Package ‘rscala’

November 5, 2018

Type  Package
Title  Bridge Between 'R' and 'Scala' with Callbacks
Version  3.2.4
Date  2018-11-05

URL  https://github.com/dbdahl/rscala

BugReports  https://github.com/dbdahl/rscala/issues
Imports  utils

SystemRequirements  Scala (>= 2.11)

Description  'Scala' <http://www.scala-lang.org/> is embedded in 'R' and call-
backs from 'Scala' to 'R' are available. Support is provided to write 'R' packages that ac-
cess 'Scala'. After installation, please run 'rscala::scalaConfig()'.

Depends  R (>= 3.1.0)

LazyData  TRUE

License  Apache License 2.0 | file LICENSE

Encoding  UTF-8

RoxygenNote  6.1.0

Suggests  testthat

NeedsCompilation  no

Author  David B. Dahl [aut, cre]

Maintainer  David B. Dahl <dahl@stat.byu.edu>

Repository  CRAN

Date/Publication  2018-11-05 18:30:03 UTC

R topics documented:

*.rscalaBridge ......................................................... 2
+.rscalaBridge ....................................................... 3
close.rscalaBridge .................................................. 4
is.scalaReference .................................................... 4
Description

This operator compiles and executes a snippet of Scala code. All definitions are local to the supplied Scala snippet. Subsequent uses of the same code snippet skips the time-consuming compilation step. The return value is a vector or matrix of R's basic types (if possible) or an rscala reference (otherwise).

Usage

```r
## S3 method for class 'rscalaBridge'
bridge * snippet
```

Arguments

- `bridge`: An rscala bridge.
- `snippet`: String providing a Scala code snippet.

Value

Returns a vector or matrix of R's basic types (if possible) or an rscala reference (otherwise).

See Also

`^rscalaBridge`, `+rscalaBridge`, `scala`
Examples

s <- scala()
s * 'scala.util.Random.nextDouble() <= 0.75'
s(mean=10, sd=2.5) * 'mean + sd * scala.util.Random.nextGaussian()'
close(s)

+.rscalaBridge  Declaration Operator

Description

This operator compiles and executes a snippet of Scala code in Scala's global environment, where subsequent uses of the same code snippet do not skip the time-consuming compilation step and the return value is NULL. As such, this operator is used to define global imports, objects, classes, methods, etc.

Usage

## S3 method for class 'rscalaBridge'

bridge + snippet

Arguments

<table>
<thead>
<tr>
<th>bridge</th>
<th>An rscala bridge.</th>
</tr>
</thead>
<tbody>
<tr>
<td>snippet</td>
<td>String providing a Scala code snippet.</td>
</tr>
</tbody>
</table>

Value

Returns NULL, invisibly.

See Also

*.rscalaBridge, ^.rscalaBridge, scala

Examples

s <- scala()
s + '
import scala.util.Random.nextInt
import scala.math.{Pi, log, exp, sqrt}
val const = -log(sqrt(2*Pi))
def dnorm(x: Double, mean: Double, sd: Double, logScale: Boolean) = {
  val z = (x - mean) / sd
  val result = const - log(sd) - z * z / 2
if (logScale) result else exp(result)

s$const()

s$nextInt(100L)

s$dnorm(8, 10, 2, FALSE)

close(s)

---

**close.rscalaBridge**  
*Close a Scala Bridge*

**Description**

Close a Scala Bridge

**Usage**

```r
close(con, ...)
```

**Arguments**

- `con`: An rscala bridge.
- `...`: Currently ignored.

**Value**

Returns NULL, invisibly.

---

**is.rscalaReference**  
*Test for Scala Reference*

**Description**

Test for Scala Reference

**Usage**

```r
is.rscalaReference(x)
```

**Arguments**

- `x`: An arbitrary R object.
**Value**

Logical indicating whether \( x \) is an rscala reference.

**Examples**

```r
is.scalaReference(c(1,2))
```

---

**scala**

*Instantiate a Scala Bridge*

**Description**

This function creates an instance of an rscala bridge. Details on this function (and the rscala package as a whole) are provided in the package vignette and the associated paper in the *Journal of Statistical Software*. See the reference below.

**Usage**

```r
scala(JARs = character(), serialize.output = .Platform$OS.type ==
  "windows", stdout = TRUE, stderr = TRUE, port = 0L,
  heap.maximum = NULL, debug = FALSE)
```

**Arguments**

- **JARs**
  Character vector whose elements are some combination of individual JAR files or package names which contain embedded JARs. These JAR files are added to the runtime classpath.

- **serialize.output**
  Logical indicating whether Scala output should be serialized back to R. This is slower and probably only needed on Windows.

- **stdout**
  Whether "standard output" results that are not serialized should be sent. TRUE or FALSE sends output to the R console (although that may not work on Windows). FALSE or NULL discards the output. Otherwise, this is the name of the file that receives the output.

- **stderr**
  Same as stdout, except influences the "standard error".

- **port**
  If 0, two random ports are selected. Otherwise, port and port+1 are used to the TCP/IP connections.

- **heap.maximum**
  String giving Scala’s heap maximum, e.g., "8G" or "512M". The value here supersedes that from scalaMemory. Without this being set in either scala or scalaMemory, the heap maximum will be 90% of the available RAM.

- **debug**
  (Developer use only.) Logical indicating whether debugging should be enabled.
Details

Multiple interpreters can be created and each runs independently with its own memory space. Each interpreter can use multiple threads/cores, but the bridge between R and Scala is itself not thread-safe, so multiple R threads/cores should not simultaneously access the same bridge.

Terminate the bridge using close.rscalaBridge.

Value

Returns an rscala bridge.

References

close.rscalaBridge, scalaMemory scalaPushRegister, scalaPullRegister

Examples

```r
s <- scala()
rng <- s $ .new scala.util.Random()
rng $ alphanumeric() $ take(15L) $ mkString (',')
s * '2+3'
h <- s(x=2, y=3) ^ 'x+y'
h $ toString()
s(mean=h, sd=2, r=rng) * 'mean + sd * r.nextGaussian()'
close(s)
```

---

**scalaConfig**

*Configure Scala and Java*

**Description**

This function installs Scala and/or Java in the user's `~/.rscala` directory.

**Usage**

```r
scalaConfig(verbose = TRUE, reconfig = FALSE, download = character(0), require.sbt = FALSE)
```
Arguments

verbose Should details of the search for Scala and Java be provided? Or, if an rscala bridge is provided instead of a logical, the function returns a list of details associated with the supplied bridge.

reconfig If TRUE, the script ".rscala/config.R" is rewritten based on a new search for Scala and Java. If FALSE, the previous configuration is sourced from the script ".rscala/config.R". If "live", a new search is performed, but the results do not overwrite the previous configuration script. Finally, the value set here is superceded by the value of the environment variable RSCALA_RECONFIG, if it exists.

download A character vector which may be length-zero or whose elements are any combination of "java", "scala", or "sbt". Or, TRUE denotes all three. The indicated software will be installed at ".rscala".

require.sbt Should SBT be required, downloading and installing it in ".rscala/sbt" if necessary?

Value

Returns a list of details of the Scala and Java binaries.

Examples

scalaConfig()

scalaDisconnect  Temporarily Disconnect Scala by Closing Connections

Description

This function temporarily disconnects an rscala bridge by closing its associated socket connections. The primary place where this function is used is at the end of examples of packages that depend on rscala (because, under some versions of R, "R CMD check --as-cran" does not permit connections to persist after an example ends).

Usage

scalaDisconnect(bridge = scalaFindBridge())
### scalaFindBridge

#### Arguments

**bridge**  
An rscala bridge.

#### Examples

```r
showConnections()
```

```r
s <- scala()
showConnections()
```

```
# No additional connections yet.
```

```r
s * "3+4"
showConnections()
```

```
# Now there are two additional connections.
```

```r
scalaDisconnect()
showConnections()
```

```
# The new connections are gone.
```

```r
s * "3+4"
showConnections()
```

```
# New connections are established as needed.
```

```r
close(s)
```

---

---

### Find a Scala Bridge

#### Description

This function attempts to find an instance of an rscala bridge based on an rscala reference or by searching the environment path.

#### Usage

```r
scalaFindBridge(reference = NULL)
```

#### Arguments

**reference**  
 Either: i. An rscala reference, or ii. NULL (in which case the environment path is searched).

#### Value

An rscala bridge.
scalaJARs  Add JAR Files to Classpath

Description
Add JAR Files to Classpath

Usage
scalaJARs(JARs, bridge = scalaFindBridge())

Arguments
JARs Character vector whose elements are some combination of individual JAR files or package names which contain embedded JARs. These JAR files are added to the runtime classpath.
bridge An rscala bridge from the scala function.
If the JARs argument is missing, a character vector of loaded JARs is returned.

Value
Returns NULL, invisibly.

See Also
scalaFindBridge

Examples
## Not run:
scalaJARs("PATH/TO/jarFileToLoad.jar", e)
## End(Not run)

scalaLast  Retrieve the Last Scala Computation

Description
This function retrieves the last result from the supplied rscala bridge.

Usage
scalaLast(bridge = scalaFindBridge())
Arguments

bridge An rscala bridge

See Also

scalaFindBridge

Examples

s <- scala()
s * "2+3"
scalaLast(s)
close(s)

---

**scalaLazy**

*Lazily Execute Functions on a Scala Bridge*

Description

Lazily Execute Functions on a Scala Bridge

Usage

scalaLazy(functions, bridge = scalaFindBridge())

Arguments

functions A single function or list of functions. Each function takes a Scala bridge as its only argument. These functions are called immediately after the next time the bridge is connected. These functions are where setup code should go, like `global` imports, objects, classes, methods, etc. For example, it might equal `function(s) { s + 'import scala.util.Random' }`. **Note** the use of the declaration operator `:=` instead of the operators `*` or `~`.

bridge An rscala bridge from the scala function.

Value

Returns NULL, invisibly.

See Also

scalaFindBridge
### Examples

```scala
s <- scala()
scala.lazy(function(s) { s + 'import scala.util.Random' })
s$.new_Random().$nextDouble()
close(s)
```

### Description

Depending on the argument type, this function has several uses related to memory in Scala.

### Usage

```scala
scalaMemory(x)
```

### Arguments

- **x**
  
  If the argument is a string (e.g., "8G" or "512M"). the function sets the default maximum heap size for new instances of rscala bridges created by the function `scala`. If the argument is missing, the current default maximum heap size for new instances is returned. Set the argument to NULL to disable this global option, and therefore use Scala's own default. If the argument is an rscala bridge, the function returns a numeric vector giving the current and the maximum heap sizes.

### See Also

- `scala`

### Examples

```r
## Not run:

scalaMemory("1G")

## End(Not run)
```
Description

The push function serializes an R object to Scala and the pull function does the opposite. A couple of built push and pull methods are provided, namely "generic" and "list". The "generic" method serializes an arbitrary R object to an instance of RObject in Scala. Since the RObject merely contains an array of bytes, the RObject is really only useful as storage for later serialization. The "generic" method has an optional as.is argument which is either TRUE to cause the list to serialized as a single object or FALSE to cause each element of the list to be serialized individually. More methods may be added using the functions scalaPushRegister and scalaPullRegister.

Usage

scalaPull(reference, method, ...)

scalaPush(x, method = "generic", bridge = scalaFindBridge(), ...)

Arguments

| reference | An rscala reference. |
|方法 | A string giving the specific 'push' or 'pull' method to use. |
|... | Other arguments passed to specialized push and pull functions. |
|x | An R object. |
|bridge | An rscala bridge. |

See Also

scalaPushRegister, scalaPullRegister

Examples

```r
s <- scala()
s(rn=scalaPush(rnorm,n=5) * 'R.evalD1("%-%",rn,n)'
mtcarsRef <- scalaPush(mtcars, "list")
mtcarsRef$names()
mtcarsRef$mpg()
mtcars2 <- scalaPull(mtcarsRef, "list")
identical(mtcars, mtcars2)

# Oops, the variable names are bad...
tryCatch(ref <- scalaPush(iris, "list"), error=function(e) e)
```
# ... so let's clean up the variable names.
irisCleaned <- iris
names(irisCleaned) <- gsub("\W","_",names(iris))
irisCleaned$Species <- as.character(iris$Species)
ref2 <- scalaPush(irisCleaned, "list")
scalaType(ref2)
ref2$Sepal.Length()
irisCleaned2 <- scalaPull(ref2,"list")
identical(irisCleaned, irisCleaned2)

close(s)

---

### scalaPushRegister

**Register Functions to Push and Pull Between R and Scala**

#### Description

The `rscala` package provides support for serializing objects between R and Scala. These registration functions allow additional, more-specialized push and pull methods to be added. Package developers may want to call these registration functions in the package's `.onLoad` function.

#### Usage

```r
scalaPushRegister(pusher, method, bridge = scalaFindBridge())
scalaPullRegister(puller, method, bridge = scalaFindBridge())
```

#### Arguments

- **pusher**: A function whose first two arguments are as shown in the example below. Other arguments can be used as additional arguments.
- **method**: A string giving the name of the specific 'push' or 'pull' method.
- **bridge**: An rscala bridge.
- **puller**: A function whose first two arguments are as shown in the example below. Other arguments can be used as additional arguments.

#### See Also

- `scalaPush`, `scalaPull`
Examples

```r
s <- scala()

name <- "Grace"
nameAsROrder <- scalaPush(name,"generic")  # Basic serialization
scaleType(nameAsROrder)
identical(name,scalePull(nameAsROrder,"generic"))

scalaPush.character <- function(x, bridge) {
  if (is.character(x) && (length(x) == 1L ) ) bridge(x=x) ^ 'x'
  else stop("'x' should be a character vector.")
}
scalaPushRegister(scalaPush.character, "character")
nameAsString <- scalaPush(name, "character", s)  # More specific serialization
scaleType(nameAsString)

scalaPull.character <- function(reference, bridge) {
  if (scaleType(reference) == "String") reference$toString()
  else stop("'reference' should be a 'String'.")
}
scalaPullRegister(scalaPull.character, "character")
identical(name,scalePull(nameAsString,"character"))

close(s)
```

---

**scalaSBT**

*Run SBT and Deploy JAR Files*

**Description**

This function runs SBT (Scala Build Tool) to package JAR files and then copy them to the appropriate directories of the R package source.

**Usage**

```r
scalaSBT(\texttt{args = c("+package","packageSrc"), copy.to.package = TRUE})
```

**Arguments**

- **args**
  - A character vector giving the arguments to be passed to the SBT command.

- **copy.to.package**
  - Should the jars be to the appropriate directories of the R package source.
Details
Starting from the current working directory and moving up the file system hierarchy as needed, this function searches for the directory containing the file 'build.sbt', the SBT build file. It temporarily changes the working directory to this directory. Unless the args argument is overwritten, it then runs `sbt +package packageSrc +publishLocal` to package the cross-compiled the Scala code, package the source code, and publish the JAR files locally. Finally, it optionally copies the JAR files to the appropriate directories of the R package source. Specifically, source JAR files go into `(PKGHOME)/inst/java/scala-(VERSION)`, where `(PKGHOME)` is the package home and (VERSION) is the major Scala version (e.g., 2.12). It is assumed that the package home is a subdirectory of the directory containing the 'build.sbt' file.

Note that SBT may give weird errors about not being able to download needed dependences. The issue is that some OpenJDK builds less than version 10 do not include root certificates. The solution is to either: i. manually install OpenJDK version 10 or greater, or ii. manually install Oracle's version of Java. Both are capable with the rscala package.

Value

NULL

---

**scalaType**

*Get or Specify a Scala Type*

---

**Description**

This function gets the Scala type of an rscala reference. It also, together with the associated convenience objects, specifies a Scala type for transcompilation purposes.

**Usage**

scalaType(type)

stI0

stD0

stL0

stR0

stS0

stI1

stD1

stL1
Arguments

\texttt{type} \hspace{1em} An rscala reference or a character vector of length one giving a Scala type.

Format

See 'Value' below.

Details

The convenience objects are of the form \texttt{stXY} (where \(X\) is in \{I, D, L, R, S\} and \(Y\) is in \{0, 1, 2\}) as indicated below:

- \(I\) corresponds to Scala’s \texttt{Int} and R’s \texttt{integer}.
- \(D\) corresponds to Scala’s \texttt{Double} and R’s \texttt{double}.
- \(L\) corresponds to Scala’s \texttt{Boolean} and R’s \texttt{logical}.
- \(R\) corresponds to Scala’s \texttt{Byte} and R’s \texttt{raw}.
- \(S\) corresponds to Scala’s \texttt{String} and R’s \texttt{character}.
- \(0\) corresponds to a Scala primitive and an R length one vector.
- \(1\) corresponds to a Scala array and an R vector.
- \(2\) corresponds to a Scala array of arrays and an R matrix.

For example, \texttt{stS2} is equivalent to Scala’s \texttt{scalaType("Array[Array[String]]")} and R’s type for \texttt{matrix(character())}. Also, \texttt{stL1} is equivalent to Scala’s \texttt{scalaType("Boolean")} and R’s type for \texttt{logical(1)}.

Value

An object of class \texttt{rscalaType} whose value is a character vector of length one indicating a Scala type.
scalaVersionJARs

Examples
  scalaType("Double")
  stD0
  scalaType("Array[Byte]")
  stR1
  scalaType("Array[Array[Int]]")
  stI2

scalaVersionJARs                  JAR Files for Support Scala Versions

Description
  This function returns a named list whose elements give the file system paths of the JAR files for the supported major versions of Scala.

Usage
  scalaVersionJARs()

Value
  A list whose names correspond to Scala major versions and whose elements are file system paths.

Examples
  scalaVersionJARs()

^.*rscalaBridge                  Evaluation Operator Returning a Reference and Transcompile Operator

Description
  This operator is equivalent to ^.*rscalaBridge, except the return value is always an rscala reference. This operator also allows (a small subset of) R code to be transcompiled to Scala code and produces an rscala reference to an anonymous Scala function.

Usage
  # S3 method for class 'rscalaBridge'
  bridge ^ snippet
Arguments

bridge  An rscala bridge.
snippet  String providing a Scala code snippet.

Value

Returns an rscala reference.

`.rscalaBridge`, `.rscalaBridge.scala`

Examples

```r
s <- scala()
x <- s ^ 'new scala.util.Random()'  # These two lines ...  
x <- s $ .newscala.util.Random()  # ... are equivalent
s(rng=x) * 'rng.nextDouble()'
f <- s ^ function(x=scalaType('Double')) { pi - x }
f$apply(3.14)
s(n=10L, mapper=s ^ function(x=scalaType("Int")) { 2 * x })  # "Array.tabulate(n)(mapper)"
logStdNormalDensity <- s ^ function(x=scalaType("Double"), mean=0.0, sd=1.0) {
  variance <- sd^2
  -0.5*log(2*pi*variance) - 0.5/variace * (x-mean)^2
}
identical(logStdNormalDensity$apply(1.0), dnorm(1.0, log=TRUE))
```
