Package ‘quanteda.textmodels’

March 13, 2020

**Type**  Package

**Title**  Scaling Models and Classifiers for Textual Data

**Version**  0.9.1

**Depends**  R (>= 3.1.0), methods

**Imports**  ggplot2, LiblineaR, Matrix (>= 1.2), quanteda (>= 2.0), RSpectra, Rcpp (>= 0.12.12), RcppParallel, RSSL, SparseM, stringi

**Suggests**  ca, covr, fastNaiveBayes, knitr, lsa, microbenchmark, naivebayes, spelling, RColorBrewer, testthat, rmarkdown

**LinkingTo**  Rcpp, RcppParallel, RcppArmadillo (>= 0.7.600.1.0), quanteda

**URL**  https://github.com/quanteda/quanteda.textmodels

**License**  GPL-3

**Encoding**  UTF-8

**LazyData**  true

**Language**  en-GB

**RoxygenNote**  7.0.2

**SystemRequirements**  C++11

**Collate**  'RcppExports.R' 'quanteda.textmodels-package.R'

'data-documentation.R' 'textmodel-methods.R'

'textmodel_affinity.R' 'textmodel_ca.R' 'textmodel_lsa.R'

'textmodel_nb.R' 'textmodel_svm.R' 'textmodel_svmlin.R'

'textmodel_wordfish.R' 'textmodel_wordscores.R'

'textplot_influence.R' 'textplot_scale1d.R' 'utils.R'

**VignetteBuilder**  knitr
data_corpus_dailnoconf1991

Confidence debate from 1991 Irish Parliament

Description

Texts of speeches from a no-confidence motion debated in the Irish Dáil from 16-18 October 1991 over the future of the Fianna Fail-Progressive Democrat coalition. (See Laver and Benoit 2002 for details.)
data_corpus_EPcoaldebate

Usage

data_corpus_dailnoconf1991

Format

data_corpus_dailnoconf1991 is a corpus with 58 texts, including docvars for name, party, and position.

Source

References

Examples

```r
## Not run:
library("quanteda")
data_dfm_dailnoconf1991 <- dfm(data_corpus_dailnoconf1991, remove_punct = TRUE)
tmod <- textmodel_affinity(data_dfm_dailnoconf1991,
c("Govt", "Opp", "Opp", rep(NA, 55)))
(pred <- predict(tmod))
dat <-
data.frame(party = as.character(docvars(data_corpus_dailnoconf1991, "party")),
govt = coef(pred)[, "Govt"],
position = as.character(docvars(data_corpus_dailnoconf1991, "position")),
stringsAsFactors = FALSE)
bymedian <- with(dat, reorder(paste(party, position), govt, median))
par(mar = c(5, 6, 4, 2)+.1)
boxplot(govt ~ bymedian, data = dat,
horizontal = TRUE, las = 1,
xlab = "Degree of support for government")
abline(h = 7.5, col = "red", lty = "dashed")
text(c(0.9, 0.9), c(8.5, 6.5), c("Government", "Opposition"))

## End(Not run)
```

data_corpus_EPcoaldebate

*Crowd-labelled sentence corpus from a 2010 EP debate on coal subsidies*
Description

A multilingual text corpus of speeches from a European Parliament debate on coal subsidies in 2010, with individual crowd codings as the unit of observation. The sentences are drawn from officially translated speeches from a debate over a European Parliament debate concerning a Commission report proposing an extension to a regulation permitting state aid to uncompetitive coal mines.

Each speech is available in six languages: English, German, Greek, Italian, Polish and Spanish. The unit of observation is the individual crowd coding of each natural sentence. For more information on the coding approach see Benoit et al. (2016).

Usage

data_corpus_EPcoaldebate

Format

The corpus consists of 16,806 documents (i.e. codings of a sentence) and includes the following document-level variables:

- sentence_id character; a unique identifier for each sentence
- crowd_subsidy_label factor; whether a coder labelled the sentence as "Pro-Subsidy", "Anti-Subsidy" or "Neutral or inapplicable"
- language factor; the language (translation) of the speech
- name_last character; speaker's last name
- name_first character; speaker's first name
- ep_group factor; abbreviation of the EP party group of the speaker
- country factor; the speaker's country of origin
- vote factor; the speaker's vote on the proposal (For/Against/Abstain/NA)
- coder_id character; a unique identifier for each crowd coder
- coder_trust numeric; the "trust score" from the Crowdflower platform used to code the sentences, which can theoretically range between 0 and 1. Only coders with trust scores above 0.8 are included in the corpus.

References

Description

Speeches and document-level variables from the debate over the Irish budget of 2010.

Usage

data_corpus_irishbudget2010

Format

The corpus object for the 2010 budget speeches, with document-level variables for year, debate, serial number, first and last name of the speaker, and the speaker's party.

Details

At the time of the debate, Fianna Fáil (FF) and the Greens formed the government coalition, while Fine Gael (FG), Labour (LAB), and Sinn Féin (SF) were in opposition.

Source

References

Examples

summary(data_corpus_irishbudget2010)

Description

A corpus object containing 2,000 movie reviews classified by positive or negative sentiment.

Usage

data_corpus_moviepreferences
The corpus includes the following document variables:

- **sentiment**: factor indicating whether a review was manually classified as positive `pos` or negative `neg`.
- **id1**: Character counting the position in the corpus.
- **id2**: Random number for each review.

**Details**

For more information, see `cat(meta(data_corpus_moviereviews,"readme"))`.

**Source**

https://www.cs.cornell.edu/people/pabo/movie-review-data/

**References**

**Examples**

```r
# check polarities
table(data_corpus_moviereviews$sentiment)

# make the data into sentences, because each line is a sentence
data_corpus_moviereviewsents <-
quanteda::corpus_segment(data_corpus_moviereviews, "\n", extract_pattern = FALSE)
pprint(data_corpus_moviereviewsents, max_ndoc = 3)
```

---

data_dfm_lbgexample  
dfm from data in Table 1 of Laver, Benoit, and Garry (2003)

**Description**

Constructed example data to demonstrate the Wordscores algorithm, from Laver Benoit and Garry (2003), Table 1.

**Usage**

data_dfm_lbgexample

**Format**

A dfm object with 6 documents and 37 features.
Details

This is the example word count data from Laver, Benoit and Garry’s (2003) Table 1. Documents R1 to R5 are assumed to have known positions: -1.5, -0.75, 0, 0.75, 1.5. Document V1 is assumed unknown, and will have a raw text score of approximately -0.45 when computed as per LBG (2003).

References

textmodel_affinity

Class affinity maximum likelihood text scaling model

Description

textmodel_affinity implements the maximum likelihood supervised text scaling method described in Perry and Benoit (2017).

Usage

textmodel_affinity(
  x,
  y,
  exclude = NULL,
  smooth = 0.5,
  ref_smooth = 0.5,
  verbose = quanteda_options("verbose")
)

Arguments

x the dfm or bootstrap_dfm object on which the model will be fit. Does not need to contain only the training documents, since the index of these will be matched automatically.

y vector of training classes/scores associated with each document identified in data

exclude a set of words to exclude from the model

smooth a smoothing parameter for class affinities; defaults to 0.5 (Jeffreys prior). A plausible alternative would be 1.0 (Laplace prior).

ref_smooth a smoothing parameter for token distributions; defaults to 0.5

verbose logical; if TRUE print diagnostic information during fitting.

See Also

predict.textmodel_affinity() for methods of applying a fitted textmodel_affinity model object to predict quantities from (other) documents.

Examples

(af <- textmodel_affinity(data_dfm_lbgexample, y = c("L", NA, NA, NA, "R", NA)))
predict(af)
predict(af, newdata = data_dfm_lbgexample[6, ])

## Not run:
# compute bootstrapped SEs
dfm <- quanteda::bootstrap_dfm(data_corpus_dailnoconf1991, n = 10, remove_punct = TRUE)
textmodel_affinity(dfm, y = c("Govt", "Opp", "Opp", rep(NA, 55)))

## End(Not run)

---

textmodel_ca

Correspondence analysis of a document-feature matrix

Description

textmodel_ca implements correspondence analysis scaling on a dfm. The method is a fast/sparse version of function ca.

Usage

textmodel_ca(x, smooth = 0, nd = NA, sparse = FALSE, residual_floor = 0.1)

Arguments

- **x**
  the dfm on which the model will be fit
- **smooth**
  a smoothing parameter for word counts; defaults to zero.
- **nd**
  Number of dimensions to be included in output; if NA (the default) then the maximum possible dimensions are included.
- **sparse**
  retains the sparsity if set to TRUE; set it to TRUE if x (the dfm) is too big to be allocated after converting to dense
- **residual_floor**
  specifies the threshold for the residual matrix for calculating the truncated svd. Larger value will reduce memory and time cost but might reduce accuracy; only applicable when sparse = TRUE
textmodel_lsa

Details

svds in the RSpectra package is applied to enable the fast computation of the SVD.

Value

textmodel_ca() returns a fitted CA textmodel that is a special class of ca object.

Note

You may need to set sparse = TRUE) and increase the value of residual_floor to ignore less important information and hence to reduce the memory cost when you have a very big dfm. If your attempt to fit the model fails due to the matrix being too large, this is probably because of the memory demands of computing the $V \times V$ residual matrix. To avoid this, consider increasing the value of residual_floor by 0.1, until the model can be fit.

tmod <- textmodel_ca(dfmat)
summary(tmod)

textmodel_lsa Latent Semantic Analysis

Description

Fit the Latent Semantic Analysis scaling model to a dfm, which may be weighted (for instance using quanteda::dfm_tfidf()).

Usage

textmodel_lsa(x, nd = 10, margin = c("both", "documents", "features"))
Arguments

- `x`: the `dfm` on which the model will be fit
- `nd`: the number of dimensions to be included in output
- `margin`: margin to be smoothed by the SVD

Details

- `svds` in the `RSpectra` package is applied to enable the fast computation of the SVD.

Note

The number of dimensions `nd` retained in LSA is an empirical issue. While a reduction in `k` can remove much of the noise, keeping too few dimensions or factors may lose important information.

See Also

- `predict.textmodel_lsa()`, `coef.textmodel_lsa()`

Examples

```r
dfmat <- quanteda::dfm(data_corpus_irishbudget2010)
# create an LSA space and return its truncated representation in the low-rank space
tmod <- textmodel_lsa(dfmat[, 1:10])
head(tmod$docs)

# matrix in low_rank LSA space
tmod$matrix_low_rank[, 1:5]

# fold queries into the space generated by dfmat[1:10,]
# and return its truncated versions of its representation in the new low-rank space
pred <- predict(tmod, newdata = dfmat[11:14,])
pred$docs_newspace
```
Description

Fit a multinomial or Bernoulli Naive Bayes model, given a dfm and some training labels.

Usage

```r
textmodel_nb(
  x,
  y,
  smooth = 1,
  prior = c("uniform", "docfreq", "termfreq"),
  distribution = c("multinomial", "Bernoulli")
)
```

Arguments

- `x`: the dfm on which the model will be fit. Does not need to contain only the training documents.
- `y`: vector of training labels associated with each document identified in `train`. (These will be converted to factors if not already factors.)
- `smooth`: smoothing parameter for feature counts, added to the feature frequency totals by training class
- `prior`: prior distribution on texts; one of "uniform", "docfreq", or "termfreq". See Prior Distributions below.
- `distribution`: count model for text features, can be multinomial or Bernoulli. To fit a "binary multinomial" model, first convert the dfm to a binary matrix using `quanteda::dfm_weight(x, scheme = "boolean")`.

Value

`textmodel_nb()` returns a list consisting of the following (where \( I \) is the total number of documents, \( J \) is the total number of features, and \( k \) is the total number of training classes):

- `call`: original function call
- `param`: \( k \times V \); class conditional posterior estimates
- `x`: the \( N \times V \) training dfm `x`
- `y`: the \( N \)-length `y` training class vector, where NAs will not be used will be retained in the saved `x` matrix
- `distribution`: character; the distribution of `x` for the NB model
- `priors`: numeric; the class prior probabilities
- `smooth`: numeric; the value of the smoothing parameter
Prior distributions

Prior distributions refer to the prior probabilities assigned to the training classes, and the choice of prior distribution affects the calculation of the fitted probabilities. The default is uniform priors, which sets the unconditional probability of observing the one class to be the same as observing any other class.

"Document frequency" means that the class priors will be taken from the relative proportions of the class documents used in the training set. This approach is so common that it is assumed in many examples, such as the worked example from Manning, Raghavan, and Schütze (2008) below. It is not the default in quanteda, however, since there may be nothing informative in the relative numbers of documents used to train a classifier other than the relative availability of the documents. When training classes are balanced in their number of documents (usually advisable), however, then the empirically computed "docfreq" would be equivalent to "uniform" priors.

Setting prior to "termfreq" makes the priors equal to the proportions of total feature counts found in the grouped documents in each training class, so that the classes with the largest number of features are assigned the largest priors. If the total count of features in each training class was the same, then "uniform" and "termfreq" would be the same.

Smoothing parameter

The smooth value is added to the feature frequencies, aggregated by training class, to avoid zero frequencies in any class. This has the effect of giving more weight to infrequent term occurrences.

predict.textmodel_nb()

Examples

```r
# Example from 13.1 of _An Introduction to Information Retrieval_
txt <- c(d1 = "Chinese Beijing Chinese",
       d2 = "Chinese Chinese Shanghai",
       d3 = "Chinese Macao",
       d4 = "Tokyo Japan Chinese",
       d5 = "Chinese Chinese Chinese Tokyo Japan")
x <- quanteda::dfm(txt, tolower = FALSE)
```
y <- factor(c("Y", "Y", "Y", "N", NA), ordered = TRUE)

## replicate IIR p261 prediction for test set (document 5)
(tmod1 <- textmodel_nb(x, y, prior = "docfreq"))
summary(tmod1)
coef(tmod1)
predict(tmod1, type = "prob")
predict(tmod1)

# contrast with other priors
predict(textmodel_nb(x, y, prior = "uniform"))
predict(textmodel_nb(x, y, prior = "termfreq"))

## replicate IIR p264 Bernoulli Naive Bayes
(tmod2 <- textmodel_nb(x, y, distribution = "Bernoulli", prior = "docfreq")
predict(tmod2, newdata = x[5, ], type = "prob")
predict(tmod2, newdata = x[5, ])

---

textmodel_svm  
Linear SVM classifier for texts

Description

Fit a fast linear SVM classifier for texts, using the LiblineaR package.

Usage

textmodel_svm(x, y, weight = c("uniform", "docfreq", "termfreq"), ...)

Arguments

  x  
  the dfm on which the model will be fit. Does not need to contain only the training documents.

  y  
  vector of training labels associated with each document identified in train. (These will be converted to factors if not already factors.)

  weight  
  weights for different classes for imbalanced training sets, passed to wi in LiblineaR. "uniform" uses default; "docfreq" weights by the number of training examples, and "termfreq" by the relative sizes of the training classes in terms of their total lengths in tokens.

  ...  
  additional arguments passed to LiblineaR

Examples

# use party leaders for govt and opposition classes
quanteda::docvars(data_corpus_irishbudget2010, "govtopp") <-
dfm <- quanteda::dfm(data_corpus_irishbudget2010)
tmod <- textmodel_svm(dfm, y = quanteda::docvars(dfm, "govtopp"))
predict(tmod)
predict(tmod, type = "probability")

# multiclass problem - all party leaders
tmod2 <- textmodel_svm(dfm, y = c(rep(NA, 3), "SF", "FF", "FG", NA, "LAB", NA, NA, "Green", rep(NA, 3)))
predict(tmod2)
predict(tmod2, type = "probability")

---------------------------------  

**textmodel_svmlin**  
*(faster) Linear SVM classifier for texts*

Description

This function has been retained for testing purposes only; we recommend that you use `textmodel_svm` instead. That function is more efficient, and implements prediction for more than two classes.

Usage

`textmodel_svmlin(x, y, intercept = TRUE, ...)`

Arguments

- `x`  
  the dfm on which the model will be fit. Does not need to contain only the training documents.

- `y`  
  vector of training labels associated with each document identified in `train`. (These will be converted to factors if not already factors.)

- `intercept`  
  logical; if TRUE, add an intercept to the data

- `...`  
  additional arguments passed to `svmlin`

Details

Fit a fast linear SVM classifier for texts, using the R interface to the svmlin code by Vikas Sindhwani and S. Sathiya Keerthi for fast linear transductive SVMs. This is passed through to `svmlin` as implemented by the RSSL package.
Value
textmodel_svmlin() returns (for now) an object structured as a return object from svmlin.

References

See Also
svmlin, text{textmodel_svm}

Examples
# use Lenihan for govt class and Bruton for opposition
quanteda::docvars(data_corpus_irishbudget2010, "govtopp") <-
c("Govt", "Opp", rep(NA, 12))
dfmat <- quanteda::dfm(data_corpus_irishbudget2010)

tmod <- textmodel_svmlin(dfmat, y = quanteda::docvars(dfmat, "govtopp"),
pos_frac = 5/14)
predict(tmod)

predict(textmodel_svmlin(dfmat, y = quanteda::docvars(dfmat, "govtopp"),
intercept = FALSE, pos_frac = 5/14))

```r
svd_sparse = TRUE, 
residual_floor = 0.5
```

**Arguments**

- **x**
  - the dfm on which the model will be fit

- **dir**
  - set global identification by specifying the indexes for a pair of documents such that \( \hat{\theta}_{dir[1]} < \hat{\theta}_{dir[2]} \).

- **priors**
  - prior precisions for the estimated parameters \( \alpha_i, \psi_j, \beta_j, \) and \( \theta_i \), where \( i \) indexes documents and \( j \) indexes features

- **tol**
  - tolerances for convergence. The first value is a convergence threshold for the log-posterior of the model, the second value is the tolerance in the difference in parameter values from the iterative conditional maximum likelihood (from conditionally estimating document-level, then feature-level parameters).

- **dispersion**
  - sets whether a quasi-Poisson quasi-likelihood should be used based on a single dispersion parameter ("poisson"), or quasi-Poisson ("quasipoisson")

- **dispersion_level**
  - sets the unit level for the dispersion parameter, options are "feature" for term-level variances, or "overall" for a single dispersion parameter

- **dispersion_floor**
  - constraint for the minimal underdispersion multiplier in the quasi-Poisson model. Used to minimize the distorting effect of terms with rare term or document frequencies that appear to be severely underdispersed. Default is 0, but this only applies if dispersion = "quasipoisson".

- **sparse**
  - specifies whether the "dfm" is coerced to dense. While setting this to TRUE will make it possible to handle larger dfm objects (and make execution faster), it will generate slightly different results each time, because the sparse SVD routine has a stochastic element.

- **abs_err**
  - specifies how the convergence is considered

- **svd_sparse**
  - uses svd to initialize the starting values of theta, only applies when sparse = TRUE

- **residual_floor**
  - specifies the threshold for residual matrix when calculating the svds, only applies when sparse = TRUE

**Details**

The returns match those of Will Lowe's R implementation of wordfish (see the austin package), except that here we have renamed words to be features. (This return list may change.) We have also followed the practice begun with Slapin and Proksch's early implementation of the model that used a regularization parameter of \( se(\sigma) = 3 \), through the third element in priors.

**Value**

An object of class `textmodel_fitted_wordfish`. This is a list containing:

- **dir**
  - global identification of the dimension
theta  estimated document positions
alpha  estimated document fixed effects
beta   estimated feature marginal effects
psi    estimated word fixed effects
docs   document labels
features feature labels
sigma  regularization parameter for betas in Poisson form
ll     log likelihood at convergence
se.theta standard errors for theta-hats
x      dfm to which the model was fit

Note

In the rare situation where a warning message of "The algorithm did not converge." shows up, removing some documents may work.

Author(s)

Benjamin Lauderdale, Haiyan Wang, and Kenneth Benoit

predict.textmodel_wordfish()

Examples

(tmod1 <- textmodel_wordfish(data_dfm_lbgexample, dir = c(1,5)))
summary(tmod1, n = 10)
coef(tmod1)
predict(tmod1)
predict(tmod1, se.fit = TRUE)
predict(tmod1, interval = "confidence")

## Not run:
library("quanteda")
dfmat <- dfm(data_corpus_irishbudget2010)
(tmod2 <- textmodel_wordfish(dfmat, dir = c(6,5)))
(tmod3 <- textmodel_wordfish(dfmat, dir = c(6,5),
                           dispersion = "quasipoisson", dispersion_floor = 0))
(tmod4 <- textmodel_wordfish(dfmat, dir = c(6,5),
                           dispersion = "quasipoisson", dispersion_floor = .5))
textmodel_wordscores

Wordscores text model

Description

textmodel_wordscores implements Laver, Benoit and Garry's (2003) "Wordscores" method for scaling texts on a single dimension, given a set of anchoring or reference texts whose values are set through reference scores. This scale can be fitted in the linear space (as per LBG 2003) or in the logit space (as per Beauchamp 2012). Estimates of virgin or unknown texts are obtained using the predict() method to score documents from a fitted textmodel_wordscores object.

Usage

textmodel_wordscores(x, y, scale = c("linear", "logit"), smooth = 0)

Arguments

x the dfm on which the model will be trained
y vector of training scores associated with each document in x
scale scale on which to score the words; "linear" for classic LBG linear posterior weighted word class differences, or "logit" for log posterior differences
smooth a smoothing parameter for word counts; defaults to zero to match the LBG (2003) method. See Value below for additional information on the behaviour of this argument.

Details

The textmodel_wordscores() function and the associated predict() method are designed to function in the same manner as stats::predict.lm(). coef() can also be used to extract the word coefficients from the fitted textmodel_wordscores object, and summary() will print a nice summary of the fitted object.
Value

A fitted `textmodel_wordscores` object. This object will contain a copy of the input data, but in its original form without any smoothing applied. Calling `predict.textmodel_wordscores()` on this object without specifying a value for `newdata`, for instance, will predict on the unsmoothed object. This behaviour differs from versions of `quanteda <= 1.2`.

`textplot_influence`  
**Influence plot for text scaling models**

Description

Plot the results of a fitted scaling model, from (e.g.) a predicted `textmodel_affinity` model.

Usage

`textplot_influence(x, n = 30, ...)`
Arguments

- x: the object output from `influence()` run on the fitted or predicted scaling model object to be plotted
- n: the number of features whose influence will be plotted
- ...: additional arguments passed to `plot()`

Author(s)

Patrick Perry and Kenneth Benoit

See Also

- `textmodel_affinity()`
- `influence.predict.textmodel_affinity()`

Examples

```r
tmod <- textmodel_affinity(data_dfm_lbexample, y = c("L", NA, NA, NA, "R", NA))
pred <- predict(tmod)
textplot_influence(influence(pred))
```

Description

Plot the results of a fitted scaling model, from (e.g.) a predicted `textmodel_wordscores` model or a fitted `textmodel_wordfish` or `textmodel_ca` model. Either document or feature parameters may be plotted: an ideal point-style plot (estimated document position plus confidence interval on the x-axis, document labels on the y-axis) with optional renaming and sorting, or as a plot of estimated feature-level parameters (estimated feature positions on the x-axis, and a measure of relative frequency or influence on the y-axis, with feature names replacing plotting points with some being chosen by the user to be highlighted).

Usage

```r
textplot_scale1d(
  x,
  margin = c("documents", "features"),
  doclabels = NULL,
  sort = TRUE,
  groups = NULL,
  highlighted = NULL,
  alpha = 0.7,
  highlighted_color = "black"
)
```
Arguments

- **x**: the fitted or predicted scaling model object to be plotted
- **margin**: "documents" to plot estimated document scores (the default) or "features" to plot estimated feature scores by a measure of relative frequency
- **doclabels**: a vector of names for document; if left NULL (the default), docnames will be used
- **sort**: if TRUE (the default), order points from low to high score. If a vector, order according to these values from low to high. Only applies when margin = "documents".
- **groups**: either: a character vector containing the names of document variables to be used for grouping; or a factor or object that can be coerced into a factor equal in length or rows to the number of documents. NA values of the grouping value are dropped. See groups for details.
- **highlighted**: a vector of feature names to draw attention to in a feature plot; only applies if margin = "features"
- **alpha**: A number between 0 and 1 (default 0.5) representing the level of alpha transparency used to overplot feature names in a feature plot; only applies if margin = "features"
- **highlighted_color**: color for highlighted terms in highlighted

Value

- a ggplot2 object

Note

The groups argument only applies when margin = "documents".
