculate

... \hspace{1cm} Further arguments passed to strip function.
ngrams

Value

Returns a list of:

- **raw**: A list of pasted single vectors of the ngrams per row.
- **group**: A list of pasted vectors of ngrams grouped by grouping.var.
- **unlist1**: A list of a single vector of pasted ngrams per grouping.var in the order used.
- **unlist2**: A list of a single vector of pasted ngrams per grouping.var in alphabetical order.
- **group_n**: A list of a single vector of pasted ngrams per grouping.var in alphabetical order.
- **all**: A single vector of pasted ngrams sorted alphabetically.
- **all_n**: A list of lists a single vectors of ngrams sorted alphabetically (not pasted).

Examples

```r
## Not run:
ngrams(DATA$state, DATA$person, 2)
ngrams(DATA$state, DATA$person, 3)
ngrams(DATA$state, , 3)
with(mraja1, ngrams(dialogue, list(sex, fam.aff), 3))

## Alternative ngram analysis:
n_gram <- function(x, n = 2, sep = " "){
  m <- qdap::bag_o_words(x)
  if (length(m) < n) return(character(0))
  starts <- 1:length(m) - (n - 1))
  ends <- n:length(m)
  Map(function(x, y){
    paste(m[x:y], collapse=sep)
  }, starts, ends)
}

dat <- sentSplit(DATA, "state")

dat[["grams"]]<- sapply(dat[["state"]], function(x) {
  unbag(n_gram(x, sep = "---"))
})

m <- with(dat, as.tdm(grams, person))
rownames(m) <- gsub("---", " ", rownames(m))
as.matrix(m)
rowSums(as.matrix(m))

dat2 <- sentSplit(raj, "dialogue")

dat2[["grams"]]<- sapply(dat2[["dialogue"]], function(x) {
  unbag(n_gram(x, sep = "---"))
})
```
Count Object Pronouns Per Grouping Variable

Description

Count the number of object pronouns per grouping variables.

Usage

```r
object_pronoun_type(text.var, grouping.var = NULL,
object.pronoun.list = NULL, ...)
```

Arguments

- `text.var` The text variable
- `grouping.var` The grouping variables. Default `NULL` generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.
- `object.pronoun.list` A named list of object pronouns. See `Details` for more.
- `...` Other arguments passed to `termco`

Details

The following object pronoun categories are the default searched terms:

- `me = c(" me ", " my ", " mine ")`
- `us = c(" us ", " our ", " ours ")`
- `you = c(" you’d ", " you’ll ", " you’re ", " you’ve ", " you ", " your ")`
- `him = c(" him ", " his ")`
- `her = c(" her ", " hers ")`
- `them = c(" them ")`
- `their = c(" their ", " theirs ")`
- `it = c(" it’d ", " it’ll ", " it’s ", " it ")`
Value

Returns a list, of class "object_pronoun_type", of data frames regarding object pronoun word counts:

- **preprocessed**: List of uncollapsed dataframes (raw, prop, rnp) of the class "termco" that contain all searchable object pronouns.
- **raw**: raw word counts by grouping variable
- **prop**: proportional word counts by grouping variable; proportional to each individual’s object pronoun use
- **rnp**: a character combination data frame of raw and proportional object pronoun use

subject_pronoun_type, pronoun_type

Examples

```r
## Not run:
dat <- pres.debates2012
dat <- dat[dat$person %in% qcv(ROMNEY, OBAMA), ]
(out <- object_pronoun_type(dat$dialogue, dat$person))
plot(out)
plot(out, 2)
plot(out, 3)
plot(out, 3, ncol=2)

scores(out)
counts(out)
proportions(out)
preprocessed(out)

plot(scores(out))
plot(counts(out))
plot(proportions(out))

## End(Not run)
```

outlier_detect  

**Detect Outliers in Text**

Description

Locate possible outliers for text variables given numeric word function.

Usage

```r
outlier_detect(text.var, grouping.var = NULL, FUN = word_count, 
    scale.by = "grouping")
```
outlier_labeler

Locate Outliers in Numeric String

Description

Locate and label possible outliers in a string.

Usage

outlier_labeler(x, standardize = TRUE, ...)

Arguments

- **x**: A numeric vector.
- **standardize**: logical. If TRUE scales the vector first.
- **...**: Other arguments passed to `scale`.

Value

Returns a matrix (one column) of possible outliers coded as "3sd", "2sd" and "1.5sd", corresponding to \( \geq 3, 2, \) or 1.5 standard deviations.
See Also

scale

Examples

## Not run:
outlier_labeler(mtcars$h[20:32])
by(mtcars$mpg, mtcars$cyl, outlier_labeler)
tapply(mtcars$mpg, mtcars$cyl, outlier_labeler)

## (Not run)

---

**paste2**

**Paste an Unspecified Number Of Text Columns**

**Description**

* paste2 - Paste unspecified columns or a list of vectors together.
* colpaste2df - Wrapper for `paste2` that returns a dataframe with columns pasted together.

**Usage**

```r
paste2(multi.columns, sep = ".", handle.na = TRUE, trim = TRUE)
colpaste2df(mat, combined.columns, sep = ".", name.sep = "&", keep.orig = TRUE, ...)
```

**Arguments**

- `multi.columns` - The multiple columns or a list of vectors to paste together.
- `sep` - The character to be used in `paste2` to paste the columns.
- `handle.na` - logical. If `TRUE` returns `NA` if any column/vector contains a missing value.
- `trim` - logical. If `TRUE` leading/trailing white space is removed.
- `mat` - A matrix or dataframe.
- `combined.columns` - A list of named vectors of the colnames/indexes of the numeric columns to be pasted. If a vector is unnamed a name will be assigned.
- `name.sep` - The character to be used to paste the column names.
- `keep.orig` - logical. If `TRUE` the original columns (i.e., `combined.columns`) will be retained as well.
- `...` - Other arguments passed to `paste2`.

**Value**

- `paste2` - Returns a vector with row-wise elements pasted together.
- `colpaste2df` - Returns a dataframe with pasted columns.
Note

`paste` differs from `paste2` because paste does not allowed an unspecified number of columns to be pasted. This behavior can be convenient for inside of functions when the number of columns being pasted is unknown.

See Also

`paste, colsplit2df`

Examples

```r
## Not run:
## paste2 examples
v <- rep(list(state.abb[1:8], month.abb[1:8]), 5)
n <- sample(5:10, 1)
paste(v[1:n]) # odd looking return
paste2(v[1:n])
paste2(v[1:n], sep="|")
paste2(mtcars[1:10,], sep="|") # odd looking return
paste2(CO2[1:10,], sep="|--")

## colpaste2df examples
A <- list(
  a = c(1, 2, 3),
  b = qcv(mpg, hp),
  c = c("disp", "am")
)
B <- list(
  c(1, 2, 3),
  new.col = qcv(mpg, hp),
  c("disp", "am")
)
E <- list(
  c(1, 2, 3, 4, 5),
  qcv(mpg, hp),
  c("disp", "am")
)
colpaste2df(head(mtcars), A)
colpaste2df(head(mtcars), B)
colpaste2df(head(mtcars), E)
colpaste2df(head(mtcars), qcv(am, disp, drat), sep=" ", name.sep = "|")
colpaste2df(head(CO2), list(c(1, 2, 3, 4, 5), qcv("conc", "uptake")))

## End(Not run)
```
Description

Create Many Eyes style phrase nets.

Usage

```r
phrase_net(text.var, freq = 4, r = 0.35, edge.constant = 6, vertex.constant = 3, ...)
```

Arguments

- `text.var` The text variable.
- `freq` The minimum word frequency occurrence.
- `r` The minimum correlation value
- `edge.constant` A constant to multiple the edges by.
- `vertex.constant` A constant to multiple the vertex label sizes by.
- `...` Other arguments passed to `filter`.

Value

Returns an igraph object.

Note

While Many Eyes phrase nets inspired this function the two outputs are not identical. The `phrase_net` function operates off of correlations between words in sentences.

http://trinker.github.io/many-eye

Examples

```r
## Not run:
x <- "Questions must be at least 2 days old to be eligible for a bounty. There can only be 1 active bounty per question at any given time. Users must have at least 75 reputation to offer a bounty, and may only have a maximum of 3 active bounties at any given time. The bounty period lasts 7 days. Bounties must have a minimum duration of at least 1 day. After the bounty ends, there is a grace period of 24 hours to manually award the bounty. If you do not award your bounty within 7 days (plus the grace period), the highest voted answer created after the bounty started with at least 2 upvotes will be"n
phrase_net(x)
```
awarded half the bounty amount. If there's no answer meeting that criteria, the bounty is not awarded to anyone. If the bounty was started by the question owner, and the question owner accepts an answer during the bounty period, and the bounty expires without an explicit award - we assume the bounty owner liked the answer they accepted and award it the full bounty amount at the time of bounty expiration. In any case, you will always give up the amount of reputation specified in the bounty, so if you start a bounty, be sure to follow up and award your bounty to the best answer! As an additional bonus, bounty awards are immune to the daily reputation cap and community wiki mode.

```r
phrase_net(sent_detect(x), r=.5)
library(igraph)
plot(phrase_net(sent_detect(x), r=.5), edge.curved = FALSE)

## Declaration of Independence Example
y <- readLines("http://www.constitution.org/usdeclar.txt")
y <- paste(y[grepl("When, in the", y):length(y)], collapse=" ")
phrase_net(sent_detect(y), r=.7)

## Multiple grouping variables
z <- lapply(split(raj.act.1$dialogue, raj.act.1$person), paste, collapse=" ")
par(mfrow=c(2, 5), mai=c(.05, .15, .15, .15))
lapply(seq_along(z), function(i) {
  x <- try(phrase_net(sent_detect(z[i]), r=.6))
  if (!inherits(x, "try-error")) {
    print(x)
    box()
    mtext(names(z)[i])
  }
})
lapply(seq_along(z), function(i) {
  x <- try(phrase_net(sent_detect(z[i]), r=.6))
  if (!inherits(x, "try-error")) {
    dev.new()
    print(x)
    mtext(names(z)[i], padj=-1, cex=1.7, col="red")
  }
})

## End(Not run)

plot(animated_character)

Plots an animated_character Object
plot.animated_discourse_map

Description

Plots an animated_character object.

Usage

```r
## S3 method for class 'animated_character'
plot(x, ...)
```

Arguments

- `x` The animated_character object.
- `...` Other arguments passed to `print.animated_character`.

plot.animated_discourse_map

*Plots an animated_discourse_map Object*

Description

Plots an animated_discourse_map object.

Usage

```r
## S3 method for class 'animated_discourse_map'
plot(x, ...)
```

Arguments

- `x` The animated_discourse_map object.
- `...` Other arguments passed to `print.animated_discourse_map`.

plot.animated_formality

*Plots a animated_formality Object*

Description

Plots a animated_formality object.

Usage

```r
## S3 method for class 'animated_formality'
plot(x, ...)
```
Arguments

x The animated_formality object.
...

Other arguments passed to print.animated_formality.

plot.animated_lexical_classification

Plots an animated_lexical_classification Object

Description

Plots an animated_lexical_classification object.

Usage

## S3 method for class 'animated_lexical_classification'
plot(x, ...)

Arguments

x The animated_lexical_classification object.
...

Other arguments passed to print.animated_lexical_classification.

plot.animated_polarity

Plots an animated_polarity Object

Description

Plots an animated_polarity object.

Usage

## S3 method for class 'animated_polarity'
plot(x, ...)

Arguments

x The animated_polarity object.
...

Other arguments passed to print.animated_polarity.
**plot.automated_readability_index**

Plots a `automated_readability_index` object.

**Description**

Plots a `automated_readability_index` object.

**Usage**

```r
## S3 method for class 'automated_readability_index'
plot(x, ...)  
```

**Arguments**

- `x` : The `readability_score` object.
- `...` : ignored

---

**plot.character_table**

Plots a `character_table` object.

**Description**

Plots a `character_table` object.

**Usage**

```r
## S3 method for class 'character_table'
plot(x, label = FALSE, lab.digits = 1,
     percent = NULL, zero.replace = NULL, ...)
```

**Arguments**

- `x` : The `character_table` object.
- `label` : logical. If TRUE the cells of the heat map plot will be labeled with count and proportional values.
- `lab.digits` : Integer values specifying the number of digits to be printed if label is TRUE.
- `percent` : logical. If TRUE output given as percent. If FALSE the output is proportion. If NULL uses the value from `question_type`. Only used if label is TRUE.
- `zero.replace` : Value to replace 0 values with. If NULL uses the value from `question_type`. Only used if label is TRUE.
- `...` : Other arguments passed to `qheat`
plot.cm_distance

Plots a cm_distance object

Description
Plots a cm_distance object.

Usage
## S3 method for class 'cm_distance'
plot(x, digits = 3, constant = 1,
     label.dist = FALSE, label.cex = 1, label.cex.scale.by.n = FALSE, alpha = NULL,
     label.color = "black", use.vertex.shape = FALSE, arrow.size = 0.6,
     ...)
Arguments

- `x` A cm_distance object.
- `digits` The number of digits to use if distance labels are included on the edges.
- `constant` A constant to weight the edges by.
- `label.dist` logical. If TRUE distance measures are placed on the edges.
- `layout` A layout; see `layout`.
- `label.cex` A constant to use for the label size.
- `label.cex.scale.by.n` logical. If TRUE the label size is scaled by the number of uses of the code.
- `alpha` The cut off value for pvalue inclusion of edges.
- `label.color` Color of the vertex labels.
- `use.vertex.shape` logical. If TRUE the vertex label if plotted on a circle.
- `arrow.size` The size of the arrows. Currently this is a constant, so it is the same for every edge.
- `...` Further arguments passed to the chosen layout.

Value

Returns the igraph object.

Note

This plotting method is not particularly well developed. It is suggested that the user further develop the graph via direct use of the igraph package.

---

plot.coleman_liau  
Plots a coleman_liau Object

Description

Plots a coleman_liau object.

Usage

```r
# S3 method for class 'coleman_liau'
plot(x, ...)
```

Arguments

- `x` The readability_score object.
- `...` ignored
plot.combo_syllable_sum

Plots a combo_syllable_sum Object

Description

Plots a combo_syllable_sum object.

Usage

## S3 method for class 'combo_syllable_sum'
plot(x, ...)

Arguments

x The combo_syllable_sum object.
...

plot.cumulative_animated_formality

Plots a cumulative_animated_formality Object

Description

Plots a cumulative_animated_formality object.

Usage

## S3 method for class 'cumulative_animated_formality'
plot(x, ...)

Arguments

x The cumulative_animated_formality object.
...

ignored
plot.cumulative_animated_lexical_classification

Plots a cumulative_animated_lexical_classification Object

Description

Plots a cumulative_animated_lexical_classification object.

Usage

```r
## S3 method for class 'cumulative_animated_lexical_classification'
plot(x, ...)
```

Arguments

- `x` The cumulative_animated_lexical_classification object.
- `...` ignored

plot.cumulative_animated_polarity

Plots a cumulative_animated_polarity Object

Description

Plots a cumulative_animated_polarity object.

Usage

```r
## S3 method for class 'cumulative_animated_polarity'
plot(x, ...)
```

Arguments

- `x` The cumulative_animated_polarity object.
- `...` ignored
plot.cumulative_combo_syllable_sum

Plots a cumulative_combo_syllable_sum Object

Description

Plots a cumulative_combo_syllable_sum object.

Usage

```r
## S3 method for class 'cumulative_combo_syllable_sum'
plot(x, ...)
```

Arguments

- `x` The cumulative_combo_syllable_sum object.
- `...` ignored

plot.cumulative_end_mark

Plots a cumulative_end_mark Object

Description

Plots a cumulative_end_mark object.

Usage

```r
## S3 method for class 'cumulative_end_mark'
plot(x, ...)
```

Arguments

- `x` The cumulative_end_mark object.
- `...` ignored
plot.cumulative_formality

Plots a cumulative_formality Object

Description

Plots a cumulative_formality object.

Usage

```r
## S3 method for class 'cumulative_formality'
plot(x, ...)
```

Arguments

- `x` The cumulative_formality object.
- `...` ignored

plot.cumulative_lexical_classification

Plots a cumulative_lexical_classification Object

Description

Plots a cumulative_lexical_classification object.

Usage

```r
## S3 method for class 'cumulative_lexical_classification'
plot(x, ...)
```

Arguments

- `x` The cumulative_lexical_classification object.
- `...` ignored
plot.cumulative_polarity

Plots a cumulative_polarity Object

Description
Plots a cumulative_polarity object.

Usage
### S3 method for class 'cumulative_polarity'
plot(x, ...)

Arguments
x The cumulative_polarity object.
...

plot.cumulative_syllable_freq

Plots a cumulative_syllable_freq Object

Description
Plots a cumulative_syllable_freq object.

Usage
### S3 method for class 'cumulative_syllable_freq'
plot(x, ...)

Arguments
x The cumulative_syllable_freq object.
...

ignored
**plot.discourse_map**  
*Plots a discourse_map Object*

---

**Description**

Plots a discourse_map object.

**Usage**

```r
## S3 method for class 'discourse_map'
plot(x, ...)
```

**Arguments**

- `x`  
  The discourse_map object.

- `...`  
  Other arguments passed to `print.discourse_map`.

---

**plot.diversity**  
*Plots a diversity object*

---

**Description**

Plots a diversity object.

**Usage**

```r
## S3 method for class 'diversity'
plot(x, ...)
```

**Arguments**

- `x`  
  The diversity object.

- `...`  
  Other arguments passed to `qheat`
**plot.end_mark**  
**Plots an end_mark Object**

**Description**

Plots an end_mark object.

**Usage**

```r
## S3 method for class 'end_mark'
plot(x, ...)
```

**Arguments**

- `x` - The end_mark object.
- `...` - ignored

---

**plot.end_mark_by**  
**Plots a end_mark_by Object**

**Description**

Plots a end_mark_by object.

**Usage**

```r
## S3 method for class 'end_mark_by'
plot(x, values = FALSE, ...)
```

**Arguments**

- `x` - The end_mark_by object.
- `values` - logical. If TRUE the cell values will be included on the heatmap.
- `...` - Other arguments passed to qheat.
plot.end_mark_by_count

Plots a end_mark_by_count Object

Description

Plots a end_mark_by_count object.

Usage

## S3 method for class 'end_mark_by_count'
plot(x, values = TRUE, ...)

Arguments

x            The end_mark_by_count object.
values       logical. If TRUE the cell values will be included on the heatmap.
...          Arguments passed to qheat.

plot.end_mark_by_preprocessed

Plots a end_mark_by_preprocessed Object

Description

Plots a end_mark_by_preprocessed object.

Usage

## S3 method for class 'end_mark_by_preprocessed'
plot(x, ncol = 1, ...)

Arguments

x            The end_mark_by_preprocessed object.
ncol         The number of columns to use for facet_wrap.
...          ignored
plot.end_mark_by_proportion

Plots a end_mark_by_proportion Object

Description

Plots a end_mark_by_proportion object.

Usage

## S3 method for class 'end_mark_by_proportion'
plot(x, values = TRUE, ...)  

Arguments

x The end_mark_by_proportion object.
values logical. If TRUE the cell values will be included on the heatmap.
... Arguments passed to qheat.

plot.end_mark_by_score

Plots a end_mark_by_score Object

Description

Plots a end_mark_by_score object.

Usage

## S3 method for class 'end_mark_by_score'
plot(x, values = TRUE, ...)  

Arguments

x The end_mark_by_score object.
values logical. If TRUE the cell values will be included on the heatmap.
... Arguments passed to qheat.
plot.flesch_kincaid

Plots a flesch_kincaid Object

Description

Plots a flesch_kincaid object.

Usage

```r
## S3 method for class 'flesch_kincaid'
plot(x, ...)
```

Arguments

- `x`: The readability_score object.
- `...`: ignored

plot.formality

Plots a formality Object

Description

Plots a formality object including the parts of speech used to calculate contextual/formal speech.

Usage

```r
## S3 method for class 'formality'
plot(x, point.pch = 20, point.cex = 0.5,
     point.colors = c("gray65", "red"), bar.colors = NULL,
     short.names = TRUE, min.wrdcnt = NULL, order.by.formality = TRUE,
     plot = TRUE, ...)
```

Arguments

- `x`: The formality object.
- `point.pch`: The plotting symbol.
- `point.cex`: The plotting symbol size.
- `point.colors`: A vector of colors (length of two) to plot word count and formality score.
- `bar.colors`: A palette of colors to supply to the bars in the visualization. If two palettes are provided to the two bar plots respectively.
- `short.names`: logical. If TRUE shortens the length of legend and label names for more compact plot width.
- `min.wrdcnt`: A minimum word count threshold that must be achieved to be considered in the results. Default includes all subgroups.
order.by.formality

logical. If TRUE the group formality plot will be ordered by average formality score, otherwise alphabetical order is assumed.

plot

logical. If TRUE the plot will automatically plot. The user may wish to set to FALSE for use in knitr, sweave, etc. to add additional plot layers.

... ignored

Value

Invisibly returns the ggplot2 objects that form the larger plot.

plot.formality_scores  Plots a formality_scores Object

Description

Plots a formality_scores object.

Usage

## S3 method for class 'formality_scores'
plot(x, ...)

Arguments

x The formality_scores object.

... ignored

plot.freq_terms  Plots a freq_terms Object

Description

Plots a freq_terms object.

Usage

## S3 method for class 'freq_terms'
plot(x, plot = TRUE, ...)

Arguments

x The freq_terms object.

plot logical. If TRUE the plot will automatically plot. The user may wish to set to FALSE for use in knitr, sweave, etc. to add additional plot layers.

... ignored.
**plot.gantt**  
*Plots a gantt object*

**Description**  
Plots a gantt object.

**Usage**

```r
## S3 method for class 'gantt'
plot(x, base = FALSE, title = NULL, ...)
```

**Arguments**

- `x`: The sums_gantt object  
- `base`: logical. If `TRUE` prints in base graphics system. If `FALSE` prints in ggplot graphics system.  
- `title`: An optional title.  
- `...`: Other arguments passed to `gantt_wrap` or `plot_gantt_base`

---

**plot.kullback_leibler**  
*Plots a kullback_leibler object*

**Description**  
Plots a kullback_leibler object.

**Usage**

```r
## S3 method for class 'kullback_leibler'
plot(x, digits = 3, ...)
```

**Arguments**

- `x`: The kullback_leibler object  
- `digits`: Number of decimal places to print.  
- `...`: Other arguments passed to qheat
### plot.lexical

**Plots a lexical Object**

**Description**

Plots a lexical object.

**Usage**

```r
## S3 method for class 'lexical'
plot(x, min.freq = 1, rot.per = 0,
    random.order = FALSE, title = TRUE, title.color = "blue", ...)
```

**Arguments**

- `x`: The lexical object.
- `min.freq`: Words with frequency below `min.freq` will not be plotted.
- `rot.per`: Proportion words with 90 degree rotation.
- `random.order`: logical. If codeTRUE plot words in random order. If FALSE, they will be plotted in decreasing frequency.
- `title`: The title of the plot. Use `NULL` to eliminate.
- `title.color`: The color of the title.
- `...`: Other arguments passed to `wordcloud`.

### plot.lexical_classification

**Plots a lexical_classification Object**

**Description**

Plots a lexical_classification object as a heat map Gantt plot with lexical_classification over time (measured in words) and lexical_classification scores per sentence. In the dotplot plot the black dots are the average lexical_classification per grouping variable.

**Usage**

```r
## S3 method for class 'lexical_classification'
plot(x, bar.size = 5, low = "blue",
    mid = "grey99", high = "red",
    ave.lexical_classification.shape = "+", alpha = 1/4, shape = 19,
    point.size = 2.5, jitter = 0.1, nrow = NULL, na.rm = TRUE,
    order.by.lexical_classification = TRUE, plot = TRUE,
    error.bars = TRUE, error.bar.height = 0.5, error.bar.size = 0.5,
    error.bar.color = "black", error.bar.alpha = 0.6, ...)
```
plot.lexical_classification

Arguments

- **x**: The lexical_classification object.
- **bar.size**: The size of the bars used in the Gantt plot.
- **low**: The color to be used for lower values.
- **mid**: The color to be used for mid-range values (default is a less striking color).
- **high**: The color to be used for higher values.
- **ave.lexical_classification.shape**: The shape of the average lexical_classification score used in the dot plot.
- **alpha**: Transparency level of points (ranges between 0 and 1).
- **shape**: The shape of the points used in the dot plot.
- **point.size**: The size of the points used in the dot plot.
- **jitter**: Amount of vertical jitter to add to the points.
- **nrow**: The number of rows in the dotplot legend (used when the number of grouping variables makes the legend too wide). If **null** no legend if plotted.
- **na.rm**: logical. Should missing values be removed?
- **order.by.lexical_classification**: logical. If **true** the group lexical_classification plot will be ordered by average lexical_classification score, otherwise alphabetical order is assumed.
- **plot**: logical. If **true** the plot will automatically plot. The user may wish to set to **false** for use in knitr, sweave, etc. to add additional plot layers.
- **error.bars**: logical. If **true** error bars are added to the lexical_classification dot plot using the standard error of the mean lexical_classification score.
- **error.bar.height**: The height of the error bar ends.
- **error.bar.size**: The size/thickness of the error bars.
- **error.bar.color**: The color of the error bars. If **null** each bar will be colored by grouping variable.
- **error.bar.alpha**: The alpha level of the error bars.
- **...**: ignored

Value

Invisibly returns the ggplot2 objects that form the larger plot.
plot.lexical_classification_preprocessed

Plots a lexical_classification_preprocessed Object

Description

Plots a lexical_classification_preprocessed object.

Usage

```r
## S3 method for class 'lexical_classification_preprocessed'
plot(x, jitter = 0.1,
     text.size = 3.5, alpha = 0.3, ncol = 3, ...)
```

Arguments

- `x` The lexical_classification_preprocessed object.
- `jitter` The amount to jitter the points by in the boxplots.
- `text.size` The text size to use for plotting the mean in the boxplots.
- `alpha` The alpha level to use for points.
- `ncol` The number of columns to use for `facet_wrap`.
- `...` ignored

plot.lexical_classification_score

Plots a lexical_classification_score Object

Description

Plots a lexical_classification_score object.

Usage

```r
## S3 method for class 'lexical_classification_score'
plot(x, error.bar.height = 0.35,
     error.bar.size = 0.5, error.bar.alpha = 0.3, ...)
```

Arguments

- `x` The lexical_classification_score object.
- `error.bar.height` The height of the error bar ends.
- `error.bar.size` The size/thickness of the error bars.
- `error.bar.alpha` The alpha level of the error bars.
- `...` ignored
plot.linsear_write  
Plots a linsear_write Object

Description

Plots a linsear_write object.

Usage

## S3 method for class 'linsear_write'
plot(x, alpha = 0.4, ...)

Arguments

x  
The readability_score object.

alpha  
The alpha level for the points and smooth fill in the scatterplot (length one or two; if two 1-points, 2-smooth fill).

...  
ignored

plot.linsear_write_count  
Plots a linsear_write_count Object

Description

Plots a linsear_write_count object.

Usage

## S3 method for class 'linsear_write_count'
plot(x, ...)

Arguments

x  
The linsear_write_count object.

...  
ignored
plot.linsear_write_scores

Plots a linsear_write_scores Object

Description

Plots a linsear_write_scores object.

Usage

## S3 method for class 'linsear_write_scores'
plot(x, alpha = c(0.4, 0.08), ...)

Arguments

- **x**: The readability_score object.
- **alpha**: The alpha level for the points and smooth fill in the scatterplot (length one or two; if two 1-points, 2-smooth fill).
- **...**: Other arguments passed to `geom_smooth`.

plot.Network

Plots a Network Object

Description

Plots a Network object.

Usage

## S3 method for class 'Network'
plot(x, ...)

Arguments

- **x**: The Network object.
- **...**: Other arguments passed to `print.Network`.
plot.object_pronoun_type

Plots an object_pronoun_type Object

Description

Plots an object_pronoun_type object.

Usage

```r
## S3 method for class 'object_pronoun_type'
plot(x, type = 1, ...)
```

Arguments

- `x` The object_pronoun_type object.
- `type` An integer of 1, 2, 3) corresponding to 1 - heat map; 2 - lexical dispersion plot; 3 - faceted bar graph.
- `...` Other arguments passed to `qheat`, `dispersion_plot`, or `facet_wrap`.

plot.polarity

Plots a polarity Object

Description

Plots a polarity object as a heat map Gantt plot with polarity over time (measured in words) and polarity scores per sentence. In the dotplot plot the black dots are the average polarity per grouping variable.

Usage

```r
## S3 method for class 'polarity'
plot(x, bar.size = 5, low = "blue",
     mid = "grey99", high = "red", ave.polarity.shape = "+",
     alpha = 1/4, shape = 19, point.size = 2.5, jitter = 0.1,
     nrow = NULL, na.rm = TRUE, order.by.polarity = TRUE, plot = TRUE,
     error.bars = TRUE, error.bar.height = 0.5, error.bar.size = 0.5,
     error.bar.color = "black", ...)
```
Arguments

- **x**: The polarity object.
- **bar.size**: The size of the bars used in the Gantt plot.
- **low**: The color to be used for lower values.
- **mid**: The color to be used for mid-range values (default is a less striking color).
- **high**: The color to be used for higher values.
- **ave.polarity.shape**: The shape of the average polarity score used in the dot plot.
- **alpha**: Transparency level of points (ranges between 0 and 1).
- **shape**: The shape of the points used in the dot plot.
- **point.size**: The size of the points used in the dot plot.
- **jitter**: Amount of vertical jitter to add to the points.
- **nrow**: The number of rows in the dotplot legend (used when the number of grouping variables makes the legend too wide). If NULL no legend if plotted.
- **na.rm**: logical. Should missing values be removed?
- **order.by.polarity**: logical. If TRUE the group polarity plot will be ordered by average polarity score, otherwise alphabetical order is assumed.
- **plot**: logical. If TRUE the plot will automatically plot. The user may wish to set to FALSE for use in knitr, sweave, etc. to add additional plot layers.
- **error.bars**: logical. If TRUE error bars are added to the polarity dot plot using the standard error of the mean polarity score.
- **error.bar.height**: The height of the error bar ends.
- **error.bar.size**: The size/thickness of the error bars.
- **error.bar.color**: The color of the error bars. If NULL each bar will be colored by grouping variable.
- **...**: ignored

Value

Invisibly returns the ggplot2 objects that form the larger plot.
Description

Plots a polarity_count object as a heat map Gantt plot with polarity over time (measured in words) and polarity scores per sentence. In the dotplot plot the black dots are the average polarity per grouping variable.

Usage

```r
## S3 method for class 'polarity_count'
plot(x, bar.size = 5, low = "blue",
     mid = "grey99", high = "red", ave.polarity.shape = "+",
     alpha = 1/4, shape = 19, point.size = 2.5, jitter = 0.1,
     nrow = NULL, na.rm = TRUE, order.by.polarity = TRUE, plot = TRUE,
     error.bars = TRUE, error.bar.height = 0.5, error.bar.size = 0.5,
     error.bar.color = "black", ...)
```

Arguments

- `x` The polarity_count object.
- `bar.size` The size of the bars used in the Gantt plot.
- `low` The color to be used for lower values.
- `mid` The color to be used for mid-range values (default is a less striking color).
- `high` The color to be used for higher values.
- `ave.polarity.shape` The shape of the average polarity score used in the dot plot.
- `alpha` Transparency level of points (ranges between 0 and 1).
- `shape` The shape of the points used in the dot plot.
- `point.size` The size of the points used in the dot plot.
- `jitter` Amount of vertical jitter to add to the points.
- `nrow` The number of rows in the dotplot legend (used when the number of grouping variables makes the legend too wide). If NULL no legend if plotted.
- `na.rm` logical. Should missing values be removed?
- `order.by.polarity` logical. If TRUE the group polarity plot will be ordered by average polarity score, otherwise alphabetical order is assumed.
- `plot` logical. If TRUE the plot will automatically plot. The user may wish to set to FALSE for use in knitr, sweave, etc. to add additional plot layers.
- `error.bars` logical. If TRUE error bars are added to the polarity dot plot using the standard error of the mean polarity score.
plot.polarity_score

error.bar.height
  The height of the error bar ends.
error.bar.size
  The size/thickness of the error bars.
error.bar.color
  The color of the error bars. If NULL each bar will be colored by grouping variable.
... ignored

Value

Invisibly returns the ggplot2 objects that form the larger plot.

Description

Plots a polarity_score object.

Usage

```r
## S3 method for class 'polarity_score'
plot(x, error.bar.height = 0.35,
     error.bar.size = 0.5, error.bar.alpha = 0.3, ...)
```

Arguments

- `x` The polarity_score object.
- `error.bar.height` The height of the error bar ends.
- `error.bar.size` The size/thickness of the error bars.
- `error.bar.color` The color of the error bars. If NULL each bar will be colored by grouping variable.
- `error.bar.alpha` The alpha level of the error bars.
- `...` ignored
plot.pos  

Plots a pos Object

Description

Plots a pos object.

Usage

```
## S3 method for class 'pos'
plot(x, ...)
```

Arguments

- `x`: The pos object
- `...`: ignored

plot.pos_by  

Plots a pos_by Object

Description

Plots a pos_by object.

Usage

```
## S3 method for class 'pos_by'
plot(x, label = FALSE, lab.digits = 1,
     percent = NULL, zero.replace = NULL, ...)
```

Arguments

- `x`: The pos_by object
- `label`: logical. If TRUE the cells of the heat map plot will be labeled with count and proportional values.
- `lab.digits`: Integer values specifying the number of digits to be printed if label is TRUE.
- `percent`: logical. If TRUE output given as percent. If FALSE the output is proportion. If NULL uses the value from question_type. Only used if label is TRUE.
- `zero.replace`: Value to replace 0 values with. If NULL uses the value from question_type. Only used if label is TRUE.
- `...`: Other arguments passed to qheat.
plot.pos_preprocessed  
*Plots a pos_preprocessed Object*

**Description**

Plots a pos_preprocessed object.

**Usage**

```r
## S3 method for class 'pos_preprocessed'
plot(x, ...)
```

**Arguments**

- `x` The pos_preprocessed object.
- `...` ignored

---

plot.pronoun_type  
*Plots an pronoun_type Object*

**Description**

Plots an pronoun_type object.

**Usage**

```r
## S3 method for class 'pronoun_type'
plot(x, type = 1, ...)
```

**Arguments**

- `x` The pronoun_type object.
- `type` An integer of 1, 2, 3) corresponding to 1 - heat map; 2 - lexical dispersion plot; 3 - facetted bar graph.
- `...` Other arguments passed to `qheat`, `dispersion_plot`, or `facet_wrap`. 

plot.question_type

Plots a question_type Object

Description

Plots a question_type object.

Usage

```r
## S3 method for class 'question_type'
plot(x, label = FALSE, lab.digits = 1,
     percent = NULL, zero.replace = NULL, ...)
```

Arguments

- `x` The question_type object.
- `label` logical. If TRUE the cells of the heat map plot will be labeled with count and proportional values.
- `lab.digits` Integer values specifying the number of digits to be printed if label is TRUE.
- `percent` logical. If TRUE output given as percent. If FALSE the output is proportion. If NULL uses the value from question_type. Only used if label is TRUE.
- `zero.replace` Value to replace 0 values with. If NULL uses the value from question_type. Only used if label is TRUE.
- `...` Other arguments passed to qheat.

plot.question_type_preprocessed

Plots a question_type_preprocessed Object

Description

Plots a question_type_preprocessed object.

Usage

```r
## S3 method for class 'question_type_preprocessed'
plot(x, ...)
```

Arguments

- `x` The question_type_preprocessed object.
- `...` Arguments passed to gantt_plot.
### plot.readability_count

*Plots a readability_count Object*

#### Description
Plots a readability_count object.

#### Usage
```r
## S3 method for class 'readability_count'
plot(x, alpha = 0.3, ...)
```

#### Arguments
- **x** The readability_count object.
- **alpha** The alpha level to use for points.
- **...** ignored

### plot.readability_score

*Plots a readability_score Object*

#### Description
Plots a readability_score object.

#### Usage
```r
## S3 method for class 'readability_score'
plot(x, alpha = 0.3, auto.label, grid,
     div.col, ...)
```

#### Arguments
- **x** The readability_score object.
- **alpha** The alpha level to be used for the points.
- **auto.label** logical. For plotting fry only, if TRUE labels automatically added. If FALSE the user clicks interactively.
- **grid** logical. For plotting fry only, if TRUE a micro grid is displayed similar to Fry’s original depiction, though this makes visualizing more difficult.
- **div.col** For plotting fry only, the color of the grade level division lines.
- **...** ignored
## plot.rmgantt

**Plots a rmgantt object**

**Description**

Plots a rmgantt object.

**Usage**

```r
## S3 method for class 'rmgantt'
plot(x, title, transform = FALSE, ...)
```

**Arguments**

- `x`: The sums_rmgantt object
- `title`: An optional title.
- `transform`: logical. If TRUE and there are two repeated measures the faceting is reversed.
- `...`: Other arguments passed to gantt_wrap

## plot.sent_split

**Plots a sent_split Object**

**Description**

Plots a sent_split object.

**Usage**

```r
## S3 method for class 'sent_split'
plot(x, text.var = NULL, rm.var = NULL, ...)
```

**Arguments**

- `x`: The sent_split object.
- `text.var`: The text variable (character string).
- `rm.var`: An optional repeated measures character vector of 1 or 2 to facet by. If NULL the rm.var from sentSplit is used. To avoid this behavior use FALSE.
- `...`: Other arguments passed to tot_plot.
plot.SMOG  
*Plots a SMOG Object*

**Description**

Plots a SMOG object.

**Usage**

```r
## S3 method for class 'SMOG'
plot(x, ...)
```

**Arguments**

- `x` The readability_score object.
- `...` ignored

---

plot.subject_pronoun_type  
*Plots a subject_pronoun_type Object*

**Description**

Plots an subject_pronoun_type object.

**Usage**

```r
## S3 method for class 'subject_pronoun_type'
plot(x, type = 1, ...)
```

**Arguments**

- `x` The subject_pronoun_type object.
- `type` An integer of 1, 2, 3) corresponding to 1 - heat map; 2 - lexical dispersion plot; 3 - facetted bar graph.
- `...` Other arguments passed to `qheat`, `dispersion_plot`, or `facet_wrap`. 
### plot.sums_gantt

**Plots a sums_gantt object**

**Description**

Plots a sums_gantt object.

**Usage**

```r
## S3 method for class 'sums_gantt'
plot(x, base = TRUE, title = NULL, ...)
```

**Arguments**

- `x` The sums_gantt object
- `base` logical. If TRUE prints in base graphics system. If FALSE prints in ggplot graphics system.
- `title` An optional title.
- `...` Other arguments passed to gantt_wrap or plot_gantt_base

### plot.sum_cmspan

**Plot Summary Stats for a Summary of a cmspans Object**

**Description**

Plots a heat map of summary statistics for sum_cmspan objects (the object produced by calling summary on a cmspans object).

**Usage**

```r
## S3 method for class 'sum_cmspan'
plot(x, digits = 3, sep = ".", name.sep = "&",
     values = TRUE, high = "red", transpose = TRUE, plot = TRUE,
     facet.vars = "time", rev.codes = !transpose,
     rev.stats = !transpose, ...
```

**Arguments**

- `x` The sum_cmspan object (the object produced by calling summary on a cmspans object)
- `digits` The number of digits displayed if values is TRUE.
- `sep` The character that was used in paste2 to paste the columns.
- `name.sep` The character that was used to paste the column names.
plot.table_count

values logical. If TRUE the cell values will be included on the heatmap.
high The color to be used for higher values.
transpose logical. If TRUE the dataframe is rotated 90 degrees.
plot logical. If TRUE the plot will automatically plot. The user may wish to set to FALSE for use in knitr, sweave, etc. to add additional plot layers.
facet.vars A character vector of names to facet by. Default is "time".
rev.codes logical If TRUE the plotting order of the code groups is reversed.
rev.stats logical If TRUE the plotting order of the code descriptive statistics is reversed.
... Other arguments passed to qheat.

See Also

summary.cmspans

plot.syllable_freq  Plots a syllable_freq Object

Description

Plots a syllable_freq object.

Usage

## S3 method for class 'syllable_freq'
plot(x, ...)

Arguments

x The syllable_freq object.
... ignored

plot.table_count  Plots a table_count Object

Description

Plots a table_count object.

Usage

## S3 method for class 'table_count'
plot(x, values = TRUE, high = "red", ...)
plot.table_proportion

Arguments

x The table_count object.
values logical. If TRUE the cell values will be included on the heatmap.
high The color to be used for higher values.
... Other arguments passed to qheat.

Description

Plots a table_proportion object.

Usage

## S3 method for class 'table_proportion'
plot(x, values = TRUE, high = "red", ...)

Arguments

x The table_proportion object.
values logical. If TRUE the cell values will be included on the heatmap.
high The color to be used for higher values.
... Other arguments passed to qheat.

plot.table_score

Description

Plots a table_score object.

Usage

## S3 method for class 'table_score'
plot(x, values = TRUE, high = "red", ...)

Arguments

x The table_score object.
values logical. If TRUE the cell values will be included on the heatmap.
high The color to be used for higher values.
... Other arguments passed to qheat.
plot.termco: Plots a termco object

Description

Plots a termco object.

Usage

## S3 method for class 'termco'
plot(x, label = FALSE, lab.digits = 1,
     percent = NULL, zero.replace = NULL, ...)

Arguments

- **x**: The termco object.
- **label**: logical. If TRUE the cells of the heat map plot will be labeled with count and proportional values.
- **lab.digits**: Integer values specifying the number of digits to be printed if label is TRUE.
- **percent**: logical. If TRUE output given as percent. If FALSE the output is proportion. If NULL uses the value from termco. Only used if label is TRUE.
- **zero.replace**: Value to replace 0 values with. If NULL uses the value from termco. Only used if label is TRUE.
- **...**: Other arguments passed to qheat.

plot.type_token_ratio: Plots a type_token_ratio Object

Description

Plots a type_token_ratio object.

Usage

## S3 method for class 'type_token_ratio'
plot(x, ...)

Arguments

- **x**: The type_token_ratio object.
- **...**: ignored.
plot.weighted_wfm

Plots a weighted_wfm object

Description

Plots a weighted_wfm object.

Usage

```r
## S3 method for class 'weighted_wfm'
plot(x, non.zero = FALSE, digits = 0,
     by.column = NULL, high = ifelse(non.zero, "black", "blue"),
     grid = ifelse(non.zero, "black", "white"), plot = TRUE, ...)
```

Arguments

- `x`: The weighted_wfm object
- `non.zero`: logical. If TRUE all values converted to dummy coded based on x_ij > 0.
- `digits`: The number of digits displayed if values is TRUE.
- `by.column`: logical. If TRUE applies scaling to the column. If FALSE applies scaling by row (use NULL to turn off scaling).
- `high`: The color to be used for higher values.
- `grid`: The color of the grid (Use NULL to remove the grid).
- `plot`: logical. If TRUE the plot will automatically plot. The user may wish to set to FALSE for use in knitr, sweave, etc. to add additional plot layers.
- `...`: Other arguments passed to qheat.

plot.wfdf

Plots a wfdf object

Description

Plots a wfdf object.

Usage

```r
## S3 method for class 'wfdf'
plot(x, ...)
```

Arguments

- `x`: The wfdf object
- `...`: Other arguments passed to plot.wfm.
plot.wfm

Plots a wfm object

Description

Plots a wfm object.

Usage

```r
## S3 method for class 'wfm'
plot(x, non.zero = FALSE, digits = 0, by.column = NULL,
     high = ifelse(non.zero, "black", "blue"), grid = ifelse(non.zero,
     "black", "white"), plot = TRUE, ...)
```

Arguments

- `x` The wfm object
- `non.zero` logical. If TRUE all values converted to dummy coded based on x_ij > 0.
- `digits` The number of digits displayed if values is TRUE.
- `by.column` logical. If TRUE applies scaling to the column. If FALSE applies scaling by row (use NULL to turn off scaling).
- `high` The color to be used for higher values.
- `grid` The color of the grid (Use NULL to remove the grid).
- `plot` logical. If TRUE the plot will automatically plot. The user may wish to set to FALSE for use in knit, sweave, etc. to add additional plot layers.
- `...` Other arguments passed to qheat.

plot.word_cor

Plots a word_cor object

Description

Plots a word_cor object.

Usage

```r
## S3 method for class 'word_cor'
plot(x, label = TRUE, lab.digits = 3,
     high = "red", low = "white", grid = NULL, ncol = NULL, ...)
```
Arguments

- **x**: The word_cor object.
- **label**: logical. If TRUE the cells of the heat map plot will be labeled with count and proportional values.
- **lab.digits**: Integer values specifying the number of digits to be printed if label is TRUE.
- **high**: The color to be used for higher values.
- **low**: The color to be used for lower values.
- **grid**: The color of the grid (Use NULL to remove the grid).
- **ncol**: The number of columns to arrange the facets in (specifying an integer results in the use of `facet_wrap`, specifying NULL utilizes a single column with `facet_grid`. The second approach limits columns but allows the y scale’s space to be free.
- **...**: Other arguments passed to qheat if matrix and other arguments passed to `geom_point` if a list.

---

**plot.word_length**

*Plots a word_length Object*

Description

Plots a word_length object.

Usage

```r
## S3 method for class 'word_length'
plot(x, label = FALSE, lab.digits = 1,
     percent = NULL, zero.replace = NULL, ...)
```

Arguments

- **x**: The word_length object.
- **label**: logical. If TRUE the cells of the heat map plot will be labeled with count and proportional values.
- **lab.digits**: Integer values specifying the number of digits to be printed if label is TRUE.
- **percent**: logical. If TRUE output given as percent. If FALSE the output is proportion. If NULL uses the value from `word_length`. Only used if label is TRUE.
- **zero.replace**: Value to replace 0 values with. If NULL uses the value from `word_length`. Only used if label is TRUE.
- **...**: Other arguments passed to qheat.
plot.word_position

Plots a word_position object

Description

Plots a word_position object.

Usage

## S3 method for class 'word_position'
plot(x, qheat = TRUE, scale = TRUE, ...)

Arguments

- **x**: The word_position object.
- **qheat**: logical. If TRUE qheat is used to plot. If FALSE heatmap is used.
- **scale**: logical. If TRUE scales heatmap by row. If FALSE no scaling occurs.
- **...**: Other arguments passed to qheat or heatmap.

plot.word_proximity

Plots a word_proximity object

Description

Plots a word_proximity object.

Usage

## S3 method for class 'word_proximity'
plot(x, label = TRUE, lab.digits = NULL,
     high = "red", low = "white", grid = NULL, ...)

Arguments

- **x**: The word_proximity object
- **label**: logical. If TRUE the cells of the heat map plot will be labeled with count and proportional values.
- **lab.digits**: Integer values specifying the number of digits to be printed if label is TRUE.
- **high**: The color to be used for higher values.
- **low**: The color to be used for lower values.
- **grid**: The color of the grid (Use NULL to remove the grid).
- **...**: Other arguments passed to qheat.
plot.word_stats

Plots a word_stats object

Description
Plots a word_stats object.

Usage

## S3 method for class 'word_stats'
plot(x, label = FALSE, lab.digits = NULL, ...)

Arguments

x | The word_stats object
label | logical. If TRUE the cells of the heat map plot will be labeled with count and proportional values.
lab.digits | Integer values specifying the number of digits to be printed if label is TRUE.
... | Other arguments passed to qheat.

plot.word_stats_counts

Plots a word_stats_counts Object

Description
Plots a word_stats_counts object.

Usage

## S3 method for class 'word_stats_counts'
plot(x, alpha = 0.3, ...)

Arguments

x | The word_stats_counts object.
alpha | The alpha level to use for points.
... | ignored
**Description**

polarity - Approximate the sentiment (polarity) of text by grouping variable(s).

**Usage**

```r
polarity(text.var, grouping.var = NULL,
         polarity.frame = qdapDictionaries::key.pol, constrain = FALSE,
         negators = qdapDictionaries::negation.words,
         amplifiers = qdapDictionaries::amplification.words,
         deamplifiers = qdapDictionaries::deamplification.words,
         question.weight = 0, amplifier.weight = 0.8, n.before = 4,
         n.after = 2, rm.incomplete = FALSE, digits = 3, ...)
```

**Arguments**

- `text.var`: The text variable.
- `grouping.var`: The grouping variables. Default `NULL` generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.
- `polarity.frame`: A dataframe or hash key of positive/negative words and weights.
- `constrain`: logical. If `true` polarity values are constrained to be between -1 and 1 using the following transformation:
  \[
  \left(1 - \frac{1}{\exp(\delta)} \right) \cdot 2 - 1
  \]
- `negators`: A character vector of terms reversing the intent of a positive or negative word.
- `amplifiers`: A character vector of terms that increase the intensity of a positive or negative word.
- `deamplifiers`: A character vector of terms that decrease the intensity of a positive or negative word.
- `question.weight`: The weighting of questions (values from 0 to 1). Default 0 corresponds with the belief that questions (pure questions) are not polarized. A weight may be applied based on the evidence that the questions function with polarity.
- `amplifier.weight`: The weight to apply to amplifiers/deamplifiers (values from 0 to 1). This value will multiply the polarized terms by 1 + this value.
- `n.before`: The number of words to consider as valence shifters before the polarized word.
- `n.after`: The number of words to consider as valence shifters after the polarized word.
- `rm.incomplete`: logical. If `true` text rows ending with qdap’s incomplete sentence end mark (|) will be removed from the analysis.
- `digits`: Integer; number of decimal places to round when printing.
- `...`: Other arguments supplied to `strip`. 
Details

The equation used by the algorithm to assign value to polarity of each sentence first utilizes the sentiment dictionary (Hu and Liu, 2004) to tag polarized words. A context cluster \((x_i^T)\) of words is pulled from around this polarized word (default 4 words before and two words after) to be considered as valence shifters. The words in this context cluster are tagged as neutral \((x_i^0)\), negator \((x_i^N)\), amplifier \((x_i^a)\), or de-amplifier \((x_i^d)\). Neutral words hold no value in the equation but do affect word count \((n)\). Each polarized word is then weighted \(w\) based on the weights from the polarity frame argument and then further weighted by the number and position of the valence shifters directly surrounding the positive or negative word. The researcher may provide a weight \(c\) to be utilized with amplifiers/de-amplifiers (default is .8; deamplifier weight is constrained to -1 lower bound). Last, these context cluster \((x_i^T)\) are summed and divided by the square root of the word count \((\sqrt{n})\) yielding an unbounded polarity score \((\delta)\). Note that context clusters containing a comma before the polarized word will only consider words found after the comma.

\[
\delta = \frac{x_i^T}{\sqrt{n}}
\]

Where:

\[
x_i^T = \sum ((1 + c(x_i^A - x_i^D)) \cdot w(-1)\sum x_i^N)
\]

\[
x_i^A = \sum (w_{neg} \cdot x_i^a)
\]

\[
x_i^D = \max(x_i^{D'}, -1)
\]

\[
x_i^{D'} = \sum (-w_{neg} \cdot x_i^a + x_i^d)
\]

\[
w_{neg} = (\sum x_i^N) \mod 2
\]

Value

Returns a list of:

all  
A dataframe of scores per row with:
  - group.var - the grouping variable
  - wc - word count
  - polarity - sentence polarity score
  - pos.words - words considered positive
  - neg.words - words considered negative
  - text.var - the text variable

group  
A dataframe with the average polarity score by grouping variable:
• group.var - the grouping variable
• total.sentences - Total sentences spoken.
• total.words - Total words used.
• ave.polarity - The sum of all polarity scores for that group divided by number of sentences spoken.
• sd.polarity - The standard deviation of that group’s sentence level polarity scores.
• stan.mean.polarity - A standardized polarity score calculated by taking the average polarity score for a group divided by the standard deviation.

digits integer value of number of digits to display; mostly internal use

Note

The polarity score is dependent upon the polarity dictionary used. This function defaults to the word polarity dictionary used by Hu, M., & Liu, B. (2004), however, this may not be appropriate for the context of children in a classroom. The user may (is encouraged) to provide/ augment the dictionary (see the sentiment.frame function). For instance the word "sick" in a high school setting may mean that something is good, whereas "sick" used by a typical adult indicates something is not right or negative connotation (deixis).

Also note that polarity assumes you’ve run sentSplit.

## Parts of Speech Tagging

### Description

**pos** - Apply part of speech tagger to transcript(s).
pos - Apply part of speech tagger to transcript(s) by zero or more grouping variable(s).
pos_tags - Useful for interpreting the parts of speech tags created by pos and pos_by.

Usage

pos(text.var, parallel = FALSE, cores = detectCores()/2,
    progress.bar = TRUE, na.omit = FALSE, digits = 1, percent = TRUE,
    zero.replace = 0, gc.rate = 10)

pos_by(text.var, grouping.var = NULL, digits = 1, percent = TRUE,
    zero.replace = 0, ...)

pos_tags(type = "pretty")

Arguments

text.var The text variable.
parallel logical. If TRUE attempts to run the function on multiple cores. Note that this
        may not mean a speed boost if you have one core or if the data set is smaller as
        the cluster takes time to create.
cores The number of cores to use if parallel = TRUE. Default is half the number of
        available cores.
progress.bar logical. If TRUE attempts to provide a OS appropriate progress bar. If parallel
        is TRUE this argument is ignored. Note that setting this argument to TRUE may
        slow down the function.
na.omit logical. If TRUE missing values (NA) will be omitted.
digits Integer; number of decimal places to round when printing.
percent logical. If TRUE output given as percent. If FALSE the output is proportion.
zero.replace Value to replace 0 values with.

gc.rate An integer value. This is a necessary argument because of a problem with the
        garbage collection in the openNLP function that pos wraps. Consider adjusting
        this argument upward if the error java.lang.OutOfMemoryError occurs.

grouping.var The grouping variables. Default NULL generates one word list for all text. Also
        takes a single grouping variable or a list of 1 or more grouping variables.

type An optional character string giving the output of the pos tags. This must be
        one of the strings "pretty" (a left justified version of the output optimized
        for viewing but not good for export), "matrix" (a matrix version of the output),
        "dataframe"\"df\" (a dataframe version of the output), "all" (a list of all three
        of the previous output types).

... Other argument supplied to pos.

Value

pos - returns a list of 4:
text The original text
The original words replaced with parts of speech in context.

POSprop Dataframe of the proportion of parts of speech by row.

POSfreq Dataframe of the frequency of parts of speech by row.

POSrnp Dataframe of the frequency and proportions of parts of speech by row.

percent The value of percent used for plotting purposes.

text The original text

Note
Note that contractions are treated as two words; for example the word count on "what's" is 2 for "what + is". This is not consistent with the word_count treatment of contractions but makes sense in a part of speech framework where a phrase such as "She’s cool" is treated as a pronoun, verb and adjective respectively for "She + is + cool".

potential NA

Search for Potential Missing Values

Description

Search for potential missing values (i.e., sentences that are merely a punctuation mark) and optionally replace with missing value (NA). Useful in the initial cleaning process.

Usage

potential NA(text.var, n = 3)

Arguments

text.var  The text variable.

n  Number of characters to consider for missing (default is 3).

Value

Returns a dataframe of potential missing values row numbers and text.

Examples

## Not run:
DATA$state[3, 7] <- "."
potential NA(DATA$state, 20)
potential NA(DATA$state)
# USE TO SELECTIVELY REPLACE CELLS WITH MISSING VALUES
DATA$state[potential_NA(DATA$state, 20)$row[-c(3)]] <- NA
DATA
DATA <- qdap::DATA

## End(Not run)

---

**preprocessed**  
*Generic Preprocessed Method*

---

**Description**

Access the preprocessed dataframes/lists from select qdap outputs.

**Usage**

```r
preprocessed(x, ...)  
```

**Arguments**

- `x` A qdap object (list) with a dataframe/list of preprocessed data (e.g., `pos_by`).
- `...` Arguments passed to preprocessed method of other classes.

**Value**

Returns a data.frame or list of preprocessed data.

**See Also**

- `scores`, `counts`, `proportions`, `visual`  

---

**preprocessed.check_spelling_interactive**  
*Check Spelling*

---

**Description**

View `check_spelling_interactive` preprocessed.

**Usage**

```r
## S3 method for class 'check_spelling_interactive'
preprocessed(x, ...)
```
Arguments

The `check_spelling_interactive` object.

Details

call_spelling_interactive Method for preprocessed

Description

View `end_mark_by` preprocessed.

Usage

```r
## S3 method for class 'end_mark_by'
preprocessed(x, ...)
```

Arguments

The `end_mark_by` object.

Details

call_mark_by Method for preprocessed

Description

View `formality` preprocessed.

Usage

```r
## S3 method for class 'formality'
preprocessed(x, ...)
```
Arguments

x The formality object.

Details

formality Method for preprocessed

preprocessed.lexical_classification

Lexical Classification

Description

preprocessed.lexical_classification - View preprocessed from lexical_classification.

Usage

## S3 method for class 'lexical_classification'
preprocessed(x, ...)

Arguments

x The lexical_classification object.

Details

lexical_classification Method for preprocessed.

preprocessed.object_pronoun_type

Question Counts

Description

View object_pronoun_type preprocessed.

Usage

## S3 method for class 'object_pronoun_type'
preprocessed(x, ...)

Arguments

x The object_pronoun_type object.

Details

object_pronoun_type Method for preprocessed.
Arguments

- \( x \) The object\_pronoun\_type object.
- \( \ldots \) ignored

Details

object\_pronoun\_type Method for preprocessed

---

preprocessed.pos \hspace{1cm} Parts of Speech

---

Description

View pos preprocessed.

Usage

```
## S3 method for class 'pos'
preprocessed(x, \ldots)
```

Arguments

- \( x \) The \texttt{pos} object.
- \( \ldots \) ignored

Details

pos Method for preprocessed

---

preprocessed.pos\_by \hspace{1cm} Parts of Speech

---

Description

View pos\_by preprocessed.

Usage

```
## S3 method for class 'pos\_by'
preprocessed(x, \ldots)
```

Arguments

- \( x \) The \texttt{pos\_by} object.
- \( \ldots \) ignored
Details

pos_by Method for preprocessed

preprocessed.pronoun_type

Question Counts

Description

View pronoun_type preprocessed.

Usage

```r
## S3 method for class 'pronoun_type'
preprocessed(x, ...)
```

Arguments

- `x`: The pronoun_type object.
- `...`: ignored

Details

pronoun_type Method for preprocessed

preprocessed.question_type

Question Counts

Description

View question_type preprocessed.

Usage

```r
## S3 method for class 'question_type'
preprocessed(x, ...)
```

Arguments

- `x`: The question_type object.
- `...`: ignored

Details

question_type Method for preprocessed
### preprocessed.subject_pronoun_type

*Question Counts*

**Description**

View `subject_pronoun_type` preprocessed.

**Usage**

```r
## S3 method for class 'subject_pronoun_type'
preprocessed(x, ...)
```

**Arguments**

- `x`: The `subject_pronoun_type` object.
- `...`: ignored

**Details**

`subject_pronoun_type` Method for `preprocessed`

### preprocessed.word_position

*Word Position*

**Description**

View `word_position` preprocessed.

**Usage**

```r
## S3 method for class 'word_position'
preprocessed(x, ...)
```

**Arguments**

- `x`: The `word_position` object.
- `...`: ignored

**Details**

`word_position` Method for `preprocessed`
Description
A dataset containing a cleaned version of all three presidential debates for the 2012 election.

Usage
data(pres_debates2012)

Format
A data frame with 2912 rows and 4 variables

Details
- person. The speaker
- tot. Turn of talk
- dialogue. The words spoken
- time. Variable indicating which of the three debates the dialogue is from

Description
A dataset containing the raw version of the first presidential debate.

Usage
data(pres_debate_raw2012)

Format
A data frame with 94 rows and 2 variables

Details
- person. The speaker
- dialogue. The words spoken
print.adjacency_matrix

Prints an adjacency_matrix Object

Description

Prints an adjacency_matrix object.

Usage

```r
## S3 method for class 'adjacency_matrix'
print(x, ...)
```

Arguments

- `x`: The adjacency_matrix object.
- `...`: ignored

print.all_words

Prints an all_words Object

Description

Prints an all_words object.

Usage

```r
## S3 method for class 'all_words'
print(x, ...)
```

Arguments

- `x`: The all_words object.
- `...`: ignored
print.animated_character

*Prints an animated_character Object*

**Description**

Prints an animated_character object.

**Usage**

```r
## S3 method for class 'animated_character'
print(x, pause = 0, ...)
```

**Arguments**

- `x`: The animated_character object.
- `pause`: The length of time to pause between plots.
- `...`: Ignored.

print.animated_discourse_map

*Prints an animated_discourse_map Object*

**Description**

Prints an animated_discourse_map object.

**Usage**

```r
## S3 method for class 'animated_discourse_map'
print(x, title = NULL,
      seed = sample(1:10000, 1), layout = layout.auto, pause = 0, ...)
```

**Arguments**

- `x`: The animated_discourse_map object.
- `title`: The title of the plot.
- `seed`: The seed to use in plotting the graph.
- `layout`: igraph layout to use.
- `pause`: The length of time to pause between plots.
- `...`: Other Arguments passed to `plot.igraph`. 
print.animated_formality

Prints a animated_formality Object

Description

Prints a animated_formality object.

Usage

```r
## S3 method for class 'animated_formality'
print(x, title = NULL,
    seed = sample(1:10000, 1), layout = layout.auto, pause = 0,
    legend = c(-0.5, -1.5, 0.5, -1.45), legend.cex = 1, bg = NULL,
    net.legend.color = "black", ...)
```

Arguments

- `x` The animated_formality object.
- `title` The title of the plot.
- `seed` The seed to use in plotting the graph.
- `layout` `igraph` layout to use.
- `pause` The length of time to pause between plots.
- `legend` The coordinates of the legend. See `color.legend` for more information.
- `legend.cex` character expansion factor. NULL and NA are equivalent to 1.0. See `mtext` for more information.
- `bg` The color to be used for the background of the device region. See `par` for more information.
- `net.legend.color` The text legend color for the network plot.
- `...` Other Arguments passed to `plot.igraph`.

print.animated_lexical_classification

Prints an animated_lexical_classification Object

Description

Prints an animated_lexical_classification object.
Usage

```r
## S3 method for class 'animated_lexical_classification'
print(x, title = NULL,
      seed = sample(1:10000, 1), layout = layout.auto, pause = 0,
      legend = c(-0.5, -1.5, 0.5, -1.45), legend.cex = 1, bg = NULL,
      net.legend.color = "black", ...)
```

Arguments

- `x`: The animated_lexical_classification object.
- `title`: The title of the plot.
- `seed`: The seed to use in plotting the graph.
- `layout`: `igraph` layout to use.
- `pause`: The length of time to pause between plots.
- `legend`: The coordinates of the legend. See `color.legend` for more information.
- `legend.cex`: Character expansion factor. NULL and NA are equivalent to 1.0. See `mtext` for more information.
- `bg`: The color to be used for the background of the device region. See `par` for more information.
- `net.legend.color`: The text legend color for the network plot.
- `...`: Other Arguments passed to `plot.igraph`.

print.animated_polarity

*Prints an animated_polarity Object*

Description

Prints an animated_polarity object.

Usage

```r
## S3 method for class 'animated_polarity'
print(x, title = NULL,
      seed = sample(1:10000, 1), layout = layout.auto, pause = 0,
      legend = c(-0.5, -1.5, 0.5, -1.45), legend.cex = 1, bg = NULL,
      net.legend.color = "black", ...)
```
Arguments

- `x` The animated_polarity object.
- `title` The title of the plot.
- `seed` The seed to use in plotting the graph.
- `layout` igraph layout to use.
- `pause` The length of time to pause between plots.
- `legend` The coordinates of the legend. See `color.legend` for more information.
- `legend.cex` character expansion factor. NULL and NA are equivalent to 1.0. See `mtext` for more information.
- `bg` The color to be used for the background of the device region. See `par` for more information.
- `net.legend.color` The text legend color for the network plot.
- `...` Other Arguments passed to `plot.igraph`.

print.automated_readability_index

Prints an automated_readability_index Object

Description

Prints an automated_readability_index object.

Usage

```r
## S3 method for class 'automated_readability_index'
print(x, digits = 3, ...)```

Arguments

- `x` The automated_readability_index object.
- `digits` The number of digits displayed if values is TRUE.
- `...` ignored
print.boolean_qdap \hspace{0.2cm} *Prints a boolean_qdap object*

**Description**

Prints a boolean_qdap object

**Usage**

```r
## S3 method for class 'boolean_qdap'
print(x, ...)
```

**Arguments**

- \(x\) The boolean_qdap object
- \(\ldots\) ignored

print.character_table \hspace{0.2cm} *Prints a character_table object*

**Description**

Prints a character_table object.

**Usage**

```r
## S3 method for class 'character_table'
print(x, digits = 2, percent = NULL,
      zero.replace = NULL, ...)
```

**Arguments**

- \(x\) The character_table object
- \(digits\) Integer values specifying the number of digits to be printed.
- \(percent\) logical. If TRUE output given as percent. If FALSE the output is proportion. If NULL uses the value from \texttt{termco}. Only used if \texttt{label} is TRUE.
- \(zero.replace\) Value to replace 0 values with. If NULL uses the value from \texttt{termco}. Only used if \texttt{label} is TRUE.
- \(\ldots\) ignored
print.check_spelling

Prints a check_spelling Object

Description

Prints a check_spelling object.

Usage

```r
## S3 method for class 'check_spelling'
print(x, ...)
```

Arguments

- `x` The check_spelling object.
- `...` ignored

print.check_spelling_interactive

Prints a check_spelling_interactive Object

Description

Prints a check_spelling_interactive object.

Usage

```r
## S3 method for class 'check_spelling_interactive'
print(x, ...)
```

Arguments

- `x` The check_spelling_interactive object.
- `...` ignored
print.check_text  

**Description**

Prints a check_text object.

**Usage**

```r
## S3 method for class 'check_text'
print(x, include.text = TRUE, file = NULL, ...)
```

**Arguments**

- `x`  
  The check_text object.
- `include.text`  
  logical. If TRUE the offending text is printed as well.
- `file`  
  A connection, or a character string naming the file to print to. If NULL prints to the console.
- `...`  
  ignored

print.cm_distance  

**Description**

Prints a cm_distance object.

**Usage**

```r
## S3 method for class 'cm_distance'
print(x, mean.digits = 0, sd.digits = 2,
     sd.mean.digits = 3, pval.digits = 3, new.order = NULL,
     na.replace = "-", diag.replace = na.replace, print = TRUE, ...)
```

**Arguments**

- `x`  
  The cm_distance object.
- `mean.digits`  
  The number of digits to print for the mean code distances.
- `sd.digits`  
  The number of digits to print for the standard deviations of the code distances.
- `sd.mean.digits`  
  The number of digits to print for the standardized mean distances.
- `pval.digits`  
  The number of digits to print for the p-values.
- `new.order`  
  An integer vector reordering the columns and rows of the output. Omission of a column number will result in omission from the output.
print.coleman_liau

Description

Prints an coleman_liau object.

Usage

## S3 method for class 'coleman_liau'
print(x, digits = 3, ...)

Arguments

x The coleman_liau object.
digits The number of digits displayed if values is TRUE.
... ignored

print.colsplit2df

Description

Prints a colsplit2df object.

Usage

## S3 method for class 'colsplit2df'
print(x, ...)
print.combo_syllable_sum

Prints an combo_syllable_sum object

Description

Prints an combo_syllable_sum object

Usage

## S3 method for class 'combo_syllable_sum'
print(x, ...)

Arguments

x The combo_syllable_sum object

... ignored

print.cumulative_animated_formality

Prints a cumulative_animated_formality Object

Description

Prints a cumulative_animated_formality object.

Usage

## S3 method for class 'cumulative_animated_formality'
print(x, ...)

Arguments

x The cumulative_animated_formality object.

... ignored
print.cumulative_animated_lexical_classification

Prints a cumulative_animated_lexical_classification Object

Description

Prints a cumulative_animated_lexical_classification object.

Usage

## S3 method for class 'cumulative_animated_lexical_classification'
print(x, ...)

Arguments

x The cumulative_animated_lexical_classification object.

... ignored

print.cumulative_animated_polarity

Prints a cumulative_animated_polarity Object

Description

Prints a cumulative_animated_polarity object.

Usage

## S3 method for class 'cumulative_animated_polarity'
print(x, ...)

Arguments

x The cumulative_animated_polarity object.

... ignored
### print.cumulative_combo_syllable_sum

*Prints a cumulative_combo_syllable_sum Object*

**Description**

Prints a cumulative_combo_syllable_sum object.

**Usage**

```r
## S3 method for class 'cumulative_combo_syllable_sum'
print(x, ...)
```

**Arguments**

- `x` The cumulative_combo_syllable_sum object.
- `...` ignored

### print.cumulative_end_mark

*Prints a cumulative_end_mark Object*

**Description**

Prints a cumulative_end_mark object.

**Usage**

```r
## S3 method for class 'cumulative_end_mark'
print(x, ...)
```

**Arguments**

- `x` The cumulative_end_mark object.
- `...` ignored
print.cumulative_formality

Prints a cumulative_formality Object

Description

Prints a cumulative_formality object.

Usage

```r
## S3 method for class 'cumulative_formality'
print(x, ...)
```

Arguments

- `x`: The cumulative_formality object.
- `...`: ignored

print.cumulative_lexical_classification

Prints a cumulative_lexical_classification Object

Description

Prints a cumulative_lexical_classification object.

Usage

```r
## S3 method for class 'cumulative_lexical_classification'
print(x, ...)
```

Arguments

- `x`: The cumulative_lexical_classification object.
- `...`: ignored
print.cumulative_polarity

Prints a cumulative_polarity Object

Description

Prints a cumulative_polarity object.

Usage

```r
## S3 method for class 'cumulative_polarity'
print(x, ...)
```

Arguments

- `x`: The cumulative_polarity object.
- `...`: ignored

print.cumulative_syllable_freq

Prints a cumulative_syllable_freq Object

Description

Prints a cumulative_syllable_freq object.

Usage

```r
## S3 method for class 'cumulative_syllable_freq'
print(x, ...)
```

Arguments

- `x`: The cumulative_syllable_freq object.
- `...`: ignored
**print.discourse_map**  
*Prints a discourse_map Object*

**Description**

Prints a discourse_map object.

**Usage**

```r
## S3 method for class 'discourse_map'
print(x, edge.curved = TRUE, title = NULL, ...)
```

**Arguments**

- `x`  The discourse_map object.
- `edge.curved`  logical. If TRUE edges are plotted with curves.
- `title`  The title of the plot.
- `...`  Other Arguments passed to `plot.igraph`.

---

**print.Dissimilarity**  
*Prints a Dissimilarity object*

**Description**

Prints a Dissimilarity object.

**Usage**

```r
## S3 method for class 'Dissimilarity'
print(x, digits = 3, ...)
```

**Arguments**

- `x`  The Dissimilarity object
- `digits`  Number of decimal places to print.
- `...`  ignored
Description

Prints a diversity object.

Usage

```r
## S3 method for class 'diversity'
print(x, digits = 3, ...)
```

Arguments

- `x` The diversity object
- `digits` Number of decimal places to print.
- `...` ignored

Description

Prints an end_mark object

Usage

```r
## S3 method for class 'end_mark'
print(x, ...)
```

Arguments

- `x` The end_mark object
- `...` ignored
**print.end_mark_by**

Prints an *end_mark_by* object

---

**Description**

Prints an *end_mark_by* object

**Usage**

```r
## S3 method for class 'end_mark_by'
print(x, ...)
```

**Arguments**

- `x` The *end_mark_by* object
- `...` ignored

---

**print.end_mark_by_preprocessed**

Prints a *end_mark_by_preprocessed* object

---

**Description**

Prints a *end_mark_by_preprocessed* object

**Usage**

```r
## S3 method for class 'end_mark_by_preprocessed'
print(x, ...)
```

**Arguments**

- `x` The *end_mark_by_preprocessed* object
- `...` ignored
print.flesch_kincaid  

**Description**

Prints an flesch_kincaid object.

**Usage**

```r
## S3 method for class 'flesch_kincaid'
print(x, digits = 3, ...)
```

**Arguments**

- `x`: The flesch_kincaid object.
- `digits`: The number of digits displayed if `values` is `TRUE`.
- `...`: ignored

print.formality  

**Description**

Prints a formality object.

**Usage**

```r
## S3 method for class 'formality'
print(x, digits, ...)
```

**Arguments**

- `x`: The formality object.
- `digits`: The number of digits to print.
- `...`: ignored
print.formality_scores

*Prints a formality_scores object*

**Description**

Prints a formality_scores object

**Usage**

```r
## S3 method for class 'formality_scores'
print(x, ...)
```

**Arguments**

- `x`: The formality_scores object
- `...`: ignored

---

print.fry

*Prints an fry Object*

**Description**

Prints an fry object.

**Usage**

```r
## S3 method for class 'fry'
print(x, digits = 3, auto.label, grid, div.col, plot, ...)
```

**Arguments**

- `x`: The fry object.
- `digits`: The number of digits displayed if values is TRUE.
- `auto.label`: logical. If TRUE labels automatically added. If FALSE the user clicks interactively.
- `grid`: logical. If TRUE a micro grid is displayed similar to Fry’s original depiction, though this makes visualizing more difficult.
- `div.col`: The color of the grade level division lines.
- `plot`: logical. If TRUE a graph is plotted corresponding to Fry’s graphic representation.
- `...`: ignored
print.inspect_text  

*Prints an inspect_text Object*

**Description**

Prints an inspect_text object.

**Usage**

```r
## S3 method for class 'inspect_text'
print(x, file = "", ...)  
```

**Arguments**

- `x`  The inspect_text object.
- `file`  A connection, or a character string naming the file to print to. If "" (the default), prints to the standard output connection, the console unless redirected by `sink`.
- `...`  Other arguments passed to `strwrap`.

print.kullback_leibler  

*Prints a kullback_leibler Object.*

**Description**

Prints a kullback_leibler object.

**Usage**

```r
## S3 method for class 'kullback_leibler'
print(x, digits = 3, ...)  
```

**Arguments**

- `x`  The kullback_leibler object
- `digits`  Number of decimal places to print.
- `...`  ignored
print.lexical_classification

*Prints an lexical_classification Object*

**Description**

Prints an lexical_classification object.

**Usage**

```r
## S3 method for class 'lexical_classification'
print(x, ...)
```

**Arguments**

- `x`: The lexical_classification object.
- `...`: Other arguments passed to `print.lexical_classification_by`.

print.lexical_classification_by

*Prints a lexical_classification Object*

**Description**

Prints a lexical_classification_by object.

**Usage**

```r
## S3 method for class 'lexical_classification_by'
print(x, ave.digits = 1,
     se.digits = 2, trunc = 25, ...)
```

**Arguments**

- `x`: The lexical_classification_by object.
- `ave.digits`: The number of average lexical distribution proportion digits to print.
- `se.digits`: The number of standard error of the lexical distribution proportion digits to print.
- `trunc`: The width to truncate content/function word lists.
- `...`: ignored
print.lexical_classification_preprocessed

Prints a lexical_classification_preprocessed Object

Description

Prints a lexical_classification_preprocessed object.

Usage

```r
## S3 method for class 'lexical_classification_preprocessed'
print(x, ...)
```

Arguments

- `x`: The lexical_classification_preprocessed object.
- `...`: Ignored

print.lexical_classification_score

Prints a lexical_classification_score Object

Description

Prints a lexical_classification_score object.

Usage

```r
## S3 method for class 'lexical_classification_score'
print(x, digits = 3, ...)
```

Arguments

- `x`: The lexical_classification_score object.
- `digits`: The number of digits displayed if `values` is TRUE.
- `...`: Ignored
**print.linsear_write**  
*Prints an linsear_write Object*

---

**Description**

Prints an linsear_write object.

**Usage**

```r
## S3 method for class 'linsear_write'
print(x, digits = 3, ...)
```

**Arguments**

- `x`  
  The linsear_write object.

- `digits`  
  The number of digits displayed if values is TRUE.

- `...`  
  ignored

---

**print.linsear_write_count**  
*Prints a linsear_write_count Object*

---

**Description**

Prints a linsear_write_count object.

**Usage**

```r
## S3 method for class 'linsear_write_count'
print(x, digits = 3, ...)
```

**Arguments**

- `x`  
  The linsear_write_count object.

- `digits`  
  The number of digits displayed.

- `...`  
  ignored
print.linsear_write_scores

Prints a linsear_write_scores Object

Description
Prints a linsear_write_scores object.

Usage
```r
## S3 method for class 'linsear_write_scores'
print(x, digits = 3, ...)
```

Arguments
- `x`: The linsear_write_scores object.
- `digits`: The number of digits displayed.
- `...`: ignored

print.Network

Prints a Network Object

Description
Prints a Network object.

Usage
```r
## S3 method for class 'Network'
print(x, title = NA, title.color = "black",
      seed = sample(1:10000, 1), layout = igraph::layout.auto,
      legend = c(-0.5, -1.5, 0.5, -1.45), legend.cex = 1, bg = NULL,
      legend.text.color = "black", legend.gradient = NULL,
      vertex.color = "grey80", vertex.size = 9, vertex.frame.color = NA,
      vertex.label.color = "grey40", vertex.label.cex = 1.1,
      edge.label.color = "black", edge.label.cex = 0.9, ...)
```

Arguments
- `x`: The Network object.
- `title`: The title of the plot. NULL eliminates title. NA uses title attribute of the Network object.
- `title.color`: The color of the title.
- `seed`: The seed to use in plotting the graph.
print.ngrams

Description
Prints an ngrams object

Usage
```r
## S3 method for class 'ngrams'
print(x, ...)
```

Arguments
- `x` The ngrams object
- `...` ignored
**print.object_pronoun_type**

*Prints a object_pronoun_type object*

**Description**

Prints a object_pronoun_type object

**Usage**

```r
## S3 method for class 'object_pronoun_type'
print(x, ...)
```

**Arguments**

- `x`: The object_pronoun_type object
- `...`: Ignored

---

**print.phrase_net**

*Prints a phrase_net Object*

**Description**

Prints a phrase_net object.

**Usage**

```r
## S3 method for class 'phrase_net'
print(x, edge.curved = TRUE, ...)
```

**Arguments**

- `x`: The phrase_net object.
- `edge.curved`: Logical. If TRUE edges are plotted with curves.
- `...`: Other Arguments passed to `plot.igraph`. 
print.polarity

**Description**

Prints an polarity object.

**Usage**

```r
## S3 method for class 'polarity'
print(x, digits = 3, ...)
```

**Arguments**

- `x`: The polarity object.
- `digits`: The number of digits displayed if `values` is `TRUE`.
- `...`: Ignored

print.polarity_count

**Description**

Prints a polarity_count object.

**Usage**

```r
## S3 method for class 'polarity_count'
print(x, digits = 3, ...)
```

**Arguments**

- `x`: The polarity_count object.
- `digits`: The number of digits displayed.
- `...`: Ignored
print.polarity_score  Prints a polarity_score Object

Description

Prints a polarity_score object.

Usage

```r
## S3 method for class 'polarity_score'
print(x, digits = 3, ...)
```

Arguments

- `x` The polarity_score object.
- `digits` The number of digits displayed if values is TRUE.
- `...` ignored

print.polysyllable_sum  Prints a polysyllable_sum Object

Description

Prints an polysyllable_sum object

Usage

```r
## S3 method for class 'polysyllable_sum'
print(x, ...)
```

Arguments

- `x` The polysyllable_sum object
- `...` ignored
print.pos  

Prints a pos Object.

Description

Prints a pos object.

Usage

```r
## S3 method for class 'pos'
print(x, digits = 1, percent = NULL,
      zero.replace = NULL, ...)
```

Arguments

- `x` The pos object
- `digits` Integer values specifying the number of digits to be printed.
- `percent` logical. If TRUE output given as percent. If FALSE the output is proportion. If NULL uses the value from `termco`. Only used if `label` is TRUE.
- `zero.replace` Value to replace 0 values with. If NULL uses the value from `termco`. Only used if `label` is TRUE.
- `...` ignored

print.pos_by  

Prints a pos_by Object.

Description

Prints a pos_by object.

Usage

```r
## S3 method for class 'pos_by'
print(x, digits = 1, percent = NULL,
      zero.replace = NULL, ...)
```

Arguments

- `x` The pos_by object
- `digits` Integer values specifying the number of digits to be printed.
- `percent` logical. If TRUE output given as percent. If FALSE the output is proportion. If NULL uses the value from `termco`. Only used if `label` is TRUE.
- `zero.replace` Value to replace 0 values with. If NULL uses the value from `termco`. Only used if `label` is TRUE.
- `...` ignored
### Description

Prints a pos_preprocessed object

### Usage

```r
## S3 method for class 'pos_preprocessed'
print(x, ...)
```

### Arguments

- `x`: The pos_preprocessed object
- `...`: ignored

### Description

Prints a pronoun_type object

### Usage

```r
## S3 method for class 'pronoun_type'
print(x, ...)
```

### Arguments

- `x`: The pronoun_type object
- `...`: ignored
print.qdapProj

Prints a \textit{qdapProj} Object

Description

Prints a \textit{qdapProj} object.

Usage

\begin{verbatim}
## S3 method for class 'qdapProj'
print(x, ...)
\end{verbatim}

Arguments

- \texttt{x} \hspace{1cm} The \textit{qdapProj} object.
- \texttt{...} \hspace{1cm} ignored

print.qdap_context

Prints a \textit{qdap_context} object

Description

Prints a \textit{qdap_context} object.

Usage

\begin{verbatim}
## S3 method for class 'qdap_context'
print(x, file = NULL, pretty = TRUE,
       width = 70, sep.block = TRUE, double_space = TRUE, ...)
\end{verbatim}

Arguments

- \texttt{x} \hspace{1cm} The \textit{qdap_context} object
- \texttt{file} \hspace{1cm} The name of the file (can print csv, xlsx, txt, doc and other text based files). If NULL file prints to the console.
- \texttt{pretty} \hspace{1cm} logical. If TRUE generates a prettier text version of the output (cannot be used with csv/xlsx file types). If FALSE a semi-structured dataframe is generated.
- \texttt{width} \hspace{1cm} A positive integer giving the target column for wrapping lines in the output.
- \texttt{sep.block} \hspace{1cm} logical. If TRUE the blocked events are separated with text lines.
- \texttt{double_space} \hspace{1cm} logical. If TRUE and pretty = TRUE double spacing between speech chunks (speakers) is used.
- \texttt{...} \hspace{1cm} ignored
print.question_type

Prints a question_type object

Description

Prints a question_type object

Usage

```r
## S3 method for class 'question_type'
print(x, ...)
```

Arguments

- `x`: The question_type object
- `...`: ignored

print.question_type_preprocessed

Prints a question_type_preprocessed object

Description

Prints a question_type_preprocessed object

Usage

```r
## S3 method for class 'question_type_preprocessed'
print(x, ...)
```

Arguments

- `x`: The question_type_preprocessed object
- `...`: ignored
print.readability_count

Prints a readability_count Object

Description
Prints a readability_count object.

Usage

```r
## S3 method for class 'readability_count'
print(x, digits = 3, ...)
```

Arguments

- `x`: The readability_count object.
- `digits`: The number of digits displayed.
- `...`: ignored

print.readability_score

Prints a readability_score Object

Description
Prints a readability_score object.

Usage

```r
## S3 method for class 'readability_score'
print(x, digits = 3, ...)
```

Arguments

- `x`: The readability_score object.
- `digits`: The number of digits displayed if values is TRUE.
- `...`: ignored
**print.sent_split**  
*Prints a sent_split object*

**Description**  
Prints a sent_split object.

**Usage**  
```r  
## S3 method for class 'sent_split'
print(x, ...)  
```

**Arguments**

- `x`  
The sent_split object
- `...`  
ignored

**print.SMOG**  
*Prints an SMOG Object*

**Description**  
Prints an SMOG object.

**Usage**  
```r  
## S3 method for class 'SMOG'
print(x, digits = 3, ...)  
```

**Arguments**

- `x`  
The SMOG object.
- `digits`  
The number of digits displayed if `values` is TRUE.
- `...`  
ignored
print.subject_pronoun_type

*Prints a subject_pronoun_type object*

---

**Description**

Prints a subject_pronoun_type object

**Usage**

```r
## S3 method for class 'subject_pronoun_type'
print(x, ...)
```

**Arguments**

- `x` The subject_pronoun_type object
- `...` ignored

---

print.sub_holder  

*Prints a sub_holder object*

---

**Description**

Prints a sub_holder object

**Usage**

```r
## S3 method for class 'sub_holder'
print(x, ...)
```

**Arguments**

- `x` The sub_holder object
- `...` ignored
**print.sum_gantt**  
*Prints a sums_gantt object*

**Description**

Prints a sums_gantt object.

**Usage**

```r
## S3 method for class 'sums_gantt'
print(x, ...)  
```

**Arguments**

- **x**: The sums_gantt object
- **...**: ignored

---

**print.sum_cmspans**  
*Prints a sum_cmspans object*

**Description**

Prints a sum_cmspans object.

**Usage**

```r
## S3 method for class 'sum_cmspans'
print(x, digits = NULL, ...)  
```

**Arguments**

- **x**: The sum_cmspans object
- **digits**: Integer; number of decimal places to round in the display of the output.
- **...**: ignored
print.syllable_sum

Description

Prints an syllable_sum object

Usage

## S3 method for class 'syllable_sum'
print(x, ...)

Arguments

x The syllable_sum object
...

print.table_count

Description

Prints a table_count object

Usage

## S3 method for class 'table_count'
print(x, ...)

Arguments

x The table_count object
...

ignored
print.table_proportion

*Prints a table_proportion object*

**Description**

Prints a table_proportion object

**Usage**

```r
## S3 method for class 'table_proportion'
print(x, ...)
```

**Arguments**

- `x` The table_proportion object
- `...` ignored

print.table_score

*Prints a table_score object*

**Description**

Prints a table_score object

**Usage**

```r
## S3 method for class 'table_score'
print(x, ...)
```

**Arguments**

- `x` The table_score object
- `...` ignored
print.termco

Prints a termco object.

Description
Prints a termco object.

Usage

```r
## S3 method for class 'termco'
print(x, digits = NULL, percent = NULL,
      zero.replace = NULL, ...)
```

Arguments

- `x`: The termco object
- `digits`: Integer values specifying the number of digits to be printed.
- `percent`: logical. If TRUE output given as percent. If FALSE the output is proportion. If NULL uses the value from `termco`. Only used if `label` is TRUE.
- `zero.replace`: Value to replace 0 values with. If NULL uses the value from `termco`. Only used if `label` is TRUE.
- `...`: ignored

print.trunc

Prints a trunc object

Description
Prints a trunc object

Usage

```r
## S3 method for class 'trunc'
print(x, ...)
```

Arguments

- `x`: The trunc object
- `...`: ignored
print.type_token_ratio

*Prints a type_token_ratio Object*

### Description

Prints a type_token_ratio object.

### Usage

```r
## S3 method for class 'type_token_ratio'
print(x, digits = 3, ...)
```

### Arguments

- `x` The type_token_ratio object.
- `digits` The number of type-token ratio digits to print.
- `...` ignored

print.wfm

*Prints a wfm Object*

### Description

Prints a wfm object.

### Usage

```r
## S3 method for class 'wfm'
print(x, digits = 3, width = 10000, ...)
```

### Arguments

- `x` The wfm object.
- `digits` The number of digits displayed if `values` is TRUE.
- `width` The width to temporarily set for printing (default = 10000). See `options` for more.
- `...` ignored
print.wfm_summary

Prints a wfm_summary Object

Description

Prints a wfm_summary object.

Usage

```r
## S3 method for class 'wfm_summary'
print(x, ...)
```

Arguments

- `x` The wfm_summary object.
- `...` ignored

print.which_misspelled

Prints a which_misspelled Object

Description

Prints a which_misspelled object.

Usage

```r
## S3 method for class 'which_misspelled'
print(x, ...)
```

Arguments

- `x` The which_misspelled object.
- `...` ignored
print.word_associate  *Prints a word_associate object*

**Description**

Prints a word_associate object.

**Usage**

```r
## S3 method for class 'word_associate'
print(x, ...)
```

**Arguments**

- `x`  
  The word_associate object
- `...`  
  ignored

---

print.word_cor  *Prints a word_cor object*

**Description**

Prints a word_cor object.

**Usage**

```r
## S3 method for class 'word_cor'
print(x, digits = 3, ...)
```

**Arguments**

- `x`  
  The word_cor object
- `digits`  
  The number of digits to print
- `...`  
  ignored
**print.word_length**

Prints a word_length object

**Description**

Prints a word_length object

**Usage**

```r
## S3 method for class 'word_length'
print(x, ...)
```

**Arguments**

- `x` The word_length object
- `...` ignored

---

**print.word_list**

Prints a word_list Object

**Description**

Prints a word_list object.

**Usage**

```r
## S3 method for class 'word_list'
print(x, ...)
```

**Arguments**

- `x` The word_list object
- `...` ignored
print.word_position  
Prints a word_position object.

Description
Prints a word_position object.

Usage

```r
# S3 method for class 'word_position'
print(x, ...)
```

Arguments

- `x`  
The word_position object
- `...`  
Values passed to `plot.word_position`

print.word_proximity  
Prints a word_proximity object

Description
Prints a word_proximity object

Usage

```r
# S3 method for class 'word_proximity'
print(x, digits = NULL, ...)
```

Arguments

- `x`  
The word_proximity object
- `digits`  
The number of digits to print
- `...`  
ignored
print.word_stats

Description

Prints a word_stats object.

Usage

```r
## S3 method for class 'word_stats'
print(x, digits = NULL, ...)
```

Arguments

- `x`: The word_stats object
- `digits`: Integer; number of decimal places to round in the display of the output.
- `...`: ignored

print.word_stats_counts

Description

Prints a word_stats_counts object.

Usage

```r
## S3 method for class 'word_stats_counts'
print(x, ...)
```

Arguments

- `x`: The word_stats_counts object
- `...`: ignored
**pronoun_type**  

*Count Object/Subject Pronouns Per Grouping Variable*

**Description**

Count the number of subject/object pronouns per grouping variables.

**Usage**

```
pronoun_type(text.var, grouping.var = NULL, pronoun.list = NULL, ...)
```

**Arguments**

- **text.var**  The text variable
- **grouping.var**  The grouping variables. Default NULL generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.
- **pronoun.list**  A named list of subject/object pronouns. See **Details** for more.
- **...**  Other arguments passed to **termco**

**Details**

The following subject/object pronoun categories are the default searched terms:

- `I` = c("i'd ", " i'll ", " i'm ", " i've ", " i ")
- `we` = c(" we'd ", " we'll ", " we're ", " we've ", " we ")
- `you` = c(" you'd ", " you'll ", " you're ", " you've ", " you ", " your ")
- `he` = c(" he'd ", " he'll ", " he's ", " he ")
- `she` = c(" she'd ", " she'll ", " she's ", " she ")
- `they` = c(" they'd ", " they'll ", " they're ", " they've ", " they ")
- `it` = c(" it'd ", " it'll ", " it's ", " it ")
- `me` = c(" me ", " my ", " mine ")
- `us` = c(" us ", " our ", " ours ")
- `him` = c(" him ", " his ")
- `her` = c(" her ", " hers ")
- `them` = c(" them ")
- `their` = c(" their ", " theirs ")

pronoun_type

Value

Returns a list, of class "pronoun_type", of data frames regarding subject/object pronoun word counts:

- **preprocessed**: List of uncollapsed dataframes (raw, prop, rnp) of the class "termco" that contain all searchable subject/object pronouns.
- **raw**: raw word counts by grouping variable
- **prop**: proportional word counts by grouping variable; proportional to each individual’s subject/object pronoun use
- **rnp**: a character combination data frame of raw and proportional subject/object pronoun use

Examples

```r
## Not run:
dat <- pres_debates2012
dat <- dat[dat$person %in% c("ROMNEY", "OBAMA"), ]
(out <- pronoun_type(dat$dialogue, dat$person))
plot(out)
plot(out, 2)
plot(out, 3)
plot(out, 3, ncol=2)

scores(out)
counts(out)
proportions(out)
preprocessed(out)

plot(scores(out))
plot(counts(out))
```
plot(proportions(out))

(out2 <- pronoun_type(hamlet$dialogue, hamlet$person))
plot(out2, 3, ncol=7)

## End(Not run)

---

**prop**

*Convert Raw Numeric Matrix or Data Frame to Proportions*

**Description**

Convert a raw matrix or dataframe to proportions/percent. Divides each element of a column by the column sum.

**Usage**

```r
prop(mat, digits = 2, percent = FALSE, by.column = TRUE, round = FALSE)
```

**Arguments**

- `mat`: A numeric matrix or dataframe.
- `digits`: Integer; number of decimal places to round.
- `percent`: logical. If `TRUE` output given as percent. If `FALSE` the output is proportion.
- `by.column`: logical. If `TRUE` applies to the column. If `FALSE` applies by row.
- `round`: logical. If `TRUE` rounds the returned values (controlled by `digits`).

**Value**

Returns a matrix with proportionally scaled values.

**Examples**

```r
## Not run:
y <- wdf(DATA$state, DATA$person, stopwords = c("your", "yours"), margins = TRUE)
prop(wfm(y), 4)[1:10, ]  # as a proportion
prop(wfm(y), 4, TRUE)[1:10, ]  # as a percentage
heatmap(prop(wfm(y), 4))
wdstraj <- word_stats(rajSPLIT$dialogue, rajSPLIT$person)
prop(wdstraj$gts[, -1], 5)[1:15, 1:6]
```

## End(Not run)
proportions

**Generic Proportions Method**

**Description**
Access the proportions dataframes from select qdap outputs.

**Usage**

```r
proportions(x, ...)
```

**Arguments**

- `x` A qdap object (list) with a proportions dataframe (e.g., `termco`).
- `...` Arguments passed to proportions method of other classes.

**Value**
Returns a data.frame of proportions.

**See Also**

word_position Method for proportions

qcombine

Combine Columns

Description

Quickly combine columns (summed) and rename.

Usage

```r
qcombine(mat, combined.columns, elim.old = TRUE)
```

Arguments

- `mat` A matrix or dataframe with numeric combine columns.
- `combined.columns` A list of named vectors of the colnames/indexes of the numeric columns to be combined (summed). If a vector is unnamed a name will be assigned.
- `elim.old` logical. If TRUE eliminates the columns that are combined together by the named match.list. TRUE outputs the table proportionally (see prop).

Value

Returns a dataframe with combines columns.
See Also

transform

Examples

```r
## Not run:
A <- list(
  a = c(1, 2, 3),
  b = qcv(mpg, hp),
  c = c("disp", "am")
)
B <- list(
  c(1, 2, 3),
  d = qcv(mpg, hp),
  c("disp", "am")
)
qcombine(head(mtcars), A)
qcombine(head(mtcars), B)
qcombine(head(mtcars), B, elim.old = FALSE)
## End(Not run)
```

---

**qcv**

*Quick Character Vector*

**Description**

Create a character vector without the use of quotation marks.

**Usage**

```r
qcv(..., terms = NULL, space.wrap = FALSE, trailing = FALSE,
    leading = FALSE, split = " ", rm.blank = TRUE)
```

**Arguments**

- **terms**
  - An optional argument to present the terms as one long character string. This is useful if the split (separator) is not a comma (e.g., spaces are the term separators).
- **space.wrap**
  - logical. If TRUE wraps the vector of terms with a leading/trailing space.
- **trailing**
  - logical. If TRUE wraps the vector of terms with a trailing space.
- **leading**
  - logical. If TRUE wraps the vector of terms with a leading space.
- **split**
  - Character vector of length one to use for splitting (i.e., the separator used in the vector). For use with the argument terms.
- **rm.blank**
  - logical. If TRUE removes all blank spaces from the vector.
- **...**
  - Character objects. Either ...or terms argument must be utilized.
qdap

Value

Returns a character vector.

See Also

c

Examples

```r
## Not run:
qcv(I, like, dogs)
qcv(terms = "I, like, dogs") #default separator is " "
qcv(terms = "I, like, dogs", split = ",")
qcv(terms = "I like dogs")
qcv(I, like, dogs, space.wrap = TRUE)
qcv(I, like, dogs, trailing = TRUE)
qcv(I, like, dogs, leading = TRUE)
exclude(Top25Words, qcv(the, of, and))
qcv(terms = "mpg cyl disp hp drat wt qsec vs am gear carb")

## End(Not run)
```

qdap

qdap: Quantitative Discourse Analysis Package

Description

This package automates many of the tasks associated with quantitative discourse analysis of transcripts containing discourse. The package provides parsing tools for preparing transcript data, coding tools and analysis tools for richer understanding of the data. Many functions allow the user to aggregate data by any number of grouping variables, providing analysis and seamless integration with other R packages which enable higher level analysis and visualization of text. This empowers the researcher with more flexible, efficient and targeted methods and tools.

qdap_df

Create qdap Specific Data Structure

Description

Creating this qdap specific data structure enables short hand with subsequent qdap function calls that utilize the text.var argument. Combined with the `%%%` operator, the user need not specify a data set or the text.var argument (as many qdap functions contain a text.var argument). Change text.var column of a qdap_df object.
qdap\_df

**Usage**

qdap\_df(dataframe, text\_var)

Text(object)

Text(object) <- value

**Arguments**

dataframe

A `data.frame` with a text variable. Generally, `sentSplit` should be run first (`sentSplit` actually produces a `data.frame` that is of the class "qdap\_df").

text\_var

The name of the text\_var column.

object

A `data.frame` of the class "qdap\_df".

value

A character string of the updated text\_var column.

**Value**

Returns a `data.frame` of the class "qdap\_df".

**References**

Inspired by `dplyr`'s `tbl\_df` structure.

**See Also**

`%\&\%`, `sentSplit`

**Examples**

```r
## Not run:
dat <- qdap\_df(DATA, state)
dat %\&\% trans\_cloud(grouping.var=person)
dat %\&\% trans\_cloud(grouping.var=person, text.var=stemmer(DATA$state))
dat %\&\% termco(grouping.var=person, match.list=list("fun", "computer"))
class(dat)

## Change text column in `qdap\_df` (Example 1)
dat2 <- sentSplit(DATA, "state", stem.col = TRUE)
class(dat2)
dat2 %\&\% trans\_cloud()
Text(dat2)
## change the `text.var` column
Text(dat2) <- "stem.text"
dat2 %\&\% trans\_cloud()

## Change text column in `qdap\_df` (Example 2)
(dat2$fake\_dat <- paste(emoticon[1:11,2], dat2$state))
Text(dat2) <- "fake\_dat"
(m <- dat2 %\&\% sub\_holder(emoticon[,2]))
m$unhold(strip(m$output))
```
## qheat

### Quick Heatmap

**Description**

A quick heatmap function for visualizing typical qdap dataframe/matrix outputs.

**Usage**

```r
qheat(mat, low = "white", high = "darkblue", values = FALSE,
```
digits = 1, text.size = 3, text.color = "grey40",
xaxis.col = "black", yaxis.col = "black", order.by = NULL,
grid = "white", by.column = TRUE, auto.size = FALSE, mat2 = NULL,
plot = TRUE, facet.vars = NULL, facet.flip = FALSE,
diag.na = FALSE, diag.values = "", ...

## Default S3 method:
qheat(mat, low = "white", high = "darkblue",
values = FALSE, digits = 1, text.size = 3, text.color = "grey40",
xaxis.col = "black", yaxis.col = "black", order.by = NULL,
grid = "white", by.column = TRUE, auto.size = FALSE, mat2 = NULL,
plot = TRUE, facet.vars = NULL, facet.flip = FALSE,
diag.na = FALSE, diag.values = "", ...

## S3 method for class 'diversity'
qheat(mat, low = "white", high = "darkblue",
values = FALSE, digits = 1, text.size = 3, text.color = "grey40",
xaxis.col = "black", yaxis.col = "black", order.by = NULL,
grid = "white", by.column = TRUE, auto.size = FALSE, mat2 = NULL,
plot = TRUE, facet.vars = NULL, facet.flip = FALSE,
diag.na = FALSE, diag.values = "", ...

## S3 method for class 'termco'
qheat(mat, low = "white", high = "darkblue",
values = FALSE, digits = 1, text.size = 3, text.color = "grey40",
xaxis.col = "black", yaxis.col = "black", order.by = NULL,
grid = "white", by.column = TRUE, auto.size = FALSE, mat2 = NULL,
plot = TRUE, facet.vars = NULL, facet.flip = FALSE,
diag.na = FALSE, diag.values = "", ...

## S3 method for class 'word_stats'
qheat(mat, low = "white", high = "darkblue",
values = FALSE, digits = 1, text.size = 3, text.color = "grey40",
xaxis.col = "black", yaxis.col = "black", order.by = NULL,
grid = "white", by.column = TRUE, auto.size = FALSE, mat2 = NULL,
plot = TRUE, facet.vars = NULL, facet.flip = FALSE,
diag.na = FALSE, diag.values = "", ...

## S3 method for class 'character_table'
qheat(mat, low = "white", high = "darkblue",
values = FALSE, digits = 1, text.size = 3, text.color = "grey40",
xaxis.col = "black", yaxis.col = "black", order.by = NULL,
grid = "white", by.column = TRUE, auto.size = FALSE, mat2 = NULL,
plot = TRUE, facet.vars = NULL, facet.flip = FALSE,
diag.na = FALSE, diag.values = "", ...

## S3 method for class 'question_type'
qheat(mat, low = "white", high = "darkblue",
values = FALSE, digits = 1, text.size = 3, text.color = "grey40",
xaxis.col = "black", yaxis.col = "black", order.by = NULL,
grid = "white", by.column = TRUE, auto.size = FALSE, mat2 = NULL,
plot = TRUE, facet.vars = NULL, facet.flip = FALSE,
diag.na = FALSE, diag.values = "", ...)
```r
values = FALSE, digits = 1, text.size = 3, text.color = "grey40",
xaxis.col = "black", yaxis.col = "black", order.by = NULL,
grid = "white", by.column = TRUE, auto.size = FALSE, mat2 = NULL,
plot = TRUE, facet.vars = NULL, facet.flip = FALSE,
diag.na = FALSE, diag.values = "", ...)  
```

```
## S3 method for class 'pos_by'
qheat(mat, low = "white", high = "darkblue",
values = FALSE, digits = 1, text.size = 3, text.color = "grey40",
xaxis.col = "black", yaxis.col = "black", order.by = NULL,
grid = "white", by.column = TRUE, auto.size = FALSE, mat2 = NULL,
plot = TRUE, facet.vars = NULL, facet.flip = FALSE,
diag.na = FALSE, diag.values = "", ...)  
```

**Arguments**

- `mat` A matrix or dataframe produced by many qdap functions in which the first column is the grouping variable and the rest of the matrix is numeric. Also accepts objects directly from `word_stats` and `question_type`.
- `low` The color to be used for lower values.
- `high` The color to be used for higher values.
- `values` logical. If TRUE the cell values will be included on the heatmap.
- `digits` The number of digits displayed if values is TRUE.
- `text.size` A integer size to plot the text if values is TRUE.
- `text.color` A character vector to plot the text if values is TRUE.
- `xaxis.col` A single character vector color choice for the high values.
- `yaxis.col` A single character vector color choice for the low values.
- `order.by` An optional character vector of a variable name to order the columns by. To reverse use a negative (-) before the column name.
- `grid` The color of the grid (Use NULL to remove the grid).
- `by.column` logical. If TRUE applies scaling to the column. If FALSE applies scaling by row (use NULL to turn off scaling).
- `auto.size` logical. If TRUE the visual will be resized to create square cells.
- `mat2` A second matrix equal in dimensions to mat that will be used for cell labels if values is TRUE.
- `plot` logical. If TRUE the plot will automatically plot. The user may wish to set to FALSE for use in knitr, sweave, etc. to add additional plot layers.
- `facet.vars` A character vector of 1 or 2 column names to facet by.
- `facet.flip` logical If TRUE the direction of the faceting is reversed.
- `diag.na` logical. If TRUE and mat is a symmetrical matrix the diagonals are set to NA. This is useful with correlation matrices because the diagonal of ones do not affect the scaling of the heatmap.
- `diag.values` The string to be used for the diagonal labels (values) if diag.na is set to TRUE. Default is to not print a value.
- `...` Not currently used.
Details

qheat is useful for finding patterns and anomalies in large qdap generated dataframes and matrices.

Note

qheat is a fast way of working with data formats produced by qdap. The function isn’t designed to be extended beyond exploratory qdap usage.

Examples

```r
## Not run:
dat <- sentSplit(DATA, "state")
ws.ob <- with(dat, word_stats(state, list(sex, adult), tot=tot))
qheat(ws.ob)
qheat(ws.ob) + coord_flip()
qheat(ws.ob, order.by = "sptot",
       xaxis.col = c("red", "black", "green", "blue"))
qheat(ws.ob, order.by = "sptot")
qheat(ws.ob, order.by = "-sptot")
qheat(ws.ob, values = TRUE)
qheat(ws.ob, values = TRUE, text.color = "red")
qheat(ws.ob, "yellow", "red", grid = FALSE)
qheat(mtcars, facet.vars = "cyl")
qheat(mtcars, facet.vars = c("gear", "cyl"))
qheat(t(mtcars), by.column=FALSE)
qheat(cor(mtcars), diag.na=TRUE, diag.value="", by.column=NULL, values = TRUE)

dat1 <- data.frame(G=LETTERS[1:5], matrix(rnorm(20), ncol = 4))
dat2 <- data.frame(matrix(LETTERS[1:25], ncol=5))
qheat(dat1, values=TRUE)
qheat(dat1, values=TRUE, mat2=dat2)

## End(Not run)
```

qprep

Quick Preparation of Text

Description

Wrapper for bracketX, replace_number, replace_symbol, replace_abbreviation and scrubber to quickly prepare text for analysis. Care should be taken with this function to ensure data is properly formatted and complete.

Usage

```r
qprep(text.var, rm.dash = TRUE, bracket = "all", missing = NULL,
       names = FALSE, abbreviation = qdapDictionaries::abbreviations,
       replace = NULL, ignore.case = TRUE, num.paste = TRUE, ...)
```
Arguments

text.var The text variable.

rm.dash logical. If TRUE dashes will be removed.

bracket The type of bracket (and encased text) to remove. This is one of the strings "curly", "square", "round", "angle" and "all". These strings correspond to: {, [, , < or all four types. Also takes the argument NULL which turns off this parsing technique.

missing Value to assign to empty cells.

names logical. If TRUE the sentences are given as the names of the counts.

abbreviation A two column key of abbreviations (column 1) and long form replacements (column 2) or a vector of abbreviations. Default is to use qdap’s abbreviations data set. Also takes the argument NULL which turns off this parsing technique.

replace A vector of long form replacements if a data frame is not supplied to the abbreviation argument.

ignore.case logical. If TRUE replaces without regard to capitalization.

num.paste logical. If TRUE a the elements of larger numbers are separated with spaces. If FALSE the elements will be joined without spaces. Also takes the argument NULL which turns off this parsing technique.

... Other arguments passed to replace_symbol.

Note

Care should be taken with this function to ensure data is properly formatted and complete.

See Also

bracketX, replace_abbreviation, replace_number, replace_symbol

Examples

## Not run:

x <- "I like 60 (laughter) #d-bot and $6 @ the store w/o 8p.m."
quprep(x)

## End(Not run)
Description

qtheme - This function builds generic themes to add a theme to a Network object rather than individual print arguments.

theme_nightheat A night heat theme.
theme_badkitchen A 70s kitchen theme.
theme_cafe A cafe theme.
theme_grayscale A grayscale theme.
theme_norah A Norah theme.
theme_hipster A hipster theme.
theme_duskheat A duskheat theme.

Usage

qtheme(x = "generic", title, title.color, layout, legend, legend.cex, legend.text.color, legend.gradient, bg, vertex.color, vertex.size, vertex.frame.color, vertex.label.color, vertex.label.cex, edge.label.color, edge.label.cex)

theme_nightheat(x = pars["x"], title = pars["title"],
    title.color = pars["title.color"], layout = pars["layout"],
    legend = pars["legend"], legend.cex = pars["legend.cex"],
    legend.gradient = pars["legend.gradient"], bg = pars["bg"],
    legend.text.color = pars["legend.text.color"],
    vertex.color = pars["vertex.color"],
    vertex.size = pars["vertex.size"],
    vertex.frame.color = pars["vertex.frame.color"],
    vertex.label.color = pars["vertex.label.color"],
    vertex.label.cex = pars["vertex.label.cex"],
    edge.label.color = pars["edge.label.color"],
    edge.label.cex = pars["edge.label.cex"], ...)

theme_badkitchen(x = pars["x"], title = pars["title"],
    title.color = pars["title.color"], layout = pars["layout"],
    legend = pars["legend"], legend.cex = pars["legend.cex"],

vertex.color = pars["vertex.color"],
vertex.size = pars["vertex.size"],
vertex.frame.color = pars["vertex.frame.color"],
vertex.label.color = pars["vertex.label.color"],
vertex.label.cex = pars["vertex.label.cex"],
edge.label.color = pars["edge.label.color"],
edge.label.cex = pars["edge.label.cex"], ...)

Arguments

x The name of the qtheme.
title The title of the plot. NULL eliminates title. NA uses title attribute of the Network object.
title.color The color of the title.
layout igraph layout to use.
legend The coordinates of the legend. See color.legend for more information.
legend.cex character expansion factor. NULL and NA are equivalent to 1.0. See mtext for more information.
legend.text.color The text legend text color.
legend.gradient A vector of ordered colors to use for the gradient fills in the network edges.
bg The color to be used for the background of the device region. See par for more information.
vertex.color The font family to be used for vertex labels.
vertex.size The size of the vertex.
### Examples

```r
## Not run:
(poldat <- with(sentSplit(DATA, 4), polarity(state, person)))
m <- Network(poldat)
m

m + theme_nightheat
m + theme_cafe
m + theme_grayscale
m + theme_norah
m + theme_hipster
m + theme_badkitchen
m + theme_duskheat

## make your own themes
theme_irish <- theme(x = "irish", bg = "grey25",
vertex.label.color = "grey50", legend.text.color = "white",
legend.gradient = c("darkgreen", "white", "darkorange"),
edge.label.color="white", vertex.size= 20)

m + theme_irish

## End(Not run)
```

### Description

Transcript apply question counts.

### Usage

```r
question_type(text.var, grouping.var = NULL, neg.cont = FALSE,
percent = TRUE, zero.replace = 0, digits = 2,
contraction = qdapDictionaries::contractions, bracket = "all",
amplifiers = qdapDictionaries::amplification.words, ...)
```
Arguments

text.var The text variable
grouping.var The grouping variables. Default NULL generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.
neg.cont logical. If TRUE provides separate counts for the negative contraction forms of the interrogative words.
percent logical. If TRUE output given as percent. If FALSE the output is proportion.
zero.replace Value to replace 0 values with.
digits Integer; number of decimal places to round when printing.
contraction A two column key of contractions (column 1) and expanded form replacements (column 2) or a vector of contractions. Default is to use qdapDictionaries’s contractions data set.
bracket The type of bracket (and encased text) to remove. This is one or more of the strings "curly", "square", "round", "angle" and "all". These strings correspond to: {, [ , (, < or all four types.
amplifiers A character vector of terms that increase the intensity of a positive or negative word. Default is to use qdapDictionaries's amplification.words data set.

Details

The algorithm searches for the following interrogative words (and optionally, their negative contraction form as well):

1) whose 2) whom 3) who 4) where 5) what 6) which 7) why 8) when 9) were* 10) was* 11) does* 12) did* 13) do* 14) is 15) are* 16) will* 17) how 18) should 19) could 20) could 21) shall 22) may 23) might* 24) must* 25) can* 26) has 27) have* 28) had* 29) ok 30) right 31) correct 32) implied do/does/did

The interrogative word that is found first (with the exception of "ok", "right"/"alright", and "correct") in the question determines the sentence type. "ok", "right"/"alright", and "correct" sentence types are determined if the sentence is a question with no other interrogative words found and "ok", "right"/"alright", or "correct" is the last word of the sentence. Those interrogative sentences beginning with the word "you", "wanna", or "want" are categorized as implying do/does/did question type, though the use of do/does/did is not explicit. Those sentence beginning with "you" followed by a select interrogative word (and or their negative counter parts) above (marked with *) or 1-2 amplifier(s) followed by the select interrogative word are categorized by the select word rather than an implied do/does/did question type. A sentence that is marked "ok" over rides an implied do/does/did label. Those with undetermined sentence type are labeled unknown.

Value

Returns a list of:

raw A dataframe of the questions used in the transcript and their type.
count A dataframe of total questions (tot.quest) and counts of question types (initial interrogative word) by grouping variable(s).
rnp

Dataframe of the frequency and proportions of question types by grouping variable.

inds

The indices of the original text variable that contain questions.

missing

The row numbers of the missing data (excluded from analysis).

percent

The value of percent used for plotting purposes.

zero.replace

The value of zero.replace used for plotting purposes.

 raj

Romeo and Juliet (Unchanged & Complete)

Description
A dataset containing the original transcript from Romeo and Juliet as it was scraped from: http://shakespeare.mit.edu/romeo_juliet/full.html.

Usage
data(raj)

Format
A data frame with 840 rows and 3 variables

Details
• person. Character in the play
• dialogue. The spoken dialogue
• act. The act (akin to repeated measures)

References
http://shakespeare.mit.edu/romeo_juliet/full.html

raj.act.1

Romeo and Juliet: Act 1

Description
A dataset containing Romeo and Juliet: Act 1.

Usage
data(raj.act.1)

Format
A data frame with 235 rows and 2 variables
Details

• person. Character in the play
• dialogue. The spoken dialogue

References

http://shakespeare.mit.edu/romeo_juliet/full.html

Description

Romeo and Juliet: Act 1 Parts of Speech by Person A dataset containing a list from pos_by using the mraja1spl data set (see pos_by for more information).

Usage

data(raj.act.1POS)

Format

A list with 10 elements http://shakespeare.mit.edu/romeo_juliet/full.html

Details

text  The original text
POStagged  The original words replaced with parts of speech in context.
POSprop  Dataframe of the proportion of parts of speech by row.
POSfreq  Dataframe of the frequency of parts of speech by row.
POSrnp  Dataframe of the frequency and proportions of parts of speech by row
percent  The value of percent used for plotting purposes.
zero.replace  The value of zero.replace used for plotting purposes.
pos.by.freq  Dataframe of the frequency of parts of speech by grouping variable.
pos.by.prop  Dataframe of the proportion of parts of speech by grouping variable.
pos.by.rnp  Dataframe of the frequency and proportions of parts of speech by grouping variable.
Romeo and Juliet: Act 2

Description
A dataset containing Romeo and Juliet: Act 2.

Usage
data(raj.act.2)

Format
A data frame with 205 rows and 2 variables

Details
• person. Character in the play
• dialogue. The spoken dialogue

References
http://shakespeare.mit.edu/romeo_juliet/full.html

Romeo and Juliet: Act 3

Description
A dataset containing Romeo and Juliet: Act 3.

Usage
data(raj.act.3)

Format
A data frame with 197 rows and 2 variables

Details
• person. Character in the play
• dialogue. The spoken dialogue

References
http://shakespeare.mit.edu/romeo_juliet/full.html
Romeo and Juliet: Act 4

Description
A dataset containing Romeo and Juliet: Act 4.

Usage
data(raj.act.4)

Format
A data frame with 115 rows and 2 variables

Details
• person. Character in the play
• dialogue. The spoken dialogue

References
http://shakespeare.mit.edu/romeo_juliet/full.html

Romeo and Juliet: Act 5

Description
A dataset containing Romeo and Juliet: Act 5.

Usage
data(raj.act.5)

Format
A data frame with 88 rows and 2 variables

Details
• person. Character in the play
• dialogue. The spoken dialogue

References
http://shakespeare.mit.edu/romeo_juliet/full.html
raj.demographics  Romeo and Juliet Demographics

Description
A dataset containing Romeo and Juliet demographic information for the characters.

Usage
data(raj.demographics)

Format
A data frame with 34 rows and 4 variables

Details
• person. Character in the play
• sex. Gender
• fam.aff. Family affiliation of character
• died. Dummy coded death variable (0-no; 1-yes); if yes the character dies in the play

References
http://shakespeare.mit.edu/romeo_juliet/full.html

rajPOS  Romeo and Juliet Split in Parts of Speech

Description
A dataset containing a list from pos using the raj data set (see pos for more information).

Usage
data(rajPOS)

Format
A list with 4 elements
rajSPLIT

Details

- **text**  The original text
- **POSTagged**  The original words replaced with parts of speech in context.
- **POSprop**  Dataframe of the proportion of parts of speech by row.
- **POSfreq**  Dataframe of the frequency of parts of speech by row.

References

http://shakespeare.mit.edu/romeo_juliet/full.html

---

rajSPLIT  Romeo and Juliet (Complete & Split)

Description

A dataset containing the complete dialogue of Romeo and Juliet with turns of talk split into sentences.

Usage

data(rajSPLIT)

Format

A data frame with 2151 rows and 8 variables

Details

- person. Character in the play
- sex. Gender
- fam.aff. Family affiliation of character
- died. Dummy coded death variable (0-no; 1-yes); if yes the character dies in the play
- dialogue. The spoken dialogue
- act. The act (akin to repeated measures)
- stem.text. Text that has been stemmed

References

http://shakespeare.mit.edu/romeo_juliet/full.html
random_sent - Generates a random sample of sentences (sentences are sampled at the word level and therefore are likely nonsensical).

random_data - Generate random dialogue, people, and demographic variables

Usage

random_sent(n = 10, len = 14, range = len - 1,
dictionary = qdapDictionaries::Top200Words, endmark.fun = function()
sample(c(".", ",", ":", ":"), 1, prob = c(0.85, 0.05, 0.05, 0.05)))

random_data(n = 10, ..., n.people = 10, ages = 7:10,
people.names = unique(tolower(qdapDictionaries::NAMES[[1]])))

Arguments

n Number of sentences to create.
len Average length of sentences (in words).
range Range around len that number of words may vary. This may be a recycled single integer vector or an integer vector of length 2.
dictionary A dictionary of words to sample from.
endmark.fun A function to create random end marks.
n.people An integer of the number of people to include in the sample (number of people is sampled from; if n is smaller not all people may be included).
ages The possible ages to choose from (numeric).
people.names A vector of names to choose from at least as large as n.people.
... Other arguments passed to random_sent

Value

random_sent - Returns a random vector of sentence strings.
random_data - Returns a data.frame of people, dialogue, and demographic variables of the class sent_split.

Examples

## Not run:
random_sent()
random_sent(200, 10)
dict <- sort(unique(bag_o_words(pres_debates2012[['dialogue']]))
rank_freq_mplot

random_sent(dictionary=dict)

random_data()
random_data(ages = seq(10, 20, by = .5))
random_data(50) %>% word_stats(person)
random_data(100) %>% word_stats(list(race, sex))
random_data(dictionary = dict)

## End(Not run)

rank_freq_mplot  

<table>
<thead>
<tr>
<th>rank_freq_mplot</th>
<th>Rank Frequency Plot</th>
</tr>
</thead>
</table>

**Description**

*rank_freq_mplot* - Plot a faceted word rank versus frequencies by grouping variable(s).

*rank_freq_plot* - Plot word rank versus frequencies.

**Usage**

```r
rank_freq_mplot(text.var, grouping.var = NULL, ncol = 4, jitter = 0.2, log.freq = TRUE, log.rank = TRUE, hap.col = "red", dis.col = "blue", alpha = 1, shape = 1, title = "Rank-Frequency Plot", digits = 2, plot = TRUE)

rank_freq_plot(words, frequencies, plot = TRUE, title.ext = NULL, jitter.ammount = 0.1, log.scale = TRUE, hap.col = "red", dis.col = "blue")
```

**Arguments**

- **text.var**
The text variable.
- **grouping.var**
The grouping variables. Default NULL generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.
- **ncol**
An integer value indicating the number of columns in the facet wrap.
- **jitter**
Amount of horizontal jitter to add to the points.
- **log.freq**
Logical. If TRUE plots the frequencies in the natural log scale.
- **log.rank**
Logical. If TRUE plots the ranks in the natural log scale.
- **hap.col**
Color of the hapax legomenon points.
- **dis.col**
Color of the dis legomenon points.
- **alpha**
Transparency level of points (ranges between 0 and 1).
- **shape**
An integer specifying the symbol used to plot the points.
- **title**
Optional plot title.
- **digits**
Integer; number of decimal places to round.
plot logical. If TRUE provides a rank frequency plot.
words A vector of words.
frequencies A vector of frequencies corresponding to the words argument.
title.ext The title extension that extends: "Rank-Frequency Plot ..."
jitter amourt Amount of horizontal jitter to add to the points.
log.scale logical. If TRUE plots the rank and frequency as a log scale.

Value

Returns a rank-frequency plot and a list of three dataframes:

WORD_COUNTS The word frequencies supplied to `rank_freq_plot` or created by `rank_freq_mplot`.
RANK_AND_FREQUENCY_STATS A dataframe of rank and frequencies for the words used in the text.
LEGOMENA_STATS A dataframe displaying the percent hapax legomena and percent dis legomena of the text.

Note

`rank_freq_mplot` utilizes the ggplot2 package, whereas, `rank_freq_plot` employs base graphics. `rank_freq_mplot` is more general & flexible; in most cases `rank_freq_mplot` should be preferred.

References

Examples

```r
## Not run:
#rank_freq_mplot EXAMPLES:
x1 <- rank_freq_mplot(DATA$state, DATA$person, ncol = 2, jitter = 0)
ltruncdf(x1, 10)
x2 <- rank_freq_mplot(mraja$dialogue, mraja$person, ncol = 5,
                      hap.col = "purple")
ltruncdf(x2, 10)
invisible(rank_freq_mplot(mraja$dialogue, mraja$person, ncol = 5,
                         log.freq = FALSE, log.rank = FALSE, jitter = .6))
invisible(rank_freq_mplot(raj$dialogue, jitter = .5, alpha = 1/15))
invisible(rank_freq_mplot(raj$dialogue, jitter = .5, shape = 19, alpha = 1/15))

#rank_freq_plot EXAMPLES:
mod <- with(mraja, word_list(dialogue, person, cut.n = 10,
                            cap.list=unique(mraja$person)))
x3 <- rank_freq_plot(mod$fwl$Romeo$WORD, mod$fwl$Romeo$fREQ, title.ext = 'Romeo')
ltruncdf(x3, 10)
ltruncdf(rank_freq_plot(mod$fwl$Romeo$WORD, mod$fwl$Romeo$fREQ, plot = FALSE), 10)
invisible(rank_freq_plot(mod$fwl$Romeo$WORD, mod$fwl$Romeo$fREQ, title.ext = 'Romeo',
                         jitter.ammount = 0.15, hap.col = "darkgreen", dis.col = "purple"))
invisible(rank_freq_plot(mod$fwl$Romeo$WORD, mod$fwl$Romeo$FREQ, title.ext = 'Romeo', jitter.amount = 0.5, log.scale=FALSE))
invisible(lapply(seq_along(mod$fwl), function(i){
  dev.new()
  rank_freq_plot(mod$fwl[[i]]$WORD, mod$fwl[[i]]$FREQ, 
  title.ext = names(mod$fwl)[i], jitter.amount = 0.5, log.scale=FALSE)
}))

## End(Not run)

---

**raw.time.span**  
**Minimal Raw Time Span Data Set**

**Description**

A dataset containing a list of named vectors of time spans.

**Usage**

```r
data(raw.time.span)
```

**Format**

A list with 3 elements

---

**read.transcript**  
**Read Transcripts Into R**

**Description**

Read .docx, .csv or .xlsx files into R.

**Usage**

```r
read.transcript(file, col.names = NULL, text.var = NULL, 
merge.broke.tot = TRUE, header = FALSE, dash = "", 
ellipsis = "...", quote2bracket = FALSE, rm.empty.rows = TRUE, 
na.strings = c("999", "NA", "", ""), sep = NULL, skip = 0, 
nontext2factor = TRUE, text, comment.char = "", ...)
```
Arguments

- **file**: The name of the file which the data are to be read from. Each row of the table appears as one line of the file. If it does not contain an absolute path, the file name is relative to the current working directory, `getwd()`.

- **col.names**: A character vector specifying the column names of the transcript columns.

- **text.var**: A character string specifying the name of the text variable will ensure that variable is classed as character. If NULL `read.transcript` attempts to guess the text.variable (dialogue).

- **merge.broke.tot**: logical. If TRUE and if the file being read in is .docx with broken space between a single turn of talk `read.transcript` will attempt to merge these into a single turn of talk.

- **header**: logical. If TRUE the file contains the names of the variables as its first line.

- **dash**: A character string to replace the en and em dashes special characters (default is to remove).

- **ellipsis**: A character string to replace the ellipsis special characters (default is text ...).

- **quote2bracket**: logical. If TRUE replaces curly quotes with curly braces (default is FALSE). If FALSE curly quotes are removed.

- **rm.empty.rows**: logical. If TRUE `read.transcript` attempts to remove empty rows.

- **na.strings**: A vector of character strings which are to be interpreted as NA values.

- **sep**: The field separator character. Values on each line of the file are separated by this character. The default of NULL instructs `read.transcript` to use a separator suitable for the file type being read in.

- **skip**: Integer; the number of lines of the data file to skip before beginning to read data.

- **nontext2factor**: logical. If TRUE attempts to convert any non-text to a factor.

- **text**: Character string: if file is not supplied and this is, then data are read from the value of text. Notice that a literal string can be used to include (small) data sets within R code.

- **comment.char**: A character vector of length one containing a single character or an empty string. Use `""` to turn off the interpretation of comments altogether.

- **...**: Further arguments to be passed to `read.table`.

Value

Returns a dataframe of dialogue and people.

Warning

`read.transcript` may contain errors if the file being read in is .docx. The researcher should carefully investigate each transcript for errors before further parsing the data.

Note

If a transcript is a .docx file `read.transcript` expects two columns (generally person and dialogue) with some sort of separator (default is colon separator). .doc files must be converted to .docx before reading in.

dat4 <- read.transcript(doc3, sep = " ", skip = 1); truncdf(dat4, 40)

dat5 <- read.transcript(doc4); truncdf(dat5, 40) # an .xlsx file
trans <- "sam: Computer is fun. Not too fun.
greg: No it's not, it's dumb.
teacher: What should we do?
sam: You liar, it stinks!"

read.transcript(text=trans)

## Read in text specify spaces as sep
## EXAMPLE 1

read.transcript(text="The New York Times reports a lot of words here.
Greenwire reports a lot of words.
Only three words.
The Financial Times reports a lot of words.
Greenwire short.
The New York Times reports a lot of words again.",
col.names=qcv(NO, ARTICLE), sep=" ")
```

Read transcript (text="34.
12.
31.
2.
9.
13.

The New York Times reports a lot of words here.
Greenwire reports a lot of words.
Only three words.
The Financial Times reports a lot of words.
Greenwire short.
The New York Times reports a lot of words again.

col.names=qcv(NO, ARTICLE), sep="\n\n")

## End (Not run)

## EXAMPLE 2

**Description**

Replace elements of a dataframe, matrix or vector with least restrictive class.

**Usage**

replacer(dat, replace = 0, with = "-")

**Arguments**

- **dat**: Data; either a dataframe, matrix or vector.
- **replace**: Element to replace.
- **with**: Replacement element.

**Value**

Returns a dataframe, matrix or vector with the element replaced.

**Examples**

## Not run:

replacer(mtcars[1:10, ], 0, "REP")
replacer(mtcars[1:10, ], 4, NA)
replacer(c("a", "b"), "a", "foo")
replace missing values (NA)
dat <- data.frame(matrix(sample(c(1:3, NA), 25, TRUE), ncol=5))
replacer(dat, NA, "FOO")

## End (Not run)
replace_abbreviation  

Replace Abbreviations  

Description  

This function replaces abbreviations with long form.

Usage  

```
replace_abbreviation(text.var,  
  abbreviation = qdapDictionaries::abbreviations, replace = NULL,  
  ignore.case = TRUE)
```

Arguments  

- **text.var**: The text variable.  
- **abbreviation**: A two column key of abbreviations (column 1) and long form replacements (column 2) or a vector of abbreviations. Default is to use qdapDictionaries’s `abbreviations` data set.  
- **replace**: A vector of long form replacements if a data frame is not supplied to the abbreviation argument.  
- **ignore.case**: logical. If TRUE replaces without regard to capitalization.

Value  

Returns a vector with abbreviations replaced.

See Also  

`bracketX`, `qprep`, `replace_contraction`, `replace_number`, `replace_symbol`

Examples  

```r  
## Not run:  
x <- c("Mr. Jones is here at 7:30 p.m.",  
  "Check it out at www.github.com/trinker/qdap",  
  "i.e. He’s a sr. dr.; the best in 2012 A.D.",  
  "the robot at t.s. is 10ft. 3in.")

replace_abbreviation(x)  

# create abbreviation and replacement vectors  
abv <- c("in.", "ft.", "t.s.")  
repl <- c("inch", "feet", "talkstats")

replace_abbreviation(x, abv, repl)  

(KEY <- rbind(abbreviations, data.frame(abv = abv, rep = repl)))
```
replace_abbreviation(x, KEY)

## End(Not run)

---

**replace_contraction**  
*Replace Contractions*

**Description**

This function replaces contractions with long form.

**Usage**

```r
replace_contraction(text.var,  
contraction = qdapDictionaries::contractions, replace = NULL,  
ignore.case = TRUE, sent.cap = TRUE)
```

**Arguments**

- **text.var**: The text variable.
- **contraction**: A two column key of contractions (column 1) and expanded form replacements (column 2) or a vector of contractions. Default is to use qdapDictionaries's *contractions* data set.
- **replace**: A vector of expanded form replacements if a data frame is not supplied to the contraction argument.
- **ignore.case**: logical. If TRUE replaces without regard to capitalization.
- **sent.cap**: logical. If TRUE capitalizes the beginning of every sentence.

**Value**

Returns a vector with contractions replaced.

**See Also**

- `bracketX`
- `qprep`
- `replace_abbreviation`
- `replace_number`
- `replace_symbol`

**Examples**

```r
## Not run:
x <- c("Mr. Jones isn't going.",  
"Check it out what's going on.",  
"He's here but didn't go.",  
"the robot at t.s. wasn't nice",  
"he'd like it if i'd go away")

replace_contraction(x)

## End(Not run)
```
**replace_number**  
*Replace Numbers With Text Representation*

**Description**
Replaces numeric represented numbers with words (e.g., 1001 becomes one thousand one).

**Usage**
```
replace_number(text.var, num.paste = TRUE, remove = FALSE)
```

**Arguments**
- `text.var` The text variable.
- `num.paste` logical. If TRUE a the elements of larger numbers are separated with spaces. If FALSE the elements will be joined without spaces.
- `remove` logical. If TRUE numbers are removed from the text.

**Value**
Returns a vector with abbreviations replaced.

**Note**
The user may want to use `replace_ordinal` first to remove ordinal number notation. For example `replace_number` would turn "21st" into "twenty onest", whereas `replace_ordinal` would generate "twenty first".

**References**

**See Also**
`bracketX`, `qprep`, `replace_abbreviation`, `replace_contraction`, `replace_symbol`, `replace_ordinal`

**Examples**
```r
## Not run:
x <- c("I like 346,457 ice cream cones.", "They are 99 percent good")
y <- c("I like 346457 ice cream cones.", "They are 99 percent good")
replace_number(x)
replace_number(y)
replace_number(x, FALSE)
replace_number(x, remove=TRUE)
```

## End(Not run)
replace_ordinal  

Replace Mixed Ordinal Numbers With Text Representation

Description

Replaces mixed text/numeric represented ordinal numbers with words (e.g., "1st" becomes "first").

Usage

\[
\text{replace_ordinal}(\text{text.var}, \text{num.paste} = \text{TRUE, remove = FALSE})
\]

Arguments

- \text{text.var} \hspace{1cm} \text{The text variable.}
- \text{num.paste} \hspace{1cm} \text{logical. If TRUE a the elements of larger numbers are separated with spaces. If FALSE the elements will be joined without spaces.}
- \text{remove} \hspace{1cm} \text{logical. If TRUE ordinal numbers are removed from the text.}

Note

Currently only implemented for ordinal values 1 through 100

See Also

- \text{bracketX, qprep, replace_abbreviation, replace_contraction, replace_symbol, replace_number}

Examples

```r
## Not run:
x <- c(
  "I like the 1st one not the 22nd one.",
  "For the 100th time stop!"
)
replace_ordinal(x)
replace_ordinal(x, FALSE)
replace_ordinal(x, remove = TRUE)
"I like the 1st 1 not the 22nd 1." %>% replace_ordinal %>% replace_number

## End(Not run)
```
replace_symbol

Replace Symbols With Word Equivalents

Description

This function replaces symbols with word equivalents (e.g., @ becomes "at").

Usage

replace_symbol(text.var, dollar = TRUE, percent = TRUE, pound = TRUE, 
at = TRUE, and = TRUE, with = TRUE)

Arguments

text.var The text variable.
dollar logical. If TRUE replaces dollar sign ($) with "dollar".
percent logical. If TRUE replaces percent sign (%) with "percent".
pound logical. If TRUE replaces pound sign (#) with "number".
at logical. If TRUE replaces at sign (@) with "at".
and logical. If TRUE replaces and sign (&) with "and".
with logical. If TRUE replaces with sign (w/) with "with".

Value

Returns a character vector with symbols replaced..

See Also

bracketX, qprep, replace_abbreviation, replace_contraction, replace_number,

Examples

## Not run:
x <- c("I am @ Jon's & Jim's w/ Marry", 
   "I owe $41 for food", 
   "two is 10% of a ")
replace_symbol(x)

## End(Not run)
**Remove Rows That Contain Markers**

**Description**

*rm_row* - Remove rows from a data set that contain a given marker/term.

*rm_empty_row* - Removes the empty rows of a data set that are common in reading in data (default method in *read.transcript*).

**Usage**

```r
rm_row(dataframe, search.column, terms, contains = FALSE, 
       ignore.case = FALSE, keep.rownames = FALSE, ...)
```

```r
rm_empty_row(dataframe)
```

**Arguments**

- **dataframe** A dataframe object.
- **search.column** Column name to search for markers/terms.
- **terms** Terms/markers of the rows that are to be removed from the dataframe. The term/marker must appear at the beginning of the string and is case sensitive.
- **contains** logical. If TRUE rm_row searches for the terms anywhere within the string. If FALSE rm_row searches only the beginning of the string.
- **ignore.case** logical. If TRUE case is ignored during matching, if FALSE the pattern matching is case sensitive.
- **keep.rownames** logical. If TRUE the original, non-sequential, rownames will be used.
- **...** Other arguments passed to *grepl*.

**Value**

*rm_row* - returns a dataframe with the termed/markered rows removed.

*rm_empty_row* - returns a dataframe with empty rows removed.

**Examples**

```
## Not run:
#rm_row EXAMPLE:
rm_row(DATA, "person", c("sam", "greg"))
rm_row(DATA, 1, c("sam", "greg"))
rm_row(DATA, "state", c("Comp"))
rm_row(DATA, "state", c("I "))
rm_row(DATA, "state", c("you"), contains = TRUE, ignore.case=TRUE)

#rm_empty_row EXAMPLE:
(dat <- rbind.data.frame(DATA[, c(1, 4)], matrix(rep(" ", 4),
```

```r
330
```
Description

Removal of stop words in a variety of contexts.

Usage

```r
rm_stopwords(text.var, stopwords = qdapDictionaries::Top25Words,
unlist = FALSE, separate = TRUE, strip = FALSE, unique = FALSE,
char.keep = NULL, names = FALSE, ignore.case = TRUE,
apostrophe.remove = FALSE, ...)
```

```r
rm_stop(text.var, stopwords = qdapDictionaries::Top25Words,
unlist = FALSE, separate = TRUE, strip = FALSE, unique = FALSE,
char.keep = NULL, names = FALSE, ignore.case = TRUE,
apostrophe.remove = FALSE, ...)
```

text.var %sw% stopwords

Arguments

text.var A character string of text or a vector of character strings.

stopwords A character vector of words to remove from the text. qdap has a number of
data sets that can be used as stop words including: Top200Words, Top100Words,
Top25Words. For the tm package’s traditional English stop words use tm::stopwords("english").

unlist logical. If TRUE unlists into one vector. General use intended for when separate
is FALSE.

separate logical. If TRUE separates sentences into words. If FALSE retains sentences.

strip logical. IF TRUE strips the text of all punctuation except apostrophes.

unique logical. If TRUE keeps only unique words (if unlist is TRUE) or sentences (if unlist
is FALSE). General use intended for when unlist is TRUE.

char.keep If strip is TRUE this argument provides a means of retaining supplied character(s).

names logical. If TRUE will name the elements of the vector or list with the original
text.var.

ignore.case logical. If TRUE stopwords will be removed regardless of case. Additionally,
case will be stripped from the text. If FALSE stop word removal is contingent
upon case. Additionally, case is not stripped.
sample.time.span

apostrophe.remove

logical. If TRUE removes apostrophe’s from the output.

... further arguments passed to strip function.

Value

Returns a vector of sentences, vector of words, or (default) a list of vectors of words with stop words removed. Output depends on supplied arguments.

See Also

strip, bag_o_words, stopwords

Examples

```r
## Not run:
rm_stopwords(DATA$state)
rm_stopwords(DATA$state, tm::stopwords("english"))
rm_stopwords(DATA$state, Top200Words)
rm_stopwords(DATA$state, Top200Words, strip = TRUE)
rm_stopwords(DATA$state, Top200Words, separate = FALSE)
rm_stopwords(DATA$state, Top200Words, separate = FALSE, ignore.case = FALSE)
rm_stopwords(DATA$state, Top200Words, unlist = TRUE)
rm_stopwords(DATA$state, Top200Words, unlist = TRUE, strip=TRUE)
rm_stop(DATA$state, Top200Words, unlist = TRUE, unique = TRUE)

c("I like it alot", "I like it too") %sw% qdapDictionaries::Top25Words

## End(Not run)
```

---

sample.time.span  Minimal Time Span Data Set

Description

A fictitious dataset containing time spans for codes A and B.

Usage

data(sample.time.span)

Format

A data frame with 9 rows and 6 variables
Details

- code. The qualitative code.
- start. The integer start time.
- end. The integer end time.
- Start. The chron start time.
- End. The chron end time.
- variable. An arbitrary single time repeated measures variable (ignore).

scores

Generic Scores Method

Description

Access the scores dataframes from select qdap outputs.

Usage

scores(x, ...)

Arguments

x A qdap object (list) with a dataframe of scores (e.g., fry, formality).
... Arguments passed to scores method of other classes.

Value

Returns a data.frame of scores.

See Also

Details

dendmark_by Method for scores
scores.flesch_kincaid  Readability Measures

Description
scores.flesch_kincaid - View scores from flesch_kincaid.

Usage
```r
## S3 method for class 'flesch_kincaid'
scores(x, ...)
```

Arguments
- `x` The flesch_kincaid object.
- `...` ignored

Details
flesch_kincaid Method for scores

scores.formality  Formality

Description
View formality scores.

Usage
```r
## S3 method for class 'formality'
scores(x, ...)
```

Arguments
- `x` The formality object.
- `...` ignored

Details
formality Method for scores
scores.fry

Readability Measures

Description
scores.fry - View scores from fry.

Usage
## S3 method for class 'fry'
scores(x, ...)

Arguments
x The fry object.
... ignored

Details
fry Method for scores

scores.lexical_classification

Lexical Classification

Description
scores.lexical_classification - View scores from lexical_classification.

Usage
## S3 method for class 'lexical_classification'
scores(x, ...)

Arguments
x The lexical_classification object.
... ignored

Details
lexical_classification Method for scores
**scores.linsear_write**  
*Readability Measures*

**Description**

scores.linsear_write - View scores from linsear_write.

**Usage**

```r
## S3 method for class 'linsear_write'
scores(x, ...)
```

**Arguments**

- `x`  
The linsear_write object.
- `...`  
  ignored

**Details**

linsear_write Method for scores

---

**scores.object_pronoun_type**  
*Question Counts*

**Description**

View object_pronoun_type scores.

**Usage**

```r
## S3 method for class 'object_pronoun_type'
scores(x, ...)
```

**Arguments**

- `x`  
The object_pronoun_type object.
- `...`  
  ignored

**Details**

object_pronoun_type Method for scores
scores.polarity

Description
scores.polarity - View scores from polarity.

Usage
```r
## S3 method for class 'polarity'
scores(x, ...)
```

Arguments
- `x` The polarity object.
- `...` ignored

Details
polarity Method for scores

scores.pos_by

Description
View pos_by scores.

Usage
```r
## S3 method for class 'pos_by'
scores(x, ...)
```

Arguments
- `x` The pos_by object.
- `...` ignored

Details
pos_by Method for scores
Description

View pronoun_type scores.

Usage

```r
## S3 method for class 'pronoun_type'
scores(x, ...)
```

Arguments

- `x` The pronoun_type object.
- `...` ignored

Details

pronoun_type Method for scores

---

Description

View question_type scores.

Usage

```r
## S3 method for class 'question_type'
scores(x, ...)
```

Arguments

- `x` The question_type object.
- `...` ignored

Details

question_type Method for scores
scores.SMOG

Description
scores.SMOG - View scores from SMOG.

Usage
```r
## S3 method for class 'SMOG'
scores(x, ...)
```

Arguments
- `x` The SMOG object.
- `...` ignored

Details
SMOG Method for scores

scores.subject_pronoun_type

Description
View subject_pronoun_type scores.

Usage
```r
## S3 method for class 'subject_pronoun_type'
scores(x, ...)
```

Arguments
- `x` The `subject_pronoun_type` object.
- `...` ignored

Details
subject_pronoun_type Method for scores
scores.termco  Term Counts

**Description**

View termco scores.

**Usage**

```r
## S3 method for class 'termco'
scores(x, ...)
```

**Arguments**

- `x` The `termco` object.
- `...` ignored

**Details**

termco Method for scores

scores.word_length  Word Length Counts

**Description**

View word_length scores.

**Usage**

```r
## S3 method for class 'word_length'
scores(x, ...)
```

**Arguments**

- `x` The `word_length` object.
- `...` ignored

**Details**

word_length Method for scores
scores.word_position  Word Position

<table>

| Details              | question_type Method for scores |
Description

Use to clean text variables when importing a new data set. Removes extra white spaces other textual anomalies that may cause errors.

Usage

```r
scrubber(text.var, num2word = FALSE, rm.quote = TRUE,
         fix.comma = TRUE, fix.space = TRUE, ...)
```

Arguments

- `text.var`  
  The text variable.
- `num2word`  
  logical If TRUE replaces a numbers with text representations.
- `rm.quote`  
  logical If TRUE removes any `\`.
- `fix.comma`  
  logical If TRUE removes any spaces before a comma.
- `fix.space`  
  logical. If TRUE extra spaces before endmarks are removed.
- `...`  
  Other arguments passed to `replace_number`.

Value

Returns a parsed character vector.

See Also

- `strip`

Examples

```r
## Not run:
x <- c("I like 456 dogs\t , don't you?", 'The end'')
scrubber(x)
scrubber(x, TRUE)

## End(Not run)
```
Search

Search Columns of a Data Frame

Description

Search - Find terms located in columns of a data frame.

boolean_search - Conducts a Boolean search for terms/strings within a character vector.

%bs% - Binary operator version of boolean_search.

Usage

Search(dataframe, term, column.name = NULL, max.distance = 0.02, ...)

boolean_search(text.var, terms, ignore.case = TRUE, values = FALSE,
               exclude = NULL, apostrophe.remove = FALSE, char.keep = NULL,
               digit.remove = FALSE)

text.var %bs% terms

Arguments

dataframe A dataframe object to search.
term A character string to search for.
column.name Optional column of the data frame to search (character name or integer index).
max.distance Maximum distance allowed for a match. Expressed either as integer, or as a fraction of the pattern length times the maximal transformation cost (will be replaced by the smallest integer not less than the corresponding fraction).
text.var The text variable.
terms A character string(s) to search for. The terms are arranged in a single string with AND (use AND or && to connect terms together) and OR (use OR or || to allow for searches of either set of terms. Spaces may be used to control what is searched for. For example using " I " on c("I'm", "I want", "in") will result in FALSE TRUE FALSE whereas "I" will match all three (if case is ignored).
ignore.case logical. If TRUE case is ignored.
values logical. Should the values be returned or the index of the values.
exclude Terms to exclude from the search. If one of these terms is found in the sentence it cannot be returned.
apostrophe.remove logical. If TRUE removes apostrophes from the text before examining.
char.keep A character vector of symbol character (i.e., punctuation) that strip should keep. The default is to strip everything except apostrophes. termco attempts to auto detect characters to keep based on the elements in match.list.
digit.remove logical. If TRUE strips digits from the text before counting. termco attempts to auto detect if digits should be retained based on the elements in match.list.
... Other arguments passed to agrep.
Details

The terms string is first split by the OR separators into a list. Next the list of vectors is split on the AND separator to produce a list of vectors of search terms. Each sentence is matched against the terms. For a sentence to be counted it must fit all of the terms in an AND Boolean or one of the conditions in an OR Boolean.

Value

Search - Returns the rows of the data frame that match the search term.

boolean_search - Returns the values (or indices) of a vector of strings that match given terms.

See Also

trans_context
termco

Examples

```r
## Not run:
## Dataframe search:
(SampDF <- data.frame("islands"=names(islands)[1:32],mtcars, row.names=NULL))

Search(SampDF, "Cuba", "islands")
Search(SampDF, "New", "islands")
Search(SampDF, "Ho")
Search(SampDF, "Ho", max.distance = 0)
Search(SampDF, "Axel Heiberg")
Search(SampDF, 19) #too much tolerance in max.distance
Search(SampDF, 19, max.distance = 0)
Search(SampDF, 19, "qsec", max.distance = 0)

##Boolean search:
boolean_search(DATA$state, " I OR liar&&stinks")
boolean_search(DATA$state, " I &&.", values=TRUE)
boolean_search(DATA$state, " I OR.", values=TRUE)
boolean_search(DATA$state, " I &&.")

## Exclusion:
boolean_search(DATA$state, " I ||.", values=TRUE)
boolean_search(DATA$state, " I ||.", exclude = c("way", "truth"), values=TRUE)

## From stackoverflow: http://stackoverflow.com/q/19640562/1000343
dat <- data.frame(x = c("Doggy", "Hello", "Hi Dog", "Zebra"), y = 1:4)
z <- data.frame(z =c("Hello", "Dog"))

dat[boolean_search(dat$x, paste(z$z, collapse = "OR")), ]

## Binary operator version
dat[dat$x %bs% paste(z$z, collapse = "OR"), ]

## Passing to `trans_context`
```
sentiment_frame

```r
inds <- boolean_search(DATA.SPLIT$state, " I&.|| I&!", ignore.case = FALSE)
with(DATA.SPLIT, trans_context(state, person, inds=inds))

(inds2 <- boolean_search(raj$dialogue, spaste(paste(negation.words, 
collapse = " || "))))
trans_context(raj$dialogue, raj$person, inds2)
```

```r
## End(Not run)

sentiment_frame

Description

sentiment_frame - Generate a sentiment lookup hash table for use with the xxx.frame argument of various sentiment functions.

Usage

```r
sentiment_frame(positives, negatives, pos.weights = 1, 
    neg.weights = -1)
```

Arguments

- **positives**: A character vector of positive words.
- **negatives**: A character vector of negative words.
- **pos.weights**: A vector of weights to weight each positive word by. Length must be equal to length of positives or length 1 (if 1 weight will be recycled).
- **neg.weights**: A vector of weights to weight each negative word by. Length must be equal to length of negatives or length 1 (if 1 weight will be recycled).

sentsplit

Description

sentsplit - Splits turns of talk into individual sentences (provided proper punctuation is used). This procedure is usually done as part of the data read in and cleaning process.

sentCombine - Combines sentences by the same grouping variable together.

TOT - Convert the tot column from sentsplit to turn of talk index (no sub sentence). Generally, for internal use.

sent_detect - Detect and split sentences on endmark boundaries.

sent_detect_nlp - Detect and split sentences on endmark boundaries using openNLP & NLP utilities which matches the onld version of the openNLP package's now removed sentDetect function.
Usage

```
sentSplit(dataframe, text.var, rm.var = NULL, endmarks = c("?", ".", 
"!", "|"), incomplete.sub = TRUE, rm.bracket = TRUE, 
stem.col = FALSE, text.place = "right", verbose = is.global(2), 
...)
```

textCombine(text.var, grouping.var = NULL, as.list = FALSE)

```
TOT(tot)
```

```
sent_detect(text.var, endmarks = c("?", ".", ",!", "|"), 
incomplete.sub = TRUE, rm.bracket = TRUE, ...)
```

```
sent_detect_nlp(text.var, ...)
```

Arguments

```
dataframe      A dataframe that contains the person and text variable.
text.var        The text variable.
rm.var          An optional character vector of 1 or 2 naming the variables that are repeated
                measures (This will restart the "tot" column).
endmarks        A character vector of endmarks to split turns of talk into sentences.
incomplete.sub  A character vector of endmarks to split turns of talk into sentences.
rm.bracket      logical. If TRUE removes brackets from the text.
stem.col        logical. If TRUE stems the text as a new column.
text.place      A character string giving placement location of the text column. This must be
                one of the strings "original", "right" or "left".
verbose         logical. If TRUE select diagnostics from check_text are reported.
```

```
Arguments

```
grouping.var    The grouping variables. Default NULL generates one word list for all text. Also
                takes a single grouping variable or a list of 1 or more grouping variables.
as.list         logical. If TRUE returns the output as a list. If FALSE the output is returned as a
                dataframe.
tot             A tot column from a sentSplit output.
...             Additional options passed to stem2df.
```

Value

```
sentSplit - returns a dataframe with turn of talk broken apart into sentences. Optionally a stemmed
version of the text variable may be returned as well.
sentCombine - returns a list of vectors with the continuous sentences by grouping.var pasted to-
gether. returned as well.
TOT - returns a numeric vector of the turns of talk without sentence sub indexing (e.g. 3.2 become
3).
sent_detect - returns a character vector of sentences split on endmark.
sent_detect - returns a character vector of sentences split on endmark.
```
Warning

`sentSplit` requires the dialogue (text) column to be cleaned in a particular way. The data should contain qdap punctuation marks (c(“?”, “.”, “!”, “|”)) at the end of each sentence. Additionally, extraneous punctuation such as abbreviations should be removed (see `replace_abbreviation`). Trailing sentences such as I thought I... will be treated as incomplete and marked with "|" to denote an incomplete/trailing sentence.

Suggestion

It is recommended that the user runs `check_text` on the output of `sentSplit`'s text column.

Author(s)

Dason Kurkiewicz and Tyler Rinker <tyler.rinker@gmail.com>.

## 'sent_detect'
sent_detect(DATA$state)
```
space_fill  

Replace Spaces

Description

Replace spaces in words groups that should be grouped together.

Usage

space_fill(text.var, terms, sep = "~~", rm.extra = TRUE, ignore.case = TRUE, fixed = FALSE, ...)

Arguments

text.var  
The text variable.
terms  
A character vector of grouped word terms to insert a new separating/space character.
sep  
A character string to separate the terms.
rm.extra  
logical. Should trailing, leading and > 1 continuous white spaces be removed?
ignore.case  
logical. If FALSE, the pattern matching is case sensitive and if TRUE, case is ignored during matching.
fixed  
logical. If TRUE, pattern is a string to be matched as is. Overrides all conflicting arguments.
...
Other arguments passed to gsub.

Details

space_fill is useful for keeping grouped words together. Many functions in qdap take a char.keep or char2space argument. This can be used to prepare multi word phrases (e.g., proper nouns) as a single unit.

Value

Returns a character vector with extra, trailing and/or leading spaces removed.

Note

link[qdap]{strip} by default does not remove the double tilde "~~" character.
Examples

```r
## Not run:
x <- c("I want to hear the Dr. Martin Luther King Jr. speech.",
  "I also want to go to the white House to see President Obama speak.")

keeps <- c("Dr. Martin Luther King Jr.", "The White House", "President Obama")
space_fill(x, keeps)
strip(space_fill(x, keeps))

## End(Not run)
```

---

**Add Leading/Trailing Spaces**

**Description**

Adds trailing and/or leading spaces to a vector of terms.

**Usage**

```r
spaste(terms, trailing = TRUE, leading = TRUE)
```

**Arguments**

- `terms`: A character vector of terms to insert trailing and/or leading spaces.
- `trailing`: logical. If TRUE inserts a trailing space in the terms.
- `leading`: logical. If TRUE inserts a leading space in the terms.

**Value**

Returns a character vector with trailing and/or leading spaces.

**Examples**

```r
## Not run:
spaste(Top25Words)
spaste(Top25Words, FALSE)
spaste(Top25Words, trailing = TRUE, leading = FALSE) #or
spaste(Top25Words, , FALSE)

## End(Not run)
```
**speakerSplit**

*Break and Stretch if Multiple Persons per Cell*

**Description**

Look for cells with multiple people and create separate rows for each person.

**Usage**

```r
speakerSplit(dataframe, person.var = 1, sep = c("and", ",", ";"),
             track.reps = FALSE)
```

**Arguments**

- `dataframe`: A dataframe that contains the person variable.
- `person.var`: The person variable to be stretched.
- `sep`: The separator(s) to search for and break on. Default is: `c("and", ",", ";")`
- `track.reps`: logical. If `TRUE` leaves the row names of person variable cells that were repeated and stretched.

**Value**

Returns an expanded dataframe with person variable stretched and accompanying rows repeated.

**Examples**

```r
## Not run:
DATA$person <- as.character(DATA$person)
DATA$person[c(1, 4, 6)] <- c("greg, sally, & sam",
                        "greg, sally", "sam and sally")

speakerSplit(DATA)
speakerSplit(DATA, track.reps=TRUE)

DATA$person[c(1, 4, 6)] <- c("greg_sally_sam",
                        "greg.sally", "sam; sally")

speakerSplit(DATA, sep = c(".", ",", ";");)

DATA <- qdap::DATA #reset DATA

## End(Not run)
```
stemmer

Description

stemmer - Stems a vector of text strings (A wrapper for the \texttt{tm} package's \texttt{stemDocument}.

stem_words - Wrapper for stemmer that stems a vector of words.

stem2df - Wrapper for stemmer that stems a vector of text strings and returns a dataframe with the vector added.

Usage

stemmer(text.var, rm.bracket = TRUE, capitalize = TRUE, warn = TRUE, char.keep = "~", ...)

stem_words(...)  

stem2df(dataframe, text.var, stem.name = NULL, ...)

Arguments

text.var The text variable. In \texttt{stemmer} this is a vector text string. For \texttt{stem2df} this is a character vector of length one naming the text column.

rm.bracket logical. If TRUE brackets are removed from the text.

capitalize logical. If TRUE selected terms are capitalized.

warn logical. If TRUE warns about rows not ending with standard qdap punctuation endmarks.

char.keep A character vector of symbols that should be kept within sentences.

... Various:

stemmer - \textit{Other arguments passed to capitalizer}

stem_words - \textit{Words or terms}.

stem2df - \textit{Other arguments passed to stemmer}

dataframe A dataframe object.

stem.name A character vector of length one for the stemmed column. If NULL defaults to "stem.text".

Value

stemmer - returns a character vector with stemmed text.

stem_words - returns a vector of individually stemmed words.

stem2df - returns a dataframe with a character vector with stemmed text.

See Also

capitalizer
Examples

```r
## Not run:
#stemmer EXAMPLE:
stemmer(DATA$state)
out1 <- stemmer(raj$dialogue)
htruncdf(out1, 20, 60)

#stem_words EXAMPLE:
stem_words(doggies, jumping, swims)

#stem2df EXAMPLE:
out2 <- stem2df(DATA, "state", "new")
truncdf(out2, 30)

## End(Not run)
```

---

**Description**

Strip text of unwanted characters.

**Usage**

```r
strip(x, char.keep = "~", digit.remove = TRUE,
apostrophe.remove = TRUE, lower.case = TRUE)

## S3 method for class 'character'
strip(x, char.keep = "~", digit.remove = TRUE,
apostrophe.remove = TRUE, lower.case = TRUE)

## S3 method for class 'factor'
strip(x, char.keep = "~", digit.remove = TRUE,
apostrophe.remove = TRUE, lower.case = TRUE)

## Default S3 method:
strip(x, char.keep = "~", digit.remove = TRUE,
apostrophe.remove = TRUE, lower.case = TRUE)

## S3 method for class 'list'
strip(x, char.keep = "~", digit.remove = TRUE,
apostrophe.remove = TRUE, lower.case = TRUE)
```

**Arguments**

- **x**: The text variable.
char.keep

A character vector of symbols (i.e., punctuation) that strip should keep. The default is to strip every symbol except apostrophes and a double tilde "~~". The double tilde "~~" is included for a convenient means of keeping word groups together in functions that split text apart based on spaces. To remove double tildes "~~" set char.keep to NULL.

digit.remove

logical. If TRUE strips digits from the text.

apostrophe.remove

logical. If TRUE removes apostrophes from the output.

lower.case

logical. If TRUE forces all alpha characters to lower case.

Value

Returns a vector of text that has been stripped of unwanted characters.

See Also

rm_stopwords

Examples

## Not run:
data(state) #no strip applied
strip(data(state))
strip(data(state, apostrophe.remove=FALSE))
strip(data(state, char.keep = c("?", "."))

## End(Not run)

---

strWrap

Wrap Character Strings to Format Paragraphs

Description

A wrapper for as.character that writes to the Mac/Windows clipboard.

Usage

strWrap(text = "clipboard", width = 70, copy2clip = interactive())

Arguments

text         character vector, or an object which can be converted to a character vector by as.character.

width        A positive integer giving the target column for wrapping lines in the output.

copy2clip   logical. If TRUE attempts to copy the output to the clipboard.
Value
Prints a wrapped text vector to the console and copies the wrapped text to the clipboard on a Mac or Windows machine.

See Also
strwrap

Examples
```r
## Not run:
x <- paste2(DATA$state, sep = " ")
strWrap(x)
strWrap(x, 10)
# should be copied to the clipboard on a Mac or Windows machine.

## End(Not run)
```

subject_pronoun_type  Count Subject Pronouns Per Grouping Variable

Description
Count the number of subject pronouns per grouping variables.

Usage

```r
subject_pronoun_type(text.var, grouping.var = NULL,
subject.pronoun.list = NULL, ...)
```

Arguments
- `text.var` The text variable
- `grouping.var` The grouping variables. Default `NULL` generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.
- `subject.pronoun.list` A named list of subject pronouns. See Details for more.
- `...` Other arguments passed to termco

Details
The following subject pronoun categories are the default searched terms:

- I - c(" i'd ", " i'll ", " i'm ", " i've ", " i ")
- we - c(" we'd ", " we'll ", " we're ", " we've ", " we ")
- you - c(" you'd ", " you'll ", " you're ", " you've ", " you ", " your ")
subject_pronoun_type

- he - c(" he’d ", " he’ll ", " he’s ", " he ")
- she - c(" she’d ", " she’ll ", " she’s ", " she ")
- it - c(" it’d ", " it’ll ", " it’s ", " it ")
- they - c(" they’d ", " they’ll ", " they’re ", " they’ve ", " they ")

Value

Returns a list, of class "subject_pronoun_type", of data frames regarding subject pronoun word counts:

preprocessed List of uncollapsed dataframes (raw, prop, rnp) of the class "termco" that contain all searchable subject pronouns.

raw raw word counts by grouping variable

prop proportional word counts by grouping variable; proportional to each individual’s subject pronoun use

rnp a character combination data frame of raw and proportional subject pronoun use

```
summary.cmspans  Summarize a cmspans object

Description

Summarize a cmspans object

Usage

## S3 method for class 'cmspans'
summary(object, grouping.var = NULL, rm.var = NULL,
         total.span = TRUE, aggregate = FALSE, percent = TRUE, digits = 2,
         ...)

Arguments

object The cmspans object

grouping.var The grouping variables. Also takes a single grouping variable or a list of 1 or
more grouping variables.

rm.var An optional single vector or list of 1 or 2 of repeated measures to aggregate by.

total.span logical or an option list of vectors (length 1 or 2) of the total duration of the
event. If FALSE the "total" column is divided by the sum of the total duration for
all codes in that rm.var to arrive at "total_percent". If TRUE and object is from
cm_time2long the difference for the time span from the transcript_time_span
of the list used in cm_time2long are utilized to divide the "total" column. The
user may also provide a list of vectors with each vector representing a single
total time duration or provide the start and end time of the event. The user may
give input in numeric seconds or in character "hh:mm:ss" form.

aggregate logical. If TRUE the output will be aggregated (i.e., the output will collapse the
rm.var).

percent logical. If TRUE output given as percent. If FALSE the output is proportion.

digits Integer; number of decimal places to round when printing.

... Other argument passed to qheat in plot (ignored in summary).

See Also

plot.sum_cmspans

Examples

## Not run:
## Example 1
foo <- list(
  persongreg = qcv(terms='7:11, 20:24, 30:33, 49:56'),

Summary of a `wfdf` object

**Description**

Summarize a `wfdf` object with familiar `tm` package look.

**Usage**

```r
## S3 method for class 'wfdf'
summary(object, ...)
```

**Arguments**

- `object` The `wfdf` object
- `...` Ignored.

**Details**

- **Non-/sparse entries** is the ratio of non-zeros to zero counts. **Sparsity** is that ratio represented as a percent. **Hapax legomenon** is the number(percent) of terms that appear only once in the dialogue. **Dis legomenon** is the number(percent) of terms that appear exactly two times once.

**Examples**

```r
## Not run:
x <- with(DATA, wfdf(state, list(sex, adult)))
summary(x)

## End(Not run)
```

Summary of a `wfm` object

**Description**

Summarize a `wfm` object with familiar `tm` package look.

**Usage**

```r
## S3 method for class 'wfm'
summary(object, ...)
```

**Arguments**

- `object` The `wfm` object
- `...` Ignored.
**Details**

Non-/sparse entries is the ratio of non-zeros to zero counts. **Sparsity** is that ratio represented as a percent. **Hapax legomenon** is the number(percent) of terms that appear only once in the dialogue. **Dis legomenon** is the number(percent) of terms that appear exactly two times once.

**Examples**

```r
## Not run:
x <- with(DATA, wfm(state, list(sex, adult)))
summary(x)

## End(Not run)
```

### syllable_sum

**Syllabication**

- Count the number of syllables per row of text.
- Count the number of syllables in a single text string.
- Count the number of polysyllables per row of text.
- Count the number of both syllables and polysyllables per row of text.

### Usage

```r
syllable_sum(text.var, parallel = FALSE, ...)
syllable_count(text, remove.bracketed = TRUE, algorithm.report = FALSE,
  env = qdap::env.syl)
polyssylable_sum(text.var, parallel = FALSE)
combo_syllable_sum(text.var, parallel = FALSE)
```

### Arguments

- **text.var**
  - The text variable
- **parallel**
  - logical. If TRUE attempts to run the function on multiple cores. Note that this may not mean a speed boost if you have one core or if the data set is smaller as the cluster takes time to create.
- **text**
  - A single character vector of text.
- **remove.bracketed**
  - logical. If TRUE brackets are removed from the analysis.
- **algorithm.report**
  - logical. If TRUE generates a report of words not found in the dictionary (i.e., syllables were calculated with an algorithm).
env A lookup environment to lookup the number of syllables in found words.
... Other arguments passed to syllable_count.

Details

The worker function of all the syllable functions is syllable_count, though it is not intended for direct use on a transcript. This function relies on a combined dictionary lookup (based on the Nettalk Corpus (Sejnowski & Rosenberg, 1987)) and backup algorithm method.

Value

syllable_sum - returns a vector of syllable counts per row.
syllable_count - returns a dataframe of syllable counts and algorithm/dictionary uses and, optionally, a report of words not found in the dictionary.
polysyllable_sum - returns a vector of polysyllable counts per row.
combo_syllable_sum - returns a dataframe of syllable and polysyllable counts per row.

References

Examples

```r
## Not run:
syllable_count("Robots like Dason lie.")
syllable_count("Robots like Dason lie.", algorithm.report = TRUE)

syllable_sum(DATA$state)
x1 <- syllable_sum(rajSPLIT$dialogue)
plot(x1)
cumulative(x1)

polysyllable_sum(DATA$state)
x2 <- polysyllable_sum(rajSPLIT$dialogue)
plot(x2)
cumulative(x2)

combo_syllable_sum(DATA$state)
x3 <- combo_syllable_sum(rajSPLIT$dialogue)
plot(x3)
cumulative(x3)
```

## End(Not run)
**synonyms**

**Search For Synonyms**

**Description**

`synonyms` - Search for synonyms that match term(s).

`synonyms_frame` - Generate a synonym lookup hash key for use with the `synonym.frame` argument in the `synonym` function.

**Usage**

```r
synonyms(terms, return.list = TRUE, multiwords = TRUE,
          report.null = TRUE, synonym.frame = qdapDictionaries::key.syn)

syn(terms, return.list = TRUE, multiwords = TRUE, report.null = TRUE,
   synonym.frame = qdapDictionaries::key.syn)

synonyms_frame(synonym.list, prior.frame)

syn.frame(synonym.list, prior.frame)
```

**Arguments**

- **terms**
  - The terms to find synonyms for.

- **return.list**
  - logical. If TRUE returns the output for multiple synonyms as a list by search term rather than a vector.

- **multiwords**
  - logical. If TRUE retains vector elements that contain phrases (defined as having one or more spaces) rather than a single word.

- **report.null**
  - logical. If TRUE reports the words that no match was found at the head of the output.

- **synonym.frame**
  - A dataframe or hash key of positive/negative words and weights.

- **synonym.list**
  - A named list of lists (or vectors) of synonyms.

- **prior.frame**
  - A prior synonyms data.frame in the format produced by `synonyms_frame`.

**Value**

Returns a list of vectors or vector of possible words that match term(s).

**References**

The synonyms dictionary (see `key.syn`) was generated by web scraping the Reverso Online Dictionary. The word list fed to Reverso is the unique words from the combination of DICTIONARY and labMT.
Examples

```r
## Not run:
synonyms(c("the", "cat", "job", "environment", "read", "teach"))
head(syn(c("the", "cat", "job", "environment", "read", "teach"),
       return.list = FALSE), 30)
syn(c("the", "cat", "job", "environment", "read", "teach"), multiwords = FALSE)

## User defined synonym lookup
syn_dat <- list(
   like = list(c("want", "desire"), c("love", "care")),
   show = list(c("reveal"), c("movie", "opera")),
   R = c("old friend", "statistics language")
)
synonyms_frame(syn_dat)
syn(c("R", "show"), synonym.frame = syn_frame(syn_dat))

syns.hash <- syn_frame(syn_dat, prior.frame = qdapDictionaries::key.syn)
syn(c("R", "show", "like", "robot"), synonym.frame = syns.hash)

## End(Not run)
```

---

t.DocumentTermMatrix Transposes a DocumentTermMatrix object

**Description**

Transposes a DocumentTermMatrix object

**Usage**

```r
## S3 method for class 'DocumentTermMatrix'
t(x, 
```

**Arguments**

- `x` The DocumentTermMatrix object
- `...` ignored
t.TermDocumentMatrix

Transposes a TermDocumentMatrix object

Description
Transposes a TermDocumentMatrix object

Usage
```r
## S3 method for class 'TermDocumentMatrix'
t(x, ...)
```

Arguments
- `x` The TermDocumentMatrix object
- `...` ignored

termco

Search For and Count Terms

Description
termco - Search a transcript by any number of grouping variables for categories (themes) of grouped root terms. While there are other termco functions in the termco family (e.g., `termco_d`) `termco` is a more powerful and flexible wrapper intended for general use.

`termco_d` - Search a transcript by any number of grouping variables for root terms.

`term_match` - Search a transcript for words that exactly match term(s).

`termco2mat` - Convert a termco dataframe to a matrix for use with visualization functions (e.g., `heatmap.2`).

Usage
```r
termco(text.var, grouping.var = NULL, match.list, short.term = TRUE,
         ignore.case = TRUE, elim.old = TRUE, percent = TRUE, digits = 2,
         apostrophe.remove = FALSE, char.keep = NULL, digit.remove = NULL,
         zero.replace = 0, ...)

termco_d(text.var, grouping.var = NULL, match.string,
         short.term = FALSE, ignore.case = TRUE, zero.replace = 0,
         percent = TRUE, digits = 2, apostrophe.remove = FALSE,
         char.keep = NULL, digit.remove = TRUE, ...)

term_match(text.var, terms, return.list = TRUE,
            apostrophe.remove = FALSE)
```
termco2mat(dataframe, drop.wc = TRUE, short.term = TRUE, 
            rm.zerocol = FALSE, no.quote = TRUE, transform = TRUE, 
            trim/terms = TRUE)

Arguments

text.var The text variable.
grouping.var The grouping variables. Default NULL generates one word list for all text. Also 
takes a single grouping variable or a list of 1 or more grouping variables.
mismatch A list of named character vectors.
short.term logical. If TRUE column names are trimmed versions of the match list, otherwise 
the terms are wrapped with ‘term(phrase)’
ignore.case logical. If TRUE case is ignored.
elim.old logical. If TRUE eliminates the columns that are combined together by the named 
match.list.
percent logical. If TRUE output given as percent. If FALSE the output is proportion.
digits Integer; number of decimal places to round when printing.
apostrophe.remove logical. If TRUE removes apostrophes from the text before examining.
char.keep A character vector of symbol character (i.e., punctuation) that strip should keep. 
The default is to strip everything except apostrophes. termco attempts to auto 
detect characters to keep based on the elements in match.list.
digit.remove logical. If TRUE strips digits from the text before counting. termco attempts to 
auto detect if digits should be retained based on the elements in match.list.
zero.replace Value to replace 0 values with.
mismatch.string A vector of terms to search for. When using inside of term_match the term(s) 
must be words or partial words but do not have to be when using termco d (i.e., 
they can be phrases, symbols etc.).
terms The terms to search for in the text.var. Similar to mismatch.list but these terms 
must be words or partial words rather than multiple words and symbols.
return.list logical. If TRUE returns the output for multiple terms as a list by term rather than 
a vector.
dataframe A termco (or termco_d) dataframe or object.
drop.wc logical. If TRUE the word count column will be dropped.
rm.zerocol logical. If TRUE any column containing all zeros will be removed from the ma-

no.quote logical. If TRUE the matrix will be printed without quotes if it’s character.
transform logical. If TRUE the matrix will be transformed.
trim/terms logical. If TRUE trims the column header/names to ensure there is not a problem 
with spacing when using in other R functions.

Other argument supplied to strip.
Value

`termco` & `termco_d` - both return a list, of class "termco", of data frames and information regarding word counts:

- **raw**: raw word counts by grouping variable
- **prop**: proportional word counts by grouping variable; proportional to each individual's word use
- **rnp**: a character combination data frame of raw and proportional
- **zero_replace**: value to replace zeros with; mostly internal use
- **percent**: The value of percent used for plotting purposes.
- **digits**: integer value of number of digits to display; mostly internal use

`term_match` - returns a list or vector of possible words that match term(s).

`termco2mat` - returns a matrix of term counts.

Warning

Percentages are calculated as a ratio of counts of `matchNlist` elements to word counts. Word counts do not contain symbols or digits. Using symbols, digits or small segments of full words (e.g., "to") could total more than 100%.

Note

The `match.list`/`match.string` is (optionally) case and character sensitive. Spacing is an important way to grab specific words and requires careful thought. Using "read" will find the words "bread", "read", "reading", and "ready". If you want to search for just the word "read" you'd supply a vector of `c(" read ", " reads", " reading", " reader")`. To search for non character arguments (i.e., numbers and symbols) additional arguments from `strip` must be passed.

Combining columns from a termco object:

```r
library(termco)

# Assuming we have a termco object named `dialogue`
# and a list of discourse markers:
markers <- list(response_cries = c("oh", "ah", "aha", "ouch", "yuk"),
                 back_channels = c("uh-huh", "uhuh", "yeah"),
                 summons = "hey",
                 justification = "because")

# Plotting markers
plot(markers, high="red")

# Combining markers with other columns
with(dialogue, termco(list(person, time, dialogues_markers, elim.old = FALSE))
)
```

This code snippet demonstrates combining columns from a `termco` object with discourse markers to analyze and visualize the data.
Description

Combines the columns of a termco object. Generally intended for internal use but documented for completeness.

Usage

termco_c(termco.object, combined.columns, new.name, short.term = TRUE, zero.replace = NULL, elim.old = TRUE, percent = NULL, digits = 2)

Arguments

termco.object An object generated by either termco, termco_d or termco_c.
combined.columns The names/indexes of the columns to be combined.
new.name A character vector of length one to name the new combined column.
short.term logical. If TRUE column names are trimmed versions of the match list, otherwise the terms are wrapped with 'term(phrase)'
zeero.replace Value to replace zeros with.
elim.old logical. If TRUE eliminates the columns that are combined together by the named match.list.
percent logical. If TRUE output given as percent. If FALSE the output is proportion.
digits Integer; number of decimal places to round when printing.

Value

Returns a return a list, of class "termco", of data frames and information regarding word counts:

raw raw word counts by grouping variable
prop proportional word counts by grouping variable; proportional to each individual’s word use
rnp a character combination data frame of raw and proportional
zero_replace value to replace zeros with; mostly internal use
percent The value of percent used for plotting purposes.
digits integer value od number of digits to display; mostly internal use

See Also

termco
Add Title to Select qdap Plots

**Description**

Add title to select qdap objects that store a plot.

**Usage**

`title(object)`

`Title(object) <- value`

**Arguments**

- `object`: A select qdap object that stores a plot.
- `value`: The value to assign to title.

Visualize Word Length by Turn of Talk

**Description**

Uses a bar graph to visualize patterns in sentence length and grouping variables by turn of talk.

**Usage**

`tot_plot(dataframe, text.var, grouping.var = NULL, facet.vars = NULL, tot = TRUE, transform = FALSE, ncol = NULL, ylab = NULL, xlab = NULL, bar.space = 0, scale = NULL, space = NULL, plot = TRUE)`

**Arguments**

- `dataframe`: A dataframe that contains the text variable and optionally the grouping.var and tot variables.
- `text.var`: The text variable (character string).
- `grouping.var`: The grouping variables to color by. Default NULL colors everything in "black". Also takes a single grouping variable or a list of 1 or more grouping variables.
- `facet.vars`: An optional single vector or list of 1 or 2 to facet by.
- `tot`: The turn of talk variable (character string). May be TRUE (assumes "tot" is the variable name), FALSE (use row numbers), or a character string of the turn of talk column.
transform logical. If TRUE the repeated facets will be transformed from stacked to side by side.

ncol number of columns. gantt_wrap uses facet_wrap rather than facet_grid.

ylab Optional y label.

tot_plot {dataframe: BstateB, tot_plot: TRUE, bar.space = .03)

<tr>
<td>stopwords</td>
<td>Words to exclude from the cloud.</td>
</tr>
<tr>
<td>min.freq</td>
<td>An integer value indicating the minimum frequency a word must appear to be included.</td>
</tr>
<tr>
<td>caps</td>
<td>logical. If TRUE selected words will be capitalized.</td>
</tr>
<tr>
<td>caps.list</td>
<td>A vector of words to capitalize (caps must be TRUE).</td>
</tr>
<tr>
<td>random.order</td>
<td>Plot words in random order. If false, they will be plotted in decreasing frequency.</td>
</tr>
</tbody>
</table>
**trans_cloud**

- **rot.per** Proportion words with 90 degree rotation.
- **cloud.colors** A vector of colors equal to the length of target words +1.
- **title** logical. If TRUE adds a title corresponding to the grouping.var.
- **cloud.font** The font family of the cloud text.
- **title.font** The font family of the cloud title.
- **title.color** A character vector of length one corresponding to the color of the title.
- **title.padj** Adjustment for the title. For strings parallel to the axes, padj = 0 means right or top alignment, and padj = 1 means left or bottom alignment.
- **title.location** On which side of the plot (1=bottom, 2=left, 3=top, 4=right).
- **title.cex** Character expansion factor for the title. NULL and NA are equivalent to 1.0.
- **title.names** Optional vector of title names equal in length to the grouping.var that will override the default use of the grouping.var names.
- **proportional** logical. If TRUE scales the word clouds across grouping.var to allow cloud to cloud comparisons.
- **max.word.size** A size argument to control the minimum size of the words.
- **min.word.size** A size argument to control the maximum size of the words.
- **legend** A character vector of names corresponding to the number of vectors in target.words.
- **legend.cex** Character expansion factor for the legend. NULL and NA are equivalent to 1.0.
- **legend.location** The x and y co-ordinates to be used to position the legend.
- **char.keep** A character vector of symbol character (i.e., punctuation) that strip should keep. The default is to strip everything except apostrophes. This enables the use of special characters to be turned into spaces or for characters to be retained.
- **char2space** A vector of characters to be turned into spaces. If char.keep is NULL, char2space will activate this argument.

**Value**

Returns a series of word cloud plots with target words (themes) colored.

**See Also**

wordcloud, gradient_cloud

**Examples**

```r
## Not run:
terms <- list(
  I=c("i", "i'm"),
  mal=qcv(stinks, dumb, distrust),
  articles=qcv(the, a, an),
  pronoun=qcv(we, you)
)
```
trans_context

Print Context Around Indices

Description

Print (or save to an external file) n text elements before and after indices.

Usage

trans_context(text.var, grouping.var, inds, n.before = 3, tot = TRUE, n.after = n.before, ord.ind = TRUE)
trans_context

Arguments

- **text.var**: The text variable.
- **grouping.var**: The grouping variables. Also takes a single grouping variable or a list of 1 or more grouping variables.
- **inds**: A list of integer indices to print context for.
- **n.before**: The number of rows before the indexed occurrence.
- **tot**: logical. If TRUE condenses sub-units (e.g., sentences) into turns of talk for that grouping.var.
- **n.after**: The number of rows after the indexed occurrence.
- **ord.inds**: logical. If TRUE inds is ordered least to greatest.

Value

Returns a dataframe of the class "qdap_context" that can be printed (i.e., saved) in flexible outputs. The dataframe can be printed as a dataframe style or pretty text output. The resulting file contains n rows before and after each index of a vector of indices.

See Also

boolean_search, question_type, end_mark

Examples

```
# Not run:
(x <- with(DATA, trans_context(state, person, inds=c(1, 4, 7, 11))))
print(x, pretty=FALSE)
print(x, double_space = FALSE)
print(x, file="foo.xlsx")
print(x, file="foo.csv")
print(x, file="foo.txt")
print(x, file="foo.txt", pretty = FALSE)
print(x, file="foo.doc")

# With 'end_mark'
inds1 <- which(end_mark(DATA.SPLIT[, "state"]) == "?")
with(DATA.SPLIT, trans_context(state, person, inds=inds1))
with(DATA.SPLIT, trans_context(state, person, n.before = 0, inds=inds1))

# With 'boolean_search'
inds2 <- boolean_search(DATA.SPLIT$state, " I &."
with(DATA.SPLIT, trans_context(state, person, inds=inds2))

inds3 <- boolean_search(DATA$state, " I ||.")
with(DATA.SPLIT, trans_context(state, person, inds=inds3))
with(DATA.SPLIT, trans_context(state, list(person, sex), inds=inds3))
with(DATA.SPLIT, trans_context(state, list(sex, adult), inds=inds3))

inds4 <- boolean_search(raj$dialogue, paste(paste(negation.words, collapse = " || ")))
trans_context(raj$dialogue, raj$person, inds4)
```
### trans_venn

Venn Diagram by Grouping Variable

**Description**

Produce a Venn diagram by grouping variable.

**Usage**

trans_venn(text.var, grouping.var, stopwords = NULL, 
rm.duplicates = TRUE, title = TRUE, title.font = NULL, 
title.color = "black", title.cex = NULL, title.name = NULL, 
legend = TRUE, legend.cex = 0.8, legend.location = "bottomleft", 
legend.text.col = "black", legend.horiz = FALSE, ...)

**Arguments**

- **text.var**
  - The text variable.

- **grouping.var**
  - The grouping variables. Default NULL generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.

- **stopwords**
  - Words to exclude from the analysis.

- **rm.duplicates**
  - logical. If TRUE removes the duplicated words from the analysis (only single usage is considered).

- **title**
  - logical. IF TRUE adds a title corresponding to the grouping.var.

- **title.font**
  - The font family of the cloud title.

- **title.color**
  - A character vector of length one corresponding to the color of the title.

- **title.cex**
  - Character expansion factor for the title. NULL and NA are equivalent to 1.0

- **title.name**
  - A title for the plot.

- **legend**
  - logical. If TRUE uses the names from the target.words list corresponding to cloud.colors.
legend.cex  Character expansion factor for the legend. NULL and NA are equivalent to 1.0.
legend.location The x and y co-ordinates to be used to position the legend. The location may also be specified by setting x to a single keyword from the list "bottomright", "bottom", "bottomleft", "left", "topleft", "top", "topright", "right" and "center". This places the legend on the inside of the plot frame at the given location.
legend.text.col The color used for the legend text.
legend.horiz   logical; if TRUE, set the legend horizontally rather than vertically.
... Other arguments passed to plot.

Value

Returns a Venn plot by grouping variable(s).

Warning

The algorithm used to overlap the Venn circles becomes increasingly overburdened and less accurate with increased grouping variables. An alternative is to use a network plot with `Dissimilarity` measures labeling the edges between nodes (grouping variables) or a heat map (`qheat`).

See Also

`venneuler`

Examples

```r
## Not run:
with(DATA, trans_venn(state, person, legend.location = "topright"))
# the plot below will take a considerable amount of time to plot
with(raj.act.1, trans_venn(dialogue, person, legend.location = "topleft"))

## End(Not run)
```

Trim  

Remove Leading/Trailing White Space

Description

Remove leading/trailing white space.

Usage

Trim(x)
Arguments

x  The text variable.

Value

Returns a vector with the leading/trailing white spaces removed.

Examples

```r
## Not run:
(x <- c("talkstats.com ", " really? ", " yeah"))
trim(x)

## End(Not run)
```

---

type_token_ratio  

**Type-Token Ratio**

Description

Calculate type-token ratio by grouping variable.

Usage

```r
type_token_ratio(text.var, grouping.var = NULL, n.words = 1000, ...)
```

Arguments

- `text.var`: The text variable
- `grouping.var`: The grouping variables. Default NULL generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.
- `n.words`: An integer specifying the number of words in each chunk.
- `...`: ignored.

Value

Returns a list of class `type_text_ratio`. This object contains a type-token ratio for the overall text and a data frame type-token ratios per grouping variable.

References

Examples

```r
with(raj, type_token_ratio(dialogue, person))
plot(with(raj, type_token_ratio(dialogue, person)))
```
**unique_by**

*Find Unique Words by Grouping Variable*

**Description**
Find unique words used by grouping variable.

**Usage**

```
unique_by(text.var, grouping.var)
```

**Arguments**

- `text.var`: The text variable
- `grouping.var`: The grouping variables. Default NULL generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.

**Value**
Returns a list of unique words by grouping variable.

**Examples**
```
## Not run:
dat <- pres_debates2012[pres_debates2012$time == "time 3", ]
with(dat, unique_by(dialogue, person))
with(pres_debates2012, unique_by(dialogue, list(time, person)))
with(DATA, unique_by(state, person))
## End(Not run)
```

---

**vertex_apply**

*Apply Parameter to List of Igraph Vertices/Edges*

**Description**
vertex_apply - Uniformly apply igraph vertex plotting parameters to a list of igraph objects.
edge_apply - Uniformly apply igraph edge plotting parameters to a list of igraph objects.

**Usage**

```
vertex_apply(x, ..., hold.ends = NULL)
```

```
edge_apply(x, ..., hold.ends = c("label.color"))
```
Arguments

x A list of igraph objects.
hold.ends A vector of parameters passed to ... that should not be altered for the first and last (ends) objects in the list.

... Arguments passed igraph's V and E. See Drawing Graphs for more.

Value

Returns a list of igraph objects.

Examples

## Not run:
x <- with(DATA.SPLIT, polarity(state, person))
bg_black <- Animate(x, neutral="white")
print(bg_black)

bgb <- vertex_apply(bg_black, label="grey80", size=20, color="grey40")
bgb <- edge_apply(bgb, label.color="yellow")
print(bgb, bg="black", pause=.75)

## End(Not run)

---

visualGeneric visual Method

Description

Access the visual-graph-plot object from select qdap outputs.

Usage

visual(x, ...)

Arguments

x A qdap object (list) with a visual-graph-plot object (e.g., discourse_map).

... Arguments passed to visual method of other classes.

Value

Returns a plot object.

See Also

scores, counts, preprocessed, proportions
visual.discourse_map  Discourse Map

Description
visual.discourse_map - View visual from discourse_map.

Usage
## S3 method for class 'discourse_map'
visual(x, ...)

Arguments
x  The discourse_map object.
... ignored

Details
discourse_map Method for visual

weight  Weight a qdap Object

Description
Weight a word_proximity object.

Usage
weight(x, type = "scale", ...)

Arguments
x  A qdap object with a weight method.
type  A weighting type of: c("scale_log", "scale", "rev_scale", "rev_scale_log", "log", "sqrt", "scale_sqrt", "rev_sqrt", "rev_scale_sqrt"). The weight type section name (i.e. A_B_C where A, B, and C are sections) determines what action will occur. log will use log, sqrt will use sqrt, scale will standardize the values. rev will multiply by -1 to give the inverse sign. This enables a comparison similar to correlations rather than distance.
... ignored.

Value
Returns a weighted list of matrices.
**Note**

A constant of .000000000001 is added to each element when log is used to deal with the problem of \( \log(0) \).

---

### Description

**wfm** - Generate a word frequency matrix by grouping variable(s).

**wfdf** - Generate a word frequency data frame by grouping variable.

**wfm_expanded** - Expand a word frequency matrix to have multiple rows for each word.

**wfm_combine** - Combines words (rows) of a word frequency matrix (wfdf) together.

**weight** - Weight a word frequency matrix for analysis where such weighting is sensible.

**weight.wfdf** - Weight a word frequency matrix for analysis where such weighting is sensible.

**as.wfm** - Attempts to coerce a matrix to a **wfm**.

### Usage

```r
wfm(text.var = NULL, grouping.var = NULL, output = "raw",
     stopwords = NULL, char2space = "~~", ...)  

## S3 method for class 'wfdf'
wfm(text.var = NULL, grouping.var = NULL,
     output = "raw", stopwords = NULL, char2space = "~~", ...)

## S3 method for class 'character'
wfm(text.var = NULL, grouping.var = NULL,
     output = "raw", stopwords = NULL, char2space = "~~", ...)

## S3 method for class 'factor'
wfm(text.var = NULL, grouping.var = NULL,
     output = "raw", stopwords = NULL, char2space = "~~", ...)

wfdf(text.var, grouping.var = NULL, stopwords = NULL,
      margins = FALSE, output = "raw", digits = 2, char2space = "~~", ...

wfm_expanded(text.var, grouping.var = NULL, ...)

wfm_combine(wf.obj, word.lists, matrix = TRUE)

## S3 method for class 'wfm'
weight(x, type = "prop", ...)
```
## S3 method for class 'wfm'
weight(x, type = "prop", ...)

as.wfm(x, ...)

## S3 method for class 'matrix'
as.wfm(x, ...)

## Default S3 method:
as.wfm(x, ...)

## S3 method for class 'TermDocumentMatrix'
as.wfm(x, ...)

## S3 method for class 'DocumentTermMatrix'
as.wfm(x, ...)

## S3 method for class 'data.frame'
as.wfm(x, ...)

## S3 method for class 'wfdf'
as.wfm(x, ...)

## S3 method for class 'Corpus'
as.wfm(x, col = "docs", row = "text", ...)

## S3 method for class 'Corpus'
wfm(text.var, ...)

### Arguments

text.var The text variable.
grouping.var The grouping variables. Default NULL generates one word list for all text. Also
takes a single grouping variable or a list of 1 or more grouping variables.
output Output type (either "proportion" or "percent").
stopwords A vector of stop words to remove.
char2space A vector of characters to be turned into spaces. If char.keep is NULL, char2space
will activate this argument.
margins logical. If TRUE provides grouping.var and word variable totals.
digits An integer indicating the number of decimal places (round) or significant digits
(signif) to be used. Negative values are allowed.
wf.obj A wfm or wfdf object.
word.lists A list of character vectors of words to pass to wfm_combine
matrix logical. If TRUE returns the output as a wfm rather than a wfdf object.
x An object with words for row names and integer values.
The type of weighting to use: c("prop", "max", "scaled"). All weight by column. "prop" uses a proportion weighting and all columns sum to 1. "max" weights in proportion to the max value; all values are integers and column sums may not be equal. "scaled" uses scale to scale with center = FALSE; output is not integer and column sums may not be equal.

col
The column name (generally not used).
row
The row name (generally not used).
...
Other arguments supplied to Corpus or TermDocumentMatrix. If as.wfm this is other arguments passed to as.wfm methods (currently ignored).

Value

wfm - returns a word frequency of the class matrix.
wdf - returns a word frequency of the class data.frame with a words column and optional margin sums.
wfm_expanded - returns a matrix similar to a word frequency matrix (wfm) but the rows are expanded to represent the maximum usages of the word and cells are dummy coded to indicate that number of uses.
wfm_combine - returns a word frequency matrix (wfm) or dataframe (wdf) with counts for the combined word.lists merged and remaining terms (else).
weight - Returns a weighted matrix for use with other R packages. The output is not of the class "wfm".
as.wfm - Returns a matrix of the class "wfm".

Note

Words can be kept as one by inserting a double tilde ("~~"), or other character strings passed to char2space, as a single word/entry. This is useful for keeping proper names as a single unit.

Examples

```r
## Not run:
## word frequency matrix (wfm) example:
with(DATA, wfm(state, list(sex, adult)))[1:15, ]
with(DATA, wfm(state, person))[1:15, ]
Filter(with(DATA, wfm(state, list(sex, adult))), 5)
with(DATA, wfm(state, list(sex, adult)))

## Filter particular words based on max/min values in wfm
v <- with(DATA, wfm(state, list(sex, adult)))
Filter(v, 5)
Filter(v, 5, count.apostrophe = FALSE)
Filter(v, 5, 7)
Filter(v, 4, 4)
Filter(v, 3, 4)
Filter(v, 3, 4, stopwords = Top25Words)

## insert double tilde ("~~") to keep phrases(i.e., first last name)
```
```r

alt <- c("fun", "I ")
state2 <- space_fill(DATA$state, alts, rm.extra = FALSE)
with(DATA, wfm(state2, list(sex, adult)))[1:18,]

## word frequency dataframe (wdf) example:
with(DATA, wdf(state, list(sex, adult)))[1:15,]
with(DATA, wdf(state, person))[1:15,]

## wfm_expanded example:
z <- wfm(DATA$state, DATA$person)
wfm_expanded(z)[30:45,] #two "you"s

## wf_combine examples:
========================
## raw no margins (will work)
x <- wfm(DATA$state, DATA$person)

## raw with margin (will work)
y <- wdf(DATA$state, DATA$person, margins = TRUE)

## Proportion matrix
z2 <- wfm(DATA$state, DATA$person, output="proportion")

WL1 <- c(y[1], 1)
WL2 <- list(c("read", "the", "a"), c("you", "your", "you're"))
WL3 <- list(bob = c("read", "the", "a"), yours = c("you", "your", "you're"))
WL4 <- list(bob = c("read", "the", "a"), yours = c("a", "you", "your", "you're"))
WL5 <- list(yours = c("you", "your", "you're"))
WL6 <- list(c("you", "your", "you're")) #no name so will be called words 1
WL7 <- c("you", "your", "you're")

wfm_combine(z2, WL2) #Won't work not a raw frequency matrix
wfm_combine(x, WL2) #Works (raw and no margins)
wfm_combine(y, WL2) #Works (raw with margins)
wfm_combine(y, c("you", "your", "you're"))
wfm_combine(y, WL1)
wfm_combine(y, WL3)

## wfm_combine(y, WL4) #Error
wfm_combine(y, WL5)
wfm_combine(y, WL6)
wfm_combine(y, WL7)

wordl <- c("you", "it", "it's", "no", "not", "we")
y <- wdf(DATA$state, list(DATA$sex, DATA$adult), margins = TRUE)
z <- wfm_combine(y, wordl)

chisq.test(z)
chisq.test(wfm(y))

## Dendrogram
presdeb <- with(pres_debates2012, wfm(dialogue, list(person, time)))
library(sjPlot)
sjc.dend(t(presdeb), 2:4)
```
## Words correlated within turns of talk

### EXAMPLE 1
```r
library(reports)
x <- factor(with(rajsplit, paste(act, pad(TOT(tot)), sep = "|")))
dat <- wfm(rajsplit$dialogue, x)
cor(t(dat)[, c("romeo", "juliet")])
cor(t(dat)[, c("romeo", "banished")])
cor(t(dat)[, c("romeo", "juliet", "hate", "love")])
qheat(cor(t(dat)[, c("romeo", "juliet", "hate", "love")]),
     diag_na = TRUE, values = TRUE, digits = 3, by.column = NULL)
dat2 <- wfm(DATA$state, id(DATA))
qheat(cor(t(dat2)), low = "yellow", high = "red",
     grid = "grey90", diag_na = TRUE, by.column = NULL)
```

### EXAMPLE 2
```r
x2 <- factor(with(pres_debates2012, paste(time, pad(TOT(tot)), sep = "|")))
dat2 <- wfm(pres_debates2012$dialogue, x2)
wrds <- word_list(pres_debates2012$dialogue,
   stopwords = c("it's", "that's", Top200Words))
wrds2 <- tolower(sort(wrds$rfswl[[1]][[1]]))
qheat(word_cor(t(dat2), word = wrds2, r = NULL),
     diag_na = TRUE, values = TRUE, digits = 3, by.column = NULL,
     high="red", low="yellow", grid=TRUE)
```

### EXAMPLE 3
```r
library(gridExtra); library(ggplot2); library(grid)
dat3 <- lapply(qcv(Obama, Romney), function(x) {
   with(pres_debates2012, wfm(dialogue[person == x], x2[person == x]))
})
```

# Presidential debates by person
dat5 <- pres_debates2012
dat5 <- dat5[dat5$person %in% qcv(Romney, Obama),]
disp <- with(dat5, dispersion_plot(dialogue, wrds2, grouping.var = person,
                                   total.color = NULL, rm.vars=time))
cors <- lapply(dat3, function(m) {
   word_cor(t(m), word = wrds2, r = NULL)
})
plots <- lapply(cors, function(x) {
   qheat(x, diag_na = TRUE, values = TRUE, digits = 3, plot = FALSE,
         by.column = NULL, high="red", low="yellow", grid=FALSE)
})
plots <- lapply(1:2, function(i) {
   plots[[i]] + ggtitle(qcv(Obama, Romney)[[i]]) +
})
theme(axis.title.x = element_blank(),
       plot.margin = unit(rep(0, 4), "lines"))
}

grid.arrange(disp, arrangeGrob(plots[[1]], plots[[2]], ncol=1), ncol=2)

### With 'word_cor'
worlis <- list(
  pronouns = c("you", "it", "it's", "we", "i'm", "i"),
  negative = qcv(no, dumb, distrust, not, stinks),
  literacy = qcv(computer, talking, telling)
)
y <- wdf(DATASET$state, qdapTools::id(DATASET, prefix = TRUE))
z <- wfm_combine(y, worlis)

word_cor(t(z), word = names(worlis), r = NULL)

### Plotting method
plot(y, TRUE)
plot(z)

### Correspondence Analysis
library(ca)

dat <- pres_debates2012
dat <- dat[dat$person %in% qcv(ROMNEY, OBAMA), ]
speech <- stemmer(dat$dialogue)
mytable1 <- with(dat, wfm(speech, list(person, time), stopwords = Top25Words))

fit <- ca(mytable1)
summary(fit)
plot(fit)
plot3d.ca(fit, labels=1)

mytable2 <- with(dat, wfm(speech, list(person, time), stopwords = Top200Words))

fit2 <- ca(mytable2)
summary(fit2)
plot(fit2)
plot3d.ca(fit2, labels=1)

### Weight a wfm
WFM <- with(DATASET, wfm(state, list(sex, adult)))
plot(weight(WFM, "scaled"), TRUE)
weight(WFM, "prop")
weight(WFM, "max")
weight(WFM, "scaled")

### End(Not run)
**word_associate**

*Find Associated Words*

**Description**

Find words associated with a given word(s) or a phrase(s). Results can be output as a network graph and/or wordcloud.

**Usage**

```r
word_associate(text.var, grouping.var = NULL, match.string, 
    text.unit = "sentence", extra.terms = NULL, target.exclude = NULL, 
    stopwords = NULL, network.plot = FALSE, wordcloud = FALSE, 
    cloud.colors = c("black", "gray55"), title.color = "blue", 
    nw.label.cex = 0.8, title.padj = -4.5, nw.label.colors = NULL, 
    nw.layout = NULL, nw.edge.color = "gray90", 
    nw.label.proportional = TRUE, nw.title.padj = NULL, 
    nw.title.location = NULL, title.font = NULL, title.cex = NULL, 
    nw.edge.curved = TRUE, cloud.legend = NULL, cloud.legend.cex = 0.8, 
    cloud.legend.location = c(-0.03, 1.03), nw.legend = NULL, 
    nw.legend.cex = 0.8, nw.legend.location = c(-1.54, 1.41), 
    legend.override = FALSE, charRspace = "~", ...)
```

**Arguments**

- `text.var`: The text variable.
- `grouping.var`: The grouping variables. Default NULL generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.
- `match.string`: A list of vectors or vector of terms to associate in the text.
- `text.unit`: The text unit (either "sentence" or "tot". This argument determines what unit to find the match string words within. For example if "sentence" is chosen the function pulls all text for sentences the match string terms are found in.
- `extra.terms`: Other terms to color beyond the match string.
- `target.exclude`: A vector of words to exclude from the match.string.
- `stopwords`: Words to exclude from the analysis.
- `network.plot`: logical. If TRUE plots a network plot of the words.
- `wordcloud`: logical. If TRUE plots a wordcloud plot of the words.
- `cloud.colors`: A vector of colors equal to the length of match.string +1.
- `title.color`: A character vector of length one corresponding to the color of the title.
- `nw.label.cex`: The magnification to be used for network plot labels relative to the current setting of cex. Default is .8.
- `title.padj`: Adjustment for the title. For strings parallel to the axes, padj = 0 means right or top alignment, and padj = 1 means left or bottom alignment.
nw.label.colors A vector of colors equal to the length of match.string +1.
nw.layout layout types supported by igraph. See layout.
nw.edge.color A character vector of length one corresponding to the color of the plot edges.
nw.label.proportional logical. If TRUE scales the network plots across grouping.var to allow plot to plot comparisons.
nw.title.padj Adjustment for the network plot title. For strings parallel to the axes, padj = 0 means right or top alignment, and padj = 1 means left or bottom alignment.
nw.title.location On which side of the network plot (1=bottom, 2=left, 3=top, 4=right).
title.font The font family of the cloud title.
title.cex Character expansion factor for the title. NULL and NA are equivalent to 1.0.
nw.edge.curved logical. If TRUE edges will be curved rather than straight paths.
cloud.legend A character vector of names corresponding to the number of vectors in match.string. Both nw.legend and cloud.legend can be set separately; or one may be set and by default the other will assume those legend labels. If the user does not desire this behavior use the legend.override argument.
cloud.legend.cex Character expansion factor for the wordcloud legend. NULL and NA are equivalent to 1.0.
cloud.legend.location The x and y co-ordinates to be used to position the wordcloud legend. The location may also be specified by setting x to a single keyword from the list "bottomright", "bottom", "bottomleft", "left", "topleft", "top", "topright", "right" and "center". This places the legend on the inside of the plot frame at the given location.
nw.legend A character vector of names corresponding to the number of vectors in match.string. Both nw.legend and cloud.legend can be set separately; or one may be set and by default the other will assume those legend labels. If the user does not desire this behavior use the legend.override argument.
nw.legend.cex Character expansion factor for the network plot legend. NULL and NA are equivalent to 1.0.
nw.legend.location The x and y co-ordinates to be used to position the network plot legend. The location may also be specified by setting x to a single keyword from the list "bottomright", "bottom", "bottomleft", "left", "topleft", "top", "topright", "right" and "center". This places the legend on the inside of the plot frame at the given location.
legend.override By default if legend labels are supplied to either cloud.legend or nw.legend may be set and if the other remains NULL it will assume the supplied vector to the previous legend argument. If this behavior is not desired legend.override should be set to TRUE.
char2space Currently a road to nowhere. Eventually this will allow the retention of characters as is allowed in trans_cloud already.

... Other arguments supplied to trans_cloud.
Value

Returns a list:

- **word frequency matrices**: Word frequency matrices for each grouping variable.
- **dialogue**: A list of dataframes for each word list (each vector supplied to match.string) and a final dataframe of all combined text units that contain any match string.
- **match.terms**: A list of vectors of word lists (each vector supplied to match.string).

Optionally, returns a word cloud and/or a network plot of the text unit containing the match.string terms.

See Also

- `trans_cloud`, `word_network_plot`, `wordcloud`, `graph.adjacency`

Examples

```r
# Not run:
ms <- c(" I ", "you")
et <- c(" it", " tell", "tru")
out1 <- word_associate(DATA2$state, DATA2$person, match.string = ms,
  wordcloud = TRUE, proportional = TRUE,
  network.plot = TRUE, nw.label.proportional = TRUE, extra.terms = et,
  cloud.legend =c("A", "B", "C"),
  title.color = "blue", cloud.colors = c("red", "purple", "gray70"))

# Note: You don't have to name the vectors in the lists but I do for clarity
ms <- list(
  list1 = c(" I ", " you", "not"),
  list2 = c(" wh")
)
et <- list(
  B = c(" the", "do", "tru"),
  C = c(" it", " already", "we")
)

out2 <- word_associate(DATA2$state, DATA2$person, match.string = ms,
  wordcloud = TRUE, proportional = TRUE,
  network.plot = TRUE, nw.label.proportional = TRUE, extra.terms = et,
  cloud.legend =c("A", "B", "C", "D"),
  title.color = "blue", cloud.colors = c("red", "blue", "purple", "gray70"))

out3 <- word_associate(DATA2$state, list(DATA2$day, DATA2$person), match.string = ms)

#----------------------------------------------------------
m <- list(
  A1 = c("you", "in"), # list 1
  A2 = c(" wh"))      # list 2
```

Find Correlated Words

Description
Find associated words within grouping variable(s).

Usage
word_cor(text.var, grouping.var = qdapTools::id(text.var), word,
         r = 0.7, values = TRUE, method = "pearson", ...)
Arguments

- **text.var**: The text variable (or frequency matrix).
- **grouping.var**: The grouping variables. Default uses each row as a group. Also takes a single grouping variable or a list of 1 or more grouping variables. Unlike other qdap functions, this cannot be NULL.
- **word**: The word(s) vector to find associated words for.
- **r**: The correlation level find associated words for. If positive this is the minimum value, if negative this is the maximum value.
- **values**: logical. If TRUE returns the named correlates (names are the words). If FALSE only the associated words are returned.
- **method**: A character string indicating which correlation coefficient is to be computed ("pearson", "kendall", or "spearman").
- **...**: Other arguments passed to wfm.

Value

Returns a vector of associated words or correlation matrix if \( r = \text{NULL} \).

Note

Note that if a word has no variablity in it’s usage across grouping variable(s) the \( \text{sd} \) will result in 0, thus \( \text{cor} \) will will likely return a warning as in this example: \( \text{cor}([3, 10], \text{rnorm}(10)) \).

References

The plotting method for the list output was inspired by Ben Marwick; see http://stackoverflow.com/a/19925445/1000343 for more.

word_count

Arguments

text.var The text variable
byrow logical. If TRUE counts by row, if FALSE counts all words.
missing Value to insert for missing values (empty cells).
digit.remove logical. If TRUE removes digits before counting words.
names logical. If TRUE the sentences are given as the names of the counts.
apostrophe.remove logical. If TRUE apostrophes will be counted in the character count.
count.space logical. If TRUE spaces are counted as characters.
grouping.var The grouping variables. Default NULL generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.
percent logical. If TRUE output given as percent. If FALSE the output is proportion.
prop.by.row logical. If TRUE applies proportional to the row. If FALSE applies by column.
zero.replace Value to replace 0 values with.
digits Integer; number of decimal places to round when printing.
... Other arguments passed to prop.

Value

word_count - returns a word count by row or total.
character_count - returns a character count by row or total.
character_table - returns a list: dataframe of character counts by grouping variable.
raw Dataframe of the frequency of characters by grouping variable.
prop Dataframe of the proportion of characters by grouping variable.
rnp Dataframe of the frequency and proportions of characters by grouping variable.
percent The value of percent used for plotting purposes.
zero.replace The value of zero.replace used for plotting purposes.

Note

wc is a convenient short hand for word_count.

word_diff_list

Differences In Word Use Between Groups

Description

Look at the differences in word uses between grouping variable(s). Look at all possible "a" vs. "b" combinations or "a" vs. all others.

Usage

word_diff_list(text.var, grouping.var, vs.all = FALSE, vs.all.cut = 1, stopwords = NULL, alphabetical = FALSE, digits = 2)
Arguments

text.var  The text variable.
grouping.var  The grouping variables. Default NULL generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.
vs.all  logical. If TRUE looks at each grouping variable against all others ("a" vs. all comparison). If FALSE looks at each "a" vs. "b", comparison (e.g., for groups "a", "b", and "c"; "a" vs. "b", "a" vs. "c" and "b" vs. "c" will be considered).
vs.all.cut  Controls the number of other groups that may share a word (default is 1).
stopwords  A vector of stop words to remove.
alphabetical  logical. If TRUE orders the word lists alphabetized by word. If FALSE order first by frequency and then by word.
digits  the number of digits to be displayed in the proportion column (default is 3).

Value

An list of word data frames comparing grouping variables word use against one another. Each dataframe contains three columns:

word  The words unique to that group
freq  The number of times that group used that word
prop  The proportion of that group’s overall word use dedicated to that particular word

Examples

### Not run:

```r
out1 <- with(DATA, word_diff_list(text.var = state,
  grouping.var = list(sex, adult)))
lapply(unlist(out1, recursive = FALSE), head, n=3)
```

```r
out2 <- with(DATA, word_diff_list(state, person))
lapply(unlist(out2, recursive = FALSE), head, n=3)
```

```r
out3 <- with(DATA, word_diff_list(state, grouping.var = list(sex, adult),
  vs.all=TRUE, vs.all.cut=2))
```

```r
out4 <- with(mraja1, word_diff_list(text.var = dialogue,
  grouping.var = list(mraja1$sex, mraja1$fam.aff)))
```

```r
out5 <- word_diff_list(mraja1$dialogue, mraja1$person)
```

```r
out6 <- word_diff_list(mraja1$dialogue, mraja1$fam.aff, stopwords = Top25Words)
```

```r
out7 <- word_diff_list(mraja1$dialogue, mraja1$fam.aff, vs.all=TRUE, vs.all.cut=2)
lapply(out7, head, n=3)
```

### End(Not run)
**Description**

Transcript apply word length counts.

**Usage**

```r
word_length(text.var, grouping.var = NULL, percent = TRUE,
            zero.replace = 0, digits = 2, ...)
```

**Arguments**

- `text.var` The text variable.
- `grouping.var` The grouping variables. Default `NULL` generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.
- `percent` logical. If `TRUE` output given as percent. If `FALSE` the output is proportion.
- `zero.replace` Value to replace 0 values with.
- `digits` Integer; number of decimal places to round when printing.
- `...` Other arguments passed to `bag_o_words`.

**Value**

Returns a list of:

- `count` Dataframe of word length counts by grouping variable(s).
- `prop` Dataframe of the proportions of word length counts by grouping variable.
- `rnp` Dataframe of the frequency and proportions of word length counts by grouping variable.
- `percent` The value of percent used for plotting purposes.
- `zero.replace` The value of zero.replace used for plotting purposes.

**Examples**

```r
## Not run:
(x <- with(DATA, word_length(state, person)))
plot(x)
scores(x)
proportions(x)
counts(x)
plot(scores(x))
plot(proportions(x))
plot(counts(x))

(x2 <- word_length(DATA[["state"]]))
```
(x2 <- word_length(DA[["state"]], apostrophe.remove=TRUE))

## Example Visualizations with Presidential Debate Data
library(tidyverse)
(x_long <- proportions(x) %>%
gather("Letter_Length", "Proportion", -c(1:2)))
ggplot(x_long, aes(x = Letter_Length, y = Proportion, color=person, group=person)) +
  geom_line(size=.8)

(x3 <- with(pres_debates2012, word_length(dialogue, person)))
(x_long2 <- proportions(x3) %>%
gather("Letter_Length", "Proportion", -c(1:2)))
ggplot(x_long, aes(x = Letter_Length, weight = Proportion, fill=person, group=person)) +
  geom_bar()
  geom_bar()
  facet_wrap(~person, ncol=1)

ggplot(x_long, aes(x = Letter_Length, weight = Proportion, fill=person)) +
  geom_bar() +
  coord_flip() +
  facet_wrap(~person, ncol=1)

ggplot(x_long, aes(x = person, weight = Proportion)) +
  geom_bar(fill="grey40") +
  coord_flip() +
  facet_grid(Letter_Length~.)

## End(Not run)

---

**word_list**

### Raw Word Lists/Frequency Counts

**Description**

Transcript Apply Raw Word Lists and Frequency Counts by grouping variable(s).

**Usage**

```r
word_list(text.var, grouping.var = NULL, stopwords = NULL,
  alphabetical = FALSE, cut.n = 20, cap = TRUE, cap.list = NULL,
  cap.I = TRUE, rm.bracket = TRUE, char.keep = NULL,
  apostrophe.remove = FALSE, ...)
```

**Arguments**

- `text.var`: The text variable.
grouping.var  The grouping variables. Default NULL generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.
stopwords  A vector of stop words to remove.
alphabetical  If TRUE the output of frequency lists is ordered alphabetically. If FALSE the list is ordered by frequency rank.
cut.n  Cut off point for reduced frequency stop word list (rfswl).
cap  logical. If TRUE capitalizes words from the cap.list.
cap.list  Vector of words to capitalize.
cap.I  logical. If TRUE capitalizes words containing the personal pronoun I.
rm.bracket  logical If TRUE all brackets and bracketed text are removed from analysis.
char.keep  A character vector of symbols (i.e., punctuation) that word_list should keep. The default is to remove every symbol except apostrophes.
apostrophe.remove  logical. If TRUE removes apostrophes from the output.
...  Other arguments passed to strip.

Value

An object of class "word_list" is a list of lists of vectors or dataframes containing the following components:
cwl  complete word list; raw words
swl  stop word list; same as rwl with stop words removed
fwl  frequency word list; a data frame of words and corresponding frequency counts
fswl  frequency stopword word list; same as fwl but with stop words removed
rfswl  reduced frequency stopword word list; same as fswl but truncated to n rows

Examples

## Not run:
word_list(raj.act.1$dialogue)

out1 <- with(raj, word_list(text.var = dialogue,
  grouping.var = list(person, act)))
names(out1)
lapply(out1$cwl, "[", 1:5)

with(DATA, word_list(state, person))
with(DATA, word_list(state, person, stopwords = Top25Words))
with(DATA, word_list(state, person, cap = FALSE, cap.list=c("do", "we")))

## End(Not run)
Description

A network plot of words. Shows the interconnected and supporting use of words between textual units containing key terms.

Usage

```r
word_network_plot(text.var, grouping.var = 1:length(text.var),
  target.words = NULL, stopwords = qdapDictionaries::Top100Words,
  label.cex = 0.8, label.size = 0.5, edge.curved = TRUE,
  vertex.shape = "circle", edge.color = "gray70",
  label.colors = "black", layout = NULL, title.name = NULL,
  title.cex = -4.5, title.location = 3, title.font = NULL,
  title.cex = 0.8, log.labels = FALSE, title.color = "black",
  legend = NULL, legend.cex = 0.8, legend.location = c(-1.54, 1.41),
  plot = TRUE, char2space = "~~", ...)
```

Arguments

text.var The text variable.

grouping.var The grouping variables. Default uses the sequence along the length of text variable (this may be the connection of sentences or turn of talk as the textual unit). Also takes a single grouping variable or a list of 1 or more grouping variables.
target.words A named list of vectors of words whose length corresponds to label.colors (+1 length in cloud colors for non-matched terms).
stopwords Words to exclude from the analysis (default is Top100Words).
label.cex The magnification to be used for network plot labels relative to the current setting of cex. Default is .8.
label.size An optional sizing constant to add to labels if log.labels is TRUE.
edge.curved logical. If TRUE edges will be curved rather than straight paths.
vertex.shape The shape of the vertices (see igraph.vertex.shapes for more).
edge.color A character vector of length one corresponding to the color of the plot edges.
label.colors A character vector of length one corresponding to the color of the labels.
layout Layout types supported by igraph. See layout.
title.name The title of the plot.
title.padj Adjustment for the network plot title. For strings parallel to the axes, padj = 0 means right or top alignment, and padj = 1 means left or bottom alignment.
title.location On which side of the network plot (1=bottom, 2=left, 3=top, 4=right).
title.font The font family of the cloud title.
`word_network_plot` 405

title.cex  Character expansion factor for the title. NULL and NA are equivalent to 1.0.
log.labels logical. If TRUE uses a proportional log label for more readable labels. The formula is: \( \log(\text{SUMS})/\max(\log(\text{SUMS})) \). label.size adds more control over the label sizes.
title.color A character vector of length one corresponding to the color of the title.
legend A character vector of names corresponding to the number of vectors in match.string.
legend.cex Character expansion factor for the network plot legend. NULL and NA are equivalent to 1.0.
legend.location The x and y co-ordinates to be used to position the network plot legend. The location may also be specified by setting x to a single keyword from the list "bottomright", "bottom", "bottomleft", "left", "topleft", "top", "topright", "right" and "center". This places the legend on the inside of the plot frame at the given location.
plot logical. If TRUE plots a network plot of the words.
char2space A vector of characters to be turned into spaces. If char.keep is NULL, char2space will activate this argument.
... Other arguments passed to `strip`.

Note

Words can be kept as one by inserting a double tilde ("~~"), or other character strings passed to char2space, as a single word/entry. This is useful for keeping proper names as a single unit.

See Also

`word_network_plot`, `graph.adjacency`

Examples

```r
## Not run:
word_network_plot(text.var=DATA$state)
word_network_plot(text.var=DATA$state, stopwords=NULL)
word_network_plot(text.var=DATA$state, DATA$person)
word_network_plot(text.var=DATA$state, DATA$person, stopwords=NULL)
word_network_plot(text.var=DATA$state, grouping.var=list(DATA$sex, DATA$adult))
word_network_plot(text.var=DATA$state, grouping.var=DATA$person,
    title.name = "TITLE", log.labels=TRUE)
word_network_plot(text.var=raj.act.1$dialogue, grouping.var=raj.act.1$person,
    stopwords = Top200Words)

#insert double tilde ("~~") to keep dual words (e.g., first last name)
alts <- c(" fun", " I ")
state2 <- mgsub(alts, gsub(" \s", "~~", alts), DATA$state)
word_network_plot(text.var=state2, grouping.var=DATA$person)

## Invisibly returns the igraph model
x <- word_network_plot(text.var=DATA$state, DATA$person)
```
word_position

Description

Find counts of the positioning of words within a sentence.

Usage

```r
word_position(text.var, match.terms, digits = 2, percent = TRUE, zero.replace = 0, ...)
```

Arguments

- `text.var`: The text variable.
- `match.terms`: A character vector of quoted terms to find the positions of.
- `digits`: Integer; number of decimal places to round when printing.
- `percent`: Logical. If TRUE output given as percent. If FALSE the output is proportion.
- `zero.replace`: Value to replace 0 values with.
- `...`: Currently ignored.

Value

Returns a list, of class "word_position", of data frames and information regarding word positions:

- `raw`: raw word position counts in long format (may be more useful for plotting)
- `count`: integer word position counts
- `prop`: proportional word position counts; proportional to each total word uses
- `rnp`: a character combination data frame of count and proportional
- `zero_replace`: value to replace zeros with; mostly internal use
- `percent`: The value of percent used for plotting purposes.
- `digits`: integer value of number of digits to display; mostly internal use
Note

Default printing is a heatmap plot.

Examples

```r
## Not run:
position <- with(DATA, word_position(sent_detect(state), Top25Words))
position
lview(position)
plot(position)
scores(position)
preprocessed(position)
counts(position)
proportions(position)
plot(proportions(position))

stopwords <- unique(c(contractions[[1]], Top200Words))
topwords <- freq_terms(pres_debates2012["dialogue"], top = 40,
at.least = 4, stopwords = stopwords[[1]])
word_position(pres_debates2012["dialogue"], topwords)
plot(word_position(pres_debates2012["dialogue"], topwords), FALSE)
plot(word_position(pres_debates2012["dialogue"], topwords), TRUE, scale=FALSE)

wordlist <- c("tax", "health", "rich", "america", "truth", "money", "cost",
"governor", "president", "we", "job", "i", "you", "because",
"our", "years")

word_position(pres_debates2012["dialogue"], wordlist)

## BY VARIABLES

## End(Not run)

### Description

word_proximity - Generate proximity measures to ascertain a mean distance measure between word uses.

### Usage

word_proximity(text.var, terms, grouping.var = NULL, parallel = TRUE,
cores = parallel::detectCores()/2)

## S3 method for class 'word_proximity'
weight(x, type = "scale", ...)

### Arguments

text.var The text variable.
terms A vector of quoted terms.
grouping.var The grouping variables. Default NULL generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.
parallel logical. If TRUE attempts to run the function on multiple cores. Note that this may not mean a speed boost if you have one core or if the data set is smaller as the cluster takes time to create.
cores The number of cores to use if parallel = TRUE. Default is half the number of available cores.
x An object to be weighted.
type A weighting type of: c("scale_log", "scale", "rev.scale", "revscale_log", "log", "sqrt", "scale_sqrt", "rev_sqrt", "revscale_sqrt"). The weight type section name (i.e. A_B_C where A, B, and C are sections) determines what action will occur. log will use log, sqrt will use sqrt. scale will standardize the values. rev will multiply by -1 to give the inverse sign. This enables a comparison similar to correlations rather than distance.

... ignored.
Details

Note that row names are the first word and column names are the second comparison word. The values for Word A compared to Word B will not be the same as Word B compared to Word A. This is because, unlike a true distance measure, word_proximity’s matrix is asymmetrical. word_proximity computes the distance by taking each sentence position for Word A and comparing it to the nearest sentence location for Word B.

Value

Returns a list of matrices of proximity measures in the unit of average sentences between words (defaults to scaled).

Note

The match.terms is character sensitive. Spacing is an important way to grab specific words and requires careful thought. Using "read" will find the words "bread", "read" "reading", and "ready". If you want to search for just the word "read" you’d supply a vector of c(" read ", " reads ", " reading ", " reader ").

**word_stats**

**Descriptive Word Statistics**

**Description**

Transcript apply descriptive word statistics.
word_stats

Usage

```r
word_stats(text.var, grouping.var = NULL, tot = NULL, parallel = FALSE, rm.incomplete = FALSE, digit.remove = FALSE, apostrophe.remove = FALSE, digits = 3, ...)
```

Arguments

- `text.var` The text variable or a "word_stats" object (i.e., the output of a word_stats function).
- `grouping.var` The grouping variables. Default NULL generates one word list for all text. Also takes a single grouping variable or a list of 1 or more grouping variables.
- `tot` Optional turns of talk variable that yields turn of talk measures.
- `parallel` logical. If TRUE attempts to run the function on multiple cores. Note that this may not mean a speed boost if you have one core or if the data set is smaller as the cluster takes time to create (parallel is slower until approximately 10,000 rows). To reduce run time pass a "word_stats" object to the word_stats function.
- `rm.incomplete` logical. If TRUE incomplete statements are removed from calculations in the output.
- `digit.remove` logical. If TRUE removes digits from calculating the output.
- `apostrophe.remove` logical. If TRUE removes apostrophes from calculating the output.
- `digits` Integer; number of decimal places to round when printing.
- `...` Any other arguments passed to end_inc.

Details

Note that a sentence is classified with only one endmark. An imperative sentence is classified only as imperative (not as a state, quest, or exclm as well). If a sentence is both imperative and incomplete the sentence will be counted as incomplete rather than imperative. labeled as both imperative

Value

Returns a list of three descriptive word statistics:

- `ts` A data frame of descriptive word statistics by row
- `gts` A data frame of word/sentence statistics per grouping variable:
  - n.tot - number of turns of talk
  - n.sent - number of sentences
  - n.words - number of words
  - n.char - number of characters
  - n.syl - number of syllables
  - n.poly - number of polysyllables
  - sptot - syllables per turn of talk
  - wptot - words per turn of talk
- wps - words per sentence
- cps - characters per sentence
- sps - syllables per sentence
- sps - poly-syllables per sentence
- cpw - characters per word
- spw - syllables per word
- n.state - number of statements
- n.quest - number of questions
- n.exclm - number of exclamations
- n.incom - number of incomplete statements
- p.state - proportion of statements
- p.quest - proportion of questions
- p.exclm - proportion of exclamations
- p.incom - proportion of incomplete statements
- n.hapax - number of hapax legomenon
- n.dis - number of dis legomenon
- grow.rate - proportion of hapax legomenon to words
- prop.dis - proportion of dis legomenon to words

mpun  An account of sentences with an improper/missing end mark
word.elem  A data frame with word element columns from gts
sent.elem  A data frame with sentence element columns from gts
omit  Counter of omitted sentences for internal use (only included if some rows contained missing values)
percent  The value of percent used for plotting purposes.
zero.replace  The value of zero.replace used for plotting purposes.
digits  integer value of number of digits to display; mostly internal use

Warning
It is assumed the user has run sent_split on their data, otherwise some counts may not be accurate.
