Package ‘rerddap’

February 2, 2019

Title General Purpose Client for 'ERDDAP' Servers

Description General purpose R client for 'ERDDAP' servers. Includes functions to search for 'datasets', get summary information on 'datasets', and fetch 'datasets', in either 'csv' or 'netCDF' format. 'ERDDAP' information: <https://upwell.pfeg.noaa.gov/erddap/information.html>.

rerddap-package  General purpose R client for ERDDAP servers

Description

General purpose R client for ERDDAP servers

ERDDAP info

NOAA's ERDDAP service holds many datasets of interest. It's built on top of OPendAP http://www.opendap.org/. You can search for datasets via ed_search(), list datasets via ed_datasets(), get information on a single dataset via info(), then get data you want for either tabledap type via tabledap(), or for griddap type via griddap().
tabledap/griddap

Tabledap and griddap have different interfaces to query for data, so `tabledap()` and `griddap()` are separated out as separate functions even though some of the internals are the same. In particular, with tabledap you can query on/subset all variables, whereas with griddap, you can only query on/subset the dimension variables (e.g., latitude, longitude, altitude).

Data size

With griddap data via `griddap()` you can get a lot of data quickly. Try small searches of a dataset to start to get a sense for the data, then you can increase the amount of data you get. See `griddap()` for more details.

Caching

`rerddap` by default caches the requests you make, so that if you happen to make the same request again, the data is restored from the cache, rather than having to go out and retrieve it remotely. For most applications, this is good, as it can speed things up when doing a lot of request in a script, and works because in most cases an ERDDAP request is "idempotent". This means that the the request will always return the same thing no matter what requests came before - it doesn’t depend on state. However this is not true if the script uses either "last" in `griddap()` or "now" in `tabledap()` as these will return different values as time elapses and data are added to the datasets. While it is desirable to have ERDDAP purely idempotent, the "last" and "now" constructs are very helpful for people using ERDDAP in dashboards, webpages, regular input to models and the like, and the benefits far outweigh the problems. However, if you are using either "last" or "now" in an `rerddap` based script, you want to be very careful to clear the `rerddap` cache, otherwise the request will be viewed as the same, and the data from the last request, rather than the latest data, will be returned.

Author(s)

---

```
browse

Browse a dataset webpage.
```

Description

Note that it is an error to call this when `base::interactive()` returns FALSE

Usage

```
browse(x, url = eurl(), ...)
```
cache_delete

Arguments

x          datasetid or an object associated with a datasetid such info(), griddap() or tabledap()
url        A URL for an ERDDAP server. Default: https://upwell.pfeg.noaa.gov/erddap/. See eurl() for more information
...

Value

if in interactive mode, opens a URL in your default browser; if not, then prints the URL in the console

Author(s)

Ben Tupper <btupper@bigelow.org>

Examples

```r
## Not run:
# browse by dataset_id
browse('erdATastnhday')

# browse info class
my_info <- info('erdATastnhday')
browse(my_info)

# browse tabledap class
my_tabledap <- tabledap('erdcALCOF1rsviz', fields=c('latitude', 'longitude', 'larvae_size', 'itis_tsn'), 'time>=2011-10-25', 'time<=2011-10-31')
browse(my_tabledap)

## End(Not run)
```

---

cache_delete  Delete cached files

Description

Delete cached files

Usage

cache_delete(x, force = FALSE)
cache_delete_all(force = FALSE)
cache_details

Arguments

x File names
force (logical) Should files be force deleted? Default: FALSE

See Also

Other cache: cache_details, cache_list, cache_setup

Examples

## Not run:
# delete files by name in cache
# cache_delete('9911750294a039b8b517c8bf288978ea.csv')
# cache_delete(c('9911750294a039b8b517c8bf288978ea.csv',
# 'b26825b6737da13d6a52c28c8dfe690f.csv'))

# You can delete from the output of griddap or tabledap fxns
## tabledap
(table_res <- tabledap('erdCinpKfmBT'))
cache_delete(table_res)

## griddap
(out <- info('erdQMe4m14day'))
(grid_res <- griddap(out,
  time = c('2015-12-28','2016-01-01'),
  latitude = c(24, 23),
  longitude = c(88, 90))
cache_delete(grid_res)

## End(Not run)
Details

Can be used to list details for all files, both .nc and .csv types, or details for just individual files of class tabledap, griddap_nc, and griddap_csv

See Also

Other cache: cache_delete, cache_list, cache_setup

Examples

```r
## Not run:
# List details for all cached files
cache_details()

## End(Not run)
```

```r
### cache_list

List cached files

### Usage

```r
cache_list()
```

### See Also

Other cache: cache_delete, cache_details, cache_setup

### Examples

```r
## Not run:
# list files in cache
cache_list()

# List info for files
## download some data first
tabledap('erdCnpKfmBT')
griddap('erdVHNchlamday',
         time = c('2015-04-01', '2015-04-10'),
         latitude = c(18, 21),
         longitude = c(-120, -119))

(x <- cache_list())
cache_details(x$nc[1])
cache_details(x$csv[1])
```
**cache_setup**

```
cache_details()

# delete files by name in cache
# cache_delete(x$nc[1])
# cache_delete(x$nc[2:3])

## End(Not run)
```

### cache_setup

**Setup cache path**

**Description**

Setup cache path

**Usage**

```
cache_setup(path_suffix = NULL, temp_dir = FALSE)
```

**Arguments**

- `path_suffix` (character) the path suffix to use for storing cached files, appended to user cache dir.
- `temp_dir` (logical) if TRUE use a randomly assigned tempdir (and path_suffix is ignored), if FALSE, you can use path_suffix.

**Details**

Looks first if the user has set a cache path suffix in an env var or R option. If not found, proceeds to use a temp directory if not in interactive mode, but if interactive, asks user to setup a default cache location that will work across sessions (but user can say no, in which case a temp directory will be used, and each package start will require cache setup again)

**Value**

the full cache path, a directory (character)

**See Also**

Other cache: `cache_delete`, `cache_details`, `cache_list`
Examples

```r
## Not run:
# default path
cache_setup()

# you can define your own path
cache_setup(path = "foobar")

# set a tempdir - better for programming with to avoid prompt
cache_setup(temp_dir = TRUE)

# cache info
cache_info()

## End(Not run)
```

colors

*cmocean colors* The *cmocean color palette* by Kristen Thyng as implemented in the *R* package "oce"

Description

```r
str(colors)
```

Usage

```r
colors
```

Format

An object of class `list` of length 13.

convert_time

*Convert a UDUNITS compatible time to ISO time*

Description

Convert a UDUNITS compatible time to ISO time

Usage

```r
convert_time(n = NULL, isoTime = NULL,
  units = "seconds since 1970-01-01T00:00:00Z", url = eurl(),
  method = "local", ...)
```
convert_units

Arguments

- `n` numeric; A unix time number.
- `isoTime` character; A string time representation.
- `units` character; Units to return. Default: "seconds since 1970-01-01T00:00:00Z"
- `url` Base URL of the ERDDAP server. See `eurl()` for more information
- `method` (character) One of local or web. Local simply uses `as.POSIXct()`, while web method uses the ERDDAP time conversion service `/erddap/convert/time.txt`
- `...` Curl options passed on to `curl::HttpClient`

Details

When `method` = "web" time zone is GMT/UTC

Examples

```r
## Not run:
# local conversions
convert_time(n = 473472000)
convert_time(isoTime = "1985-01-02T00:00:00Z")

# using an erddap web service
convert_time(n = 473472000, method = "web")
convert_time(isoTime = "1985-01-02T00:00:00Z", method = "web")
## End(Not run)
```

convert_units

Convert a CF Standard Name to/from a GCMD Science Keyword

Description

Convert a CF Standard Name to/from a GCMD Science Keyword

Usage

```r
convert_units(udunits = NULL, ucum = NULL, url = eurl(), ...)
```

Arguments

- `udunits` character; A UDUNITS character string `[http://www.unidata.ucar.edu/software/udunits/](http://www.unidata.ucar.edu/software/udunits/)`
- `ucum` character; A UCUM character string `[http://unitsofmeasure.org/ucum.html](http://unitsofmeasure.org/ucum.html)`
- `url` Base URL of the ERDDAP server. See `eurl()` for more information
- `...` Curl options passed on to `curl::HttpClient`
Examples

```r
## Not run:
convert_units(udunits = "degree_C meter-1")
convert_units(ucum = "Cel.m-1")

## End(Not run)
```

**disk**

Options for saving ERDDAP datasets.

**Description**

Options for saving ERDDAP datasets.

**Usage**

```
disk(path = NULL, overwrite = TRUE)
memory()
```

**Arguments**

- **path**
  
  Path to store files in. A directory, not a file. Default: the root cache path, see `cache_setup`

- **overwrite**
  
  (logical) Overwrite an existing file of the same name? Default: TRUE

**ed_search**

Search for ERDDAP tabledep or griddap datasets

**Description**

Search for ERDDAP tabledep or griddap datasets

**Usage**

```
ed_search(query, page = NULL, page_size = NULL, which = "griddap",
           url = eurl(), ...)
ed_datasets(which = "tabledep", url = eurl())
```
Arguments

- `query` (character) Search terms
- `page` (integer) Page number
- `page_size` (integer) Results per page
- `which` (character) One of tabledep or griddap.
- `url` A URL for an ERDDAP server. Default: `https://upwell.pfeg.noaa.gov/erddap/`. See `eurl()` for more information
- `...` Curl options passed on to `cURL::HttpClient` (must be named parameters)

Author(s)

References

[https://upwell.pfeg.noaa.gov/erddap/index.html](https://upwell.pfeg.noaa.gov/erddap/index.html)

Examples

```r
## Not run:
(out <- ed_search(query='temperature'))
out$alldata[[1]]
(out <- ed_search(query='size'))
out$info

# List datasets
ed_datasets('table')
ed_datasets('grid')

# use a different ERDDAP server
## Marine Institute (Ireland)
ed_search("temperature", url = "http://erddap.marine.ie/erddap/")

## End(Not run)
```

ed_search_adv
Advanced search for ERDDAP tabledep or griddap datasets

Description

Advanced search for ERDDAP tabledep or griddap datasets
Usage

```
ed_search_adv(query = NULL, page = 1, page_size = 1000,
    protocol = NULL, cdm_data_type = NULL, institution = NULL,
    ioos_category = NULL, keywords = NULL, long_name = NULL,
    standard_name = NULL, variableName = NULL, maxLat = NULL,
    minLon = NULL, maxLon = NULL, minLat = NULL, minTime = NULL,
    maxTime = NULL, url = eurl(), ...)```

Arguments

- **query** (character) Search terms
- **page** (integer) Page number. Default: 1
- **page_size** (integer) Results per page: Default: 1000
- **protocol** (character) One of any (default), tabledep or griddap
- **cdm_data_type** (character) One of grid, other, point, profile, timeseries, timeseriesprofile, trajectory, trajectoryprofile
- **institution** (character) An institution. See the dataset institutions
- **ioos_category** (character) An ioos category See the dataset ioos_categories
- **keywords** (character) A keywords. See the dataset keywords
- **long_name** (character) A long name. See the dataset longnames
- **standard_name** (character) A standardname. See the dataset standardnames
- **variablename** (character) A variable name. See the dataset variablenames
- **minLon, maxLon** (numeric) Minimum and maximum longitude. Some datasets have longitude values within -180 to 180, others use 0 to 360. If you specify min and max Longitude within -180 to 180 (or 0 to 360), ERDDAP will only find datasets that match the values you specify. Consider doing one search: longitude -180 to 360, or two searches: longitude -180 to 180, and 0 to 360.
- **minLat, maxLat** (numeric) Minimum and maximum latitude, between -90 and 90
- **minTime, maxTime** (numeric/character) Minimum and maximum time. Time string with the format "yyyy-MM-ddTHH:mm:ssZ, (e.g., 2009-01-21T23:00:00Z). If you specify something, you must include at least yyyy-MM-dd; you can omit Z, :ss, :mm, :HH, and T. Always use UTC (GMT/Zulu) time. Or specify the number of seconds since 1970-01-01T00:00:00Z.
- **url** A URL for an ERDDAP server. Default: https://upwell.pfeg.noaa.gov/erddap/. See eurl() for more information
- **...** Curl options passed on to curl::HttpClient (must be named parameters)

# use a different URL
ed_search_adv(query = 'temperature', url = servers()[url[6]])
## End(Not run)
```

eurl Default ERDDAP server URL

Description

Default ERDDAP server URL

Usage
eurl()

Details
default url is https://upwell.pfeg.noaa.gov/erddap/

You can set a default using an environment variable so you don’t have to pass anything to the URL parameter in your function calls.

In your .Renviron file or similar set a URL for the environment variable RERDDAP_DEFAULT_URL, like RERDDAP_DEFAULT_URL=https://upwell.pfeg.noaa.gov/erddap/

It’s important that you include a trailing slash in your URL.
fipscounty

Convert a FIPS County Code to/from a County Name

Description

Convert a FIPS County Code to/from a County Name

Usage

fipscounty(county = NULL, code = NULL, url = eurl(), ...)

Arguments

- **county**: character; A county name.
- **code**: numeric; A FIPS code.
- **url**: A URL for an ERDDAP server. Default: `https://upwell.pfeg.noaa.gov/erddap/` See `eurl()` for more information
- **...**: Curl options passed on to `crl::HttpClient`

Examples

```
## Not run:
fipscounty(code = "06053")
fipscounty(county = "CA, Monterey")
fipscounty(county = "OR, Multnomah")
## End(Not run)
```
griddap

Get ERDDAP gridded data

description
Get ERDDAP gridded data

Usage

griddap(x, ..., fields = "all", stride = 1, fmt = "nc",
url = eurl(), store = disk(), read = TRUE, callopts = list())

Arguments

x
Anything coercable to an object of class info. So the output of a call to info, or
a datasetid, which will internally be passed through info

... Dimension arguments. See examples. Can be any 1 or more of the dimensions
for the particular dataset - and the dimensions vary by dataset. For each dimen-
sion, pass in a vector of length two, with min and max value desired.

fields (character) Fields to return, in a character vector.

stride (integer) How many values to get. 1 = get every value, 2 = get every other value,
etc. Default: 1 (i.e., get every value)

fmt (character) One of csv or nc (for netcdf). Default: nc

url A URL for an ERDDAP server. Default: https://upwell.pfeg.noaa.gov/erddap/. See eurl() for more information

store One of disk (default) or memory. You can pass options to disk. Beware: if you
choose fmt="nc", we force store=disk() because nc files have to be written
to disk.

read (logical) Read data into memory or not. Does not apply when store parameter
is set to memory (which reads data into memory). For large csv, or especially
netcdf files, you may want to set this to FALSE, which simply returns a summary
of the dataset - and you can read in data piecemeal later. Default: TRUE

callopts Curl options passed on to HttpClient

Details

Details:
If you run into an error like "HTTP Status 500 - There was a (temporary?) problem. Wait a minute,
then try again.". it’s likely they are hitting up against a size limit, and they should reduce the amount
of data they are requesting either via space, time, or variables. Pass in config = verbose() to the
request, and paste the URL into your browser to see if the output is garbled to examine if there’s a
problem with servers or this package
Value

An object of class griddap_csv if csv chosen or griddap.nc if nc file format chosen. These two classes are a thin wrapper around a data.frame, so the data you get back is a data.frame with metadata attached as attributes (datasetid, path (path where the nc or csv is stored on your machine), url (url for the request)), along with a summary of the netcdf file (if fmt="nc"). If read=FALSE, you get back an empty data.frame

Dimensions and Variables

ERDDAP grid dap data has this concept of dimensions vs. variables. Dimensions are things like time, latitude, longitude, altitude, and depth. Whereas variables are the measured variables, e.g., temperature, salinity, air.

You can’t separately adjust values for dimensions for different variables. So, here’s how it’s gonna work:

Pass in lower and upper limits you want for each dimension as a vector (e.g., c(1,2)), or leave to defaults (i.e., don’t pass anything to a dimension). Then pick which variables you want returned via the fields parameter. If you don’t pass in options to the fields parameter, you get all variables back.

To get the dimensions and variables, along with other metadata for a dataset, run info, and each will be shown, with their min and max values, and some other metadata.

Where does the data go?

You can choose where data is stored. Be careful though. You can easily get a single file of hundreds of MB’s (upper limit: 2 GB) in size with a single request. To the store parameter, pass memory if you want to store the data in memory (saved as a data.frame), or pass disk if you want to store on disk in a file. Note that memory and disk are not character strings, but function calls. memory does not accept any inputs, while disk does. Possibly will add other options, like “sql” for storing in a SQL database.

Non-lat/lon grid data

Some gridded datasets have latitude/longitude components, but some do not. When nc format gridded datasets have latitude and longitude we "melt" them into a data.frame for easy downstream consumption. When nc format gridded datasets do not have latitude and longitude components, we do not read in the data, throw a warning saying so. You can readin the nc file yourself with the file path. CSV format is not affected by this issue as CSV data is easily turned into a data.frame regardless of whether latitude/longitude data are present.

Examples

```r
## Not run:
# single variable dataset
## You can pass in the output of a call to info
(out <- info('erdVNNchlamday'))
## Or, pass in a dataset id
(res <- griddap('erdVNNchlamday',
    time = c('2015-04-01', '2015-04-10'),
    latitude = c(18, 21),
    longitude = c(-120, -119))
)

# multi-variable dataset
(out <- info('erdQmekm14day'))
(res <- griddap(out,
    time = c('2015-12-28', '2016-01-01'),
    latitude = c(24, 23),
    longitude = c(88, 90))
)
(res <- griddap(out, time = c('2015-12-28', '2016-01-01'),
    latitude = c(24, 23), longitude = c(88, 90), fields = 'mod_current'))
(res <- griddap(out, time = c('2015-12-28', '2016-01-01'),
    latitude = c(24, 23), longitude = c(88, 90), fields = 'mod_current',
    stride = c(1,2,1,2)))
(res <- griddap(out, time = c('2015-12-28', '2016-01-01'),
    latitude = c(24, 23), longitude = c(88, 90),
    fields = c('mod_current', 'u_current')))  

# Write to memory (within R), or to disk
(out <- info('erdQSwindmday'))
## disk, by default (to prevent bogging down system w/ large datasets)
## you can also pass in path and overwrite options to disk()
(res <- griddap(out,
    time = c('2006-07-11', '2006-07-20'),
    longitude = c(166, 170),
    store = disk())
)
## the 2nd call is much faster as it's mostly just the time of reading in
## the table from disk
system.time( griddap(out,
    time = c('2006-07-11', '2006-07-15'),
    longitude = c(10, 15),
    store = disk() )
)
(system.time( griddap(out,
    time = c('2006-07-11', '2006-07-15'),
    longitude = c(10, 15),
    store = disk() )
)
## memory - you have to choose fmt="csv" if you use memory
```
(res <- griddap("erdMBchla1day",
  time = c('2015-01-01','2015-01-03'),
  latitude = c(14, 15),
  longitude = c(125, 126),
  fmt = "csv", store = memory()
))

### Use ncdf4 package to parse data
info("erdMBchla1day")
(res <- griddap("erdMBchla1day",
  time = c('2015-01-01','2015-01-03'),
  latitude = c(14, 15),
  longitude = c(125, 126)
))

# Get data in csv format
## by default, we get netcdf format data
(res <- griddap("erdMBchla1day",
  time = c('2015-01-01','2015-01-03'),
  latitude = c(14, 15),
  longitude = c(125, 126),
  fmt = "csv"
))

# Use a different ERDDAP server url
## NOAA IOOS PacIOOS
url = "http://oos.soest.hawaii.edu/erddap/
out <- info("NOAA_DHW_5km", url = url)
(res <- griddap(out,
  time = c('2015-11-01','2015-11-03'),
  latitude = c(21, 20),
  longitude = c(10, 11)
))

## pass directly into griddap()
griddap("NOAA_DHW_5km", url = url,
  time = c('2015-11-01','2015-11-03'),
  latitude = c(21, 20),
  longitude = c(10, 11)
)

# Using 'last'
## with time
griddap('erdVHNchlamday',
  time = c('last-5','last'),
  latitude = c(18, 21),
  longitude = c(-120, -119)
)

## with latitude
griddap('erdVHNchlamday',
  time = c('2015-04-01','2015-04-10'),
  latitude = c('last', 'last'),
  longitude = c(-120, -119)
)
## with longitude

```r
griddap('gudhVHNeclamday',
    time = c('2015-04-01', '2015-04-10'),
    latitude = c(18, 21),
    longitude = c('last', 'last'))
```

# datasets without lat/lon grid and with fmt=nc

```r
(x <- info('glos_tds_5912_ca66_3f41'))
res <- griddap(x,
    time = c('2018-04-01', '2018-04-10'),
    ny = c(1, 2),
    nx = c(3, 5))
```

## data.frame is empty

```r
res$data
```

## read in from the nc file path

```r
ncdf4::nc_open(res$summary$filename)
```

## End(Not run)

---

### info

Get information on an ERDDAP dataset.

#### Description

Get information on an ERDDAP dataset.

#### Usage

```r
info(datasetid, url = eurl(), ...)
```

```r
as.info(x, url)
```

#### Arguments

- **datasetid**  
  Dataset id

- **url**  
  A URL for an ERDDAP server. Default: `https://upwell.pfeg.noaa.gov/erddap/`. See `eurl()` for more information

- **...**  
  Further args passed on to `crl::HttpClient` (must be a named parameter)

- **x**  
  A datasetid or the output of `info`

#### Value

Prints a summary of the data on return, but you can index to various information.

The data is a list of length two with:

- **variables** - Data.frame of variables and their types
• alldata - List of data variables and their full attributes

Where alldata element has many data.frame’s, one for each variable, with metadata for that variable. E.g., for griddap dataset noaa_pfeg_696e_ec99_6fa6, alldata has:

• NC_GLOBAL
• time
• latitude
• longitude
• sss

key_words  Convert a CF Standard Name to/from a GCMD Science Keyword

Description
Convert a CF Standard Name to/from a GCMD Science Keyword

Usage
key_words(cf = NULL, gcmd = NULL, url = eurl(), ...)

Arguments
- gcmd character; A GCMD science keyword http://gcmd.gsfc.nasa.gov/learn/keyword_list.html
- url A URL for an ERDDAP server. Default: https://upwell.pfeg.noaa.gov/erddap/. See eurl() for more information
- ... Curl options passed on to curl::HttpClient

Examples
```r
## Not run:
key_words(cf = "air_pressure")
cat(key_words(cf = "air_pressure"))

# a different ERDDAP server
# key_words(cf = "air_pressure", url = servers()$url[6])

## End(Not run)

## tabledap

**Description**

Get ERDDAP tabledap data.

**Usage**

```r
tabledap(x, ..., fields = NULL, distinct = FALSE, orderby = NULL, orderbymax = NULL, orderbymin = NULL, orderbyminmax = NULL, units = NULL, url = eurl(), store = disk(), callopts = list())
```
Arguments

x
Anything coercable to an object of class info. So the output of a call to info(),
or a datasetid, which will internally be passed through info()

... Any number of key-value pairs in quotes as query constraints. See Details &
examples

fields Columns to return, as a character vector

distinct If TRUE ERDDAP will sort all of the rows in the results table (starting with the
first requested variable, then using the second requested variable if the first vari-
able has a tie, ...), then remove all non-unique rows of data. In many situations,
ERDDAP can return distinct values quickly and efficiently. But in some cases,
ERDDAP must look through all rows of the source dataset.

orderby If used, ERDDAP will sort all of the rows in the results table (starting with the
first variable, then using the second variable if the first variable has a tie, ...).
Normally, the rows of data in the response table are in the order they arrived
from the data source. orderBy allows you to request that the results table be
sorted in a specific way. For example, use orderby=c("stationID", time") to
get the results sorted by stationID, then time. The orderby variables MUST be
included in the list of requested variables in the fields parameter.

orderbymax Give a vector of one or more fields, that must be included in the fields parameter
as well. Gives back data given constraints. ERDDAP will sort all of the rows in
the results table (starting with the first variable, then using the second variable
if the first variable has a tie, ...) and then just keeps the rows where the value of
the last sort variable is highest (for each combination of other values).

orderbymin Same as orderbymax parameter, except returns minimum value.

orderbyminmax Same as orderbymax parameter, except returns two rows for every combination
of the n-1 variables: one row with the minimum value, and one row with the
maximum value.

units One of 'udunits' (units will be described via the UDUNITs standard (e.g., degrees_C))
or 'ucum' (units will be described via the UCUM standard (e.g., Cel)).

url A URL for an ERDDAP server. Default: https://upwell.pfeg.noaa.gov/erddap/. See eurl() for more information

store One of disk (default) or memory. You can pass options to disk

callopts Curl options passed on to crul::HttpClient (must be named parameters)

Details

For key-value pair query constraints, the valid operators are =, != (not equals), =~ (a regular
expression test), <, <=, >, and >= . For regular expressions you need to add a regular expression. For
others, nothing more is needed. Construct the entry like 'time>=2001-07-07' with the parameter
on the left, value on the right, and the operator in the middle, all within a set of quotes. Since
ERDDAP accepts values other than =, we can’t simply do time = '2001-07-07' as we normally
would.

Server-side functionality: Some tasks are done server side. You don’t have to worry about what that
means. They are provided via parameters in this function. See distinct, orderby, orderbymax,
orderbymin, orderbyminmax, and units.
Data is cached based on all parameters you use to get a dataset, including base url, query parameters. If you make the same exact call in the same or a different R session, as long you don’t clear the cache, the function only reads data from disk, and does not have to request the data from the web again.

If you run into an error like "HTTP Status 500 - There was a (temporary?) problem. Wait a minute, then try again.". it’s likely they are hitting up against a size limit, and they should reduce the amount of data they are requesting either via space, time, or variables. Pass in `config = verbose()` to the request, and paste the URL into your browser to see if the output is garbled to examine if there’s a problem with servers or this package

**Value**

An object of class `tabledap`. This class is a thin wrapper around a data.frame, so the data you get back is a data.frame with metadata attached as attributes (datasetid, path (path where the csv is stored on your machine), url (url for the request))

**Examples**

```r
## Not run:
# Just passing the datasetid without fields gives all columns back
tabledap('erdCinpKfmbT')

# Pass time constraints
tabledap('hawaii_soest_5742_4f35_ff55', 'time>=2011-08-24', 'time<=2011-09-01')

# Pass in fields (i.e., columns to retrieve) & time constraints
tabledap('hawaii_soest_5742_4f35_ff55',
          fields = c('longitude', 'latitude', 'speed_over_ground'),
          'time>=2011-08-24', 'time<=2011-09-01')

# Get info on a datasetid, then get data given information learned
info('erdCalCOF1rVsiz')$variables
tabledap('erdCalCOF1rVsiz', fields=c('latitude','longitude','larvae_size',
                                      'itis_tsn'), 'time>=2011-10-25', 'time<=2011-10-31')

# An example workflow
## Search for data
(out <- ed_search(query='fish', which = 'table'))
## Using a datasetid, search for information on a datasetid
id <- "nwioosHudFishDetails"
info(id)$variables
## Get data from the dataset
```
tabledap(id, fields = c('scientific_name', 'species_id', 'life_stage'))

# Time constraint
## Limit by time with date only
(info <- info('erdCmpKfMT'))
tabledap(info, fields = c('latitude', 'longitude', 'Haliotis_fulgens_Mean_Density'), 'time>='2001-07-14')

# Use distinct parameter - compare to distinct = FALSE
tabledap('hawaii_soest_5742_4f35_ff55',
  fields=c('longitude', 'latitude', 'speed_over_ground'),
  'time>='2011-08-24', 'time<='2011-09-01', distinct = TRUE)

# Use units parameter
## In this example, values are the same, but sometimes they can be different
## given the units value passed
tabledap('erdCmpKfMT', fields=c('longitude', 'latitude', 'time', 'temperature'),
  'time>='2007-09-19', 'time<='2007-09-21', units='udunits')
tabledap('erdCmpKfMT', fields=c('longitude', 'latitude', 'time', 'temperature'),
  'time>='2007-09-19', 'time<='2007-09-21', units='ucum')

# Use orderby parameter
tabledap('erdCmpKfMT', fields=c('longitude', 'latitude', 'time', 'temperature'),
  'time>='2007-09-19', 'time<='2007-09-21', orderby='temperature')
# Use orderbymax parameter
tabledap('erdCmpKfMT', fields=c('longitude', 'latitude', 'time', 'temperature'),
  'time>='2007-09-19', 'time<='2007-09-21', orderbymax='temperature')
# Use orderbymin parameter
tabledap('erdCmpKfMT', fields=c('longitude', 'latitude', 'time', 'temperature'),
  'time>='2007-09-19', 'time<='2007-09-21', orderbymin='temperature')
# Use orderbyminmax parameter
tabledap('erdCmpKfMT', fields=c('longitude', 'latitude', 'time', 'temperature'),
  'time>='2007-09-19', 'time<='2007-09-21', orderbyminmax='temperature')
# Use orderbymin parameter with multiple values
tabledap('erdCmpKfMT',
  fields=c('longitude', 'latitude', 'time', 'depth', 'temperature'),
  'time>='2007-06-10', 'time<='2007-09-21',
  orderbymax=c('depth', 'temperature'))

# Integrate with taxize
out <- tabledap('erdCaICOFIrrvcntHBtoHI',
  fields = c('latitude', 'longitude', 'scientific_name', 'itis_tsn'),
  'time>='2007-06-10', 'time<='2007-09-21')

# Write to memory (within R), or to disk
out <- info('erdCmpKfMT')
## disk, by default (to prevent bogging down system w/ large datasets)
## the 2nd call is much faster as it's mostly just the time of reading
## in the table from disk
system.time( tabeldap('erdCinpKfmBT', store = disk()) )
system.time( tabeldap('erdCinpKfmBT', store = disk()) )

## memory
  tabeldap('erdCinpKfmBT', store = memory())

# use a different ERDDAP server
# NOAA IOOS NERACOOS
url <- "http://www.neracoos.org/erddap/
  tabeldap("E01_optics_hist", url = url)

## End(Not run)
