**rsnps-package**

Get SNP (Single-Nucleotide Polymorphism) Data on the Web

**Description**

This package gives you access to data from OpenSNP (https://opensnp.org) via their API (https://opensnp.org/faq#api).

**NCBI Authentication**

This applies the functions `ncbi_snp_query()`, `ncbi_snp_query2()`, and `ncbi_snp_summary()`:

You can optionally use an API key, if you do it will allow higher rate limits (more requests per time period)

If you don’t have an NCBI API key, get one at https://www.ncbi.nlm.nih.gov/account/

Create your key from your account. After generating your key set an environment variable as `ENTREZ_KEY` in `.Renviron`

`ENTREZ_KEY='youractualkeynotthisstring'`

You can optionally pass in your API key to the key parameter in NCBI functions in this package. However, it’s much better from a security perspective to set an environment variable.

allgensnp

Get openSNP genotype data for all users at a particular snp.

Description

Get openSNP genotype data for all users at a particular snp.

Usage

allgensnp(snp = NA, ...)

Arguments

snp (character) A SNP name
... Curl options passed on to crul::HttpClient

Value
data.frame of genotypes for all users at a certain SNP

See Also

Other opensnp-fxns: allphenotypes, annotations, download_users, fetch_genotypes, genotypes, phenotypes_byid, phenotypes, users

Examples

## Not run:
x <- allgensnp(snp = 'rs7412')
head(x)

## End(Not run)

allphenotypes

Get openSNP phenotypes, their variations, and how many users have data available for a given phenotype.

Description

Either return data.frame with all results, or output a list, then call the charcteristic by id (paramater = "id") or name (paramater = "characteristic").

Usage

allphenotypes(df = FALSE, ...)

## Not run:
x <- allphenotypes(df = FALSE, id = 'rs7412')
head(x)

## End(Not run)
Annotations

Arguments

- **df**: Return a data.frame of all data. The column `known_variations` can take multiple values, so the other columns `id`, `characteristic`, and `number_of_users` are replicated in the data.frame. Default: FALSE

... Curl options passed on to `crl::HttpClient`

Value

data.frame of results, or list if df=FALSE

See Also

Other opensnp-fxns: `allgensnp`, `annotations`, `download_users`, `fetch_genotypes`, `genotypes`, `phenotypes_byid`, `phenotypes`, `users`

Examples

## Not run:
# Get all data
allphenotypes(df = TRUE)

# Output a list, then call the characteristic of interest by 'id' or # 'characteristic'
datalist <- allphenotypes()
names(datalist) # get list of all characteristics you can call
datalist[["ADHD"]] # get data.frame for 'ADHD'
datalist[c("mouth size","SAT Writing")]) # get data.frame for 'ADHD'

## End(Not run)

Get all openSNP phenotypes, their variations, and how many users have data available for a given phenotype.

Description

Either return data.frame with all results, or output a list, then call the characteristic by id (parameter = "id") or name (parameter = "characteristic").

Usage

`annotations(snp = NA, output = c("all", "plos", "mendeley", "snpedia", "metadata"), ...)`
download_users

Arguments

snp SNP name.
output Name the source or sources you want annotations from (options are: 'plos', 'mendeley', 'snpedia', 'metadata'). 'metadata' gives the metadata for the response.

... Curl options passed on to crul::HttpClient

Value
data.frame of results

See Also

Other opensnp-fxns: allgensnp, allphenotypes, download_users, fetch_genotypes, genotypes, phenotypes_byid, phenotypes, users

Examples

## Not run:
# Get all data
# get just the metadata
annotations(snp = 'rs7903146', output = 'metadata')

## just from plos
annotations(snp = 'rs7903146', output = 'plos')

## just from snpedia
annotations(snp = 'rs7903146', output = 'snpedia')

## get all annotations
annotations(snp = 'rs7903146', output = 'all')

## End(Not run)

download_users Download openSNP user files.

Description

Download openSNP user files.

Usage

download_users(name = NULL, id = NULL, dir = "~/", ...)
fetch_genotypes

Arguments

name User name
id User id
dir Directory to save file to
... Curl options passed on to crul::HttpClient

Value

File downloaded to directory you specify (or default), nothing returned in R.

See Also

Other opensnp-fxns: allgensnp, allphenotypes, annotations, fetch_genotypes, genotypes, phenotypes_byid, phenotypes, users

Examples

## Not run:
# Download a single user file, by id
download_users(id = 14)

# Download a single user file, by user name
download_users(name = 'kevinmcc')

# Download many user files
lapply(c(14,22), function(x) download_users(id=x))
read_users(id=14, nrows=5)

## End(Not run)

fetch_genotypes Download openSNP genotype data for a user

Description

Download openSNP genotype data for a user

Usage

fetch_genotypes(url, rows = 100, filepath = NULL, quiet = TRUE, ...)
Arguments

url (character) URL for the download. See example below of function use.
rows (integer) Number of rows to read in. Useful for getting a glimpse of the data. Negative and other invalid values are ignored, giving back all data. Default: 100
filepath (character) If none is given the file is saved to a temporary file, which will be lost after your session is closed. Save to a file if you want to access it later.
quiet (logical) Should download progress be suppressed. Default: TRUE
...

Further args passed on to download.file()

Details

Beware, not setting the rows parameter means that you download the entire file, which can be large (e.g., 15MB), and so take a while to download depending on your connection speed. Therefore, rows is set to 10 by default to sort of protect the user.

Internally, we use download.file() to download each file, then read.table() to read the file to a data.frame.

Value

data.frame for a single user, with four columns:

• rsid (character)
• chromosome (integer)
• position (integer)
• genotype (character)

See Also

Other opensnp-fxns: allgensnp, allphenotypes, annotations, download_users, genotypes, phenotypes_byid, phenotypes, users

Examples

## Not run:
# get a data.frame of the users data
data <- users(df = TRUE)
head( data[[1]] ) # users with links to genome data
mydata <- fetch_genotypes(url = data[[1]][1],"genotypes.download_url", 
   file="~/myfile.txt")

# see some data right away
mydata

# Or read in data later separately
read.table("~/myfile.txt", nrows=10)

## End(Not run)
genotypes

Get openSNP genotype data for one or multiple users.

Description

Get openSNP genotype data for one or multiple users.

Usage

```r
genotypes(snp = NA, userid = NA, df = FALSE, ...)
```

Arguments

- `snp` SNP name.
- `userid` ID of openSNP user.
- `df` Return data.frame (TRUE) or not (FALSE). Default: FALSE
- `...` Curl options passed on to `crul::HttpClient`]

Value

List (or data.frame) of genotypes for specified user(s) at a certain SNP.

See Also

Other opensnp-fxns: `allgensnp`, `allphenotypes`, `annotations`, `download_users`, `fetch_genotypes`, `phenotypes_byid`, `phenotypes`, `users`

Examples

```r
## Not run:
genotypes(snp='rs9939609', userid=1)
genotypes('rs9939609', userid='1,6,8', df=TRUE)
genotypes('rs9939609', userid='1-2', df=FALSE)

## End(Not run)
```
Query NCBI’s dbSNP for information on a set of SNPs

**Description**

This function queries NCBI’s dbSNP for information related to the latest dbSNP build and latest reference genome for information on the vector of SNPs submitted.

**Usage**

```r
cbni_snp_query(SNPs, key = NULL, ...)```

**Arguments**

- `SNPs` (character) A vector of SNPs (rs numbers).
- `key` (character) NCBI Entrez API key. optional. See "NCBI Authentication" in rsnps-package
- `...` Curl options passed on to `crl::HttpClient`

**Details**

This function currently pulling data for Assembly 38 - in particular note that if you think the BP position is wrong, that you may be hoping for the BP position for a different Assembly. With ENTREZ we cannot specify which assembly to pull data from, so it’s stuck with 38.

Note that you are limited in the number of SNPs you pass in to one request because URLs can only be so long. Around 600 is likely the max you can pass in, though may be somewhat more. Break up your vector of SNP codes into pieces of 600 or less and do repeated requests to get all data.

**Value**

A dataframe with columns:

- **Query**: The rs ID that was queried.
- **Chromosome**: The chromosome that the marker lies on.
- **Marker**: The name of the marker. If the rs ID queried has been merged, the up-to-date name of the marker is returned here, and a warning is issued.
- **Gene**: If the marker lies within a gene (either within the exon or introns of a gene), the name of that gene is returned here; otherwise, NA. Note that the gene may not be returned if the marker lies too far upstream or downstream of the particular gene of interest.
- **Alleles**: The alleles associated with the SNP if it is a SNV; otherwise, if it is an INDEL, microsatellite, or other kind of polymorphism the relevant information will be available here.
- **Major**: The major allele of the SNP, on the forward strand, given it is an SNV; otherwise, NA.
- **Minor**: The minor allele of the SNP, on the forward strand, given it is an SNV; otherwise, NA.
MAF: The minor allele frequency of the SNP, given it is an SNV. This is drawn from the current global reference population used by NCBI.

BP: The chromosomal position, in base pairs, of the marker, as aligned with the current genome used by dbSNP. We add 1 to the base pair position in the BP column in the output data.frame to agree with what the dbSNP website has.

ncbi_snp_summary("rs111068718") # chromosomal information may be unmapped

## End(Not run)
```

phenotypes

---

**Get openSNP phenotype data for one or multiple users.**

### Description

Get openSNP phenotype data for one or multiple users.

### Usage

```r
phenotypes(userid = NA, df = FALSE, ...)
```

### Arguments

- `userid` ID of openSNP user.
- `df` Return data.frame (TRUE) or not (FALSE). Default: FALSE
- `...` Curl options passed on to `crl::HttpClient`

### Value

List of phenotypes for specified user(s).

### See Also

Other opensnp-fxns: `allgensnp`, `allphenotypes`, `annotations`, `download_users`, `fetch_genotypes`, `genotypes`, `phenotypes_byid`, `users`
phenotypes_byid

Examples

```r
## Not run:
phenotypes(userid=1)
phenotypes(userid='1,6,8', df=TRUE)
phenotypes(userid='1-8', df=TRUE)

# coerce to data.frame
library(plyr)
df <- ldply(phenotypes(userid='1-8', df=TRUE))
head(df); tail(df)

# pass on curl options
phenotypes(1, verbose = TRUE)

## End(Not run)
```

---

phenotypes_byid  Get all openSNP known variations and all users sharing that phenotype for one phenotype(-ID).

Description

Get all openSNP known variations and all users sharing that phenotype for one phenotype(-ID).

Usage

```r
phenotypes_byid(phenotypeid = NA, return_ = c("description",
"knownvars", "users"), ...)
```

Arguments

- **phenotypeid**: ID of openSNP phenotype.
- **return_**: Return data.frame (TRUE) or not (FALSE). Default: FALSE
- **...**: Curl options passed on to `crl::HttpClient`

Value

List of description of phenotype, list of known variants, or data.frame of variants for each user with that phenotype.

See Also

Other opensnp-fxns: `allgensnp`, `allphenotypes`, `annotations`, `download_users`, `fetch_genotypes`, `genotypes`, `phenotypes`, `users`
### read_users

**Description**

Beware, these tables can be large. Check your RAM before executing. Or possibly read in a subset of the data. This function reads in the whole kitten kaboodle.

**Usage**

```
read_users(name = NULL, id = NULL, path = NULL, ...)  
```

**Arguments**

- **name**: User name
- **id**: User id
- **path**: Path to file to read from.
- **...**: Parameters passed on to `read.table()`

**Details**

If you specify a name or id, this function reads environment variables written in the function `download_users`, and then searches against those variables for the path to the file saved. Alternatively, you can supply the path.

**Value**

A data.frame.

### Examples

```r
## Not run:
# dat <- read_users(name = "kevinmcc")
# head(dat)
# dat <- read_users(id = 285)

## End(Not run)
```
Defunct functions in rsnps

Description

- LDSearch(): Function name changed to ld_search
- ld_search(): The Broad Institute took the service down, see https://www.broadinstitute.org/snap/snap
- NCBI_snp_query(): Function name changed to ncbi_snp_query
- NCBI_snp_query2(): Function name changed to ncbi_snp_query2

users

Get openSNP users.

Description

Get openSNP users.

Usage

users(df = FALSE, ...)

Arguments

df Return data.frame (TRUE) or not (FALSE). Default: FALSE

... Curl options passed on to crul::HttpClient

Value

List of openSNP users, their ID numbers, and XX if available.

See Also

Other opensnp-fxns: allgensnp, allphenotypes, annotations, download_users, fetch_genotypes, genotypes, phenotypes_byid, phenotypes

Examples

```r
## Not run:
# just the list
data <- users(df = FALSE)
data

# get a data.frame of the users data
data <- users(df = TRUE)
data[[1]] # users with links to genome data
data[[2]] # users without links to genome data

## End(Not run)
