Package ‘rmangal’

October 14, 2022

**Type**  Package

**Title**  'Mangal' Client

**Version**  2.1.1

**Description**  An interface to the 'Mangal' database - a collection of ecological networks. This package includes functions to work with the 'Mangal RESTful API' methods (<https://mangal-interactions.github.io/mangal-api/>).

**BugReports**  https://github.com/ropensci/rmangal/issues

**License**  MIT + file LICENSE

**Encoding**  UTF-8

**Imports**  httr (>= 1.3.1), igraph (>= 1.2.1), jsonlite (>= 1.5), memoise, methods

**RoxygenNote**  7.1.2

**Suggests**  ggraph (>= 2.0.0), knitr, magrittr, mapview, rmarkdown, sf, spelling, taxize, tidygraph, testthat, tibble, USAboundaries, vcr

**VignetteBuilder**  knitr

**X-schema.org-applicationCategory**  ecologicalNetworks

**X-schema.org-keywords**  ecology, networks, food webs, interactions, data publications, open access

**X-schema.org-isPartOf**  https://ropensci.org

**Config/testthat/edition**  3

**NeedsCompilation**  no

**Author**  Steve Vissault [aut, ctb] (<https://orcid.org/0000-0002-0866-4376>), Kevin Cazelles [aut, cre] (<https://orcid.org/0000-0001-6619-9874>), Gabriel Bergeron [aut, ctb], Benjamin Mercier [aut, ctb], Clément Violet [aut, ctb], Dominique Gravel [aut],
as.igraph.mgNetwork

Description

Coerce mgNetworksCollection or mgNetwork objects to igraph objects.

Usage

```r
## S3 method for class 'mgNetwork'
as.igraph(x, ...)
```

```r
## S3 method for class 'mgNetworksCollection'
as.igraph(x, ...)
```

Arguments

- `x`: either a mgNetworksCollection or a mgNetwork object.
- `...`: currently ignored.
avail_type

Value

An object of class igraph for a mgNetwork object and a list of igraph objects for mgNetworksCollection.

Methods (by class)

- mgNetwork: Convert mgNetwork objects to igraph objects.
- mgNetworksCollection: Convert mgNetworksCollection objects to a list of igraph objects.

---

avail_type | List interactions type contains in mangal-db

Description

List interactions type contains in mangal-db

Usage

avail_type()

---

clear_cache_rmangal | Clear memoise cache

Description

Resets the cache of the memoised function used for http GET queries (see memoise::forget()).

Usage

clear_cache_rmangal()

Value

TRUE when the cache has been reset.

Examples

clear_cache_rmangal()
combine_mgNetworks  Combine Mangal networks

Description

Combine mgNetworksCollection and mgNetwork objects into a mgNetworksCollection object.

Usage

combine_mgNetworks(...)

Arguments

... objects of class mgNetworksCollection or mgNetwork or a list of objects of these classes.

Value

An object of class mgNetworksCollection.

Examples

mg_random_1071 <- get_collection(c(1071))
mg_random_1074 <- get_collection(c(1074))
combine_mgNetworks(mg_random_1071, mg_random_1074)

get_citation  Retrieve all references pertaining to the networks collection or individual network

Description

Retrieve all references pertaining to the networks collection or individual network

Usage

get_citation(x)

## S3 method for class 'mgNetwork'
get_citation(x)

## S3 method for class 'mgNetworksCollection'
get_citation(x)
get_collection

Arguments

x an object of class mgNetworksCollection or mgNetworks.

Value

Bibtex entries as a character vector.

Methods (by class)

• mgNetwork: Get BibTeX entries for the publication associated to the network.
• mgNetworksCollection: Get BibTeX entries for the publication associated to the networks.

Examples

# network collection
lagoon_net_collection <- get_collection(search_datasets("lagoon"))
get_citation(lagoon_net_collection)
# individual network
mg_18 <- get_network_by_id(18)
get_citation(mg_18)

---

get_collection Get a collection of networks

Description

Retrieve a set of networks based on the results of one of the search_*() function. The function also accepts a numeric vector of Mangal network IDs.

Usage

get_collection(x, ...)

## Default S3 method:
get_collection(x, ...)

## S3 method for class 'mgSearchDatasets'
get_collection(x, ...)

## S3 method for class 'mgSearchNetworks'
get_collection(x, ...)

## S3 method for class 'mgSearchReferences'
get_collection(x, ...)
get_collection

## S3 method for class 'mgSearchNodes'
get_collection(x, ...)

## S3 method for class 'mgSearchTaxonomy'
get_collection(x, ...)

## S3 method for class 'mgSearchInteractions'
get_collection(x, ...)

Arguments

x  numeric vector of Mangal network IDs or an object returned by by one of the search_*() functions.

... arguments to be passed on to get_network_by_id().

Value

Returns a object of class mgNetworksCollection which is a collection (actually, a list) of mgNetwork objects get_network_by_id()).

Methods (by class)

- default: Get a collection of networks (default).
- mgSearchDatasets: Get a collection of networks from a mgSearchDatasets object.
- mgSearchNetworks: Get a collection of networks from a mgSearchNetworks object.
- mgSearchReferences: Get a collection of networks from a mgSearchReferences object.
- mgSearchNodes: Get a collection of networks from a mgSearchNodes object.
- mgSearchTaxonomy: Get a collection of networks from a mgSearchTaxa object.
- mgSearchInteractions: Get a collection of networks from a mgSearchTaxa object.

See Also

search_datasets(), search_interactions(), search_networks(), search_nodes(), search_references(), search_taxonomy().

Examples

mg_2 <- get_collection(c(1076:1077), verbose = FALSE)
mg_anemone <- get_collection(search_networks(query='anemone%'), verbose = FALSE)
get_network_by_id

Retrieve network information, nodes, edges and references for a given set of Mangal network IDs

Description

Summarize mgNetwork properties.
Summarize mgNetworksCollection properties.

Usage

get_network_by_id(ids, as_sf = FALSE, force_collection = FALSE, verbose = TRUE)

get_network_by_id_indiv(id, as_sf = FALSE, verbose = TRUE)

## S3 method for class 'mgNetwork'
print(x, ...)

## S3 method for class 'mgNetworksCollection'
print(x, ...)

## S3 method for class 'mgNetwork'
summary(object, ...)

## S3 method for class 'mgNetworksCollection'
summary(object, ...)

Arguments

ids a vector of Mangal ID for networks (numeric).

as_sf a logical. Should networks metadata be converted into an sf object? Note that to use this feature sf must be installed.

force_collection a logical. Should the output to be of class mgNetworksCollection even if it includes only one network.

verbose a logical. Should extra information be reported on progress?

id a single ID network (numeric).

x an object of class mgNetwork or mgNetworksCollection.

... ignored.

object object of of class mgNetwork or mgNetworksCollection.
Value

A mgNetwork object includes five data frames:

- network: includes all generic information on the network (if as_sf=TRUE then it is an object of class sf);
- nodes: information pertaining to nodes (includes taxonomic information);
- interactions: includes ecological interactions and their attributes;
- dataset: information pertaining to the original dataset;
- reference: details about the original publication.

A summary method is available for objects of class mgNetwork object and returns the following network properties:

- the number of nodes;
- the number of edges;
- the connectance;
- the linkage density;
- the degree (in, out an total) and the eigenvector centrality of every nodes.

Functions

- get_network_by_id_indiv: Retrieve a network by its collection of networks (default).

Examples

```r
net18 <- get_network_by_id(id = 18)
net18_c <- get_network_by_id(id = 18, force_collection = TRUE)
ets <- get_network_by_id(id = c(18, 23))
```

---

### search_datasets

**Query datasets**

Identify relevant datasets using a keyword or a custom query. If the query is a character string, then all character columns in the table are searched and the entries for which at least one partial match was found are returned. Alternatively, a named list can be used to look for an exact match in a specific column (see Details section).

**Usage**

```r
search_datasets(query, verbose = TRUE, ...)```
Arguments

query either a character string including a single keyword or a named list containing a custom query (see details section below). Note that if an empty character string is passed, then all datasets available are returned.

verbose a logical. Should extra information be reported on progress?

... further arguments to be passed to `httr::GET()`.

Details

If query is a named list, the name used should be one of the following:

- id: unique identifier of the dataset
- name: name of the dataset
- date: date (YYYY-mm-dd) of the corresponding publication
- description: a brief description of the data set
- ref_id: the Mangal identifier of the dataset

Note that for lists with more than one element, only the first element is used, the others are ignored. Examples covering custom queries are provided below.

Value

An object of class `mgSearchDatasets`, which basically is a `data.frame` object including all datasets corresponding to the query. For each dataset entry, the networks and the original reference are attached.

References

- [https://mangal.io/#/](https://mangal.io/#/)
- [https://mangal-interactions.github.io/mangal-api/#datasets](https://mangal-interactions.github.io/mangal-api/#datasets)

Examples

```r
# Return all datasets (takes time)
all_datasets <- search_datasets(""
all_datasets
class(all_datasets)
# Search with keyword
mg_lagoon <- search_datasets(query = 'lagoon')
# Search with a custom query (specific column)
mg_kemp <- search_datasets(query = list(name = 'kemp_1977'))
mg_16 <- search_datasets(query = list(ref_id = 16))
```
**Search Interactions**

Search for specific interactions using a keyword or a specific type of interactions (e.g. mutualism). If the query is a character string, then all character columns in the table are searched and the entries for which at least one partial match was found are returned. Alternatively, a named list can be used to look for an exact match in a specific column (see Details section).

**Usage**

```r
search_interactions(
  query,
  type = NULL,
  expand_node = FALSE,
  verbose = TRUE,
  ...
)
```

**Arguments**

- `query`: either a character string including a single keyword or a named list containing a custom query (see details section below). Note that if an empty character string is passed, then all datasets available are returned.
- `type`: a character one of the interactions type available (see details). Note that query is ignored if type is used.
- `expand_node`: a logical. Should the function returned extra information pertaining to nodes? Default is set to `FALSE`, which means that only the Mangal IDs of nodes are returned.
- `verbose`: a logical. Should extra information be reported on progress?
- `...`: further arguments to be passed to `httr::GET()`.

**Details**

Names of the list should match one of the column names within the table. For the interaction table, those are:

- `id`: unique identifier of the interaction;
- `attr_id`: identifier of a specific attribute;
- `direction`: edge direction ("directed", "undirected" or "unknown");
- `network_id`: Mangal network identifier;
- `node_from`: node id which the interaction end to;
- `node_to`: node to which the interaction end to;
• type: use argument type instead.

Note that for lists with more than one element, only the first element is used, the others are ignored.
The type of interactions (argument type) currently available are the following

• "competition";
• "amensalism";
• "neutralism";
• "commensalism";
• "mutualism";
• "parasitism";
• "predation";
• "herbivory";
• "symbiosis";
• "scavenger";
• "detritivore".

Value

An object of class mgSearchInteractions, i.e. a data.frame object including interactions. All networks in which interactions are involved are also attached to the data.frame.

References

• https://mangal.io/#/
• https://mangal-interactions.github.io/mangal-api/#taxonomy

Examples

```
df_inter <- search_interactions(type = "competition", verbose = FALSE)
# Get all networks containing competition
competition_networks <- get_collection(df_inter, verbose = FALSE)
df_net_926 <- search_interactions(list(network_id = 926), verbose = FALSE)
```

Description

Search over all networks using a keyword, a custom query or a spatial object. If the query is a character string, then all character columns in the table are searched and the entries for which at least one partial match was found are returned. Alternatively, a named list can be used to look for an exact match in a specific column (see Details section)
search_networks

Usage

search_networks(query, verbose = TRUE, ...)

search_networks_sf(query_sf, verbose = TRUE, ...)

Arguments

query either a character string including a single keyword or a named list containing a
custom query (see details section below), or a spatial object (see the description
of query_sf). Note that if an empty character string is passed, then all datasets
available are returned.

verbose a logical. Should extra information be reported on progress?

... further arguments to be passed to httr::GET().

query_sf a spatial object of class sf used to search in a specific geographical area.

Details

Names of the list should match one of the column names within the table. For the networks table, those are

- id: unique identifier of the network;
- all_interactions: false interaction can be considered as real false interaction
- dataset_id: the identifier of the dataset;
- public: network publicly available;

Note that for lists with more than one element, only the first element is used, the others are ignored. An example is provided below.

Value

An object of class mgSearchNetworks, which is a data.frame object with all networks informations

Functions

- search_networks_sf: Search networks within a spatial object passed as an argument. Note that sf must be installed to use this function.

References

- https://mangal.io/#/
- https://mangal-interactions.github.io/mangal-api/#networks
Examples

```r
mg_insect <- search_networks(query="insect%")
# Retrieve the search results
nets_insect <- get_collection(mg_insect)
# Spatial query
library(sf)
library(USAboundaries)
area <- us_states(state="california")
networks_in_area <- search_networks_sf(area, verbose = FALSE)
plot(networks_in_area)
# Retrieve network ID 5013
net_5013 <- search_networks(query = list(id = 5013))
# Network(s) of dataset ID 19
mg_19 <- search_networks(list(dataset_id = 19))
```

search_nodes

<table>
<thead>
<tr>
<th>Description</th>
<th>Query nodes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Search for networks by querying the nodes table. If the query is a character string, then all character columns in the table are searched and the entries for which at least one partial match was found are returned. Alternatively, a named list can be used to look for an exact match in a specific column (see Details section)</td>
<td>search_nodes(query, verbose = TRUE, ...)</td>
</tr>
</tbody>
</table>

Usage

```r
search_nodes(query, verbose = TRUE, ...)
```

Arguments

- **query**: either a character string including a single keyword or a named list containing a custom query (see details section below). Note that if an empty character string is passed, then all datasets available are returned.
- **verbose**: a logical. Should extra information be reported on progress?
- **...**: further arguments to be passed to `httr::GET()`.

Details

Names of the list should match one of the column names within the table. For the `networks` table, those are:

- id: unique identifier of the nodes;
- original_name: taxonomic name as in the original publication;
• node_level: either population, taxon or individual;
• network_id: Mangal network identifier.

Note that for lists with more than one element, only the first element is used, the others are ignored. An example is provided below.

Value

An object of class mgSearchNodes, which basically is a data.frame object including taxa that are matching the query and corresponding information. All networks in which taxa are involved are also attached to the data.frame.

References

• https://mangal.io/#/
• https://mangal-interactions.github.io/mangal-api/#nodes

See Also

search_taxonomy()

Examples

```r
res_acer <- search_nodes("Acer")
res_926 <- search_nodes(list(network_id = 926))
```
Arguments

- **query**: either a character string including a single keyword or a named list containing a custom query (see details section below). Note that if an empty character string is passed, then all datasets available are returned.
- **doi**: character a Digital Object Identifier (DOI) of the article. Note that query is ignored if doi is specified.
- **verbose**: a logical. Should extra information be reported on progress?
- ... further arguments to be passed to `httr::GET()`.

Details

Names of the list should match one of the column names within the table. For the reference table, those are:

- `id`: unique identifier of the reference
- `first_author`: first author
- `doi`: use `doi` instead
- `jstor`: JSTOR identifier
- `year`: year of publication.

Note that for lists with more than one element, only the first element is used, the others are ignored. An example is provided below.

Value

An object of class `mgSearchReferences`, which is a list that includes a wide range of details associated to the reference, including all datasets and networks related to the publication that are included in Mangal database.

References

- [https://mangal.io/#/](https://mangal.io/#/)
- [https://mangal-interactions.github.io/mangal-api/#references](https://mangal-interactions.github.io/mangal-api/#references)

Examples

```r
search_references(doi = "10.2307/3225248")
search_references(list(jstor = 3683041))
search_references(list(year = 2010))
```
search_taxonomy

Description

Search network by taxon names and unique taxonomic identifiers. This function offers the opportunity to retrieve taxon based on (i) known identifier such as the taxonomic serial number (TSN), GBIF ID etc. or (ii) text search using partial match. Have a look at the list of arguments to see the complete list of identifiers accessible. If any unique identifier argument is used (i.e. tsn etc.), then query is ignored. Moreover, if several taxonomic identifiers are specified, then only the first one is considered.

Usage

```r
search_taxonomy(
  query,
  tsn = NULL,
  gbif = NULL,
  eol = NULL,
  col = NULL,
  bold = NULL,
  ncbi = NULL,
  verbose = TRUE,
  ...
)
```

Arguments

- `query`: a character string including a single keyword. Note that if an empty character string is passed, then all datasets available are returned.
- `verbose`: a logical. Should extra information be reported on progress?
- `...`: further arguments to be passed to `httr::GET()`.
**Details**

Taxon names of the taxonomy table were validated with TNRS (see https://tnrs.biendata.org and/or GNR might not be the taxon name documented in the original publication. In order to identify relevant networks with the original name, use `search_nodes()`.

The validation of taxon names was performed by an automated procedure and if there is any doubt, the original names recorded by authors should be regarded as the most reliable information. Please report any issue related to taxonomy at https://github.com/mangal-interactions/contribute/issues/new/choose/.

**Value**

An object of class `mgSearchTaxonomy`, which is a `data.frame` including all taxa matching the query.
