Package ‘quanteda’

January 30, 2019

Version  1.4.0
Title  Quantitative Analysis of Textual Data
Description  A fast, flexible, and comprehensive framework for
quantitative text analysis in R. Provides functionality for corpus management,
creating and manipulating tokens and ngrams, exploring keywords in context,
forming and manipulating sparse matrices
of documents by features and feature co-
ocurrences, analyzing keywords, computing feature similarities and
distances, applying content dictionaries, applying supervised and unsupervised machine learning,
visually representing text and text analyses, and more.
License  GPL-3
Depends  R (>= 3.1.0), methods
Imports  data.table (>= 1.9.6), extrafont, fastmatch, ggplot2 (>=
2.2.0), ggrepel, lubridate, magrittr, Matrix (>= 1.2), network,
RSpectra, Rcpp (>= 0.12.12), RcppParallel, sna, SnowballC,
spaCy, stopwords, stringi, xml2, yaml
LinkingTo  Rcpp, RcppParallel, RcppArmadillo (>= 0.7.600.1.0)
Suggests  ca, dplyr, DT, e1071, entropy, ExPosition, lda, lsa, proxy,
purrr, RColorBrewer, rmarkdown, slam, spelling, stm, svs,
testthat, text2vec, tibble, tidytext, tm (>= 0.6), topicmodels,
xtable, knitr, igraph, wordcloud

**Description**

A set of functions for creating and managing text corpora, extracting features from text corpora, and analyzing those features using quantitative methods.

**quanteda** makes it easy to manage texts in the form of a corpus, defined as a collection of texts that includes document-level variables specific to each text, as well as meta-data for documents and for the collection as a whole. **quanteda** includes tools to make it easy and fast to manipulate the texts in a corpus, by performing the most common natural language processing tasks simply and quickly, such as tokenizing, stemming, or forming ngrams. **quanteda**’s functions for tokenizing texts and forming multiple tokenized documents into a document-feature matrix are both extremely fast and extremely simple to use. **quanteda** can segment texts easily by words, paragraphs, sentences, or even user-supplied delimiters and tags.

Built on the text processing functions in the stringi package, which is in turn built on C++ implementation of the ICU libraries for Unicode text handling, **quanteda** pays special attention to fast and correct implementation of Unicode and the handling of text in any character set.

**quanteda** is built for efficiency and speed, through its design around three infrastructures: the stringi package for text processing, the data.table package for indexing large documents efficiently, and the Matrix package for sparse matrix objects. If you can fit it into memory, **quanteda** will handle it quickly. (And eventually, we will make it possible to process objects even larger than available memory.)

**quanteda** is principally designed to allow users a fast and convenient method to go from a corpus of texts to a selected matrix of documents by features, after defining what the documents and features. The package makes it easy to redefine documents, for instance by splitting them into sentences or paragraphs, or by tags, as well as to group them into larger documents by document variables, or to subset them based on logical conditions or combinations of document variables. The package also implements common NLP feature selection functions, such as removing stopwords and stemming in numerous languages, selecting words found in dictionaries, treating words as equivalent based on a user-defined "thesaurus", and trimming and weighting features based on document frequency, feature frequency, and related measures such as tf-idf.

Once constructed, a **quanteda** document-feature matrix ("dfm") can be easily analyzed using either **quanteda**’s built-in tools for scaling document positions, or used with a number of other text analytic tools, such as: topic models (including converters for direct use with the topicmodels, LDA, and stm packages) document scaling (using **quanteda**’s own functions for the "wordfish"
and "Wordscores" models, direct use with the `ca` package for correspondence analysis, or scaling with the austin package) machine learning through a variety of other packages that take matrix or matrix-like inputs.

Additional features of `quanteda` include:

- powerful, flexible tools for working with dictionaries;
- the ability to identify keywords associated with documents or groups of documents;
- the ability to explore texts using key-words-in-context;
- fast computation of a variety of readability indexes;
- fast computation of a variety of lexical diversity measures;
- quick computation of word or document similarities, for clustering or to compute distances for other purposes;
- a comprehensive suite of descriptive statistics on text such as the number of sentences, words, characters, or syllables per document; and
- flexible, easy to use graphical tools to portray many of the analyses available in the package.

as.corpus.corpuszip  Coerce a compressed corpus to a standard corpus

Description

Recast a compressed corpus object into a standard (uncompressed) corpus object.

Usage

```r
## S3 method for class 'corpuszip'
as.corpus(x)
```

Arguments

- `x`: a compressed `corpus` object

as.dfm  Coercion and checking functions for dfm objects

Description

Convert an eligible input object into a dfm, or check whether an object is a dfm. Current eligible inputs for coercion to a dfm are: `matrix`, (sparse) `Matrix`, `TermDocumentMatrix`, `DocumentTermMatrix`, `data.frame`, and other `dfm` objects.

Usage

```r
as.dfm(x)

is.dfm(x)
```

Arguments

- `x`: a candidate object for checking or coercion to `dfm`

Value

`as.dfm` converts an input object into a `dfm`. Row names are used for docnames, and column names for featnames, of the resulting dfm.

`is.dfm` returns `TRUE` if and only if its argument is a `dfm`. 
as.dictionary

Coercion and checking functions for dictionary objects

Description

Convert a dictionary from a different format into a quanteda dictionary, or check to see if an object is a dictionary.

Usage

as.dictionary(x, format = c("tidytext"), separator = " ",
   tolower = FALSE)

is.dictionary(x)

Arguments

x  
a dictionary-like object to be coerced or checked

format  
input format for the object to be coerced to a dictionary; current legal values are a data.frame with the fields word and sentiment (as per the tidytext package)

separator  
the character in between multi-word dictionary values. This defaults to " ".

tolower  
if TRUE, convert all dictionary values to lowercase

Value

as.dictionary returns a quanteda dictionary object. This conversion function differs from the dictionary constructor function in that it converts an existing object rather than creates one from components or from a file.

is.dictionary returns TRUE if an object is a quanteda dictionary.

Examples

## Not run:
data(sentiments, package = "tidytext")
as.dictionary(subset(sentiments, lexicon == "nrc"))
as.dictionary(subset(sentiments, lexicon == "bing"))
# to convert AFINN into polarities - adjust thresholds if desired
datafinn <- subset(sentiments, lexicon == "AFINN")
datafinn[['sentiment']] <-
   with(datafinn,
      sentiment <- ifelse(score < 0, "negative",
                      ifelse(score > 0, "positive", "netural")))
with(datafinn, table(score, sentiment))
as.dictionary(datafinn)

dat <- data.frame(
  word = c("Great", "Horrible"),
  sentiment = c("positive", "negative")
)

as.dictionary(dat)

as.dictionary(dat, tolower = FALSE)

## End(Not run)

is.dictionary(dictionary(list(key1 = c("val1", "val2"), key2 = "val3")))
# [1] TRUE
is.dictionary(dictionary(list(key1 = c("val1", "val2"), key2 = "val3")))
# [1] FALSE

---

as.list.dist  
**Coerce a dist object into a list**

Description

Coerce a dist matrix into a list of selected target terms and similar terms, in descending order of similarity. Can be used after calling `textstat_simil` or `textstat_dist`.

Usage

```r
## S3 method for class 'dist'
as.list(x, sorted = TRUE, n = NULL, ...)
```

Arguments

- `x`: dist class object
- `sorted`: sort results in descending order if TRUE
- `n`: the top `n` highest-ranking items will be returned. If `n` is NULL, return all items.
- `...`: unused

---

as.matrix.dfm  
**Coerce a dfm to a matrix or data.frame**

Description

Methods for coercing a `dfm` object to a matrix or data.frame object.

Usage

```r
## S3 method for class 'dfm'
as.matrix(x, ...)
```
Arguments

x    dfm to be coerced
...  unused

Examples

# coercion to matrix
as.matrix(data_dfm_lbgexample[, 1:10])

Description

Coercion functions to and from tokens objects, checks for whether an object is a tokens object, and
functions to combine tokens objects.

Usage

as.tokens(x, concatenator = "_", ...)

## S3 method for class 'list'
as.tokens(x, concatenator = "_", ...)

## S3 method for class 'spacyr_parsed'
as.tokens(x, concatenator = "/",    
           include_pos = c("none", "pos", "tag"), use_lemma = FALSE, ...)

## S3 method for class 'tokens'
as.list(x, ...)

## S3 method for class 'tokens'
as.character(x, use.names = FALSE, ...)

is.tokens(x)

## S3 method for class 'tokens'
unlist(x, recursive = FALSE, use.names = TRUE)

## S3 method for class 'tokens'
t1 + t2

## S3 method for class 'tokens'
c(...)
**Arguments**

- **x** object to be coerced or checked
- **concatenator** character between multi-word expressions, default is the underscore character. See Details.
- ... additional arguments used by specific methods. For `c.tokens`, these are the tokens objects to be concatenated.
- **include_pos** character; whether and which part-of-speech tag to use: "none" do not use any part of speech indicator, "pos" use the pos variable, "tag" use the tag variable. The POS will be added to the token after "concatenator".
- **use_lemma** logical; if TRUE, use the lemma rather than the raw token
- **use_names** logical; preserve names if TRUE. For as.character and unlist only.
- **recursive** a required argument for unlist but inapplicable to tokens objects
- **t1** tokens one to be added
- **t2** tokens two to be added

**Details**

The concatenator is used to automatically generate dictionary values for multi-word expressions in `tokens_lookup` and `dfm_lookup`. The underscore character is commonly used to join elements of multi-word expressions (e.g. "piece_of_cake", "New_York"), but other characters (e.g. whitespace " " or a hyphen "-") can also be used. In those cases, users have to tell the system what is the concatenator in your tokens so that the conversion knows to treat this character as the inter-word delimiter, when reading in the elements that will become the tokens.

**Value**

- `as.tokens` returns a quanteda tokens object.
- `as.list` returns a simple list of characters from a tokens object.
- `as.character` returns a character vector from a tokens object.
- `is.tokens` returns TRUE if the object is of class tokens, FALSE otherwise.
- `unlist` returns a simple vector of characters from a tokens object.
- `c(...)` and `+` return a tokens object whose documents have been added as a single sequence of documents.

**Examples**

```r
# create tokens object from list of characters with custom concatenator
dict <- dictionary(country = "United States",
                     sea = c("Atlantic Ocean", "Pacific Ocean"))
lis <- list(c("The", "United-States", "has", "the", "Atlantic-Ocean",
                     "and", "the", "Pacific-Ocean", "."))
toks <- as.tokens(lis, concatenator = "-")
tokens_lookup(toks, dict)
```
\# combining tokens
toks1 <- tokens(c(doc1 = "a b c d e", doc2 = "f g h"))
toks2 <- tokens(c(doc3 = "1 2 3"))
toks1 + toks2
c(toks1, toks2)

as.yaml

\textit{Convert quanteda dictionary objects to the YAML format}

\textbf{Description}

Converts a \texttt{quanteda} dictionary object constructed by the \texttt{dictionary} function into the YAML format. The YAML files can be edited in text editors and imported into \texttt{quanteda} again.

\textbf{Usage}

\texttt{as.yaml(x)}

\textbf{Arguments}

\begin{itemize}
  \item \texttt{x} a dictionary object
\end{itemize}

\textbf{Value}

\texttt{as.yaml} a dictionary in the YAML format, as a character object

\textbf{Examples}

\begin{verbatim}
## Not run:
dict <- dictionary(list(one = c("a b", "c*"), two = c("x", "y", "z??")))
cat(yaml <- as.yaml(dict))
cat(yaml, file = (yamlfile <- paste0(tempfile(), ".yml")))
dictionary(file = yamlfile)

## End(Not run)
\end{verbatim}

\textbf{bootstrap_dfm}

\textit{Bootstrap a dfm}

\textbf{Description}

Create an array of resampled dfms.

\textbf{Usage}

\texttt{bootstrap_dfm(x, n = 10, ..., verbose = quanteda_options("verbose"))}
char_tolower

Arguments

- x: a character or corpus object
- n: number of resamples
- ...: additional arguments passed to dfm
- verbose: if TRUE print status messages

Details

Function produces multiple, resampled dfm objects, based on resampling sentences (with replacement) from each document, recombining these into new "documents" and computing a dfm for each. Resampling of sentences is done strictly within document, so that every resampled document will contain at least some of its original tokens.

Value

A named list of dfm objects, where the first, dfm_0, is the dfm from the original texts, and subsequent elements are the sentence-resampled dfms.

Author(s)

Kenneth Benoit

Examples

```r
# bootstrapping from the original text
set.seed(10)

txt <- c(textone = "This is a sentence. Another sentence. Yet another.",
         texttwo = "Premiere phrase. Deuxieme phrase.")

bootstrap_dfm(txt, n = 3, verbose = TRUE)
```

Description

char_tolower and char_toupper are replacements for tolower and toupper based on the stringi package. The stringi functions for case conversion are superior to the base functions because they correctly handle case conversion for Unicode. In addition, the *tolower* functions provide an option for preserving acronyms.

Usage

```r
char_tolower(x, keep_acronyms = FALSE, ...)
char_toupper(x, ...)
```
convert

Arguments

x the input object whose character/tokens/feature elements will be case-converted
keep_acronyms logical; if TRUE, do not lowercase any all-uppercase words (applies only to *
_tolower functions)
... additional arguments passed to stringi functions, (e.g. stri_trans_tolower), such as locale

Examples

txt1 <- c(txt1 = "b A A", txt2 = "C c a b B")
char_tolower(txt1)
char_toupper(txt1)

# with acronym preservation
txt2 <- c(txt1 = "England and France are members of NATO and UNESCO",
           text2 = "NASA sent a rocket into space.")
char_tolower(txt2)
char_tolower(txt2, keep_acronyms = TRUE)
char_toupper(txt2)

convert Convert a dfm to a non-quanteda format

Description

Convert a quanteda dfm object to a format useable by other text analysis packages. The general function convert provides easy conversion from a dfm to the document-term representations used in all other text analysis packages for which conversions are defined.

Usage

convert(x, to = c("lda", "tm", "stm", "austin", "topicmodels", "lsa",
                   "matrix", "data.frame", "tripletlist"), docvars = NULL)

Arguments

x a dfm to be converted
to target conversion format, consisting of the name of the package into whose
document-term matrix representation the dfm will be converted:
  "lda" a list with components "documents" and "vocab" as needed by the function lda.collapsed.gibbs.sampler from the lda package
  "tm" a DocumentTermMatrix from the tm package
  "stm" the format for the stm package
  "austin" the wfm format from the austin package
  "topicmodels" the "dtm" format as used by the topicmodels package
  "lsa" the "textmatrix" format as used by the lsa package
convert

"data.frame" a data.frame where each feature is a variable
"tripletlist" a named "triplet" format list consisting of document, feature, and frequency

docvars optional data.frame of document variables used as the meta information in conversion to the stm package format. This aids in selecting the document variables only corresponding to the documents with non-zero counts.

Value

A converted object determined by the value of to (see above). See conversion target package documentation for more detailed descriptions of the return formats.

Examples

corp <- corpus_subset(data_corpus_inaugural, Year > 1970)
dfmat1 <- dfm(corp)

# austins wfm format
identical(dim(dfmat1), dim(convert(dfmat1, to = "austin")))

# stm package format
stmmat <- convert(dfmat1, to = "stm")
str(stmmat)

# triplet
tripletmat <- convert(dfmat1, to = "tripletlist")
str(tripletmat)

# illustrate what happens with zero-length documents
dfmat2 <- dfm(c(punctOnly = "!!!", corp[-1]))
rowSums(dfmat2)
str(convert(dfmat2, to = "stm", docvars = docvars(corp)))

## Not run:
# tm's DocumentTermMatrix format
tmdfm <- convert(dfmat1, to = "tm")
str(tmdfm)

# topicmodels package format
str(convert(dfmat1, to = "topicmodels"))

# lda package format
str(convert(dfmat1, to = "lda"))

## End(Not run)
Construct a corpus object

Description

Creates a corpus object from available sources. The currently available sources are:

- a character vector, consisting of one document per element; if the elements are named, these names will be used as document names.
- a data.frame (or a tibble tbl_df), whose default document id is a variable identified by docid_field; the text of the document is a variable identified by textid_field; and other variables are imported as document-level meta-data. This matches the format of data.frames constructed by the the readtext package.
- a kwic object constructed by kwic.
- a tm VCorpus or SimpleCorpus class object, with the fixed metadata fields imported as docvars and corpus-level metadata imported as metacorpus information.
- a corpus object.

Usage

corpus(x, ...)

### S3 method for class 'corpus'
corpus(x, docnames = quanteda::docnames(x),
       docvars = quanteda::docvars(x), metacorpus = quanteda::metacorpus(x),
       compress = FALSE, ...)

### S3 method for class 'character'
corpus(x, docnames = NULL, docvars = NULL,
        metacorpus = NULL, compress = FALSE, ...)

### S3 method for class 'data.frame'
corpus(x, docid_field = "doc_id",
        text_field = "text", metacorpus = NULL, compress = FALSE, ...)

### S3 method for class 'kwic'
corpus(x, split_context = TRUE, extract_keyword = TRUE,
        ...

### S3 method for class 'Corpus'
corpus(x, metacorpus = NULL, compress = FALSE, ...)

Arguments

- x a valid corpus source object
- ... not used directly
corpus

docnames Names to be assigned to the texts. Defaults to the names of the character vector (if any); doc_id for a data.frame; the document names in a \texttt{tm} corpus; or a vector of user-supplied labels equal in length to the number of documents. If none of these are round, then “text1”, “text2”, etc. are assigned automatically.

docvars a data.frame of document-level variables associated with each text

metacorpus a named list containing additional (character) information to be added to the corpus as corpus-level metadata. Special fields recognized in the \texttt{summary.corpus} are:

- source a description of the source of the texts, used for referencing;
- citation information on how to cite the corpus; and
- notes any additional information about who created the text, warnings, to do lists, etc.

compress logical; if \texttt{TRUE}, compress the texts in memory using gzip compression. This significantly reduces the size of the corpus in memory, but will slow down operations that require the texts to be extracted.

docid_field optional column index of a document identifier; defaults to "doc_id", but if this is not found, then will use the rownames of the data.frame; if the rownames are not set, it will use the default sequence based on \texttt{(quanteda.options}("base_docname")\texttt{)}.

text_field the character name or numeric index of the source data.frame indicating the variable to be read in as text, which must be a character vector. All other variables in the data.frame will be imported as docvars. This argument is only used for data.frame objects (including those created by \texttt{readtext}).

split_context logical; if \texttt{TRUE}, split each kwic row into two "documents", one for "pre" and one for "post", with this designation saved in a new docvar \texttt{context} and with the new number of documents therefore being twice the number of rows in the kwic.

extract_keyword logical; if \texttt{TRUE}, save the keyword matching pattern as a new docvar \texttt{keyword}

Details

The texts and document variables of corpus objects can also be accessed using index notation. Indexing a corpus object as a vector will return its text, equivalent to \texttt{texts(x)}. Note that this is not the same as subsetting the entire corpus – this should be done using the \texttt{subset} method for a corpus.

Indexing a corpus using two indexes (integers or column names) will return the document variables, equivalent to \texttt{docvars(x)}. It is also possible to access, create, or replace docvars using list notation, e.g.

\begin{verbatim}
myCorpus["newSerialDocvar"] <- paste0("tag", 1:ndoc(myCorpus)).
\end{verbatim}

For details, see \texttt{corpus-class}.

Value

A \texttt{corpus-class} class object containing the original texts, document-level variables, document-level metadata, corpus-level metadata, and default settings for subsequent processing of the corpus.
A warning on accessing corpus elements

A corpus currently consists of an S3 specially classed list of elements, but you should not access these elements directly. Use the extractor and replacement functions instead, or else your code is not only going to be uglier, but also likely to break should the internal structure of a corpus object change (as it inevitably will as we continue to develop the package, including moving corpus objects to the S4 class system).

summary(corpus(dat, text_field = "some_text",
    metacorpus = list(source = "From a data.frame called mydf.")))

# construct a corpus from a kwic object
corpus_reshape

Recast the document units of a corpus

Description
For a corpus, reshape (or recast) the documents to a different level of aggregation. Units of aggregation can be defined as documents, paragraphs, or sentences. Because the corpus object records its current "units" status, it is possible to move from recast units back to original units, for example from documents, to sentences, and then back to documents (possibly after modifying the sentences).

Usage
corpus_reshape(x, to = c("sentences", "paragraphs", "documents"),
        use_docvars = TRUE, ...)

Arguments
- **x**: corpus whose document units will be reshaped
- **to**: new document units in which the corpus will be recast
- **use_docvars**: if TRUE, repeat the docvar values for each segmented text; if FALSE, drop the docvars in the segmented corpus. Dropping the docvars might be useful in order to conserve space or if these are not desired for the segmented corpus.
- **...**: additional arguments passed to `tokens`, since the syntactic segmenter uses this function

Value
A corpus object with the documents defined as the new units, including document-level meta-data identifying the original documents.

Examples
# simple example
corp1 <- corpus(c(textone = "This is a sentence. Another sentence. Yet another.",
                texttwo = "Premiere phrase. Deuxieme phrase."),
                docvars = data.frame(country=c("UK", "USA"), year=c(1990, 2000)),
                metacorpus = list(notes = "Example showing how corpus_reshape() works."))
summary(corp1)
summary(corpus_reshape(corp1, to = "sentences"), showmeta = TRUE)
corpus_sample

Randomly sample documents from a corpus

Description

Take a random sample of documents of the specified size from a corpus, with or without replacement. Works just as \texttt{sample} works for the documents and their associated document-level variables.

Usage

\begin{verbatim}
corpus_sample(x, size = ndoc(x), replace = FALSE, prob = NULL, by = NULL, ...)
\end{verbatim}

Arguments

\begin{itemize}
  \item \texttt{x} \hspace{1cm} a corpus object whose documents will be sampled
  \item \texttt{size} \hspace{1cm} a positive number, the number of documents to select
  \item \texttt{replace} \hspace{1cm} Should sampling be with replacement?
  \item \texttt{prob} \hspace{1cm} A vector of probability weights for obtaining the elements of the vector being sampled. May not be applied when \texttt{by} is used.
  \item \texttt{by} \hspace{1cm} a grouping variable for sampling. Useful for resampling sub-document units such as sentences, for instance by specifying \texttt{by = "document"}
  \item \ldots \hspace{1cm} unused
\end{itemize}

Value

A corpus object with number of documents equal to \texttt{size}, drawn from the corpus \texttt{x}. The returned corpus object will contain all of the meta-data of the original corpus, and the same document variables for the documents selected.

Examples

\begin{verbatim}
set.seed(2000)
# sampling from a corpus
summary(corpus_sample(data_corpus_inaugural, 5))
summary(corpus_sample(data_corpus_inaugural, 10, replace = TRUE))

# sampling sentences within document
\end{verbatim}
corpus_segment

```
corp <- corpus(c(one = "Sentence one. Sentence two. Third sentence.",
                           two = "First sentence, doc2. Second sentence, doc2."))
corpsent <- corpus_reshape(corp, to = "sentences")
texts(corpsent)
texts(corpus_sample(corpsent, replace = TRUE, by = "document"))
```

corpus_segment  Segment texts on a pattern match

Description

Segment corpus text(s) or a character vector, splitting on a pattern match. This is useful for breaking
the texts into smaller documents based on a regular pattern (such as a speaker identifier in a
transcript) or a user-supplied annotation.

Usage

```
corpus_segment(x, pattern = "###", valuetype = c("glob", "regex",
                            "fixed"), case_insensitive = TRUE, extract_pattern = TRUE,
                            pattern_position = c("before", "after"), use_docvars = TRUE)
```

```
char_segment(x, pattern = "###", valuetype = c("glob", "regex",
                            "fixed"), case_insensitive = TRUE, remove_pattern = TRUE,
                            pattern_position = c("before", "after"))
```

Arguments

- **x**: character or corpus object whose texts will be segmented
- **pattern**: a character vector, list of character vectors, dictionary, or collocations object. See pattern for details.
- **valuetype**: the type of pattern matching: "glob" for "glob"-style wildcard expressions; "regex" for regular expressions; or "fixed" for exact matching. See value-type for details.
- **case_insensitive**: ignore case when matching, if TRUE
- **extract_pattern**: extracts matched patterns from the texts and save in docvars if TRUE
- **pattern_position**: either "before" or "after", depending on whether the pattern precedes the text (as with a user-supplied tag, such as ##INTRO in the examples below) or follows the text (as with punctuation delimiters)
- **use_docvars**: if TRUE, repeat the docvar values for each segmented text; if FALSE, drop the docvars in the segmented corpus. Dropping the docvars might be useful in order to conserve space or if these are not desired for the segmented corpus.
- **remove_pattern**: removes matched patterns from the texts if TRUE
Details
For segmentation into syntactic units defined by the locale (such as sentences), use `corpus_reshape` instead. In cases where more fine-grained segmentation is needed, such as that based on commas or semi-colons (phrase delimiters within a sentence), `corpus_segment` offers greater user control than `corpus_reshape`.

Value
`corpus_segment` returns a corpus of segmented texts
`char_segment` returns a character vector of segmented texts

Boundaries and segmentation explained
The pattern acts as a boundary delimiter that defines the segmentation points for splitting a text into new "document" units. Boundaries are always defined as the pattern matches, plus the end and beginnings of each document. The new "documents" that are created following the segmentation will then be the texts found between boundaries.

The pattern itself will be saved as a new document variable named `pattern`. This is most useful when segmenting a text according to tags such as names in a transcript, section titles, or user-supplied annotations. If the beginning of the file precedes a pattern match, then the extracted text will have a `NA` for the extracted `pattern` document variable (or when `pattern_position = "after"`, this will be true for the text split between the last pattern match and the end of the document).

To extract syntactically defined sub-document units such as sentences and paragraphs, use `corpus_reshape` instead.

Using patterns
One of the most common uses for `corpus_segment` is to partition a corpus into sub-documents using tags. The default pattern value is designed for a user-annotated tag that is a term beginning with double "hash" signs, followed by a whitespace, for instance as `##INTRODUCTION The text.`

Glob and fixed pattern types use a whitespace character to signal the end of the pattern.

For more advanced pattern matches that could include whitespaces or newlines, a regex pattern type can be used, for instance a text such as

```
Mr. Smith: Text
Mrs. Jones: More text
```

could have as pattern = "$\b[A-Z].+\\s[A-Z][a-z]+: $", which would catch the title, the name, and the colon.

For custom boundary delimitation using punctuation characters that come come at the end of a clause or sentence (such as , and .), these can be specified manually and `pattern_position` set to "after". To keep the punctuation characters in the text (as with sentence segmentation), set `extract_pattern = FALSE`. (With most tag applications, users will want to remove the patterns from the text, as they are annotations rather than parts of the text itself.)

See Also
`corpus_reshape`, for segmenting texts into pre-defined syntactic units such as sentences, paragraphs, or fixed-length chunks
Examples

## segmenting a corpus

### segmenting a corpus using tags

corp1 <- corpus(c("##INTRO This is the introduction.
##DOC1 This is the first document. Second sentence in Doc 1.
", "##INTRO Document ##NUMBER Two starts before ##NUMBER Three."))
corpseg1 <- corpus_segment(corp1, pattern = "##*")
cbind(texts(corpseg1), docvars(corpseg1), metadoc(corpseg1))

### segmenting a transcript based on speaker identifiers

corp2 <- corpus("Mr. Smith: Text.\nMrs. Jones: More text.\nMr. Smith: I'm speaking, again.")
corpseg2 <- corpus_segment(corp2, pattern = "\b[a-zA-Z].\s[a-zA-Z][a-z]+\", valuetype = "regex")
cbind(texts(corpseg2), docvars(corpseg2), metadoc(corpseg2))

### segmenting a corpus using crude end-of-sentence segmentation

corpseg3 <- corpus_segment(corp1, pattern = ".\", valuetype = "fixed",
                           pattern_position = "after", extract_pattern = FALSE)
cbind(texts(corpseg3), docvars(corpseg3), metadoc(corpseg3))

### segmenting a character vector

cat(data_char_ukimmig2010[4])
char_segment(data_char_ukimmig2010[4],
             pattern = "\n\n\n\s(0,1)\", valuetype = "regex",
             remove_pattern = TRUE)

### segment a text into clauses

txt <- c(d1 = "This, is a sentence? You: come here.",
        d2 = "Yes, yes okay."
char_segment(txt, pattern = "\p{P}\", valuetype = "regex",
             pattern_position = "after", remove_pattern = FALSE)
corpus_trim

Arguments

x  corpus object to be subsetted
subset logical expression indicating the documents to keep: missing values are taken as false
select expression, indicating the docvars to keep

Value
corpus object, with a subset of documents (and docvars) selected according to arguments

See Also
subset.data.frame

Examples

summary(corpus_subset(data_corpus_inaugural, Year > 1980))
summary(corpus_subset(data_corpus_inaugural, Year > 1930 & President == "Roosevelt", select = Year))

corpus_trim  Remove sentences based on their token lengths or a pattern match

Description
Removes sentences from a corpus or a character vector shorter than a specified length.

Usage

corpus_trim(x, what = c("sentences", "paragraphs", "documents"),
min_ntoken = 1, max_ntoken = NULL, exclude_pattern = NULL)

corpus_trim(x, what = c("sentences", "paragraphs", "documents"),
min_ntoken = 1, max_ntoken = NULL, exclude_pattern = NULL)

Arguments

x corpus or character object whose sentences will be selected.
what units of trimming, "sentences" or "paragraphs", or "documents"
min_ntoken, max_ntoken minimum and maximum lengths in word tokens (excluding punctuation)
exclude_pattern a string regular expression whose match (at the sentence level) will be used to exclude sentences
Value

A corpus or character vector equal in length to the input. If the input was a corpus, then all
docvars and metadata are preserved. For documents whose sentences have been removed entirely,
a null string ("") will be returned.

Examples

txt <- c("PAGE 1. This is a single sentence. Short sentence. Three word sentence.",
"PAGE 2. Very short! Shorter.",
"Very long sentence, with multiple parts, separated by commas. PAGE 3.")
corp <- corpus(txt, docvars = data.frame(serial = 1:3))
texts(corp)

# exclude sentences shorter than 3 tokens
texts(corpus_trim(corp, min_ntoken = 3))
# exclude sentences that start with "PAGE <digit(s)>"
texts(corpus_trim(corp, exclude_pattern = "^PAGE \d+"))

# trimming character objects
char_trim(txt, "sentences", min_ntoken = 3)
char_trim(txt, "sentences", exclude_pattern = "sentence\n".)

data_char_sampletext  A paragraph of text for testing various text-based functions

Description

This is a long paragraph (2,914 characters) of text taken from a debate on Joe Higgins, delivered
December 8, 2011.

Usage

data_char_sampletext

Format

character vector with one element

Source

749, no. 1.

Examples

tokens(data_char_sampletext, remove_punct = TRUE)
data_char_ukimmig2010  Immigration-related sections of 2010 UK party manifestos

Description

Extracts from the election manifestos of 9 UK political parties from 2010, related to immigration or asylum-seekers.

Usage

data_char_ukimmig2010

Format

A named character vector of plain ASCII texts

Examples

data_corpus_ukimmig2010 <-
corpus(data_char_ukimmig2010, 
docvars = data.frame(party = names(data_char_ukimmig2010)))
metadoc(data_corpus_ukimmig2010, "language") <- "english"
summary(data_corpus_ukimmig2010, showmeta = TRUE)

data_corpus_dailnoconf1991  Confidence debate from 1991 Irish Parliament

Description

Texts of speeches from a no-confidence motion debated in the Irish Dáil from 16-18 October 1991 over the future of the Fianna Fail-Progressive Democrat coalition. (See Laver and Benoit 2002 for details.)

Usage

data_corpus_dailnoconf1991

Format

data_corpus_dailnoconf1991 is a corpus with 58 texts, including docvars for name, party, and position.

Source

## References

## Examples

```r
## Not run:
data_dfm_dailnoconf1991 <- dfm(data_corpus_dailnoconf1991, remove_punct = TRUE)
tmod <- textmodel_affinity(data_dfm_dailnoconf1991, 
c("Govt", "Opp", "Opp", rep(NA, 55)))
(pred <- predict(tmod))
dat <-
data.frame(party = as.character(docvars(data_corpus_dailnoconf1991, "party")),
   govt = coef(pred)[, "Govt"],
   position = as.character(docvars(data_corpus_dailnoconf1991, "position")),
   stringsAsFactors = FALSE)
bymedian <- with(dat, reorder(paste(party, position), govt, median))
par(mar = c(5, 6, 4, 2)+.1)
boxplot(govt ~ bymedian, data = dat,
horizontal = TRUE, las = 1,
  xlab = "Degree of support for government")
abline(h = 7.5, col = "red", lty = "dashed")
text(c(0.9, 0.9), c(8.5, 6.5), c("Government", "Opposition"))

## End(Not run)
```

---

**data_corpus_inaugural**  
*US presidential inaugural address texts*

### Description

US presidential inaugural address texts, and metadata (for the corpus), from 1789 to present.

### Usage

```r
data_corpus_inaugural
```

### Format

A corpus object with the following docvars:

- Year a four-digit integer year
- President character; President’s last name
- FirstName character; President’s first name (and possibly middle initial)
**Details**

data_corpus_inaugural is the quanteda-package corpus object of US presidents’ inaugural addresses since 1789. Document variables contain the year of the address and the last name of the president.

**Source**

**Examples**

```r
# some operations on the inaugural corpus
summary(data_corpus_inaugural)
head(docvars(data_corpus_inaugural), 10)
```

---

**data_corpus_irishbudget2010**

*Irish budget speeches from 2010*

---

**Description**

Speeches and document-level variables from the debate over the Irish budget of 2010.

**Usage**

data_corpus_irishbudget2010

**Format**

The corpus object for the 2010 budget speeches, with document-level variables for year, debate, serial number, first and last name of the speaker, and the speaker’s party.

**Details**

At the time of the debate, Fianna Fáil (FF) and the Greens formed the government coalition, while Fine Gael (FG), Labour (LAB), and Sinn Féin (SF) were in opposition.

**Source**

**References**

Examples

summary(data_corpus_irishbudget2010)

data_dfm_lbgexample  \textit{dfm from data in Table 1 of Laver, Benoit, and Garry (2003)}

Description

Constructed example data to demonstrate the Wordscores algorithm, from Laver Benoit and Garry (2003), Table 1.

Usage

data_dfm_lbgexample

Format

A \textit{dfm} object with 6 documents and 37 features.

Details

This is the example word count data from Laver, Benoit and Garry’s (2003) Table 1. Documents R1 to R5 are assumed to have known positions: -1.5, -0.75, 0, 0.75, 1.5. Document V1 is assumed unknown, and will have a raw text score of approximately -0.45 when computed as per LBG (2003).

References

data_dictionary_LSD2015

\textit{Lexicoder Sentiment Dictionary (2015)}

Description

The 2015 Lexicoder Sentiment Dictionary in \textit{quanteda} \textit{dictionary} format.

Usage

data_dictionary_LSD2015
**Format**

A dictionary of four keys containing glob-style pattern matches.

- negative 2,858 word patterns indicating negative sentiment
- positive 1,709 word patterns indicating positive sentiment
- neg_positive 1,721 word patterns indicating a positive word preceded by a negation (used to convey negative sentiment)
- neg_negative 2,860 word patterns indicating a negative word preceded by a negation (used to convey positive sentiment)

**Details**

The dictionary consists of 2,858 "negative" sentiment words and 1,709 "positive" sentiment words. A further set of 2,860 and 1,721 negations of negative and positive words, respectively, is also included. While many users will find the non-negation sentiment forms of the LSD adequate for sentiment analysis, Young and Soroka (2012) did find a small, but non-negligible increase in performance when accounting for negations. Users wishing to test this or include the negations are encouraged to subtract negated positive words from the count of positive words, and subtract the negated negative words from the negative count.

Young and Soroka (2012) also suggest the use of a pre-processing script to remove specific cases of some words (i.e., "good bye", or "nobody better", which should not be counted as positive). Pre-processing scripts are available at [http://lexicoder.com](http://lexicoder.com).

**License and Conditions**

The LSD is available for non-commercial academic purposes only. By using `data_dictionary_LSD2015`, you accept these terms.

Please cite the references below when using the dictionary.

**References**

**Examples**

```r
# simple example
txt <- "This aggressive policy will not win friends."
tokens_lookup(tokens(txt), dictionary = data_dictionary_LSD2015, exclusive = FALSE)

## tokens from 1 document.
## text1:
## [1] "This" "NEGATIVE" "policy" "will" "NEG_POSITIVE" "POSITIVE" "."

# on larger examples - notice that few negations are used
```
Create a document-feature matrix

Description

Construct a sparse document-feature matrix, from a character, corpus, tokens, or even other dfm object.

Usage

dfm(x, tolower = TRUE, stem = FALSE, select = NULL, remove = NULL,
dictionary = NULL, thesaurus = NULL, valuetype = c("glob", "regex", "fixed"), groups = NULL, verbose = quanteda_options("verbose"), ...)

Arguments

x character, corpus, tokens, or dfm object
tolower convert all features to lowercase
stem if TRUE, stem words
select a pattern of user-supplied features to keep, while excluding all others. This can be used in lieu of a dictionary if there are only specific features that a user wishes to keep. To extract only Twitter usernames, for example, set select = "@\w\b" and make sure that remove_twitter = FALSE as an additional argument passed to tokens. Note: select = "^@\w*" would be the regular expression version of this matching pattern. The pattern matching type will be set by valuetype. See also tokens_remove.
remove a pattern of user-supplied features to ignore, such as "stop words". To access one possible list (from any list you wish), use stopwords(). The pattern matching type will be set by valuetype. See also tokens_select. For behaviour of remove with ngrams > 1, see Details.
dictionary a dictionary object to apply to the tokens when creating the dfm
thesaurus a dictionary object that will be applied as if exclusive = FALSE. See also tokens_lookup. For more fine-grained control over this and other aspects of converting features into dictionary/thesaurus keys from pattern matches to values, consider creating the dfm first, and then applying dfm_lookup separately, or using tokens_lookup on the tokenized text before calling dfm.
dfm

vals

valuetype the type of pattern matching: "glob" for "glob"-style wildcard expressions; "regex" for regular expressions; or "fixed" for exact matching. See valuetype for details.

groups either: a character vector containing the names of document variables to be used for grouping; or a factor or object that can be coerced into a factor equal in length or rows to the number of documents. See groups for details.

verbose display messages if TRUE

... additional arguments passed to tokens; not used when x is a dfm

Details

The default behaviour for remove/select when constructing ngrams using dfm(x, ngrams > 1) is to remove/select any ngram constructed from a matching feature. If you wish to remove these before constructing ngrams, you will need to first tokenize the texts with ngrams, then remove the features to be ignored, and then construct the dfm using this modified tokenization object. See the code examples for an illustration.

To select on and match the features of a another dfm, x must also be a dfm.

Value

a dfm-class object

Note

When x is a dfm, groups provides a convenient and fast method of combining and refactoring the documents of the dfm according to the groups.

See Also

dfm_select, dfm-class

Examples

## for a corpus
dfmat1 <- corpus_subset(data_corpus_inaugural, Year > 1980)
dfm(dfmat1)
dfm(dfmat1, tolower = FALSE)

# grouping documents by docvars in a corpus
dfm(dfmat1, groups = "President", verbose = TRUE)

# with English stopwords and stemming
dfm(dfmat1, remove = stopwords("english"), stem = TRUE, verbose = TRUE)

# works for both words in ngrams too
dfm("Banking industry", stem = TRUE, ngrams = 2)

# with dictionaries
dfmat2 <- corpus_subset(data_corpus_inaugural, Year > 1980)
dict <- dictionary(list(christmas = c("Christmas", "Santa", "holiday"),
                        opposition = c("Opposition", "reject", "notincorpus")))
```r
taxing = "taxing",
taxation = "taxation",
taxregex = "tax*",
country = "states")
dfm(dfm2, dictionary = dict)

# removing stopwords
txt <- "The quick brown fox named Seamus jumps over the lazy dog also named Seamus, with the newspaper from a boy named Seamus, in his mouth."
corp <- corpus(txt)
# note: "also" is not in the default stopwords("english")
featernames(dfm(corp, select = stopwords("english")))
# for ngrams
featernames(dfm(corp, ngrams = 2, select = stopwords("english"), remove_punct = TRUE))
featernames(dfm(corp, ngrams = 1:2, select = stopwords("english"), remove_punct = TRUE))

# removing stopwords before constructing ngrams
toks1 <- tokens(char_tolower(txt), remove_punct = TRUE)
toks2 <- tokens_remove(toks1, stopwords("english"))
toks3 <- tokens_ngrams(toks2, 2)
featernames(dfm(toks3))

# keep only certain words
dfm(corp, select = "s") # keep only words ending in "s"
dfm(corp, select = "$", valuetype = "regex")

# testing Twitter functions
txttweets <- c("My homie @justinbieber #justinbieber shopping in #LA yesterday #beliebers",
   "2all the ha8ers including my bro @justinbieber #emabiggestfansjustinbieber",
   "Justin Bieber #justinbieber #belieber #fetusjustin #EMABiggestFansJustinBieber")
dfm(txttweets, select = "#*", remove_twitter = FALSE) # keep only hashtags
dfm(txttweets, select = "^#.*$", valuetype = "regex", remove_twitter = FALSE)

# for a dfm
dfm3 <- dfm(data_corpus_irishbudget2010)
dfm4 <- dfm(dfm3,
   groups = ifelse(docvars(data_corpus_irishbudget2010, "party") %in% c("FF", "Green"),
   "Govt", "Opposition"),
tolower = FALSE, verbose = TRUE)
```

---

**dfm_compress**

Recombine a dfm or fcm by combining identical dimension elements

**Description**

"Compresses" or groups a dfm or fcm whose dimension names are the same, for either documents or features. This may happen, for instance, if features are made equivalent through application of a thesaurus. It could also be needed after a `cbind.dfm` or `rbind.dfm` operation. In most cases, you
will not need to call `dfm_compress`, since it is called automatically by functions that change the dimensions of the dfm, e.g. `dfm_tolower`.

Usage

```r
dfm_compress(x, margin = c("both", "documents", "features"))
fcm_compress(x)
```

Arguments

- `x` input object, a dfm or fcm
- `margin` character indicating on which margin to compress a dfm, either "documents", "features", or "both" (default). For fcm objects, "documents" has no effect.
- `...` additional arguments passed from generic to specific methods

Value

`dfm_compress` returns a dfm whose dimensions have been recombined by summing the cells across identical dimension names (docnames or featnames). The docvars will be preserved for combining by features but not when documents are combined.

`fcm_compress` returns an fcm whose features have been recombined by combining counts of identical features, summing their counts.

Note

`fcm_compress` works only when the fcm was created with a document context.

Examples

```r
# dfm_compress examples
dfmat <- rbind(dfm(c("b A A", "C C a b B"), tolower = FALSE),
                dfm("A C C C C", tolower = FALSE))
colnames(dfmat) <- char_tolower(featnames(dfmat))
dfmat
dfm_compress(dfmat, margin = "documents")
dfm_compress(dfmat, margin = "features")
dfm_compress(dfmat)

# no effect if no compression needed
dfmatsubset <- dfm(data_corpus_inaugural[1:5])
dim(dfmatsubset)
dim(dfm_compress(dfmatsubset))

# compress an fcm
fcmat1 <- fcm(tokens("A D a C E a d F e B A C E D"),
               context = "window", window = 3)
## this will produce an error:
# fcm_compress(fcmat1)
```
dfm_group

Combine documents in a dfm by a grouping variable

Description

Combine documents in a dfm by a grouping variable, which can also be one of the docvars attached to the dfm. This is identical in functionality to using the "groups" argument in dfm.

Usage

dfm_group(x, groups = NULL, fill = FALSE)

Arguments

x a dfm

groups either: a character vector containing the names of document variables to be used for grouping; or a factor or object that can be coerced into a factor equal in length or rows to the number of documents. See groups for details.

fill logical; if TRUE and groups is a factor, then use all levels of the factor when forming the new "documents" of the grouped dfm. This will result in documents with zero feature counts for levels not observed. Has no effect if the groups variable(s) are not factors.

Value

dfm_group returns a dfm whose documents are equal to the unique group combinations, and whose cell values are the sums of the previous values summed by group. Document-level variables that have no variation within groups are saved in docvars. Document-level variables that are lists are dropped from grouping, even when these exhibit no variation within groups.

Setting the fill = TRUE offers a way to "pad" a dfm with document groups that may not have been observed, but for which an empty document is needed, for various reasons. If groups is a factor of dates, for instance, then using fill = TRUE ensures that the new documents will consist of one row of the dfm per date, regardless of whether any documents previously existed with that date.
Examples

corp <- corpus(c("a a b", "a b c c", "a c d d", "a c c d"),
               docvars = data.frame(grp = c("grp1", "grp1", "grp2", "grp2")))
dfmat <- dfm(corp)
dfm_group(dfmat, groups = "grp")
dfm_group(dfmat, groups = c(1, 1, 2, 2))

# equivalent
dfm(dfmat, groups = "grp")
dfm(dfmat, groups = c(1, 1, 2, 2))

dfm_lookup

Apply a dictionary to a dfm

Description

Apply a dictionary to a dfm by looking up all dfm features for matches in a a set of dictionary values, and replace those features with a count of the dictionary's keys. If exclusive = FALSE then the behaviour is to apply a "thesaurus", where each value match is replaced by the dictionary key, converted to capitals if capkeys = TRUE (so that the replacements are easily distinguished from features that were terms found originally in the document).

Usage

dfm_lookup(x, dictionary, levels = 1:5, exclusive = TRUE,
           valuertype = c("glob", "regex", "fixed"),
           case_insensitive = TRUE,
           capkeys = !exclusive, nomatch = NULL,
           verbose = quanteda_options("verbose"))

Arguments

x the dfm to which the dictionary will be applied
dictionary a dictionary class object
levels levels of entries in a hierarchical dictionary that will be applied
exclusive if TRUE, remove all features not in dictionary, otherwise, replace values in dictionary with keys while leaving other features unaffected
valuertype the type of pattern matching: "glob" for "glob"-style wildcard expressions; "regex" for regular expressions; or "fixed" for exact matching. See valuertype for details.

case_insensitive ignore the case of dictionary values if TRUE
capkeys if TRUE, convert dictionary keys to uppercase to distinguish them from other features
nomatch an optional character naming a new feature that will contain the counts of features of x not matched to a dictionary key. If NULL (default), do not tabulate unmatched features.
verbose print status messages if TRUE
dfm_match

Note

If using dfm_lookup with dictionaries containing multi-word values, matches will only occur if the features themselves are multi-word or formed from ngrams. A better way to match dictionary values that include multi-word patterns is to apply tokens_lookup to the tokens, and then construct the dfm.

See Also

dfm_replace

Examples

dict <- dictionary(list(christmas = c("Christmas", "Santa", "holiday"),
                      opposition = c("Opposition", "reject", "notincorporus"),
                      taxglob = "tax*",
                      taxregex = "tax.+$",
                      country = c("United_States", "Sweden")))
dfm <- dfm(c("My Christmas was ruined by your opposition tax plan.",
              "Does the United_States or Sweden have more progressive taxation?"),
             remove = stopwords("english"))
dfm

# glob format
dfm_lookup(dfm, dict, valuetype = "glob")
dfm_lookup(dfm, dict, valuetype = "glob", case_insensitive = FALSE)

# regex v. glob format: note that "united_states" is a regex match for "tax*"
dfm_lookup(dfm, dict, valuetype = "glob")
dfm_lookup(dfm, dict, valuetype = "regex", case_insensitive = TRUE)

# fixed format: no pattern matching
dfm_lookup(dfm, dict, valuetype = "fixed")
dfm_lookup(dfm, dict, valuetype = "fixed", case_insensitive = FALSE)

# show unmatched tokens
dfm_lookup(dfm, dict, nomatch = "_UNMATCHED")

Description

Match the feature set of a dfm to a specified vector of feature names. For existing features in x for which there is an exact match for an element of features, these will be included. Any features in x not features will be discarded, and any feature names specified in features but not found in x will be added with all zero counts.
Usage

```r
dfm_match(x, features)
```

Arguments

- `x`: a dfm
- `features`: character; the feature names to be matched in the output dfm

Details

Selecting on another dfm’s `featnames` is useful when you have trained a model on one dfm, and need to project this onto a test set whose features must be identical. It is also used in `bootstrap_dfm`.

Value

A dfm whose features are identical to those specified in `features`.

Note

Unlike `dfm_select`, this function will add feature names not already present in `x`. It also provides only fixed, case-sensitive matches. For more flexible feature selection, see `dfm_select`.

See Also

`dfm_select`

Examples

```r
# matching a dfm to a feature vector
dfm_match(dfm(""), letters[1:5])
dfm_match(data_dfm_lbgexample, c("A", "B", "Z"))
dfm_match(data_dfm_lbgexample, c("B", "newfeat1", "A", "newfeat2"))

# matching one dfm to another
txt <- c("This is text one", "The second text", "This is text three")
(dfmat1 <- dfm(txt[1:2]))
(dfmat2 <- dfm(txt[2:3]))
(dfmat3 <- dfm_match(dfmat1, featnames(dfmat2)))
setequal(featnames(dfmat2), featnames(dfmat3))
```

---

**dfm_replace**

Replace features in dfm

Description

Substitute features based on vectorized one-to-one matching for lemmatization or user-defined stemming.
dfm_sample

Usage

dfm_replace(x, pattern, replacement, case_insensitive = TRUE,
    verbose = quanteda_options("verbose"))

Arguments

x         dfm whose features will be replaced
pattern    a character vector. See pattern for more details.
replacement if pattern is a character vector, then replacement must be character vector of
    equal length, for a 1:1 match.
case_insensitive ignore case when matching, if TRUE
verbose     print status messages if TRUE

Examples

  dfmat1 <- dfm(data_corpus_irishbudget2010)

  # lemmatization
  lis <- c("foci", "focus", "focused", "focuses", "focusing", "focussed", "focusses")
  lemma <- rep("focus", length(lis))
  dfmat2 <- dfm_replace(dfmat1, pattern = lis, replacement = lemma)
  featnames(dfm_select(dfmat2, pattern = lis))

  # stemming
  feat <- featnames(dfmat1)
  featstem <- char_wordstem(feat, "porter")
  dfmat3 <- dfm_replace(dfmat1, pattern = feat, replacement = featstem, case_insensitive = FALSE)
  identical(dfmat3, dfm_wordstem(dfmat1, "porter"))

Randomly sample documents or features from a dfm

Description

Sample randomly from a dfm object, from documents or features.

Usage

  dfm_sample(x, size = ndoc(x), replace = FALSE, prob = NULL,
             margin = c("documents", "features"))
Arguments

x       the dfm object whose documents or features will be sampled
size    a positive number, the number of documents or features to select
replace logical; should sampling be with replacement?
prob    a vector of probability weights for obtaining the elements of the vector being sampled.
margin  dimension (of a dfm) to sample: can be documents or features

Value

A dfm object with number of documents or features equal to size, drawn from the dfm x.

See Also

sample

Examples

```r
set.seed(18)
dfmat <- dfm(data_corpus_inaugural[1:10])
head(dfmat)
head(dfm_sample(dfmat))
head(dfm_sample(dfmat, replace = TRUE))
head(dfm_sample(dfmat, margin = "features"))
```

Description

This function selects or removes features from a dfm or fcm, based on feature name matches with pattern. The most common usages are to eliminate features from a dfm already constructed, such as stopwords, or to select only terms of interest from a dictionary.

Usage

```r
dfm_select(x, pattern = NULL, selection = c("keep", "remove"),
value_type = c("glob", "regex", "fixed"), case_insensitive = TRUE,
min_nchar = 1L, max_nchar = 79L,
verbose = quanteda_options("verbose"))

dfm_remove(x, ...)

dfm_keep(x, ...)

cfm_select(x, pattern = NULL, selection = c("keep", "remove"),
```

```r
cfm_remove(x, ...)

cfm_keep(x, ...)
```
dfm_select

valuetype = c("glob", "regex", "fixed"), case_insensitive = TRUE,
verbose = quanteda_options("verbose"), ...)

fcm_remove(x, pattern = NULL, ...)

fcm_keep(x, pattern = NULL, ...)

Arguments

x the dfm or fcm object whose features will be selected
pattern a character vector, list of character vectors, dictionary, or collocations object. See pattern for details.
selection whether to keep or remove the features
valuetype the type of pattern matching: "glob" for "glob"-style wildcard expressions; "regex" for regular expressions; or "fixed" for exact matching. See value-type for details.
For dfm_select, pattern may also be a dfm; see Value below.
case_insensitive ignore the case of dictionary values if TRUE
min_nchar, max_nchar numerics specifying the minimum and maximum length in characters for features to be removed or kept; defaults are 1 and 79. (Set max_nchar to NULL for no upper limit.) These are applied after (and hence, in addition to) any selection based on pattern matches.
verbose if TRUE print message about how many pattern were removed
... used only for passing arguments from dfm_remove or dfm_keep to dfm_select. Cannot include selection.

Details

dfm_remove and fcm_remove are simply a convenience wrappers to calling dfm_select and fcm_select with selection = "remove".
dfm_keep and fcm_keep are simply a convenience wrappers to calling dfm_select and fcm_select with selection = "keep".

Value

A dfm or fcm object, after the feature selection has been applied.

For compatibility with earlier versions, when pattern is a dfm object and selection = "keep", then this will be equivalent to calling dfm_match. In this case, the following settings are always used: case_insensitive = FALSE, and valuetype = "fixed". This functionality is deprecated, however, and you should use dfm_match instead.

Note

This function selects features based on their labels. To select features based on the values of the document-feature matrix, use dfm_trim.
dfm_sort

Sort a dfm by frequency of one or more margins

dfm_sort(x, decreasing = TRUE, margin = c("features", "documents", "both"))

Arguments
x Document-feature matrix created by dfm
decreasing logical; if TRUE, the sort will be in descending order, otherwise sort in increasing order

description
Sorts a dfm by descending frequency of total features, total features in documents, or both.
dfm_subset

which margin to sort on features to sort by frequency of features, documents to sort by total feature counts in documents, and both to sort by both

Value

A sorted dfm matrix object

Author(s)

Ken Benoit

Examples

dfmat <- dfm(data_corpus_inaugural)
head(dfmat)
head(dfm_sort(dfmat))
head(dfm_sort(dfmat, decreasing = FALSE, "both"))

dfm_subset

Extract a subset of a dfm

Description

Returns document subsets of a dfm that meet certain conditions, including direct logical operations on docvars (document-level variables). dfm_subset functions identically to subset.data.frame, using non-standard evaluation to evaluate conditions based on the docvars in the dfm.

Usage

dfm_subset(x, subset, select, ...)

Arguments

x  
dfm object to be subsetted
subset  
logical expression indicating the documents to keep: missing values are taken as false
select  
expression, indicating the docvars to select from the dfm; or a dfm object, in which case the returned dfm will contain the same documents as the original dfm, even if these are empty. See Details.
...  
not used

Details

To select or subset features, see dfm_select instead.

When select is a dfm, then the returned dfm will be equal in document dimension and order to the dfm used for selection. This is the document-level version of using dfm_select where pattern is a dfm: that function matches features, while dfm_subset will match documents.
dfm_tfidf

Weight a dfm by tf-idf

**Description**

Weight a dfm by term frequency-inverse document frequency (tf-idf), with full control over options. Uses fully sparse methods for efficiency.

**Usage**

```r
dfm_tfidf(x, scheme_tf = "count", scheme_df = "inverse", base = 10, ...)
```

**Arguments**

- `x` object for which idf or tf-idf will be computed (a document-feature matrix)
- `scheme_tf` scheme for `dfm_weight`; defaults to "count"
- `scheme_df` scheme for `docfreq`; defaults to "inverse". Other options to `docfreq` can be passed through the ellipsis (...).
- `base` the base for the logarithms in the `tf` and `docfreq` calls; default is 10
- `...` additional arguments passed to `docfreq`.

**Value**

dfm object, with a subset of documents (and docvars) selected according to arguments

**See Also**

`subset.data.frame`

**Examples**

```r
corp <- corpus(c(d1 = "a b c d", d2 = "a a b e",
                 d3 = "b b c e", d4 = "e e f a b"),
                docvars = data.frame(grp = c(1, 1, 2, 3)))
dfmat <- dfm(corp)
# selecting on a docvars condition
dfm_subset(dfmat, grp > 1)
# selecting on a supplied vector
dfm_subset(dfmat, c(TRUE, FALSE, TRUE, FALSE))

# selecting on a dfm
dfmat1 <- dfm(c(d1 = "a b b c", d2 = "b b c d"))
dfmat2 <- dfm(c(d1 = "x y z", d2 = "a b c c d", d3 = "x x x"))
dfm_subset(dfmat1, subset = dfmat2)
dfm_subset(dfmat1, subset = dfmat2[c(3,1,2),])
```
dfm_tfidf

Details

dfm_tfidf computes term frequency-inverse document frequency weighting. The default is to use counts instead of normalized term frequency (the relative term frequency within document), but this can be overridden using scheme_tf = "prop".

dfm_weight, docfreq

Examples

dfmat1 <- as.dfm(data_dfm_lbgexample)
head(dfmat1[, 5:10])
head(dfm_tfidf(dfmat1)[, 5:10])
docfreq(dfmat1)[5:15]
head(dfm_weight(dfmat1)[, 5:10])

# replication of worked example from
dfmat2 <-
  matrix(c(1,1,2,1,0,0, 1,1,0,0,2,3),
    byrow = TRUE, nrow = 2,
    dimnames = list(docs = c("document1", "document2"),
    features = c("this", "is", "a", "sample",
                   "another", "example")) %>%
    as.dfm()
dfmat2
docfreq(dfmat2)
dfm_tfidf(dfmat2, scheme_tf = "prop") %>% round(digits = 2)

## Not run:
# comparison with tm
if (requireNamespace("tm")) {
  convert(dfmat2, to = "tm") %>% tm::weightTfIdf() %>% as.matrix()
  # same as:
  dfm_tfidf(dfmat2, base = 2, scheme_tf = "prop")
}

## End(Not run)
Convert the case of the features of a dfm and combine

**Description**

dfm_tolower and dfm_toupper convert the features of the dfm or fcm to lower and upper case, respectively, and then recombine the counts.

**Usage**

dfm_tolower(x, keep_acronyms = FALSE, ...)
dfm_toupper(x, ...)
fcm_tolower(x, keep_acronyms = FALSE, ...)
fcm_toupper(x, ...)

**Arguments**

x the input object whose character/tokens/feature elements will be case-converted
keep_acronyms logical; if TRUE, do not lowercase any all-uppercase words (applies only to *tolower functions)
... additional arguments passed to stringi functions, (e.g. stri_trans_tolower), such as locale

**Details**

fcm_tolower and fcm_toupper convert both dimensions of the fcm to lower and upper case, respectively, and then recombine the counts. This works only on fcm objects created with context = "document".

**Examples**

# for a document-feature matrix
dfm <- dfm(c("b A A", "C C a b B"), tolower = FALSE)
dfm
dfm_tolower(dfm)
dfm_toupper(dfm)

# for a feature co-occurrence matrix
fcm <- fcm(tokens(c("b A A d", "C C a b B e")),
            context = "document")
fcm
fcm_tolower(fcm)
fcm_toupper(fcm)
dfm_trim

Trim a dfm using frequency threshold-based feature selection

Description

Returns a document by feature matrix reduced in size based on document and term frequency, usually in terms of a minimum frequency, but may also be in terms of maximum frequencies. Setting a combination of minimum and maximum frequencies will select features based on a range.

Feature selection is implemented by considering features across all documents, by summing them for term frequency, or counting the documents in which they occur for document frequency. Rank and quantile versions of these are also implemented, for taking the first $n$ features in terms of descending order of overall global counts or document frequencies, or as a quantile of all frequencies.

Usage

```r
dfm_trim(x, min_termfreq = NULL, max_termfreq = NULL,
  termfreq_type = c("count", "prop", "rank", "quantile"),
  min_docfreq = NULL, max_docfreq = NULL, docfreq_type = c("count",
  "prop", "rank", "quantile"), sparsity = NULL,
  verbose = quanteda_options("verbose"), ...)
```

Arguments

- **x** a dfm object
- **min_termfreq, max_termfreq** minimum/maximum values of feature frequencies across all documents, below/above which features will be removed
- **termfreq_type** how min_termfreq and max_termfreq are interpreted. "count" sums the frequencies; "prop" divides the term frequencies by the total sum; "rank" is matched against the inverted ranking of features in terms of overall frequency, so that 1, 2, ... are the highest and second highest frequency features, and so on; "quantile" sets the cutoffs according to the quantiles (see quantile) of term frequencies.
- **min_docfreq, max_docfreq** minimum/maximum values of a feature’s document frequency, below/above which features will be removed
- **docfreq_type** specify how min_docfreq and max_docfreq are interpreted. "count" is the same as docfreq(x, scheme = "count"); "prop" divides the document frequencies by the total sum; "rank" is matched against the inverted ranking of document frequency, so that 1, 2, ... are the features with the highest and second highest document frequencies, and so on; "quantile" sets the cutoffs according to the quantiles (see quantile) of document frequencies.
- **sparsity** equivalent to 1 - min_docfreq, included for comparison with tm
- **verbose** print messages
- **...** not used
dfm_trim

Value

A dfm reduced in features (with the same number of documents)

Note

Trimming a dfm object is an operation based on the values in the document-feature matrix. To select subsets of a dfm based on the features themselves (meaning the feature labels from featnames) – such as those matching a regular expression, or removing features matching a stopword list, use dfm_select.

See Also

dfm_select, dfm_sample

Examples

(dfmat <- dfm(data_corpus_inaugural[1:5]))

# keep only words occurring >= 10 times and in >= 2 documents
dfm_trim(dfmat, min_termfreq = 10, min_docfreq = 2)

# keep only words occurring >= 10 times and in at least 0.4 of the documents
dfm_trim(dfmat, min_termfreq = 10, min_docfreq = 0.4)

# keep only words occurring <= 10 times and in <= 2 documents
dfm_trim(dfmat, max_termfreq = 10, max_docfreq = 2)

# keep only words occurring <= 10 times and in at most 3/4 of the documents
dfm_trim(dfmat, max_termfreq = 10, max_docfreq = 0.75)

# keep only words occurring 5 times in 1000, and in 2 of 5 of documents
dfm_trim(dfmat, min_docfreq = 0.4, min_termfreq = 0.005, termfreq_type = "prop")

# keep only words occurring frequently (top 20%) and in <=2 documents
dfm_trim(dfmat, min_termfreq = 0.2, max_docfreq = 2, termfreq_type = "quantile")

## Not run:
# compare to removeSparseTerms from the tm package
(dfmattm <- convert(dfmat, "tm"))
tm::removeSparseTerms(dfmattm, 0.7)
dfm_trim(dfmat, min_docfreq = 0.3)
dfm_trim(dfmat, sparsity = 0.7)

## End(Not run)
**dfm_weight**

Weight the feature frequencies in a dfm

**Description**

Weight the feature frequencies in a dfm

**Usage**

```r
dfm_weight(x, scheme = c("count", "prop", "propmax", "logcount", "boolean", "augmented", "logave"), weights = NULL, base = 10, K = 0.5)
dfm_smooth(x, smoothing = 1)
```

**Arguments**

- `x`: document-feature matrix created by dfm
- `scheme`: a label of the weight type:
  - count: `tf_{ij}`, an integer feature count (default when a dfm is created)
  - prop: the proportion of the feature counts of total feature counts (aka relative frequency), calculated as `tf_{ij} / \sum_j t_{fij}`
  - propmax: the proportion of the feature counts of the highest feature count in a document, `tf_{ij} / \max_j t_{fij}`
  - logcount: take the logarithm of 1 + each count, for the given base: `\log_{base}(1 + tf_{ij})`
  - boolean: recode all non-zero counts as 1
  - augmented: equivalent to `K + (1 - K) * dfm_weight(x, "propmax")`
  - logave: `1 + \log_{base}(\text{counts}) / (1 + \log_{base}(\text{average count within document})`, or
    \[
    \frac{1 + \log_{base} t_{fij}}{1 + \log_{base}(\sum_j t_{fij}/N_i)}
    \]
  - weights: if scheme is unused, then weights can be a named numeric vector of weights to be applied to the dfm, where the names of the vector correspond to feature labels of the dfm, and the weights will be applied as multipliers to the existing feature counts for the corresponding named features. Any features not named will be assigned a weight of 1.0 (meaning they will be unchanged).
- `base`: base for the logarithm when scheme is "logcount" or logave
- `K`: the K for the augmentation when scheme = "augmented"
- `smoothing`: constant added to the dfm cells for smoothing, default is 1
**Value**

dfm_weight returns the dfm with weighted values. Note the because the default weighting scheme is "count", simply calling this function on an unweighted dfm will return the same object. Many users will want the normalized dfm consisting of the proportions of the feature counts within each document, which requires setting scheme = "prop".

dfm_smooth returns a dfm whose values have been smoothed by adding the smoothing amount. Note that this effectively converts a matrix from sparse to dense format, so may exceed memory requirements depending on the size of your input matrix.

# combine these methods for more complex dfm weightings, e.g. as in Section 6.4
# of Introduction to Information Retrieval
head(dfm_tfidf(dfmat1, scheme_tf = "logcount"))

# apply numeric weights
str <- c("apple is better than banana", "banana banana apple much better")
(dfmat6 <- dfm(str, remove = stopwords("english")))
dfm_weight(dfmat6, weights = c(apple = 5, banana = 3, much = 0.5))

# smooth the dfm
dfmat <- dfm(data_corpus_inaugural)
dfm_smooth(dfmat, 0.5)
**dictionary**

Create a dictionary

**Description**

Create a **quanteda** dictionary class object, either from a list or by importing from a foreign format. Currently supported input file formats are the Wordstat, LIWC, Lexicoder v2 and v3, and Yoshikoder formats. The import using the LIWC format works with all currently available dictionary files supplied as part of the LIWC 2001, 2007, and 2015 software (see References).

**Usage**

```r
dictionary(x, file = NULL, format = NULL, separator = " ",
    tolower = TRUE, encoding = "auto")
```

**Arguments**

- `x` a named list of character vector dictionary entries, including **valuetype** pattern matches, and including multi-word expressions separated by **concatenator**. See examples. This argument may be omitted if the dictionary is read from file.
- `file` file identifier for a foreign dictionary
- `format` character identifier for the format of the foreign dictionary. If not supplied, the format is guessed from the dictionary file’s extension. Available options are:
  - "wordstat" format used by Provalis Research’s Wordstat software
  - "LIWC" format used by the Linguistic Inquiry and Word Count software
  - "yoshikoder" format used by Yoshikoder software
  - "lexicoder" format used by Lexicoder
  - "YAML" the standard YAML format
- `separator` the character in between multi-word dictionary values. This defaults to " ".
- `tolower` if TRUE, convert all dictionary values to lowercase
- `encoding` additional optional encoding value for reading in imported dictionaries. This uses the **iconv** labels for encoding. See the "Encoding" section of the help for file.

**Details**

Dictionaries can be subsetted using `[` and `[[`, operating the same as the equivalent **list** operators.

Dictionaries can be coerced from lists using **as.dictionary**, coerced to named lists of characters using **as.list**, and checked using **is.dictionary**.

**Value**

A dictionary class object, essentially a specially classed named list of characters.

Examples

corp <- corpus_subset(data_corpus_inaugural, Year>1900)
dict <- dictionary(list(christmas = c("Christmas", "Santa", "holiday"),
opposition = c("Opposition", "reject", "notincorpus"),
taxing = "taxing",
taxation = "taxation",
taxregex = "tax*",
country = "america"))

head(dfm(corp, dictionary = dict))

# subset a dictionary
dict[1:2]
dict[c("christmas", "opposition")]
dict[["opposition"]]

# combine dictionaries
c(dict["christmas"], dict["country"])

# Not run:
# import the Laver-Garry dictionary from Provalis Research
dictfile <- tempfile()
download.file("https://provalisresearch.com/Download/LaverGarry.zip",
dictfile, mode = "wb")
unzip(dictfile, exdir = (td <- tempdir()))
dictlg <- dictionary(file = paste(td, "LaverGarry.cat", sep = "/"))
head(dfm(data_corpus_inaugural, dictionary = dictlg))

data import a LIWC formatted dictionary from http://www.moralfoundations.org
download.file("https://goo.gl/5gmxXq", tf <- tempfile())
dictliwc <- dictionary(file = tf, format = "LIWC")
head(dfm(data_corpus_inaugural, dictionary = dictliwc))

# End(Not run)
**docfreq**  

*Compute the (weighted) document frequency of a feature*

**Description**

For a dfm object, returns a (weighted) document frequency for each term. The default is a simple count of the number of documents in which a feature occurs more than a given frequency threshold. (The default threshold is zero, meaning that any feature occurring at least once in a document will be counted.)

**Usage**

```r
docfreq(x, scheme = c("count", "inverse", "inversemax", "inverseprob",  
  "unary"), smoothing = 0, k = 0, base = 10, threshold = 0,  
  use.names = TRUE)
```

**Arguments**

- **x** a dfm
- **scheme** type of document frequency weighting, computed as follows, where \(N\) is defined as the number of documents in the dfm and \(s\) is the smoothing constant:
  - count \(df\), the number of documents for which \(n_{ij} > \text{threshold}\)
  - inverse \[ \log_{\text{base}} \left( s + \frac{N}{k + df_j} \right) \]
  - inversemax \[ \log_{\text{base}} \left( s + \frac{\max(df_j)}{k + df_j} \right) \]
  - inverseprob \[ \log_{\text{base}} \left( \frac{N - df_j}{k + df_j} \right) \]
  - unary 1 for each feature
- **smoothing** added to the quotient before taking the logarithm
- **k** added to the denominator in the "inverse" weighting types, to prevent a zero document count for a term
- **base** the base with respect to which logarithms in the inverse document frequency weightings are computed; default is 10 (see Manning, Raghavan, and Schütze 2008, p123).
- **threshold** numeric value of the threshold above which a feature will considered in the computation of document frequency. The default is 0, meaning that a feature’s document frequency will be the number of documents in which it occurs greater than zero times.
- **use.names** logical; if TRUE attach feature labels as names of the resulting numeric vector
- **...** not used
Value

a numeric vector of document frequencies for each feature

docfreq(dfmat2, scheme = "inverseprob")

---

docnames

*Get or set document names*

Description

Get or set the document names of a corpus, tokens, or dfm object.

Usage

docnames(x)
docnames(x) <- value

Arguments

x the object with docnames
value a character vector of the same length as x
Value

`docnames` returns a character vector of the document names

`docnames` <- assigns new values to the document names of an object. `docnames` can only be character, so any non-character value assigned to be a docname will be coerced to mode ‘character’.

See Also

`featnames`

Examples

```r
# get and set document names to a corpus
corp <- data_corpus_inaugural
docnames(corp) <- char_tolower(docnames(corp))

# get and set document names to a tokens
toks <- tokens(data_corpus_inaugural)
docnames(toks) <- char_tolower(docnames(toks))

# get and set document names to a dfm
dfmat <- dfm(data_corpus_inaugural[1:5])
docnames(dfmat) <- char_tolower(docnames(dfmat))

# reassign the document names of the inaugural speech corpus
docnames(data_corpus_inaugural) <- paste("Speech", 1:ndoc(data_corpus_inaugural), sep="")
```

---

`docvars`  
*Get or set document-level variables*

Description

Get or set variables associated with a document in a `corpus`, `tokens` or `dfm` object.

Usage

```r
docvars(x, field = NULL)
docvars(x, field = NULL) <- value
```

Arguments

- `x` : corpus, tokens, or dfm object whose document-level variables will be read or set
- `field` : string containing the document-level variable name
- `value` : the new values of the document-level variable
Value

docvars returns a data.frame of the document-level variables, dropping the second dimension to form a vector if a single docvar is returned.
docvars<- assigns value to the named field

Index access to docvars in a corpus

Another way to access and set docvars is through indexing of the corpus $j$ element, such as
data_corpus_irishbudget2010[, c("foren","name"); or, for a single docvar, data_corpus_irishbudget2010[["name"].
The latter also permits assignment, including the easy creation of new document variables, e.g.

Note

Reassigning document variables for a tokens or dfm object is allowed, but discouraged. A better, more reproducible workflow is to create your docvars as desired in the corpus, and let these continue to be attached "downstream" after tokenization and forming a document-feature matrix. Recognizing that in some cases, you may need to modify or add document variables to downstream objects, the assignment operator is defined for tokens or dfm objects as well. Use with caution.

Examples

# retrieving docvars from a corpus
head(docvars(data_corpus_inaugural))
tail(docvars(data_corpus_inaugural, "President"), 10)

# assigning document variables to a corpus
corp <- data_corpus_inaugural
docvars(corp, "President") <- paste("prez", 1:ndoc(corp), sep = "")
head(docvars(corp))

# alternative using indexing
head(corp[, "Year"])
corp[["President2"]]<- paste("prezTwo", 1:ndoc(corp), sep = "")
head(docvars(corp))

fcm

Create a feature co-occurrence matrix

Description

Create a sparse feature co-occurrence matrix, measuring co-occurrences of features within a user-defined context. The context can be defined as a document or a window within a collection of documents, with an optional vector of weights applied to the co-occurrence counts.
Usage

\[
\text{fcm}(x, \text{context} = \text{c("document", "window")}, \text{count} = \text{c("frequency", "boolean", "weighted")}, \text{window} = \text{5L}, \text{weights} = \text{1L}, \text{ordered} = \text{FALSE, span_sentence} = \text{TRUE, tri} = \text{TRUE, ...})
\]

Arguments

\[
\begin{align*}
x & \quad \text{character, corpus, tokens, or dfm object from which to generate the feature co-occurrence matrix} \\
\text{context} & \quad \text{the context in which to consider term co-occurrence: "document" for co-occurrence counts within document; "window" for co-occurrence within a defined window of words, which requires a positive integer value for window. Note: if x is a dfm object, then context can only be "document".} \\
\text{count} & \quad \text{how to count co-occurrences:} \\
& \quad \text{"frequency" count the number of co-occurrences within the context} \\
& \quad \text{"boolean" count only the co-occurrence or not within the context, irrespective of how many times it occurs.} \\
& \quad \text{"weighted" count a weighted function of counts, typically as a function of distance from the target feature. Only makes sense for context = "window".} \\
\text{window} & \quad \text{positive integer value for the size of a window on either side of the target feature, default is 5, meaning 5 words before and after the target feature} \\
\text{weights} & \quad \text{a vector of weights applied to each distance from 1:window, strictly decreasing by default; can be a custom-defined vector of the same length as length(weights)} \\
\text{ordered} & \quad \text{if TRUE the number of times that a term appears before or after the target feature are counted separately. Only makes sense for context = "window".} \\
\text{span_sentence} & \quad \text{if FALSE, then word windows will not span sentences} \\
\text{tri} & \quad \text{if TRUE return only upper triangle (including diagonal). Ignored if ordered = TRUE} \\
\ldots & \quad \text{not used here}
\end{align*}
\]

Details

The function \text{fcm} provides a very general implementation of a "context-feature" matrix, consisting of a count of feature co-occurrence within a defined context. This context, following Momtazi et. al. (2010), can be defined as the \text{document}, \text{sentences} within documents, \text{syntactic relationships} between features (nouns within a sentence, for instance), or according to a \text{window}. When the context is a window, a weighting function is typically applied that is a function of distance from the target word (see Jurafsky and Martin 2015, Ch. 16) and ordered co-occurrence of the two features is considered (see Church & Hanks 1990).

\text{fcm} provides all of this functionality, returning a \(V \times V\) matrix (where \(V\) is the vocabulary size, returned by \text{nfeat}). The \text{tri} = \text{TRUE} option will only return the upper part of the matrix.

Unlike some implementations of co-occurrences, \text{fcm} counts feature co-occurrences with themselves, meaning that the diagonal will not be zero.

\text{fcm} also provides "boolean" counting within the context of "window", which differs from the counting within "document".

\text{is.fcm}(x) returns \text{TRUE} if and only if its \(x\) is an object of type \text{fcm}.
**Author(s)**

**References**

**Examples**

```r
# see http://bit.ly/29b2zOA

txt1 <- "A D A C E A D F E B A C E D"
fcn(txt1, context = "window", window = 2)
fcn(txt1, context = "window", count = "weighted", window = 3)
fcn(txt1, context = "window", count = "weighted", window = 3,
   weights = c(3, 2, 1), ordered = TRUE, tri = FALSE)

# with multiple documents

txt2 <- c("a a a a b c", "a a c e", "a c e f g")
fcn(txt2, context = "document", count = "frequency")
fcn(txt2, context = "document", count = "boolean")
fcn(txt2, context = "window", window = 2)

# from tokens

txt3 <- c("The quick brown fox jumped over the lazy dog.",
         "The dog jumped and ate the fox.")
toks <- tokens(char_tolower(txt3), remove_punct = TRUE)
fcn(toks, context = "document")
fcn(toks, context = "window", window = 3)
```

---

**fcn_sort**

Sort an fcm in alphabetical order of the features

**Description**

Sorts an fcm in alphabetical order of the features.

**Usage**

```r
fcn_sort(x)
```
Arguments

x  fcm object

Value

A fcm object whose features have been alphabetically sorted. Differs from fcm_sort in that this function sorts the fcm by the feature labels, not the counts of the features.

Author(s)

Kenneth Benoit

Examples

# with tri = FALSE
fcmat1 <- fcm(tokens(c("A X Y C B A", "X Y C A B B")), tri = FALSE)
rownames(fcmat1)[3] <- colnames(fcmat1)[3] <- "Z"
fcmat1
fcm_sort(fcmat1)

# with tri = TRUE
fcmat2 <- fcm(tokens(c("A X Y C B A", "X Y C A B B")), tri = TRUE)
rownames(fcmat2)[3] <- colnames(fcmat2)[3] <- "Z"
fcmat2
fcm_sort(fcmat2)
Examples

dfmat <- dfm(data_corpus_inaugural)

# first 50 features (in original text order)
head( featnames(dfmat), 50 )

# first 50 features alphabetically
head( sort( featnames(dfmat) ), 50 )

# contrast with descending total frequency order from topfeatures()
names( topfeatures(dfmat, 50) )

head.corpus  

\textit{Return the first or last part of a corpus}

Description

For a \texttt{corpus} object, returns the first or last \( n \) documents.

Usage

\begin{verbatim}
## S3 method for class 'corpus'
head(x, n = 6L, ...)

## S3 method for class 'corpus'
tail(x, n = 6L, ...)
\end{verbatim}

Arguments

\begin{itemize}
\item \texttt{x} \hspace{1cm} a dfm object
\item \texttt{n} \hspace{1cm} a single integer. If positive, the number of documents for the resulting object: number of first/last documents for the dfm. If negative, all but the \( n \) last/first number of documents of \texttt{x}.
\item ... \hspace{1cm} additional arguments passed to other functions
\end{itemize}

Value

A \texttt{corpus} class object corresponding to the subset defined by \( n \).

Examples

\begin{verbatim}
head(data_corpus_irishbudget2010, 3) %>% summary()

tail(data_corpus_irishbudget2010, 3) %>% summary()
\end{verbatim}
head.dfm

Return the first or last part of a dfm

Description

For a dfm object, returns the first or last n documents and first \textit{nfeat} features.

Usage

```r
## S3 method for class 'dfm'
head(x, n = 6L, nf = nfeat(x), ...)

## S3 method for class 'dfm'
tail(x, n = 6L, nf = nfeat(x), ...)
```

Arguments

- \texttt{x} a dfm object
- \texttt{n} a single, positive integer. If positive, size for the resulting object: number of first/last documents for the dfm. If negative, all but the \textit{n} last/first number of documents of \texttt{x}.
- \texttt{nf} the number of features to return, where the resulting object will contain the first \textit{ncol} features; default is all features
- \texttt{...} additional arguments passed to other functions

Value

A dfm class object corresponding to the subset defined by \textit{n} and \textit{nf}.

Examples

```r
head(data_dfm_lbgexample, 3, nf = 5)
head(data_dfm_lbgexample, -4)
tail(data_dfm_lbgexample)
tail(data_dfm_lbgexample, n = 3, nf = 4)
```
kwic

Locate keywords-in-context

Description

For a text or a collection of texts (in a quanteda corpus object), return a list of a keyword supplied by the user in its immediate context, identifying the source text and the word index number within the source text. (Not the line number, since the text may or may not be segmented using end-of-line delimiters.)

Usage

kwic(x, pattern, window = 5, valuetype = c("glob", "regex", "fixed"),
   separator = " ", case_insensitive = TRUE, ...)

is.kwic(x)

Arguments

x a character, corpus, or tokens object
pattern a character vector, list of character vectors, dictionary, or collocations object. See pattern for details.
window the number of context words to be displayed around the keyword.
valuetype the type of pattern matching: "glob" for "glob"-style wildcard expressions; "regex" for regular expressions; or "fixed" for exact matching. See valuetype for details.
separator character to separate words in the output
case_insensitive match without respect to case if TRUE
... additional arguments passed to tokens, for applicable object types

Value

A kwic classed data.frame, with the document name (docname), the token index positions (from and to, which will be the same for single-word patterns, or a sequence equal in length to the number of elements for multi-word phrases), the context before (pre), the keyword in its original format (keyword, preserving case and attached punctuation), and the context after (post). The return object has its own print method, plus some special attributes that are hidden in the print view. If you want to turn this into a simple data.frame, simply wrap the result in data.frame.

Note

pattern will be a keyword pattern or phrase, possibly multiple patterns, that may include punctuation. If a pattern contains whitespace, it is best to wrap it in phrase to make this explicit. However if pattern is a collocations or dictionary object, then the collocations or multi-word dictionary keys will automatically be considered phrases where each whitespace-separated element matches a token in sequence.
Examples

head(kwic(data_corpus_inaugural, pattern = "secure\*", window = 3, valuetype = "glob"))
head(kwic(data_corpus_inaugural, pattern = "secur\", window = 3, valuetype = "regex"))
head(kwic(data_corpus_inaugural, pattern = "security\", window = 3, valuetype = "fixed"))

toks <- tokens(data_corpus_inaugural)
kwic(data_corpus_inaugural, pattern = phrase("war against"))
kwic(data_corpus_inaugural, pattern = phrase("war against"), valuetype = "regex")

kw <- kwic(data_corpus_inaugural, "provident")
is.kwic(kw)
is.kwic("Not a kwic")

metacorpus

Get or set corpus metadata

Description

Get or set the corpus-level metadata in a corpus object.

Usage

metacorpus(x, field = NULL)

metacorpus(x, field) <- value

Arguments

x
field
value

a corpus object
metadata field name(s); if NULL (default), return all metadata names
new value of the corpus metadata field

Value

For metacorpus, a named list of the metadata fields in the corpus.
For metacorpus <-, the corpus with the updated metadata.

Examples

metacorpus(data_corpus_inaugural)
metacorpus(data_corpus_inaugural, "source")
metacorpus(data_corpus_inaugural, "citation") <- "Presidential Speeches Online Project (2014)."
metacorpus(data_corpus_inaugural, "citation")
Get or set document-level meta-data

Description
Get or set document-level meta-data. Document-level meta-data are a special type of docvars, meant to contain information about documents that would not be used as a "variable" for analysis. An example could be the source of the document, or notes pertaining to its transformation, copyright information, etc.

Document-level meta-data differs from corpus-level meta-data in that the latter pertains to the collection of texts as a whole, whereas the document-level version can differ with each document.

Usage
metadoc(x, field = NULL)
metadoc(x, field = NULL) <- value

Arguments
x a corpus object
field character, the name of the metadata field(s) to be queried or set
value the new value of the new meta-data field

Value
For texts, a character vector of the texts in the corpus.
For texts <-, the corpus with the updated texts.

Note
Document-level meta-data names are preceded by an underscore character, such as _language, but when named in in the field argument, do not need the underscore character.

See Also
metacorpus

Examples
mycorp <- corpus_subset(data_corpus_inaugural, Year > 1990)
summary(mycorp, showmeta = TRUE)
metadoc(mycorp, "encoding") <- "UTF-8"
metadoc(mycorp)
metadoc(mycorp, "language") <- "english"
summary(mycorp, showmeta = TRUE)
ndoc  

Count the number of documents or features

Description
Get the number of documents or features in an object.

Usage

- \texttt{ndoc}(x)
- \texttt{nfeat}(x)

Arguments

\begin{itemize}
  \item \texttt{x} \hspace{1cm} a \texttt{quanteda} object: a corpus, dfm, or tokens object, or a readtext object from the \texttt{readtext} package.
\end{itemize}

Details

\texttt{ndoc} returns the number of documents in an object whose texts are organized as "documents" (a corpus, dfm, or tokens object, a readtext object from the \texttt{readtext} package).

\texttt{nfeat} returns the number of features from a dfm; it is an alias for \texttt{ntype} when applied to dfm objects. This function is only defined for dfm objects because only these have "features". (To count tokens, see \texttt{ntoken}.)

Value

an integer (count) of the number of documents or features

See Also

- \texttt{ntoken}

Examples

\begin{itemize}
  \item \texttt{# number of documents}
  \begin{verbatim}
  ndoc(data_corpus_inaugural)
  ndoc(corpus_subset(data_corpus_inaugural, Year > 1980))
  ndoc(tokens(data_corpus_inaugural))
  ndoc(dfm(corpus_subset(data_corpus_inaugural, Year > 1980)))
  \end{verbatim}
  \item \texttt{# number of features}
  \begin{verbatim}
  nfeat(dfm(corpus_subset(data_corpus_inaugural, Year > 1980), remove_punct = FALSE))
  nfeat(dfm(corpus_subset(data_corpus_inaugural, Year > 1980), remove_punct = TRUE))
  \end{verbatim}
\end{itemize}
nscrabble

Count the Scrabble letter values of text

Description

Tally the Scrabble letter values of text given a user-supplied function, such as the sum (default) or mean of the character values.

Usage

nscrabble(x, FUN = sum)

Arguments

x a character vector
FUN function to be applied to the character values in the text; default is sum, but could also be mean or a user-supplied function

Value

a (named) integer vector of Scrabble letter values, computed using FUN, corresponding to the input text(s)

Note

Character values are only defined for non-accented Latin a-z, A-Z letters. Lower-casing is unnecessary.

We would be happy to add more languages to this extremely useful function if you send us the values for your language!

Author(s)

Kenneth Benoit

Examples

nscrabble(c("muzjiks", "excellency"))
nscrabble(data_corpus_inaugural[1:5], mean)
**nsentence**

*Count the number of sentences*

**Description**

Return the count of sentences in a corpus or character object.

**Usage**

```r
nsentence(x, ...)
```

**Arguments**

- `x`: a character or corpus whose sentences will be counted
- `...`: additional arguments passed to `tokens`

**Value**

count(s) of the total sentences per text

**Note**

`nsentence()` relies on the boundaries definitions in the `stringi` package (see `stri_opts_brkiter`). It does not count sentences correctly if the text has been transformed to lower case, and for this reason `nsentence()` will issue a warning if it detects all lower-cased text.

**Examples**

```r
# simple example
txt <- c(text1 = "This is a sentence: second part of first sentence.",
text2 = "A word. Repeated repeated.",
text3 = "Mr. Jones has a PhD from the LSE. Second sentence.")
nsentence(txt)
```

---

**nsyllable**

*Count syllables in a text*

**Description**

Returns a count of the number of syllables in texts. For English words, the syllable count is exact and looked up from the CMU pronunciation dictionary, from the default syllable dictionary `data_int_syllables`. For any word not in the dictionary, the syllable count is estimated by counting vowel clusters.

`data_int_syllables` is a quanteda-supplied data object consisting of a named numeric vector of syllable counts for the words used as names. This is the default object used to count English syllables. This object that can be accessed directly, but we strongly encourage you to access it only through the `nsyllable()` wrapper function.
Usage

\[
\text{nsyllable}(x, \text{syllable\_dictionary} = \text{quanteda}\text{::data\_int\_syllables}, \\
\text{use\_names} = \text{FALSE})
\]

Arguments

- **x**: character vector or tokens object whose syllables will be counted. This will count all syllables in a character vector without regard to separating tokens, so it is recommended that `x` be individual terms.
- **syllable\_dictionary**: optional named integer vector of syllable counts where the names are lower case tokens. When set to `NULL` (default), then the function will use the quanteda data object `data\_int\_syllables`, an English pronunciation dictionary from CMU.
- **use\_names**: logical; if `TRUE`, assign the tokens as the names of the syllable count vector

Value

If `x` is a character vector, a named numeric vector of the counts of the syllables in each element. If `x` is a `tokens` object, return a list of syllable counts where each list element corresponds to the tokens in a document.

Note

All tokens are automatically converted to lowercase to perform the matching with the syllable dictionary, so there is no need to perform this step prior to calling `nsyllable()`.

`nsyllable()` only works reliably for English, as the only syllable count dictionary we could find is the freely available CMU pronunciation dictionary at `http://www.speech.cs.cmu.edu/cgi-bin/cmudict`. If you have a dictionary for another language, please email the package maintainer as we would love to include it.

Examples

# character
\[
\text{nsyllable}(c("cat", "syllable", "supercalifragilisticexpialidocious", \\
"Brexit", "Administration"), \text{use\_names} = \text{TRUE})
\]

# tokens
\[
\text{txt} \leftarrow \text{c(doc1 = "This is an example sentence.", \\
\text{doc2 = "Another of two sample sentences."})}
\]
\[
\text{nsyllable}(\text{tokens(txt, remove\_punct = \text{TRUE}}))
\]

# punctuation is not counted
\[
\text{nsyllable}(\text{tokens(txt), use\_names = \text{TRUE}})
\]
ntoken

Count the number of tokens or types

Description

Get the count of tokens (total features) or types (unique tokens).

Usage

ntoken(x, ...)
ntype(x, ...)

Arguments

x a quanteda object: a character, corpus, tokens, or dfm object
... additional arguments passed to tokens

Details

The precise definition of "tokens" for objects not yet tokenized (e.g. character or corpus objects) can be controlled through optional arguments passed to tokens through ....

For dfm objects, ntype will only return the count of features that occur more than zero times in the dfm.

Value

named integer vector of the counts of the total tokens or types

Note

Due to differences between raw text tokens and features that have been defined for a dfm, the counts may be different for dfm objects and the texts from which the dfm was generated. Because the method tokenizes the text in order to count the tokens, your results will depend on the options passed through to tokens.

Examples

# simple example
txt <- c(text1 = "This is a sentence, this.", text2 = "A word. Repeated repeated.")
ntoken(txt)
nstype(txt)
nstype(char_tolower(txt)) # same
ntype(char_tolower(txt)) # fewer types
ntype(char_tolower(txt), remove_punct = TRUE)

# with some real texts

\texttt{ntoken(corpus\_subset(data\_corpus\_inaugural, Year < 1806), remove\_punct = TRUE)}
\texttt{ntype(corpus\_subset(data\_corpus\_inaugural, Year < 1806), remove\_punct = TRUE)}
\texttt{ntoken(dfm(corpus\_subset(data\_corpus\_inaugural, Year < 1800)))}
\texttt{ntype(dfm(corpus\_subset(data\_corpus\_inaugural, Year < 1800)))}

---

\textbf{phrase} \hspace{1cm} \textit{Declare a compound character to be a sequence of separate pattern matches}

**Description**

Declares that a whitespace-separated expression consists of multiple patterns, separated by whitespace. This is typically used as a wrapper around \texttt{pattern} to make it explicit that the pattern elements are to be used for matches to multi-word sequences, rather than individual, unordered matches to single words.

**Usage**

\begin{verbatim}
phrase(x)

is.phrase(x)
\end{verbatim}

**Arguments**

\begin{itemize}
  \item \texttt{x} \hspace{1cm} the sequence, as a character object containing whitespace separating the patterns
\end{itemize}

**Value**

- \texttt{phrase} returns a specially classed list whose white-spaced elements have been parsed into separate character elements.
- \texttt{is.phrase} returns \texttt{TRUE} if the object was created by \texttt{phrase}; \texttt{FALSE} otherwise.

**Examples**

\begin{verbatim}
# make phrases from characters
phrase(c("a b", "c d e", "f"))

# from a dictionary
phrase(dictionary(list(catone = c("a b"), cattwo = "c d e", catthree = "f")))

# from a collocations object
(coll <- textstat_collocations(tokens("a b c a b d e b d a b")))
phrase(coll)
\end{verbatim}
**quanteda_options**  
Get or set package options for quanteda

**Description**  
Get or set global options affecting functions across *quanteda*.

**Usage**  
`quanteda_options(..., reset = FALSE, initialize = FALSE)`

**Arguments**  
- `options` options to be set, as key-value pair, same as `options`. This may be a list of valid key-value pairs, useful for setting a group of options at once (see examples).
- `reset` logical; if `TRUE`, reset all *quanteda* options to their default values
- `initialize` logical; if `TRUE`, reset only the *quanteda* options that are not already defined. Used for setting initial values when some have been defined previously, such as in `.Rprofile`.

**Details**  
Currently available options are:
- `verbose` logical; if `TRUE` then use this as the default for all functions with a `verbose` argument
- `threads` integer; specifies the number of threads to use in parallelized functions
- `print_dfm_max_ndoc` integer; specifies the number of documents to display when using the defaults for printing a dfm
- `print_dfm_max_nfeat` integer; specifies the number of features to display when using the defaults for printing a dfm
- `base_docname` character; stem name for documents that are unnamed when a corpus, tokens, or dfm are created or when a dfm is converted from another object
- `base_featname` character; stem name for features that are unnamed when they are added, for whatever reason, to a dfm through an operation that adds features
- `base_compname` character; stem name for components that are created by matrix factorization
- `language_stemmer` character; language option for `char_wordstem`, `tokens_wordstem`, and `dfm_wordstem`

**Value**  
When called using a `key = value` pair (where key can be a label or quoted character name), the option is set and `TRUE` is returned invisibly.
When called with no arguments, a named list of the package options is returned.
When called with `reset = TRUE` as an argument, all arguments are options are reset to their default values, and `TRUE` is returned invisibly.
Examples

```r
(opt <- quanteda_options())
quanteda_options(verbos = TRUE)
quanteda_options("verbos" = FALSE)
quanteda_options("threads")
quanteda_options(print_dfm_max_ndoc = 50L)
# reset to defaults
quanteda_options(reset = TRUE)
# reset to saved options
quanteda_options(opt)
```

---

**spacyr-methods**

**Extensions for and from spacy_parse objects**

**Description**

These functions provide **quanteda** methods for **spacyr** objects, and also extend **spacy_parse** to work with **corpus** objects.

**Usage**

```r
## S3 method for class 'corpus'
spacy_parse(x, ...)
```

**Arguments**

- `x` an object returned by `spacy_parse`, or (for `spacy_parse`) a **corpus** object
- `...` unused except for `spacy_parse`, in which case it passes through extra arguments to that function

**Usage**

- `docnames(x)` returns the document names
- `ndoc(x)` returns the number of documents
- `ntoken(x, ...)` returns the number of tokens by document
- `ntype(x, ...)` returns the number of types (unique tokens) by document
- `spacy_parse(x, ...)` is also defined for a **quanteda corpus**
sparsity

Examples

## Not run:
library("spacyr")
spacy_initialize()

txt <- c(doc1 = "And now, now, now for something completely different.",
         doc2 = "Jack and Jill are children.")
parsed <- spacy_parse(txt)
ntype(parsed)
ntoken(parsed)
ndoc(parsed)
docnames(parsed)

corpus_subset(data_corpus_inaugural, Year <= 1793) \%>\% spacy_parse()

## End(Not run)

sparsity(x)  

Compute the sparsity of a document-feature matrix

Description

Return the proportion of sparseness of a document-feature matrix, equal to the proportion of cells that have zero counts.

Usage

sparsity(x)

Arguments

x  
the document-feature matrix

Examples

dfmat <- dfm(data_corpus_inaugural)
sparsity(dfmat)
sparsity(dfm_trim(dfmat, min_termfreq = 5))
textmodel_affinity  

Class affinity maximum likelihood text scaling model

Description

textmodel_affinity implements the maximum likelihood supervised text scaling method described in Perry and Benoit (2017).

Usage

textmodel_affinity(x, y, exclude = NULL, smooth = 0.5, 
ref_smooth = 0.5, verbose = quanteda_options("verbose"))

Arguments

x the dfm or bootstrap_dfm object on which the model will be fit. Does not need to contain only the training documents, since the index of these will be matched automatically.
y vector of training classes/scores associated with each document identified in data
exclude a set of words to exclude from the model
smooth a smoothing parameter for class affinities; defaults to 0.5 (Jeffreys prior). A plausible alternative would be 1.0 (Laplace prior).
ref_smooth a smoothing parameter for token distributions; defaults to 0.5
verbose logical; if TRUE print diagnostic information during fitting.

Author(s)

Patrick Perry and Kenneth Benoit

See Also

predict.textmodel_affinity for methods of applying a fitted textmodel_affinity model object to predict quantities from (other) documents.
**Examples**

```r
(af <- textmodel_affinity(data_dfm_lbgexample, y = c("L", NA, NA, NA, "R", NA)))
predict(af)
predict(af, newdata = data_dfm_lbgexample[6, ])

## Not run:
# compute bootstrapped SEs
dfmat <- bootstrap_dfm(data_corpus_dailnoconf1991, n = 10, remove_punct = TRUE)
textmodel_affinity(dfmat, y = c("Govt", "Opp", "Opp", rep(NA, 55)))

## End(Not run)
```

---

## Description

textmodel_ca implements correspondence analysis scaling on a dfm. The method is a fast/sparse version of function ca.

## Usage

```r
textmodel_ca(x, smooth = 0, nd = NA, sparse = FALSE, residual_floor = 0.1)
```

## Arguments

- **x**: the dfm on which the model will be fit
- **smooth**: a smoothing parameter for word counts; defaults to zero.
- **nd**: Number of dimensions to be included in output; if NA (the default) then the maximum possible dimensions are included.
- **sparse**: retains the sparsity if set to TRUE; set it to TRUE if x (the dfm) is too big to be allocated after converting to dense
- **residual_floor**: specifies the threshold for the residual matrix for calculating the truncated svd. Larger value will reduce memory and time cost but might reduce accuracy; only applicable when sparse = TRUE

## Details

svds in the RSpectra package is applied to enable the fast computation of the SVD.

## Value

textmodel_ca() returns a fitted CA textmodel that is a special class of ca object.
Note
You may need to set sparse = TRUE and increase the value of residual_floor to ignore less important information and hence to reduce the memory cost when you have a very big dfm. If your attempt to fit the model fails due to the matrix being too large, this is probably because of the memory demands of computing the $V \times V$ residual matrix. To avoid this, consider increasing the value of residual_floor by 0.1, until the model can be fit.

textmodel_lsa Latent Semantic Analysis

Description
Fit the Latent Semantic Analysis scaling model to a dfm, which may be weighted (for instance using dfm_tfidf).

Usage
textmodel_lsa(x, nd = 10, margin = c("both", "documents", "features"))

Arguments
x the dfm on which the model will be fit
nd the number of dimensions to be included in output
margin margin to be smoothed by the SVD

Details
svds in the RSpectra package is applied to enable the fast computation of the SVD.
Note
The number of dimensions \(nd\) retained in LSA is an empirical issue. While a reduction in \(k\) can remove much of the noise, keeping too few dimensions or factors may lose important information.

Examples
```
dfmat <- dfm(data_corpus_irishbudget2010)
# create an LSA space and return its truncated representation in the low-rank space
tmod <- textmodel_lsa(dfmat[1:10, ])
head(tmod$docs)

# matrix in low_rank LSA space
tmod$matrix_low_rank[,1:5]

# fold queries into the space generated by dfmat[1:10,]
# and return its truncated versions of its representation in the new low-rank space
pred <- predict(tmod, newdata = dfmat[11:14, ])
pred$docs_newspace
```

Description
Text model_nb is a Naive Bayes classifier for texts.

Usage
```
textmodel_nb(x, y, smooth = 1, prior = c("uniform", "docfreq", "termfreq"),
              distribution = c("multinomial", "Bernoulli"))
```
Arguments

x the dfm on which the model will be fit. Does not need to contain only the training documents.

y vector of training labels associated with each document identified in train. (These will be converted to factors if not already factors.)

smooth smoothing parameter for feature counts by class

prior prior distribution on texts; one of "uniform", "docfreq", or "termfreq". See Prior Distributions below.

distribution count model for text features, can be multinomial or Bernoulli. To fit a "binary multinomial" model, first convert the dfm to a binary matrix using dfm_weight(x, scheme = "boolean").

Value
textmodel_nb() returns a list consisting of the following (where I is the total number of documents, J is the total number of features, and k is the total number of training classes):

call original function call

PwGc \(k \times J\); probability of the word given the class (empirical likelihood)

Pc \(k\)-length named numeric vector of class prior probabilities

PcGw \(k \times J\); posterior class probability given the word

Pw \(J \times 1\); baseline probability of the word

x the \(I \times J\) training dfm x

y the \(I\)-length y training class vector

distribution the distribution argument

prior the prior argument

smooth the value of the smoothing parameter

Prior distributions

Prior distributions refer to the prior probabilities assigned to the training classes, and the choice of prior distribution affects the calculation of the fitted probabilities. The default is uniform priors, which sets the unconditional probability of observing the one class to be the same as observing any other class.

"Document frequency" means that the class priors will be taken from the relative proportions of the class documents used in the training set. This approach is so common that it is assumed in many examples, such as the worked example from Manning, Raghavan, and Schütze (2008) below. It is not the default in quanteda, however, since there may be nothing informative in the relative numbers of documents used to train a classifier other than the relative availability of the documents. When training classes are balanced in their number of documents (usually advisable), however, then the empirically computed "docfreq" would be equivalent to "uniform" priors.

Setting prior to "termfreq" makes the priors equal to the proportions of total feature counts found in the grouped documents in each training class, so that the classes with the largest number of features are assigned the largest priors. If the total count of features in each training class was the same, then "uniform" and "termfreq" would be the same.

predict.textmodel_nb

Examples

```r
## Example from 13.1 of _An Introduction to Information Retrieval_

txt <- c(d1 = "Chinese Beijing Chinese",
        d2 = "Chinese Chinese Shanghai",
        d3 = "Chinese Macao",
        d4 = "Tokyo Japan Chinese",
        d5 = "Chinese Chinese Chinese Tokyo Japan")
trainingset <- dfm(txt, tolower = FALSE)
trainingclass <- factor(c("Y", "Y", "γ", "N", "NA"), ordered = TRUE)

## replicate IIR p261 prediction for test set (document 5)
(tmod1 <- textmodel_nb(trainingset, y = trainingclass, prior = "docfreq")
summary(tmod1)
coef(tmod1)
predict(tmod1)

# contrast with other priors
predict(textmodel_nb(trainingset, y = trainingclass, prior = "uniform"))
predict(textmodel_nb(trainingset, y = trainingclass, prior = "termfreq"))

## replicate IIR p264 Bernoulli Naive Bayes

tmod2 <- textmodel_nb(trainingset, y = trainingclass, distribution = "Bernoulli",
                        prior = "docfreq")
predict(tmod2, newdata = trainingset[5, ])
```
Description

Usage

textmodel_wordfish(x, dir = c(1, 2), priors = c(Inf, Inf, 3, 1),
  tol = c(1e-06, 1e-08), dispersion = c("poisson", "quasipoisson"),
  dispersion_level = c("feature", "overall"), dispersion_floor = 0,
  sparse = FALSE, abs_err = FALSE, svd_sparse = TRUE,
  residual_floor = 0.5)

Arguments

x the dfm on which the model will be fit

dir set global identification by specifying the indexes for a pair of documents such that $\theta_{dir[1]} < \theta_{dir[2]}$.

priors prior precisions for the estimated parameters $\alpha_i, \psi_j, \beta_j,$ and $\theta_i$, where $i$ indexes documents and $j$ indexes features

tol tolerances for convergence. The first value is a convergence threshold for the log-posterior of the model, the second value is the tolerance in the difference in parameter values from the iterative conditional maximum likelihood (from conditionally estimating document-level, then feature-level parameters).

dispersion sets whether a quasi-Poisson quasi-likelihood should be used based on a single dispersion parameter ("poisson"), or quasi-Poisson ("quasipoisson")

dispersion_level sets the unit level for the dispersion parameter, options are "feature" for term-level variances, or "overall" for a single dispersion parameter

dispersion_floor constraint for the minimal underdispersion multiplier in the quasi-Poisson model. Used to minimize the distorting effect of terms with rare term or document frequencies that appear to be severely underdispersed. Default is 0, but this only applies if dispersion = "quasipoisson".

sparse specifies whether the "dfm" is coerced to dense. While setting this to TRUE will make it possible to handle larger dfm objects (and make execution faster), it will generate slightly different results each time, because the sparse SVD routine has a stochastic element.

abs_err specifies how the convergence is considered

svd_sparse uses svd to initialize the starting values of theta, only applies when sparse = TRUE

residual_floor specifies the threshold for residual matrix when calculating the svds, only applies when sparse = TRUE
Details

The returns match those of Will Lowe’s R implementation of wordfish (see the austin package), except that here we have renamed words to be features. (This return list may change.) We have also followed the practice begun with Slapin and Proksch’s early implementation of the model that used a regularization parameter of $se(\sigma) = 3$, through the third element in priors.

Value

An object of class textmodel_fitted_wordfish. This is a list containing:

- dir: global identification of the dimension
- theta: estimated document positions
- alpha: estimated document fixed effects
- beta: estimated feature marginal effects
- psi: estimated word fixed effects
- docs: document labels
- features: feature labels
- sigma: regularization parameter for betas in Poisson form
- ll: log likelihood at convergence
- se.theta: standard errors for theta-hats
- x: dfm to which the model was fit

Note

In the rare situation where a warning message of "The algorithm did not converge." shows up, removing some documents may work.

```

---

textmodel_wordscores  
Wordscores text model

Description

textmodel_wordscores implements Laver, Benoit and Garry’s (2003) "Wordscores" method for scaling texts on a single dimension, given a set of anchoring or reference texts whose values are set through reference scores. This scale can be fitted in the linear space (as per LBG 2003) or in the logit space (as per Beauchamp 2012). Estimates of virgin or unknown texts are obtained using the predict() method to score documents from a fitted textmodel_wordscores object.

Usage

textmodel_wordscores(x, y, scale = c("linear", "logit"), smooth = 0)
Arguments

- **x**: the dfm on which the model will be trained
- **y**: vector of training scores associated with each document in x
- **scale**: scale on which to score the words; "linear" for classic LBG linear posterior weighted word class differences, or "logit" for log posterior differences
- **smooth**: a smoothing parameter for word counts; defaults to zero to match the LBG (2003) method. See Value below for additional information on the behaviour of this argument.

Details

The `textmodel_wordscores()` function and the associated `predict()` method are designed to function in the same manner as `predict.lm`. `coef()` can also be used to extract the word coefficients from the fitted `textmodel_wordscores` object, and `summary()` will print a nice summary of the fitted object.

Value

A fitted `textmodel_wordscores` object. This object will contain a copy of the input data, but in its original form without any smoothing applied. Calling `predict.textmodel_wordscores` on this object without specifying a value for `newdata`, for instance, will predict on the unsmoothed object. This behaviour differs from versions of `quanteda <= 1.2`.

textplot_influence  Influence plot for text scaling models

Description
Plot the results of a fitted scaling model, from (e.g.) a predicted textmodel_affinity model.

Usage
textplot_influence(x, n = 30, ...)

Arguments
x  the object output from ‘influence()’ run on the fitted or predicted scaling model
n  the number of features whose influence will be plotted
... additional arguments passed to plot

Author(s)
Patrick Perry and Kenneth Benoit

pred <- predict(tmod)
textplot_influence(influence(pred))

textplot_keyness  Plot word keyness

Description
Plot the results of a "keyword" of features comparing their differential associations with a target
and a reference group, after calculating keyness using textstat_keyness.

Usage
textplot_keyness(x, show_reference = TRUE, show_legend = TRUE,
n = 20L, min_count = 2L, margin = 0.05, color = c("darkblue",
"gray"), labelcolor = "gray30", labelsize = 4, font = NULL)
Arguments

- `x`: a return object from `textstat_keyness`
- `show_reference`: logical; if TRUE, show key reference features in addition to key target features
- `show_legend`: logical; if TRUE, show legend
- `n`: integer; number of features to plot
- `min_count`: numeric; minimum total count of feature across the target and reference categories, for a feature to be included in the plot
- `margin`: numeric; size of margin where feature labels are shown
- `color`: character or integer; colors of bars for target and reference documents. `color` must have two elements when `show_reference = TRUE`. See `color`.
- `labelcolor`: character; color of feature labels.
- `labelsiz`: numeric; size of feature labels and bars. See `size`.
- `font`: character; font-family of texts. Use default font if NULL.

Value

a `ggplot2` object

Author(s)

Haiyan Wang and Kohei Watanabe

See Also

`textstat_keyness`

Examples

```r
# compare Trump speeches to other Presidents by chi^2
dfmat1 <- data_corpus_inaugural %>%
  corpus_subset(Year > 1980) %>%
  dfm(groups = "President", remove = stopwords("english"), remove_punct = TRUE)
tstat1 <- textstat_keyness(dfmat1, target = "Trump")
textplot_keyness(tstat1, margin = 0.2, n = 10)

# compare contemporary Democrats v. Republicans
corp <- data_corpus_inaugural %>%
corpus_subset(Year > 1960)
docvars(corp, "party") <-
  ifelse(docvars(corp, "President") %in% c("Nixon", "Reagan", "Bush","Trump"),
          "Republican", "Democrat")
dfmat2 <- dfm(corp, groups = "party", remove = stopwords("english"),
             remove_punct = TRUE)
tstat2 <- textstat_keyness(dfmat2, target = "Democrat", measure = "lr")
textplot_keyness(tstat2, color = c("blue", "red"), n = 10)
```
textplot_network  

Plot a network of feature co-occurrences

Description
Plot an fcm object as a network, where edges show co-occurrences of features.

Usage

textplot_network(x, min_freq = 0.5, omit_isolated = TRUE, 
    edge_color = "#f78b4", edge_alpha = 0.5, edge_size = 2, 
    vertex_color = "#4d04d", vertex_size = 2, 
    vertex_labelcolor = NULL, vertex_labelfont = NULL, 
    vertex_labelsize = 2, offset = NULL, ...)

## S3 method for class 'fcm'
as.network(x, min_freq = 0.5, omit_isolated = TRUE, ...)

## S3 method for class 'fcm'
as.igraph(x, min_freq = 0.5, omit_isolated = TRUE, ...)

Arguments

x  
a fcm or dfm object

min_freq  
a frequency count threshold or proportion for co-occurrence frequencies of features to be included.

omit_isolated  
if TRUE, features do not occur more frequent than min_freq will be omitted.

dir_edge_color  
color of edges that connect vertices.

dir_edge_alpha  
opacity of edges ranging from 0 to 1.0.

dir_edge_size  
size of edges for most frequent co-occurrence The size of other edges are determined proportionally to the 99th percentile frequency instead of the maximum to reduce the impact of outliers.

dir_vertex_color  
color of vertices.

dir_vertex_size  
size of vertices

vertex_labelcolor  
color of texts. Defaults to the same as vertex_color. If NA is given, texts are not rendered.

vertex_labelfont  
font-family of texts. Use default font if NULL.

vertex_labelsize  
size of vertex labels in mm. Defaults to size 2.

offset  
if NULL, the distance between vertices and texts are determined automatically.

...  
additional arguments passed to network or graph_from_adjacency_matrix. Not used for as.igraph.
Details

Currently the size of the network is limited to 1000, because of the computationally intensive nature of network formation for larger matrices. When the fcm is large, users should select features using fcm_select, set the threshold using min_freq, or implement own plotting function using as.network.

textplot_network(min_freq = 0.8, vertex_labelcolor = rep(c("gray40", NA), 15))

# as.igraph
if (requireNamespace("igraph", quietly = TRUE)) {
  txt <- c("a a a b c", "a a c e", "a c e f g")
  mat <- fcm(txt)
  as.igraph(mat, min_freq = 1, omit_isolated = FALSE)
}

---

textplot_scale1d  Plot a fitted scaling model

Description

Plot the results of a fitted scaling model, from (e.g.) a predicted textmodel_wordscores model or a fitted textmodel_wordfish or textmodel_ca model. Either document or feature parameters may be plotted: an ideal point-style plot (estimated document position plus confidence interval on the x-axis, document labels on the y-axis) with optional renaming and sorting, or as a plot of estimated
feature-level parameters (estimated feature positions on the x-axis, and a measure of relative frequency or influence on the y-axis, with feature names replacing plotting points with some being chosen by the user to be highlighted).

Usage

textplot_scale1d(x, margin = c("documents", "features"),
                 doclabels = NULL, sort = TRUE, groups = NULL, highlighted = NULL,
                 alpha = 0.7, highlighted_color = "black")

Arguments

x       the fitted or predicted scaling model object to be plotted
margin  "documents" to plot estimated document scores (the default) or "features" to plot estimated feature scores by a measure of relative frequency
doclabels a vector of names for document; if left NULL (the default), docnames will be used
sort    if TRUE (the default), order points from low to high score. If a vector, order according to these values from low to high. Only applies when margin = "documents".
groups  either: a character vector containing the names of document variables to be used for grouping; or a factor or object that can be coerced into a factor equal in length or rows to the number of documents. See groups for details.
highlighted a vector of feature names to draw attention to in a feature plot; only applies if margin = "features"
alpha    A number between 0 and 1 (default 0.5) representing the level of alpha transparency used to overplot feature names in a feature plot; only applies if margin = "features"
highlighted_color color for highlighted terms in highlighted

Value

a ggplot2 object

Note

The groups argument only applies when margin = "documents".

Examples

```r
## Not run:
dfmat <- dfm(data_corpus_irishbudget2010)

## wordscores
refscores <- c(rep(NA, 4), 1, -1, rep(NA, 8))
tmod1 <- textmodel_wordscores(dfmat, y = refscores, smooth = 1)
# plot estimated document positions
textplot_scale1d(predict(tmod1, se.fit = TRUE),
                   groups = docvars(data_corpus_irishbudget2010, "party"))
# plot estimated word positions
textplot_scale1d(tmod1, highlighted = c("minister", "have", "our", "budget"))

## wordfish
tmod2 <- textmodel_wordfish(dfmat, dir = c(6, 5))
# plot estimated document positions
textplot_scale1d(tmod2)
textplot_scale1d(tmod2, groups = docvars(data_corpus_irishbudget2010, "party"))
# plot estimated word positions
textplot_scale1d(tmod2, margin = "features",
                   highlighted = c("government", "global", "children",
                                    "bank", "economy", "the", "citizenship",
                                    "productivity", "deficit"))

## correspondence analysis
tmod3 <- textmodel_ca(dfmat)
# plot estimated document positions
textplot_scale1d(tmod3, margin = "documents",
                   groups = docvars(data_corpus_irishbudget2010, "party"))

## End(Not run)
```

---

**textplot_wordcloud**

*Plot features as a wordcloud*

**Description**

Plot a dfm object as a wordcloud, where the feature labels are plotted with their sizes proportional to their numerical values in the dfm. When comparison = TRUE, it plots comparison word clouds by document.

**Usage**

```r
textplot_wordcloud(x, min_size = 0.5, max_size = 4, min_count = 3, max_words = 500, color = "darkblue", font = NULL, adjust = 0, rotation = 0.1, random_order = FALSE, random_color = FALSE, ordered_color = FALSE, labelcolor = "gray20", labelsize = 1.5, labeloffset = 0, fixed_aspect = TRUE, ..., comparison = FALSE)
```
Arguments

- **x**: a dfm object
- **min_size**: size of the smallest word
- **max_size**: size of the largest word
- **min_count**: words with frequency below min_count will not be plotted
- **max_words**: maximum number of words to be plotted. least frequent terms dropped.
- **color**: color of words from least to most frequent
- **font**: font-family of words and labels. Use default font if NULL.
- **adjust**: adjust sizes of words by a constant. Useful for non-English words for which R fails to obtain correct sizes.
- **rotation**: proportion of words with 90 degree rotation
- **random_order**: plot words in random order. If FALSE, they will be plotted in decreasing frequency.
- **random_color**: choose colors randomly from the colors. If FALSE, the color is chosen based on the frequency
- **ordered_color**: if TRUE, then colors are assigned to words in order.
- **labelcolor**: color of group labels. Only used when comparison=TRUE.
- **labelsize**: size of group labels. Only used when comparison=TRUE.
- **labeloffset**: position of group labels. Only used when comparison=TRUE.
- **fixed_aspect**: if TRUE, the aspect ratio is fixed. Variable aspect ratio only supported if rotation = 0.
- **...**: additional parameters. Only used to make it compatible with wordcloud
- **comparison**: if TRUE, plot a wordcloud that compares documents in the same way as comparison.cloud

Details

The default is to plot the word cloud of all features, summed across documents. To produce word cloud plots for specific document or set of documents, you need to slice out the document(s) from the dfm object.

Comparison wordcloud plots may be plotted by setting comparison = TRUE, which plots a separate grouping for each document in the dfm. This means that you will need to slice out just a few documents from the dfm, or to create a dfm where the "documents" represent a subset or a grouping of documents by some document variable.

Author(s)

Kohei Watanabe, building on code from Ian Fellows’s wordcloud package.
Examples

# plot the features (without stopwords) from Obama's inaugural addresses
set.seed(10)
dfmat1 <- dfm(corpus_subset(data_corpus_inaugural, President == "Obama"),
               remove = stopwords("english"), remove_punct = TRUE) #>
dfm_trim(min_termfreq = 3)

# basic wordcloud
textplot_wordcloud(dfmat1)

dfm_trim(min_termfreq = 3)

# plot in colors with some additional options
textplot_wordcloud(dfmat1, rotation = 0.25,
                   color = rev(RColorBrewer::brewer.pal(10, "RdBu")))

dfm_trim(min_termfreq = 3)

# other display options
col <- sapply(seq(0.1, 1, 0.1), function(x) adjustcolor("#1F78B4", x))
textplot_wordcloud(dfmat1, adjust = 0.5, random_order = FALSE,
                   color = col, rotation = FALSE)

dfm_trim(min_termfreq = 3)

# comparison plot of Obama v. Trump
dfmat2 <- dfm(corpus_subset(data_corpus_inaugural, President in c("Obama", "Trump")),
               remove = stopwords("english"), remove_punct = TRUE, groups = "President") #>
dfm_trim(min_termfreq = 3)

textplot_wordcloud(dfmat2, comparison = TRUE, max_words = 300,
                   color = c("blue", "red"))

dfm_trim(min_termfreq = 3)

---

textplot_xray

Plot the dispersion of key word(s)

Description

Plots a dispersion or "x-ray" plot of selected word pattern(s) across one or more texts. The format
of the plot depends on the number of kwic class objects passed: if there is only one document,
keywords are plotted one below the other. If there are multiple documents the documents are plotted
one below the other, with keywords shown side-by-side. Given that this returns a ggplot2 object,
you can modify the plot by adding ggplot2 layers (see example).

Usage

textplot_xray(..., scale = c("absolute", "relative"), sort = FALSE)

Arguments

... any number of kwic class objects
scale whether to scale the token index axis by absolute position of the token in the
document or by relative position. Defaults are absolute for single document and
relative for multiple documents.
sort whether to sort the rows of a multiple document plot by document name
Value

a ggplot2 object

Known Issues

These are known issues on which we are working to solve in future versions:

- `textplot_xray()` will not display the patterns correctly when these are multi-token sequences.
- For dictionaries with keys that have overlapping value matches to tokens in the text, only the first match will be used in the plot. The way around this is to produce one kwic per dictionary key, and send them as a list to `textplot_xray`.

Examples

```r
## Not run:
corp <- corpus_subset(data_corpus_inaugural, Year > 1970)
# compare multiple documents
textplot_xray(kwic(corp, pattern = "american"))
textplot_xray(kwic(corp, pattern = "american"), scale = "absolute")

# compare multiple terms across multiple documents
textplot_xray(kwic(corp, pattern = "america"),
              kwic(corp, pattern = "people"))

# how to modify the ggplot with different options
library(ggplot2)
tplot <- textplot_xray(kwic(corp, pattern = "american"),
                       kwic(corp, pattern = "people"))
tplot + aes(color = keyword) + scale_color_manual(values = c('red', 'blue'))

# adjust the names of the document names
docnames(corp) <- apply(docvars(corp, c("Year", "President")), 1, paste, collapse = ", ")
textplot_xray(kwic(corp, pattern = "america"),
              kwic(corp, pattern = "people"))

## End(Not run)
```

---

**texts**

*Get or assign corpus texts*

Description

Get or replace the texts in a corpus, with grouping options. Works for plain character vectors too, if groups is a factor.
Usage

texts(x, groups = NULL, spacer = " ")

texts(x) <- value

## S3 method for class 'corpus'
as.character(x, ...)

Arguments

x

texts or character object

groups
either: a character vector containing the names of document variables to be used
for grouping; or a factor or object that can be coerced into a factor equal in
length or rows to the number of documents. See groups for details.

spacer
when concatenating texts by using groups, this will be the spacing added be-
tween texts. (Default is two spaces.)

value
character vector of the new texts

Details

as.character(x) where x is a corpus is equivalent to calling texts(x)

Value

For texts, a character vector of the texts in the corpus.
For texts <-, the corpus with the updated texts.
for texts <-, a corpus with the texts replaced by value

Note

The groups will be used for concatenating the texts based on shared values of groups, without any
specified order of aggregation.
You are strongly encouraged as a good practice of text analysis workflow not to modify the sub-
stance of the texts in a corpus. Rather, this sort of processing is better performed through down-
stream operations. For instance, do not lowercase the texts in a corpus, or you will never be able to
recover the original case. Rather, apply tokens_tolower after applying tokens to a corpus, or use
the option tolower = TRUE in dfm.

Examples

nchar(texts(corpus_subset(data_corpus_inaugural, Year < 1806)))

# grouping on a document variable
nchar(texts(corpus_subset(data_corpus_inaugural, Year < 1806), groups = "President"))
# grouping a character vector using a factor
nchar(data_char_ukimmig2010[1:5])
nchar(texts(data_corpus_inaugural[1:5],
    groups = as.factor(data_corpus_inaugural[1:5, "President"))))

BritCorpus <- corpus(c("We must prioritise honour in our neighbourhood.",
    "Aluminium is a valourous metal."))
texts(BritCorpus) <-
    stringi::stri_replace_all_regex(texts(BritCorpus),
    c("ise", "([nlb])our", "nium"),
    c("ize", "$lor", "num"),
    vectorize_all = FALSE)
texts(BritCorpus)
texts(BritCorpus)[2] <- "New text number 2."
texts(BritCorpus)

---

**textstat_collocations**

*Identify and score multi-word expressions*

**Description**

Identify and score multi-word expressions, or adjacent fixed-length collocations, from text.

**Usage**

```r
textstat_collocations(x, method = "lambda", size = 2, min_count = 2,
    smoothing = 0.5, tolower = TRUE, ...)
```

```r
is.collocations(x)
```

**Arguments**

- `x` a character, corpus, or tokens object whose collocations will be scored. The tokens object should include punctuation, and if any words have been removed, these should have been removed with `padding = TRUE`. While identifying collocations for tokens objects is supported, you will get better results with character or corpus objects due to relatively imperfect detection of sentence boundaries from texts already tokenized.
- `method` association measure for detecting collocations. Currently this is limited to "lambda". See Details.
- `size` integer; the length of the collocations to be scored
- `min_count` numeric; minimum frequency of collocations that will be scored
- `smoothing` numeric; a smoothing parameter added to the observed counts (default is 0.5)
- `tolower` logical; if TRUE, form collocations as lower-cased combinations
- `...` additional arguments passed to `tokens`, if `x` is not a tokens object already
Details
Documents are grouped for the purposes of scoring, but collocations will not span sentences. If `x` is a tokens object and some tokens have been removed, this should be done using `tokens_remove(x, pattern, padding = TRUE)` so that counts will still be accurate, but the pads will prevent those collocations from being scored.

The lambda computed for a size = `K`-word target multi-word expression the coefficient for the `K`-way interaction parameter in the saturated log-linear model fitted to the counts of the terms forming the set of eligible multi-word expressions. This is the same as the "lambda" computed in Blaheta and Johnson’s (2001), where all multi-word expressions are considered (rather than just verbs, as in that paper). The `z` is the Wald `z`-statistic computed as the quotient of `lambda` and the Wald statistic for `lambda` as described below.

In detail:
Consider a `K`-word target expression `x`, and let `z` be any `K`-word expression. Define a comparison function `c(x, z) = (j_1, ..., j_K) = c` such that the `k`th element of `c` is 1 if the `k`th word in `z` is equal to the `k`th word in `x`, and 0 otherwise. Let `c_i = (j_{i1}, ..., j_{iK})`, `i = 1, ..., 2^K = M`, be the possible values of `c(x, z)`, with `c_M = (1, 1, ..., 1)`. Consider the set of `c(x, z)` across all expressions `z` in a corpus of text, and let `n_i`, for `i = 1, ..., M`, denote the number of the `c(x, z)` which equal `c_i`, plus the smoothing constant `smoothing`. The `n_i` are the counts in a `2^K` contingency table whose dimensions are defined by the `c_i`.

\[ \lambda : \text{The } K\text{-way interaction parameter in the saturated loglinear model fitted to the } n_i. \text{ It can be calculated as} \]
\[ \lambda = \sum_{i=1}^{M} (-1)^{K-b_i} \cdot \log n_i \]

where `b_i` is the number of the elements of `c_i` which are equal to 1.

Wald test `z`-statistic `z` is calculated as:

\[ z = \frac{\lambda}{[\sum_{i=1}^{M} n_i^{-1}]^{1/2}} \]

Value
`textstat_collocations` returns a data.frame of collocations and their scores and statistics. This consists of the collocations, their counts, length, and `lambda` and `z` statistics. When `size` is a vector, then `count_nested` counts the lower-order collocations that occur within a higher-order collocation (but this does not affect the statistics).

`is.collocation` returns `TRUE` if the object is of class `collocations`, `FALSE` otherwise.

Note
This function is under active development, with more measures to be added in the next release of `quanteda`.

Examples

corp <- data_corpus_inaugural[1:2]
head(cols <- textstat_collocations(corp, size = 2, min_count = 2), 10)
head(cols <- textstat_collocations(corp, size = 3, min_count = 2), 10)

# extracting multi-part proper nouns (capitalized terms)
toks1 <- tokens(data_corpus_inaugural)
toks2 <- tokens_remove(toks1, pattern = stopwords("english"), padding = TRUE)
toks3 <- tokens_select(toks2, pattern = "^([A-Z][a-z-]{2,})", valuetype = "regex",
case_insensitive = FALSE, padding = TRUE)
tstat <- textstat_collocations(toks3, size = 3, tolower = FALSE)
head(tstat, 10)

# vectorized size
txt <- c("... a b c ... a b c ... c d e",
    "a b ... a b ... a b ... a b a b",
    "b c d ... b c . b c ... b c")
textstat_collocations(txt, size = 2:3)

---

textstat_entropy  Compute entropy of documents or features

Description

Compute entropy of documents or features

Usage

textstat_entropy(x, margin = c("documents", "features"), base = 2)

Arguments

x a dfm
margin character indicating for which margin to compute entropy
base base for logarithm function

Examples

textstat_entropy(data_dfm_lbgexample)
textstat_entropy(data_dfm_lbgexample, "features")
textstat_frequency  

Tabulate feature frequencies

**Description**

Produces counts and document frequencies summaries of the features in a dfm, optionally grouped by a docvars variable or other supplied grouping variable.

**Usage**

```r
textstat_frequency(x, n = NULL, groups = NULL)
```

**Arguments**

- `x` a dfm object
- `n` (optional) integer specifying the top `n` features to be returned, within group if groups is specified
- `groups` either: a character vector containing the names of document variables to be used for grouping; or a factor or object that can be coerced into a factor equal in length or rows to the number of documents. See groups for details.

**Value**

A data.frame containing the following variables:

- **feature** (character) the feature
- **frequency** count of the feature
- **rank** rank of the feature, where 1 indicates the greatest frequency
- **docfreq** document frequency of the feature, as a count (the number of documents in which this feature occurred at least once)
- **docfreq** document frequency of the feature, as a count
- **group** (only if groups is specified) the label of the group. If the features have been grouped, then all counts, ranks, and document frequencies are within group. If groups is not specified, the group column is omitted from the returned data.frame.

**Examples**

```r
dfmat1 <- dfm(c("a a b b c d", "a d d d", "a a a"))
textstat_frequency(dfmat1)
textstat_frequency(dfmat1, groups = c("one", "two", "one"))
dfmat2 <- corpus_subset(data_corpus_inaugural, President == "Obama") %>%
  dfm(remove_punct = TRUE, remove = stopwords("english"))
```
tstat1 <- textstat_frequency(dfmat2)
head(tstat1, 10)

# plot 20 most frequent words
library("ggplot2")
ggplot(tstat1[1:20, ], aes(x = reorder(feature, frequency), y = frequency)) +
  geom_point() +
  coord_flip() +
  labs(x = NULL, y = "Frequency")

# plot relative frequencies by group
dfmat3 <- data_corpus_inaugural %>%
  corpus_subset(Year > 2000) %>%
  dfm(remove = stopwords("english"), remove_punct = TRUE) %>%
  dfm_group(groups = "President") %>%
  dfm_weight(scheme = "prop")

# calculate relative frequency by president
tstat2 <- textstat_frequency(dfmat3, n = 10,
  groups = "President")

# plot frequencies
ggplot(data = tstat2, aes(x = nrow(tstat2):1, y = frequency)) +
  geom_point() +
  facet_wrap(~ group, scales = "free") +
  coord_flip() +
  scale_x_continuous(breaks = nrow(tstat2):1,
    labels = tstat2$feature) +
  labs(x = NULL, y = "Relative frequency")

## textstat_keyness

### Calculate keyness statistics

**Description**

Calculate "keyness", a score for features that occur differentially across different categories. Here, the categories are defined by reference to a "target" document index in the dfm, with the reference group consisting of all other documents.

**Usage**

textstat_keyness(x, target = 1L, measure = c("chi2", "exact", "lr", "pmi"), sort = TRUE, correction = c("default", "yates", "williams", "none"))
textstat_keyness

Arguments

x  a dfm containing the features to be examined for keyness

target  the document index (numeric, character or logical) identifying the document forming the "target" for computing keyness; all other documents’ feature frequencies will be combined for use as a reference

measure  (signed) association measure to be used for computing keyness. Currently available: "chi2"; "exact" (Fisher’s exact test); "lr" for the likelihood ratio; "pmi" for pointwise mutual information.

sort  logical; if TRUE sort features scored in descending order of the measure, otherwise leave in original feature order

correction  if "default", Yates correction is applied to "chi2"; William’s correction is applied to "lr"; and no correction is applied for the "exact" and "pmi" measures. Specifying a value other than the default can be used to override the defaults, for instance to apply the Williams correction to the chi2 measure. Specifying a correction for the "exact" and "pmi" measures has no effect and produces a warning.

Value

a data.frame of computed statistics and associated p-values, where the features scored name each row, and the number of occurrences for both the target and reference groups. For measure = "chi2" this is the chi-squared value, signed positively if the observed value in the target exceeds its expected value; for measure = "exact" this is the estimate of the odds ratio; for measure = "lr" this is the likelihood ratio G2 statistic; for "pmi" this is the pointwise mutual information statistics.

textstat_keyness returns a data.frame of features and their keyness scores and frequency counts.

dfmat1 <- dfm(data_corpus_inaugural, groups = period)
head(dfmat1) # make sure 'post-war' is in the first row
head(tstat1 <- textstat_keyness(dfmat1), 10)
tail(tstat1, 10)

# compare pre- v. post-war terms using logical vector
dfmat2 <- dfm(data_corpus_inaugural)
Calculate lexical diversity

Description

Calculate the lexical diversity of text(s).

Usage

textstat_lexdiv(x, measure = c("TTR", "C", "R", "CTTR", "U", "S", "K", "D", "Vm", "Maas", "MATTR", "MSTTR", "all"), remove_numbers = TRUE, remove_punct = TRUE, remove_symbols = TRUE, remove_hyphens = FALSE, log.base = 10, MATTR_window = 100L, MSTTR_segment = 100L, \ldots)

Arguments

x an dfm or tokens input object for whose documents lexical diversity will be computed
measure a character vector defining the measure to compute
remove_numbers logical; if TRUE remove features or tokens that consist only of numerals (the Unicode "Number" [N] class)
remove_punct logical; if TRUE remove all features or tokens that consist only of the Unicode "Punctuation" [P] class)
remove_symbols logical; if TRUE remove all features or tokens that consist only of the Unicode "Punctuation" [S] class)
remove_hyphens logical; if TRUE split words that are connected by hyphenation and hyphenation-like characters in between words, e.g. "self-storage" becomes two features or tokens "self" and "storage". Default is FALSE to preserve such words as is, with the hyphens.
log.base a numeric value defining the base of the logarithm (for measures using logarithms)
MATTR_window a numeric value defining the size of the moving window for computation of the Moving-Average Type-Token Ratio (Covington & McFall, 2010)
MSTTR_segment a numeric value defining the size of the each segment for the computation of the the Mean Segmental Type-Token Ratio (Johnson, 1944)
\ldots for passing arguments to other methods
Details

textstat_lexdiv calculates the lexical diversity of documents using a variety of indices. In the following formulas, \( N \) refers to the total number of tokens, \( V \) to the number of types, and \( f_v(i, N) \) to the numbers of types occurring \( i \) times in a sample of length \( N \).

“TTR”: The ordinary Type-Token Ratio:
\[
TTR = \frac{V}{N}
\]

“C”: Herdan’s \( C \) (Herdan, 1960, as cited in Tweedie & Baayen, 1998; sometimes referred to as \( \log \)TTR):
\[
C = \frac{\log V}{\log N}
\]

\[
R = \frac{V}{\sqrt{N}}
\]

“CTTR”: Carroll’s Corrected TTR:
\[
CTTR = \frac{V}{\sqrt{2N}}
\]

\[
U = \frac{(\log N)^2}{\log N - \log V}
\]

“S”: Summer’s index:
\[
S = \frac{\log \log V}{\log \log N}
\]

“K”: Yule’s \( K \) (Yule, 1944, as presented in Tweedie & Baayen, 1998, Eq. 16) is calculated by:
\[
K = 10^4 \times \left[ -\frac{1}{N} + \sum_{i=1}^{V} f_v(i, N) \left( \frac{i}{N} \right)^2 \right]
\]

“D”: Simpson’s \( D \) (Simpson 1949, as presented in Tweedie & Baayen, 1998, Eq. 17) is calculated by:
\[
D = \sum_{i=1}^{V} f_v(i, N) \frac{i}{N} \frac{i - 1}{N - 1}
\]

“Vm”: Herdan’s \( V_m \) (Herdan 1955, as presented in Tweedie & Baayen, 1998, Eq. 18) is calculated by:
\[
V_m = \sqrt{\sum_{i=1}^{V} f_v(i, N)(i/N)^2 - \frac{i}{V}}
\]
"Maas": Maas’ indices ($a$, $\log V_0$ & $\log e V_0$):

\[
a^2 = \frac{\log N - \log V}{\log N^2}
\]

\[
\log V_0 = \frac{\log V}{\sqrt{1 - \frac{\log V^2}{\log N}}}
\]

The measure was derived from a formula by Mueller (1969, as cited in Maas, 1972). $\log e V_0$ is equivalent to $\log V_0$, only with $e$ as the base for the logarithms. Also calculated are $a$, $\log V_0$ (both not the same as before) and $V'$ as measures of relative vocabulary growth while the text progresses. To calculate these measures, the first half of the text and the full text will be examined (see Maas, 1972, p. 67 ff. for details). Note: for the current method (for a dfm) there is no computation on separate halves of the text.

"MATTR": The Moving-Average Type-Token Ratio (Covington & McFall, 2010) calculates TTRs for a moving window of tokens from the first to the last token, computing a TTR for each window. The MATTR is the mean of the TTRs of each window.

"MSTTR": Mean Segmental Type-Token Ratio (sometimes referred to as Split TTR) splits the tokens into segments of the given size, TTR for each segment is calculated and the mean of these values returned. When this value is < 1.0, it splits the tokens into equal, non-overlapping sections of that size. When this value is > 1, it defines the segments as windows of that size. Tokens at the end which do not make a full segment are ignored.

Value

A data.frame of documents and their lexical diversity scores.

Author(s)

Kenneth Benoit and Jiong Wei Lua. Many of the formulas have been reimplemented from functions written by Meik Michalke in the koRpus package.

References

Examples

txt <- c("Anyway, like I was sayin', shrimp is the fruit of the sea. You can barbecue it, boil it, broil it, bake it, saute it.
"There's shrimp-kabobs, shrimp creole, shrimp gumbo. Pan fried, deep fried, stir-fried. There's pineapple shrimp, lemon shrimp, coconut shrimp, pepper shrimp, shrimp soup, shrimp stew, shrimp salad, shrimp and potatoes, shrimp burger, shrimp sandwich."")

dfm(txt) %>%
textstat_lexdiv(measure = c("TTR", "CTTR", "K"))
toks <- tokens(corpus_subset(data_corpus_inaugural, Year > 2000))
textstat_lexdiv(toks, c("CTTR", "TTR", "MATTR"), MATTR_window = 100)

textstat_readability  

Calculate readability

Description

Calculate the readability of text(s) using one of a variety of computed indexes.

Usage

```r
textstat_readability(x, measure, remove_hyphens = TRUE,
  min_sentence_length = 1, max_sentence_length = 10000,
  intermediate = FALSE, ...)
```

Arguments

- **x**: a character or corpus object containing the texts
- **measure**: character vector defining the readability measure to calculate. Matches are case-insensitive.
- **remove_hyphens**: if TRUE, treat constituent words in hyphenated as separate terms, for purposes of computing word lengths, e.g. "decision-making" as two terms of lengths 8 and 6 characters respectively, rather than as a single word of 15 characters
- **min_sentence_length**, **max_sentence_length**: set the minimum and maximum sentence lengths (in tokens, excluding punctuation) to include in the computation of readability. This makes it easy to exclude "sentences" that may not really be sentences, such as section titles, table elements, and other cruft that might be in the texts following conversion. For finer-grained control, consider filtering sentences prior first, including through pattern-matching, using corpus_trim.
intermediate if TRUE, include intermediate quantities in the output
... not used

Details

The following readability formulas have been implemented, where

- \( N_w = n_w \) = number of words
- \( N_c = n_c \) = number of characters
- \( N_{st} = n_{st} \) = number of sentences
- \( N_{sy} = n_{sy} \) = number of syllables
- \( Nwf = n_{wf} \) = number of words matching the Dale-Chall List of 3000 "familiar words"
- \( ASL = \text{Average Sentence Length}: \frac{\text{number of words}}{\text{number of sentences}} \)
- \( AWL = \text{Average Word Length}: \frac{\text{number of characters}}{\text{number of words}} \)
- \( AFW = \text{Average Familiar Words}: \frac{\text{count of words matching the Dale-Chall list of 3000 "familiar words"}}{\text{number of all words}} \)
- \( Nwd = n_{wd} \) = number of "difficult" words not matching the Dale-Chall list of "familiar" words

"ARI": Automated Readability Index (Senter and Smith 1967)

\[
0.5\, ASL + 4.71\, AWL - 21.34
\]

"ARI.Simple": A simplified version of Senter and Smith’s (1967) Automated Readability Index.

\[
ASL + 9\, AWL
\]

"Bormuth.MC": Bormuth’s (1969) Mean Cloze Formula.

\[
0.886593 - 0.03640 \times AWL + 0.161911 \times AFW - 0.21401 \times ASL - 0.000577 \times ASL^2 - 0.000005 \times ASL^3
\]

"Bormuth.GP": Bormuth’s (1969) Grade Placement score.

\[
4.275 + 12.881 M - 34.934 M^2 + 20.388 M^3 + 26.194 CCS - 2.046 CCS^2 - 11.767 CCS^3 - 42.285 (M \times CCS) + 97.620 (M \times CCS)^2 - 59.538 (M \times CCS)^3
\]

where \( M \) is the Bormuth Mean Cloze Formula as in "Bormuth" above, and \( CCS \) is the Cloze Criterion Score (Bormuth, 1968).

\[
1.29 \times \frac{100 \times n_{wsy=1}}{n_w} - 38.45
\]

where \( n_{wsy=1} \) = \( N_{wsy} \) = the number of one-syllable words. The scaling by 100 in this and the other Coleman-derived measures arises because the Coleman measures are calculated on a per 100 words basis.

\[
1.16 \times \frac{100 \times n_{wsy=1}}{N_w} + 1.48 \times \frac{100 \times n_{wd}}{n_w} - 37.95
\]

\[141.8401 - 0.214590 \times 100 \times AWL + 1.079812 \times \frac{n_{st}}{n_w} \times 100 \]

"Coleman.Liau.Grade": Coleman-Liau Grade Level (Coleman and Liau 1975).

\[-27.4004 \times Coleman.Liau.ECP \times 100 + 23.06395 \]

\[5.88 \times AWL + 29.6 \times \frac{n_{st}}{n_w} - 15.8 \]

\[64 - (0.95 \times 100 \times \frac{n_{wd}}{n_w}) - (0.69 \times ASL) \]

\[0.1579 \times 100 \times \frac{n_{wd}}{n_w} + 0.0496 \times ASL + 3.6365 \]

The additional constant 3.6365 is only added if \((N_{wd} / N_w) > 0.05\).

\[0.1155 \times 100 \times \frac{n_{wd}}{n_w} + (0.0596 \times ASL) + 3.2672 \]

\[(1.0364 \times \frac{n_c}{n_{blank}}) + (0.0194 \times \frac{n_c}{n_{st}}) - 0.6059 \]

where \(n_{blank} = N_{blank} = \) the number of blanks.

\[131.059 - (10.364 \times \frac{n_c}{n_{blank}}) + (0.0194 \times \frac{n_c}{n_{st}}) \]

where \(n_{blank} = N_{blank} = \) the number of blanks.

"Dickes.Steiwer": Dickes-Steiwer Index (Dicks and Steiwer 1977).

\[235.95993 - (7.3021 \times AWL) - (12.56438 \times ASL) - (50.03293 \times TTR) \]

where TTR is the Type-Token Ratio (see textstat_lexdiv)

"DRP": Degrees of Reading Power.

\[(1 - Bormuth.MC) \times 100 \]

where Bormuth.MC refers to Bormuth’s (1969) Mean Cloze Formula (documented above)
"ELF": Easy Listening Formula (Fang 1966):
\[
\frac{n_{wsy>2}}{n_{st}}
\]
where \(n_{wsy>2} = \text{Nwmin2sy} = \text{the number of words with 2 syllables or more.}\)

"Farr. Jenkins. Paterson": Farr-Jenkins-Paterson’s Simplification of Flesch’s Reading Ease Score (Farr, Jenkins and Paterson 1951).
\[
-31.517 - (1.015 \times ASL) + (1.599 \times \frac{n_{wsy=1}}{n_w})
\]
where \(n_{wsy=1} = \text{Nwsy1} = \text{the number of one-syllable words.}\)

"Flesch": Flesch’s Reading Ease Score (Flesch 1948).
\[
206.835 - (1.015 \times ASL) - (84.6 \times \frac{n_{sy}}{n_w})
\]

"Flesch.PSK": The Powers-Sumner-Kearl’s Variation of Flesch Reading Ease Score (Powers, Sumner and Kearl, 1958).
\[
(0.0778 \times ASL) + (4.55 \times \frac{n_{sy}}{n_w}) - 2.2029
\]

"Flesch.Kincaid": Flesch-Kincaid Readability Score (Flesch and Kincaid 1975).
\[
0.39 \times ASL + 11.8 \times \frac{n_{sy}}{n_w} - 15.59
\]

"FOG": Gunning’s Fog Index (Gunning 1952).
\[
0.4 \times (ASL + 100 \times \frac{n_{wsy=3}}{n_w})
\]
where \(n_{wsy=3} = \text{Nwmin3sy} = \text{the number of words with 3-syllables or more. The scaling by 100 arises because the original FOG index is based on just a sample of 100 words).}\)

"FOG.PSK": The Powers-Sumner-Kearl Variation of Gunning’s Fog Index (Powers, Sumner and Kearl, 1958).
\[
3.0680 \times (0.0877 \times ASL) + (0.0984 \times 100 \times \frac{n_{wsy=3}}{n_w})
\]
where \(n_{wsy=3} = \text{Nwmin3sy} = \text{the number of words with 3-syllables or more. The scaling by 100 arises because the original FOG index is based on just a sample of 100 words).}\)

"FOG.NRI": The Navy’s Adaptation of Gunning’s Fog Index (Kincaid, Fishburne, Rogers and Chissom 1975).
\[
\frac{(n_{wsy<3} + 3 \times n_{wsy=3})}{(100 \times \frac{N_{sy}}{n_w})} - 3)/2
\]
where \(n_{wsy<3} = \text{Nwless3sy} = \text{the number of words with less than 3 syllables, and } n_{wsy=3} = \text{Nw3sy} = \text{the number of 3-syllable words. The scaling by 100 arises because the original FOG index is based on just a sample of 100 words).}\)
"FORCAST": FORCAST (Simplified Version of FORCAST.RGL) (Caylor and Sticht 1973).

\[
20 - \frac{n_{wsy=1} \times 150}{(n_w \times 10)}
\]

where \(n_{wsy=1} = \text{Nwsy1}\) = the number of one-syllable words. The scaling by 150 arises because the original FORCAST index is based on just a sample of 150 words.

"FORCAST.RGL": FORCAST.RGL (Caylor and Sticht 1973).

\[
20.43 - 0.11 \times \frac{n_{wsy=1} \times 150}{(n_w \times 10)}
\]

where \(n_{wsy=1} = \text{Nwsy1}\) = the number of one-syllable words. The scaling by 150 arises because the original FORCAST index is based on just a sample of 150 words.

"Fucks": Fucks’ (1955) Stilcharakteristik (Style Characteristic).

\[
AWL \ast ASL
\]

"Linsear Write": Linsear Write (Klare 1975).

\[
\left(100 - \frac{100 \times n_{wsy<3}}{n_w} \right) + \left(3 \times \frac{100 \times n_{wsy>3}}{n_w}\right)
\]

\[
\frac{\left(100 \times n_{wsy<3}\right) + \left(3 \times \frac{100 \times n_{wsy>3}}{n_w}\right)}{100 \times \frac{n_{wsy<3}}{n_w}}
\]

where \(n_{wsy<3} = \text{Nwless3sy}\) = the number of words with less than 3 syllables, and \(n_{wsy>3} = \text{Nwmin3sy}\) = the number of words with 3-syllables or more. The scaling by 100 arises because the original Linsear Write measure is based on just a sample of 100 words.

"LIW": Björnsson’s (1968) Läsbarhetsindex (For Swedish Texts).

\[
ASL + \frac{100 \times n_{wsy>7}}{n_w}
\]

where \(n_{wsy>7} = \text{Nwmin7sy}\) = the number of words with 7-syllables or more. The scaling by 100 arises because the Läsbarhetsindex index is based on just a sample of 100 words.

"nWS": Neue Wiener Sachtextformeln 1 (Bamberger and Vanecek 1984).

\[
19.35 \times \frac{n_{wsy>3}}{n_w} + 0.1672 \times ASL + 12.97 \times \frac{n_{wchar>6}}{n_w} - 3.27 \times \frac{n_{wsy=1}}{n_w} - 0.875
\]

where \(n_{wsy>3} = \text{Nwmin3sy}\) = the number of words with 3 syllables or more, \(n_{wchar>6} = \text{Nwmin6char}\) = the number of words with 6 characters or more, and \(n_{wsy=1} = \text{Nwsy1}\) = the number of one-syllable words.

"nWS.2": Neue Wiener Sachtextformeln 2 (Bamberger and Vanecek 1984).

\[
20.07 \times \frac{n_{wsy>3}}{n_w} + 0.1682 \times ASL + 13.73 \times \frac{n_{wchar>6}}{n_w} - 2.779
\]

where \(n_{wsy>3} = \text{Nwmin3sy}\) = the number of words with 3 syllables or more, and \(n_{wchar>6} = \text{Nwmin6char}\) = the number of words with 6 characters or more.
“nWS.3”: Neue Wiener Sachtextformeln 3 (Bamberger and Vanecck 1984).

\[ 29.63 \times \frac{n_{wsy>3}}{n_w} + 0.1905 \times ASL - 1.144 \]

where \[ n_{wsy>3} = Nwmin3sy \] = the number of words with 3 syllables or more.

“nWS.4”: Neue Wiener Sachtextformeln 4 (Bamberger and Vanecck 1984).

\[ 27.44 \times \frac{n_{wsy>3}}{n_w} + 0.2656 \times ASL - 1.693 \]

where \[ n_{wsy>3} = Nwmin3sy \] = the number of words with 3 syllables or more.

“RIX”: Anderson’s (1983) Readability Index.

\[ \frac{n_{wsy>7}}{n_{st}} \]

where \[ n_{wsy>7} = Nwmin7sy \] = the number of words with 7-syllables or more.

“Scrabble”: Scrabble Measure.

\[ MeanScrabbleLetterValuesofAllWords \]

. Scrabble values are for English. There is no reference for this, as we created it experimentally. It’s not part of any accepted readability index!

“SMOG”: Simple Measure of Gobbledygook (SMOG) (McLaughlin 1969).

\[ 1.043 \times \sqrt{n_{wsy>3}} \times \frac{30}{n_{st}} + 3.1291 \]

where \[ n_{wsy>3} = Nwmin3sy \] = the number of words with 3 syllables or more. This measure is regression equation D in McLaughlin’s original paper.

“SMOG.C”: SMOG (Regression Equation C) (McLaughlin’s 1969)

\[ 0.9986 \times \sqrt{Nwmin3sy \times \frac{30}{n_{st}}} + 5 + 2.8795 \]

where \[ n_{wsy>3} = Nwmin3sy \] = the number of words with 3 syllables or more. This measure is regression equation C in McLaughlin’s original paper.

\[ \sqrt{Nwmin3sy \times \frac{30}{n_{st}}} + 3 \]

“SMOG.de”: Adaptation of McLaughlin’s (1969) SMOG Measure for German Texts.

\[ \sqrt{Nwmin3sy \times \frac{30}{n_{st}}} - 2 \]

“Spache”: Spache’s (1952) Readability Measure.

\[ 0.121 \times ASL + 0.082 \times \frac{n_{wnotinspache}}{n_w} + 0.659 \]

where \[ n_{wnotinspache} = Nwnotinspache \] = number of unique words not in the Spache word list.
"Spache.old": Spache’s (1952) Readability Measure (Old).

\[ 0.141 \times ASL + 0.086 \times \frac{n_{\text{wnnotinspache}}}{n_w} + 0.839 \]

where \( n_{\text{wnnotinspache}} = N_{\text{wnnotinspache}} \) = number of unique words not in the Spache word list.

"Strain": Strain Index (Solomon 2006).

\[ n_{\text{sy}} \div n_{\text{st}} / 10 \]

The scaling by 3 arises because the original Strain index is based on just the first 3 sentences.

\[ 224.6814 - (79.8304 \times AWL) - (12.2403 \times ASL) - (1.292857 \times 100 \times \frac{n_{\text{prep}}}{n_w}) \]

where \( n_{\text{prep}} = N_{\text{prep}} \) = the number of prepositions. The scaling by 100 arises because the original Tränkle & Bailer index is based on just a sample of 100 words.

\[ Trankle.Bailer2 = 234.1063 - (96.11069 \times AWL) - (2.05444 \times 100 \times \frac{n_{\text{prep}}}{n_w}) - (1.02805 \times 100 \times \frac{n_{\text{conj}}}{n_w}) \]

where \( n_{\text{prep}} = N_{\text{prep}} \) = the number of prepositions, \( n_{\text{conj}} = N_{\text{conj}} \) = the number of conjunctions, The scaling by 100 arises because the original Tränkle & Bailer index is based on just a sample of 100 words.

\[ ASL \times 10 \times \frac{n_{\text{wsy} \geq 2}}{n_{\text{words}}} \]

where \( n_{\text{wsy} \geq 2} = N_{\text{wmin2sy}} \) = the number of words with 2 syllables or more.

"meanSentenceLength": Average Sentence Length (ASL).

\[ n_w \div n_{\text{st}} \]

"meanWordSyllables": Average Word Syllables (AWL).

\[ n_{\text{sy}} \div n_w \]

Value

textstat_readability returns a data.frame of documents and their readability scores.

Author(s)

Kenneth Benoit, re-engineered from Meik Michalke’s koRpus package.
References

*Nimaldasan is the pen name of N. Watson Solomon, Assistant Professor of Journalism, School of Media Studies, SRM University, India.

**Examples**

```r
txt <- c(doc1 = "Readability zero one. Ten, Eleven.",
         doc2 = "The cat in a dilapidated tophat.")
textstat_readability(txt, measure = "Flesch")
textstat_readability(txt, measure = c("FOG", "FOG.PSK", "FOG.NRI"))
textstat_readability(data_corpus_inaugural[48:58],
         measure = c("Flesch.Kincaid", "Dale.Chall.old"))
```

**textstat_simil**  
*Similarity and distance computation between documents or features*

**Description**

These functions compute matrixes of distances and similarities between documents or features from a `dfm` and return a `dist` object (or a matrix if specific targets are selected). They are fast and robust because they operate directly on the sparse `dfm` objects.

**Usage**

```r
textstat_simil(x, selection = NULL, margin = c("documents",
         "features"), method = c("correlation", "cosine", "jaccard", "ejaccard",
         "dice", "edice", "hamman", "simple matching", "faith"), upper = FALSE, diag = FALSE)
textstat_dist(x, selection = NULL, margin = c("documents", "features"),
         method = c("euclidean", "kullback", "manhattan", "maximum", "canberra",
         "minkowski"), upper = FALSE, diag = FALSE, p = 2)
```
Arguments

\( x \)  
\[ \text{a dfm object} \]

\( \text{selection} \)  
\[ \text{a valid index for document or feature names (depending on margin) from x, to be selected for comparison} \]

\( \text{margin} \)  
\[ \text{identifies the margin of the dfm on which similarity or difference will be computed: "documents" for documents or "features" for word/term features.} \]

\( \text{method} \)  
\[ \text{method the similarity or distance measure to be used; see Details.} \]

\( \text{upper} \)  
\[ \text{whether the upper triangle of the symmetric } V \times V \text{ matrix is recorded. Only used when value = "dist".} \]

\( \text{diag} \)  
\[ \text{whether the diagonal of the distance matrix should be recorded. Only used when value = "dist".} \]

\( p \)  
\[ \text{The power of the Minkowski distance.} \]

Details

textstat_simil options are: "correlation" (default), "cosine", "jaccard", "ejaccard", "dice", "edice", "simple matching", "hamman", and "faith".

textstat_dist options are: "euclidean" (default), "kullback", "manhattan", "maximum", "canberra", and "minkowski".

Value

By default, textstat_simil and textstat_dist return dist class objects if selection is NULL, otherwise, a matrix is returned matching distances to the documents or features identified in the selection.

These can be transformed into a list format using as.list.dist, if that format is preferred.

Note

If you want to compute similarity on a "normalized" dfm object (controlling for variable document lengths, for methods such as correlation for which different document lengths matter), then wrap the input dfm in dfm_weight(x, "prop").

References

"kullback" is the Kullback-Leibler distance, which assumes that \( P(x_i) = 0 \) implies \( P(y_i) = 0 \), and in case either \( P(x_i) \) or \( P(y_i) \) equals to zero, then \( P(x_i) * \log(p(x_i)/p(y_i)) \) is assumed to be zero as the limit value. The formula is:

\[ \sum P(x) * \log(P(x)/p(y)) \]

All other measures are described in the proxy package.

(tstat1 <- textstat_simil(dfmat, method = "cosine", margin = "documents"))
as.matrix(tstat1)

# similarities for specific documents
textstat_simil(dfmat, selection = "2017-Trump", margin = "documents")
textstat_simil(dfmat, selection = "2017-Trump", method = "cosine", margin = "documents")
textstat_simil(dfmat, selection = c("2009-Obama", "2013-Obama"), margin = "documents")

# compute some term similarities
tstat2 <- textstat_simil(dfmat, selection = c("fair", "health", "terror"), method = "cosine",
                         margin = "features")
head(as.matrix(tstat2), 10)

# create a dfm from inaugural addresses from Reagan onwards
dfmat <- dfm(corpus_subset(data_corpus_inaugural, Year > 1990),
             remove = stopwords("english"), stem = TRUE, remove_punct = TRUE)

# distances for documents
(tstat1 <- textstat_dist(dfmat, margin = "documents"))
as.matrix(tstat1)

# distances for specific documents
textstat_dist(dfmat, "2017-Trump", margin = "documents")
(tstat2 <- textstat_dist(dfmat, c("2009-Obama", "2013-Obama"), margin = "documents"))
as.list(tstat2)

tokens

Tokenize a set of texts

desc

Description

Tokenize the texts from a character vector or from a corpus.

Usage

tokens(x, what = c("word", "sentence", "character", "fastestword",
                   "fasterword"), remove_numbers = FALSE, remove_punct = FALSE,
       remove_symbols = FALSE, remove_separators = TRUE,
       remove_twitter = FALSE, remove_hyphens = FALSE, remove_url = FALSE,
       ngrams = 1L, skip = 0L, concatenator = "_",
       verbose = quanteda_options("verbose"), include_docvars = TRUE, ...)
Arguments

- **x**: a character, corpus, or tokens object to be tokenized
- **what**: the unit for splitting the text, available alternatives are:
  - "word" (recommended default) smartest, but slowest, word tokenization method; see stringi-search-boundaries for details.
  - "fasterword" dumber, but faster, word tokenization method, uses stri_split_charclass(x, "[\p{z}\p{c}]")
  - "fastestword" dumber, but fastest, word tokenization method, calls stri_split_fixed(x, "")
  - "character" tokenization into individual characters
  - "sentence" sentence segmenter, smart enough to handle some exceptions in English such as "Prof. Plum killed Mrs. Peacock." (but far from perfect).
- **remove_numbers**: logical; if TRUE remove tokens that consist only of numbers, but not words that start with digits, e.g. 2day
- **remove_punct**: logical; if TRUE remove all characters in the Unicode "Punctuation" [P] class
- **remove_symbols**: logical; if TRUE remove all characters in the Unicode "Symbol" [S] class
- **remove_separators**: logical; if TRUE remove separators and separator characters (Unicode "Separator" [Z] and "Control [C]" categories). Only applicable for what = "character" (when you probably want it to be FALSE) and for what = "word" (when you probably want it to be TRUE).
- **remove_twitter**: logical; if TRUE remove Twitter characters @ and #; set to TRUE if you wish to eliminate these. Note that this will always be set to FALSE if remove_punct = FALSE.
- **remove_hyphens**: logical; if TRUE split words that are connected by hyphenation and hyphenation-like characters in between words, e.g. "$\text{self-stORAGE} = \text{c("self", "storage")}$. Default is FALSE to preserve such words as is, with the hyphens. Only applies if what = "word" or what = "fasterword".
- **remove_url**: logical; if TRUE find and eliminate URLs beginning with http(s) – see section "Dealing with URLs".
- **ngrams**: integer vector of the n for n-grams, defaulting to 1 (unigrams). For bigrams, for instance, use 2; for bigrams and unigrams, use 1:2. You can even include irregular sequences such as 2:3 for bigrams and trigrams only. See tokens_ngrams.
- **skip**: integer vector specifying the skips for skip-grams, default is 0 for only immediately neighbouring words. Only applies if ngrams is different from the default of 1. See tokens_skipgrams.
- **concatenator**: character to use in concatenating n-grams, default is ",", which is recommended since this is included in the regular expression and Unicode definitions of "word" characters
- **verbose**: if TRUE, print timing messages to the console; off by default
- **include_docvars**: if TRUE, pass docvars and metadoc fields through to the tokens object. Only applies when tokenizing corpus objects.

... additional arguments not used
Details

The tokenizer is designed to be fast and flexible as well as to handle Unicode correctly. Most of the time, users will construct dfm objects from texts or a corpus, without calling tokens() as an intermediate step. Since tokens() is most likely to be used by more technical users, we have set its options to default to minimal intervention. This means that punctuation is tokenized as well, and that nothing is removed by default from the text being tokenized except inter-word spacing and equivalent characters.

Note that a tokens constructor also works on tokens objects, which allows setting additional options that will modify the original object. It is not possible, however, to change a setting to "un-remove" something that was removed from the input tokens object, however. For instance, tokens(tokens("Ha!", remove_punct = TRUE), remove_punct = FALSE) will not restore the "!" token. No warning is currently issued about this, so the user should use tokens.tokens() with caution.

Value

quanteda tokens class object, by default a serialized list of integers corresponding to a vector of types.

Dealing with URLs

URLs are tricky to tokenize, because they contain a number of symbols and punctuation characters. If you wish to remove these, as most people do, and your text contains URLs, then you should set what = "fasterword" and remove_url = TRUE. If you wish to keep the URLs, but do not want them mangled, then your options are more limited, since removing punctuation and symbols will also remove them from URLs. We are working on improving this behaviour.

See the examples below.

tokens(txt5, remove_punct = TRUE)
tokens_remove(tokens(txt5, remove_punct = TRUE), stopwords("english"))

# ngram tokenization
tokens(txt5, remove_punct = TRUE, ngrams = 2)
tokens(txt5, remove_punct = TRUE, ngrams = 2, skip = 1, concatenator = " ")
tokens(txt5, remove_punct = TRUE, ngrams = 1:2)

# removing features from ngram tokens
tokens_remove(tokens(txt5, remove_punct = TRUE, ngrams = 1:2), stopwords("english"))
tokens_chunk

Segment tokens object by chunks of a given size

Description

Segment tokens into new documents of equally sized token lengths, with the possibility of overlapping the chunks.

Usage

tokens_chunk(x, size, overlap = 0, use_docvars = TRUE)

Arguments

x tokens object whose token elements will be segmented into chunks
size integer; the token length of the chunks
overlap integer; the number of tokens in a chunk to be taken from the last overlap tokens from the preceding chunk
use_docvars if TRUE, repeat the docvar values for each chunk; if FALSE, drop the docvars in the chunked tokens

Value

A tokens object whose documents have been split into chunks of length size.

See Also

tokens_segment

Examples

txts <- c(doc1 = "Fellow citizens, I am again called upon by the voice of my country to execute the functions of its Chief Magistrate.",
doc2 = "When the occasion proper for it shall arrive, I shall endeavor to express the high sense I entertain of this distinguished honor.")
toks <- tokens(txts)
tokens_chunk(toks, size = 5)
tokens_chunk(toks, size = 5, overlap = 4)
tokens_compound

Convert token sequences into compound tokens

Description

Replace multi-token sequences with a multi-word, or "compound" token. The resulting compound tokens will represent a phrase or multi-word expression, concatenated with concatenator (by default, the "_" character) to form a single "token". This ensures that the sequences will be processed subsequently as single tokens, for instance in constructing a dfm.

Usage

tokens_compound(x, pattern, concatenator = "_", valuetype = c("glob", "regex", "fixed"), case_insensitive = TRUE, join = TRUE)

Arguments

x an input tokens object
pattern a character vector, list of character vectors, dictionary, or collocations object. See pattern for details.
concatenator the concatenation character that will connect the words making up the multi-word sequences. The default _ is recommended since it will not be removed during normal cleaning and tokenization (while nearly all other punctuation characters, at least those in the Unicode punctuation class [P] will be removed).
valuetype the type of pattern matching: "glob" for "glob"-style wildcard expressions; "regex" for regular expressions; or "fixed" for exact matching. See valuetype for details.
case_insensitive logical; if TRUE, ignore case when matching
join logical; if TRUE, join overlapping compounds

Value

a tokens object in which the token sequences matching pattern have been replaced by compound "tokens" joined by the concatenator

Author(s)

Kenneth Benoit and Kohei Watanabe

Examples

txt <- c("The new law included a capital gains tax, and an inheritance tax.",
        "New York City has raised taxes: an income tax and inheritance taxes."")
toks1 <- tokens(txt, remove_punct = TRUE)
tokens_lookup

Apply a dictionary to a tokens object

description

Convert tokens into equivalence classes defined by values of a dictionary object.

usage

tokens_lookup(x, dictionary, levels = 1:5, valuetype = c("glob", "regex", "fixed"), case_insensitive = TRUE, capkeys = !exclusive, exclusive = TRUE, nomatch = NULL, verbose = quanteda_options("verbose"))

arguments

x
tokens object to which dictionary or thesaurus will be supplied
dictionary
the dictionary-class object that will be applied to x
levels
integers specifying the levels of entries in a hierarchical dictionary that will be applied. The top level is 1, and subsequent levels describe lower nesting levels. Values may be combined, even if these levels are not contiguous, e.g. `levels = c(1:3)` will collapse the second level into the first, but record the third level (if present) collapsed below the first (see examples).
tokens_lookup

valuetype the type of pattern matching: "glob" for "glob"-style wildcard expressions; "regex" for regular expressions; or "fixed" for exact matching. See valuetyple for details.

case_insensitive ignore the case of dictionary values if TRUE uppercase to distinguish them from other features

capkeys if TRUE, convert dictionary keys to uppercase to distinguish them from other features

exclusive if TRUE, remove all features not in dictionary, otherwise, replace values in dictionary with keys while leaving other features unaffected

nomatch an optional character naming a new key for tokens that do not matched to a dictionary values If NULL (default), do not record unmatched tokens.

verbose print status messages if TRUE

See Also

tokens_replace

Examples

toks1 <- tokens(data_corpus_inaugural)
dict1 <- dictionary(list(country = "united states",
law=c('law*', 'constitution'),
freedom=c('free*', 'libert*')))
dfm(tokens_lookup(toks1, dict1, valuetyple='glob', verbose = TRUE))
dfm(tokens_lookup(toks1, dict1, valuetyple='glob', verbose = TRUE, nomatch = 'NONE'))

dict2 <- dictionary(list(country = "united states",
law = c('law', 'constitution'),
freedom = c('freedom', 'liberty')))
# dfm(applyDictionary(toks1, dict2, valuetyple='fixed'))
dfm(tokens_lookup(toks1, dict2, valuetyple='fixed'))

# hierarchical dictionary example
txt <- c(d1 = "The United States has the Atlantic Ocean and the Pacific Ocean.",
d2 = "Britain and Ireland have the Irish Sea and the English Channel.")
toks2 <- tokens(txt)
dict3 <- dictionary(list(US = list(Countries = c("States"),
oceans = c("Atlantic", "Pacific")),
Europe = list(Countries = c("Britain", "Ireland"),
oceans = list(west = "Irish Sea",
est = "English Channel"))))

tokens_lookup(toks2, dict3, levels = 2)
tokens_lookup(toks2, dict3, levels = 1:2)
tokens_lookup(toks2, dict3, levels = 3)
tokens_lookup(toks2, dict3, levels = c(1,3))
tokens_lookup(toks2, dict3, levels = c(2,3))

# show unmatched tokens
tokens_ngrams

Create ngrams and skipgrams from tokens

Description

Create a set of ngrams (tokens in sequence) from already tokenized text objects, with an optional skip argument to form skipgrams. Both the ngram length and the skip lengths take vectors of arguments to form multiple lengths or skips in one pass. Implemented in C++ for efficiency.

Usage

tokens_ngrams(x, n = 2L, skip = 0L, concatenator = "_")
char_ngrams(x, n = 2L, skip = 0L, concatenator = "_")
tokens_skipgrams(x, n, skip, concatenator = "_")

Arguments

x  a tokens object, or a character vector, or a list of characters
n  integer vector specifying the number of elements to be concatenated in each ngram. Each element of this vector will define a n in the n-gram(s) that are produced.
skip  integer vector specifying the adjacency skip size for tokens forming the ngrams, default is 0 for only immediately neighbouring words. For skipgrams, skip can be a vector of integers, as the "classic" approach to forming skip-grams is to set skip = k where k is the distance for which k or fewer skips are used to construct the n-gram. Thus a "4-skip-n-gram" defined as skip = 0:4 produces results that include 4 skips, 3 skips, 2 skips, 1 skip, and 0 skips (where 0 skips are typical n-grams formed from adjacent words). See Guthrie et al (2006).
concatenator  character for combining words, default is _ (underscore) character

Details

Normally, these functions will be called through tokens(x, ngrams = , ...), but these functions are provided in case a user wants to perform lower-level ngram construction on tokenized texts.

tokens_skipgrams is a wrapper to tokens_ngrams that requires arguments to be supplied for both n and skip. For k-skip skipgrams, set skip to 0:k, in order to conform to the definition of skipgrams found in Guthrie et al (2006): A k skip-gram is an ngram which is a superset of all ngrams and each (k - i) skipgram until (k - i) == 0 (which includes 0 skip-grams).
Value

- a tokens object consisting a list of character vectors of ngrams, one list element per text, or a character vector if called on a simple character vector

Note

char_ngrams is a convenience wrapper for a (non-list) vector of characters, so named to be consistent with quanteda’s naming scheme.

Author(s)

Kohei Watanabe (C++) and Ken Benoit (R)

References

Examples

```r
# ngrams
tokens_ngrams(tokens(c("a b c d e", "c d e f g"), n = 2:3))

toks <- tokens(c(text1 = "the quick brown fox jumped over the lazy dog"))
tokens_ngrams(toks, n = 1:3)
tokens_ngrams(toks, n = c(2,4), concatenator = " ")
tokens_ngrams(toks, n = c(2,4), skip = 1, concatenator = " ")
  # on character
char_ngrams(letters[1:3], n = 1:3)

# skipgrams
toks <- tokens("insurgents killed in ongoing fighting")
tokens_skipgrams(toks, n = 2, skip = 0:1, concatenator = " ")
tokens_skipgrams(toks, n = 2, skip = 0:2, concatenator = " ")
tokens_skipgrams(toks, n = 3, skip = 0:2, concatenator = " ")
```

tokens_replace

Replace tokens in a tokens object

Description

Substitute token types based on vectorized one-to-one matching. Since this function is created for lemmatization or user-defined stemming. It support substitution of multi-word features by multi-word features, but substitution is fastest when pattern and replacement are character vectors and valuetype = "fixed" as the function only substitute types of tokens. Please use tokens_lookup with exclusive = FALSE to replace dictionary values.
tokens_replace

Usage

tokens_replace(x, pattern, replacement, valuetype = "glob",
case_insensitive = TRUE, verbose = quanteda_options("verbose"))

Arguments

  x  
tokens object whose token elements will be replaced

  pattern  
a character vector or list of character vectors. See pattern for more details.

  replacement  
a character vector or (if pattern is a list) list of character vectors of the same
length as pattern

  valuetype  
the type of pattern matching: "glob" for "glob"-style wildcard expressions;
"regex" for regular expressions; or "fixed" for exact matching. See value-
type for details.

  case_insensitive  
ignore case when matching, if TRUE

  verbose  
print status messages if TRUE

See Also

tokens_lookup

Examples

toks1 <- tokens(data_corpus_irishbudget2010, remove_punct = TRUE)

  # lemmatization
  infle <- c("foci", "focus", "focused", "focuses", "focusing", "focussed", "focusses")
  lemma <- rep("focus", length(infle))
  toks2 <- tokens_replace(toks1, infle, lemma, valuetype = "fixed")
  kwic(toks2, "focus*")

  # stemming
  type <- types(toks1)
  stem <- char_wordstem(type, "porter")
  toks3 <- tokens_replace(toks1, type, stem, valuetype = "fixed", case_insensitive = FALSE)
  identical(toks3, tokens_wordstem(toks1, "porter"))

  # multi-multi substitution
  toks4 <- tokens_replace(toks1, phrase(c("Minister Deputy Lenihan")),
                          phrase(c("Minister Deputy Conor Lenihan"))
  kwic(toks4, phrase(c("Minister Deputy Conor Lenihan")))
tokens_sample

Randomly sample documents from a tokens object

Description

Sample tokenized documents randomly from a tokens object, with or without replacement. Works just as sample works, for document-level units (and their associated document-level variables).

Usage

tokens_sample(x, size = ndoc(x), replace = FALSE, prob = NULL)

Arguments

x
the tokens object whose documents will be sampled

size
a positive number, the number of documents or features to select

replace
logical; should sampling be with replacement?

prob
a vector of probability weights for obtaining the elements of the vector being sampled.

Value

A tokens object with number of documents or features equal to size, drawn from the tokens x.

See Also

sample

Examples

```r
set.seed(10)
toks <- tokens(data_corpus_inaugural[1:10])
head(toks)
head(tokens_sample(toks))
head(tokens_sample(toks, replace = TRUE))
```
tokens_select

Select or remove tokens from a tokens object

Description

These function select or discard tokens from a tokens objects. For convenience, the functions tokens_remove and tokens_keep are defined as shortcuts for tokens_select(x, pattern, selection = "remove") and tokens_select(x, pattern, selection = "keep"), respectively. The most common usage for tokens_remove will be to eliminate stop words from a text or text-based object, while the most common use of tokens_select will be to select tokens with only positive pattern matches from a list of regular expressions, including a dictionary.

Usage

tokens_select(x, pattern, selection = c("keep", "remove"),
valuetype = c("glob", "regex", "fixed"), case_insensitive = TRUE,
padding = FALSE, window = 0, min_nchar = 1L, max_nchar = 79L,
verbose = quanteda_options("verbose"))

tokens_remove(x, ...)

tokens_keep(x, ...)

Arguments

x tokens object whose token elements will be removed or kept
pattern a character vector, list of character vectors, dictionary, or collocations object. See pattern for details.
selection whether to "keep" or "remove" the tokens matching pattern
valuetype the type of pattern matching: "glob" for "glob"-style wildcard expressions; "regex" for regular expressions; or "fixed" for exact matching. See value-type for details.

case_insensitive ignore case when matching, if TRUE
padding if TRUE, leave an empty string where the removed tokens previously existed. This is useful if a positional match is needed between the pre- and post-selected tokens, for instance if a window of adjacency needs to be computed.

window integer of length 1 or 2; the size of the window of tokens adjacent to pattern that will be selected. The window is symmetric unless a vector of two elements is supplied, in which case the first element will be the token length of the window before pattern, and the second will be the token length of the window after pattern. The default is 0, meaning that only the pattern matched token(s) are selected, with no adjacent terms. Terms from overlapping windows are never double-counted, but simply returned in the pattern match. This is because tokens_select never redefines the document units; for this, see kwic.
tokens_split

\[ \text{min_nchar, max_nchar} \]

_numerics specifying the minimum and maximum length in characters for tokens to be removed or kept; defaults are 1 and 79. (Set max_nchar to NULL for no upper limit.) These are applied after (and hence, in addition to) any selection based on pattern matches.

verbose

—if TRUE print messages about how many tokens were selected or removed

... additional arguments passed by tokens_remove and tokens_keep to tokens_select. Cannot include selection.

Value

a tokens object with tokens selected or removed based on their match to pattern

Examples

```r
## tokens_select with simple examples
toks <- tokens(c("This is a sentence.", "This is a second sentence."),
               remove_punct = TRUE)
tokens_select(toks, c("is", "a", "this"), selection = "keep", padding = FALSE)
tokens_select(toks, c("is", "a", "this"), selection = "keep", padding = TRUE)
tokens_select(toks, c("is", "a", "this"), selection = "remove", padding = FALSE)
tokens_select(toks, c("is", "a", "this"), selection = "remove", padding = TRUE)

# how case_insensitive works
tokens_select(toks, c("is", "a", "this"), selection = "remove", case_insensitive = TRUE)
tokens_select(toks, c("is", "a", "this"), selection = "remove", case_insensitive = FALSE)

# use window
tokens_select(toks, "second", selection = "keep", window = 1)
tokens_select(toks, "second", selection = "remove", window = 1)
tokens_remove(toks, "is", window = c(0, 1))

# tokens_remove example: remove stopwords
txt <- c(wash1 <- "Fellow citizens, I am again called upon by the voice of my country to execute the functions of its Chief Magistrate.",
         wash2 <- "When the occasion proper for it shall arrive, I shall endeavor to express the high sense I entertain of this distinguished honor.")
tokens_remove(tokens(txt, remove_punct = TRUE), stopwords("english"))

# token_keep example: keep two-letter words
tokens_keep(tokens(txt, remove_punct = TRUE), "??")
```

tokens_split

\[ Split tokens by a separator pattern \]

Description

Replaces tokens by multiple replacements consisting of elements split by a separator pattern, with the option of retaining the separator. This function effectively reverses the operation of tokens_compound.
tokens_subset

Usage

tokens_split(x, separator = " ", valuetype = c("fixed", "regex"),
remove_separator = TRUE)

Arguments

x a tokens object
separator a single-character pattern match by which tokens are separated
valuetype the type of pattern matching: "glob" for "glob"-style wildcard expressions;
"regex" for regular expressions; or "fixed" for exact matching. See valuetype for details.
remove_separator if TRUE, remove separator from new tokens

Examples

# undo tokens_compound()
toks1 <- tokens("pork barrel is an idiomatic multi-word expression")
tokens_compound(toks1, phrase("pork barrel"))
tokens_compound(toks1, phrase("pork barrel")) %>%
tokens_split(separator = " ")

# similar to tokens(x, remove_hyphen = TRUE) but post-tokenization
toks2 <- tokens("UK-EU negotiation is not going anywhere as of 2018-12-24.")
tokens_split(toks2, separator = "-", remove_separator = FALSE)

tokens_subset Extract a subset of a tokens

Description

Returns document subsets of a tokens that meet certain conditions, including direct logical opera-
tions on docvars (document-level variables). tokens_subset functions identically to subset.data.frame,
using non-standard evaluation to evaluate conditions based on the docvars in the tokens.

Usage

tokens_subset(x, subset, select, ...)

Arguments

x tokens object to be subsetted
subset logical expression indicating the documents to keep: missing values are taken as false
select expression, indicating the docvars to select from the tokens; or a tokens object,
in which case the returned tokens will contain the same documents in the same order as the original tokens, even if these are empty.
... not used
Value

tokens object, with a subset of documents (and docvars) selected according to arguments

See Also

subset.data.frame

Examples

corp <- corpus(c(d1 = "a b c d", d2 = "a a b e", d3 = "b b c e", d4 = "e e f a b"),
docvars = data.frame(grp = c(1, 1, 2, 3)))
toks1 <- tokens(corp)
# selecting on a docvars condition
tokens_subset(toks1, grp > 1)
# selecting on a supplied vector
tokens_subset(toks1, c(TRUE, FALSE, TRUE, FALSE))
# selecting on a tokens
toks2 <- tokens(c(d1 = "a b b c", d2 = "b b c d"))
toks3 <- tokens(c(d1 = "x y z", d2 = "a b c c d", d3 = "x x x"))
tokens_subset(toks2, subset = toks3)
tokens_subset(toks2, subset = toks3[c(3,1,2)])

tokens_tolower Convert the case of tokens

Description

tokens_tolower and tokens_toupper convert the features of a tokens object and re-index the types.

Usage

tokens_tolower(x, keep_acronyms = FALSE, ...)
tokens_toupper(x, ...)

Arguments

x the input object whose character/tokens/feature elements will be case-converted
keep_acronyms logical; if TRUE, do not lowercase any all-uppercase words (applies only to *_tolower functions)
... additional arguments passed to stringi functions, (e.g. stri_trans_tolower), such as locale
### tokens_tortl

**[Experimental] Change direction of words in tokens**

#### Description

This function adds a Unicode direction mark to tokens types for punctuations and symbols to correct how right-to-left languages (e.g. Arabic, Hebrew, Persian, and Urdu) are printed in HTML-based consoles (e.g. R Studio). This is an experimental function subject to future change.

#### Usage

- `tokens_tortl(x)`
- `char_tortl(x)`

#### Arguments

- **x**
  - the input object whose punctuation marks will be modified by the direction mark

### tokens_wordstem

**Stem the terms in an object**

#### Description

Apply a stemmer to words. This is a wrapper to `wordStem` designed to allow this function to be called without loading the entire `SnowballC` package. `wordStem` uses Martin Porter’s stemming algorithm and the C `libstemmer` library generated by Snowball.

#### Usage

- `tokens_wordstem(x, language = quanteda_options("language_stemmer"))`
- `char_wordstem(x, language = quanteda_options("language_stemmer"))`
- `dfm_wordstem(x, language = quanteda_options("language_stemmer"))`
Arguments

x a character, tokens, or dfm object whose word stems are to be removed. If tokenized texts, the tokenization must be word-based.

language the name of a recognized language, as returned by getStemLanguages, or a two- or three-letter ISO-639 code corresponding to one of these languages (see references for the list of codes)

Value

tokens_wordstem returns a tokens object whose word types have been stemmed.
char_wordstem returns a character object whose word types have been stemmed.
dfm_wordstem returns a dfm object whose word types (features) have been stemmed, and recombined to consolidate features made equivalent because of stemming.

th <- tokens(txt)
tokens_wordstem(th)

# simple example
char_wordstem(c("win", "winning", "wins", "won", "winner"))

# example applied to a dfm
(origdfm <- dfm(txt))
dfm_wordstem(origdfm)

---

topfeatures Identify the most frequent features in a dfm

Description

List the most (or least) frequently occurring features in a dfm, either as a whole or separated by document.
Usage

topfeatures(x, n = 10, decreasing = TRUE, scheme = c("count", "docfreq"), groups = NULL)

Arguments

x  the object whose features will be returned
n  how many top features should be returned
decreasing  If TRUE, return the n most frequent features; otherwise return the n least frequent features
scheme  one of count for total feature frequency (within group if applicable), or docfreq for the document frequencies of features
groups  either: a character vector containing the names of document variables to be used for grouping; or a factor or object that can be coerced into a factor equal in length or rows to the number of documents. See groups for details.

Value

A named numeric vector of feature counts, where the names are the feature labels, or a list of these if groups is given.

Examples

dfmat1 <- corpus_subset(data_corpus_inaugural, Year > 1980) %>%
  dfm(remove_punct = TRUE)
dfmat2 <- dfm_remove(dfmat1, stopwords("english"))

# most frequent features
topfeatures(dfmat1)
topfeatures(dfmat2)

# least frequent features
topfeatures(dfmat2, decreasing = FALSE)

# top features of individual documents
topfeatures(dfmat2, n = 5, groups = docnames(dfmat2))

# grouping by president last name
topfeatures(dfmat2, n = 5, groups = "President")

# features by document frequencies
tail(topfeatures(dfmat1, scheme = "docfreq", n = 200))
types

Get word types from a tokens object

Description

Get unique types of tokens from a tokens object.

Usage

types(x)

Arguments

x a tokens object
