Package ‘r2dii.analysis’

November 3, 2022

Title Measure Climate Scenario Alignment of Corporate Loans

Version 0.2.1

Description These tools help you to assess if a corporate lending portfolio aligns with climate goals. They summarize key climate indicators attributed to the portfolio (e.g. production, emission factors), and calculate alignment targets based on climate scenarios. They implement in R the last step of the free software 'PACTA' (Paris Agreement Capital Transition Assessment; <https://www.transitionmonitor.com/>). Financial institutions use 'PACTA' to study how their capital allocation decisions align with climate change mitigation goals.

join_abcd_scenario

Join a data-loanbook object to the abcd and scenario

Description

join_abcd_scenario() is a simple wrapper of several calls to dplyr::join_*, forming the master dataset to be used in later steps of the analysis.

Usage

join_abcd_scenario(
  data,
  abcd,
  scenario,
  region_isos = r2dii.data::region_isos,
  add_green_technologies = FALSE
)

Arguments

data A data frame like the output of r2dii.match::prioritize.
abcd An asset level data frame like r2dii.data::abcd_demo.
scenario A scenario data frame like r2dii.data::scenario_demo_2020.
region_isos A data frame like r2dii.data::region_isos (default).
add_green_technologies Logical vector of length 1. FALSE defaults to outputting only technologies that are present in both data and abcd. Set to FALSE to add rows of all possible green technologies (with 0 production).

Value

Returns a fully joined data frame, linking portfolio, abcd and scenario.

Other utility functions: summarize_weighted_production()
summarize_weighted_production

Examples

```r
installed <- requireNamespace("r2dii.data", quietly = TRUE) &&
requireNamespace("r2dii.match", versionCheck = "0.1.0", quietly = TRUE) &&
packageVersion("r2dii.match") >= "0.1.0"

if (installed) {
  library(r2dii.data)
  library(r2dii.match)

  valid_matches <- match_name(loanbook_demo, abcd_demo) %>%
    # WARNING: Remember to validate matches (see '?prioritize')
    prioritize()

  valid_matches %>%
    join_abcd_scenario(
      abcd = abcd_demo,
      scenario = scenario_demo_2020,
      region_isos = region_isos_demo
    )
}
```

---

summarize_weighted_production

*Summaries based on the weight of each loan per sector per year*

Description

Based on the weight of each loan per sector per year, `summarize_weighted_production()` and `summarize_weighted_percent_change()` summarize the production and percent-change, respectively.

Usage

```r
summarize_weighted_production(data, ..., use_credit_limit = FALSE)
summarize_weighted_percent_change(data, ..., use_credit_limit = FALSE)
```

Arguments

- `data` A data frame like the output of `join_abcd_scenario()`.
- `...` Variables to group by.
- `use_credit_limit` Logical vector of length 1. FALSE defaults to using the column `loan_size_outstanding`. Set to TRUE to instead use the column `loan_size_credit_limit`.

summarize_weighted_production

Value

A tibble with the same groups as the input (if any) and columns: sector, technology, and year; and weighted_production or weighted_production for summarize_weighted_production() and summarize_weighted_percent_change(), respectively.

Warning

The percent-change analysis excludes companies with 0 production. percent-change is undefined for companies that have no initial production; including such companies would cause percent-change percentage to be infinite, which is wrong.

join_abcd_scenario().

Other utility functions: join_abcd_scenario()

Examples

```r
installed <- requireNamespace("r2dii.data", quietly = TRUE) &&
requireNamespace("r2dii.match", quietly = TRUE) &&
packageVersion("r2dii.match") >= "0.1.0"

if (installed) {
  library(r2dii.data)
  library(r2dii.match)

  loanbook <- head(loanbook_demo, 150)
  abcd <- head(abcd_demo, 100)
  master <- loanbook %>%
    match_name(abcd) %>%
    prioritize() %>%
    join_abcd_scenario(
      abcd = abcd,
      scenario = scenario_demo_2020,
      region_isos = region_isos_demo
    )

  summarize_weighted_production(master)

  summarize_weighted_production(master, use_credit_limit = TRUE)

  summarize_weighted_percent_change(master)

  summarize_weighted_percent_change(master, use_credit_limit = TRUE)
}
```
**target_market_share**

Add targets for production, using the market share approach

---

**Description**

This function calculates the portfolio-level production targets, as calculated using the market share approach applied to each relevant climate production forecast.

**Usage**

```r
target_market_share(
  data,
  abcd,
  scenario,
  region_isos = r2dii.data::region_isos,
  use_credit_limit = FALSE,
  by_company = FALSE,
  weight_production = TRUE,
  ald = deprecated()
)
```

**Arguments**

- `data`: A "data.frame" like the output of `r2dii.match::prioritize`
- `abcd`: An asset level data frame like `r2dii.data::abcd_demo`
- `scenario`: A scenario data frame like `r2dii.data::scenario_demo_2020`
- `region_isos`: A data frame like `r2dii.data::region_isos` (default)
- `use_credit_limit`: Logical vector of length 1. FALSE defaults to using the column `loan_size_outstanding`. Set to TRUE to use the column `loan_size_credit_limit` instead.
- `by_company`: Logical vector of length 1. FALSE defaults to outputting `production_value` at the portfolio-level. Set to TRUE to output `production_value` at the company-level.
- `weight_production`: Logical vector of length 1. TRUE defaults to outputting production, weighted by relative loan-size. Set to FALSE to output the unweighted production values.
- `ald`: [Superseded] ald has been superseded by abcd.

**Value**

A tibble including the summarized columns `metric`, `production`, `technology_share`, `percentage_of_initial_production_by_scope`, and `scope`. If `by_company = TRUE`, the output will also have the column `name_abcd`.

**Handling grouped data**

This function ignores existing groups and outputs ungrouped data.

installed <- requireNamespace("r2dii.data", quietly = TRUE) &&
requireNamespace("r2dii.match", quietly = TRUE) &&
packageVersion("r2dii.match") >= "0.1.0"

if (installed) {
    library(r2dii.data)
    library(r2dii.match)

    loanbook <- head(loanbook_demo, 100)
    abcd <- head(abcd_demo, 100)

    matched <- loanbook %>%
                match_name(abcd) %>%
                prioritize()

    # Calculate targets at portfolio level
    matched %>%
              target_market_share(
                abcd = abcd,
                scenario = scenario_demo_2020,
                region_isos = region_isos_demo
              )

    # Calculate targets at company level
    matched %>%
              target_market_share(
                abcd = abcd,
                scenario = scenario_demo_2020,
                region_isos = region_isos_demo,
                by_company = TRUE
              )

    matched %>%
              target_market_share(
                abcd = abcd,
                scenario = scenario_demo_2020,
                region_isos = region_isos_demo,
                weight_production = FALSE
              )
}
\end{verbatim}

\texttt{target_sda} \hspace{1cm} \textit{Add targets for CO2 emissions per unit production at the portfolio level, using the SDA approach}
**target_sda**

**Description**

This function calculates targets of CO2 emissions per unit production at the portfolio-level, otherwise referred to as "emissions factors". It uses the sectoral-decarbonization approach (SDA) to calculate these targets.

**Usage**

```r
target_sda(
  data,
  abcd,
  co2_intensity_scenario,
  use_credit_limit = FALSE,
  by_company = FALSE,
  region_isos = r2dii.data::region_isos,
  ald = deprecated()
)
```

**Arguments**

- **data**
  A dataframe like the output of `r2dii.match::prioritize()`.
- **abcd**
  An asset-level data frame like `r2dii.data::abcd_demo`.
- **co2_intensity_scenario**
  A scenario data frame like `r2dii.data::co2_intensity_scenario_demo`.
- **use_credit_limit**
  Logical vector of length 1. `FALSE` defaults to using the column `loan_size_outstanding`. Set to `TRUE` to instead use the column `loan_size_credit_limit`.
- **by_company**
  Logical vector of length 1. `FALSE` defaults to outputting `weighted_production_value` at the portfolio-level. Set to `TRUE` to output `weighted_production_value` at the company-level.
- **region_isos**
  A data frame like `r2dii.data::region_isos` (default).
- **ald**
  [Superseded] `ald` has been superseded by `abcd`.

**Value**

A tibble including the summarized columns `emission_factor_metric` and `emission_factor_value`. If `by_company = TRUE`, the output will also have the column `name_abcd`.

**Handling grouped data**

This function ignores existing groups and outputs ungrouped data.
