Package ‘rxode2et’

March 18, 2023

Title  Event Table Functions for 'rxode2'

Version  2.0.10

Description  Provides the event table and support functions needed for 'rxode2' (Wang, Hallow and James (2016) <doi:10.1002/psp4.12052>) and 'nlmixr2' (Fidler et al (2019) <doi:10.1002/psp4.12445>). This split will reduce computational burden of recompiling 'rxode2'.

License  GPL (>= 3)

BugReports  https://github.com/nlmixr2/rxode2et/issues/

Depends  R (>= 4.0.0)

Imports  stats, utils, methods, Rcpp, checkmate, rxode2random, rxode2parse (> 2.0.13), cli, crayon, magrittr, lotri

Suggests  testthat (>= 3.0.0), units, tibble, data.table, dplyr, pillar, nlmixr2data, qs

LinkingTo  rxode2random, rxode2parse, Rcpp

Biarch  true

Config/testthat/edition  3

Encoding  UTF-8

Language  en-US

NeedsCompilation  yes

RoxygenNote  7.2.1

**.collectWarnings**

*Collect warnings and just warn once.*

**Description**

Collect warnings and just warn once.

**Usage**

`.collectWarnings(expr, lst = FALSE)`

**Arguments**

- `expr` R expression
- `lst` When TRUE return a list with list(object,warnings) instead of issuing the warnings. Otherwise, when FALSE issue the warnings and return the object.

**Value**

The value of the expression or a list with the value of the expression and a list of warning messages

**Author(s)**

Matthew L. Fidler
add.dosing

Add dosing to eventTable

Description

This adds a dosing event to the event table. This is provided for piping syntax through magrittr. It can also be accessed by eventTable$add.dosing(...)

Usage

add.dosing(
  eventTable,
  dose,
  nbr.doses = 1L,
  dosing.interval = 24,
  dosing.to = 1L,
  rate = NULL,
  amount.units = NA_character_,
  start.time = 0,
  do.sampling = FALSE,
  time.units = NA_character_,
  ...)

Arguments

eventTypeTable eventTable object; When accessed from object it would be eventTable$
dose numeric scalar, dose amount in amount.units;
nbr.doses integer, number of doses;

dosing.interval required numeric scalar, time between doses in time.units, defaults to 24 of
time.units="hours";
dosing.to integer, compartment the dose goes into (first compartment by default);
rate for infusions, the rate of infusion (default is NULL, for bolus dosing;
amount.units optional string indicating the dosing units. Defaults to NA to indicate as per the
original EventTable definition.
start.time required dosing start time;
do.sampling logical, should observation sampling records be added at the dosing times? De-
defaults to FALSE.
time.units optional string indicating the time units. Defaults to "hours" to indicate as per
the original EventTable definition.
...
Other parameters passed to et().
Value

eventTable with updated dosing (note the event table will be updated anyway)

    add.sampling(set_units(seq(0, 12.5,by=0.005),weeks))

---

### add.sampling

Add sampling to eventTable

**Description**

This adds a dosing event to the event table. This is provided for piping syntax through magrittr. It can also be accessed by `eventTable$add.sampling()`

**Usage**

```
add.sampling(eventTable, time, time.units = NA)
```

**Arguments**

- **eventTable**  An eventTable object. When accessed from object it would be `eventTable$
- **time**  a vector of time values (in `time.units`).
- **time.units**  an optional string specifying the time units. Defaults to the units specified when the EventTable was initialized.

**Value**

`eventTable` with updated sampling. (Note the event table will be updated even if you don’t reassign the `eventTable`)

**as.et**

*Coerce object to data.frame*

**Description**

Coerce object to data.frame

**Usage**

```r
as.et(x, ...)
```

```r
## Default S3 method: 
as.et(x, ...)
```

**Arguments**

- `x` Object to coerce to et.
- `...` Other parameters

**Value**

An event table

---

**et**

*Event Table Function*

**Description**

Event Table Function
Usage

et(x, ..., envir = parent.frame())

## S3 method for class 'rxode2'
et(x, ..., envir = parent.frame())

## S3 method for class 'rxSolve'
et(x, ..., envir = parent.frame())

## S3 method for class 'rxParams'
et(x, ..., envir = parent.frame())

## Default S3 method:
et(
  x,
  ...,
  time,
  amt,
  evid,
  cmt,
  ii,
  addl,
  ss,
  rate,
  dur,
  until,
  id,
  amountUnits,
  timeUnits,
  addSampling,
  envir = parent.frame(),
  by = NULL,
  length.out = NULL
)

Arguments

x This is the first argument supplied to the event table. This is named to allow et
to be used in a pipe-line with arbitrary objects.

... Times or event tables. They can also be one of the named arguments below.

envir the environment in which expr is to be evaluated. May also be NULL, a list, a
data frame, a pairlist or an integer as specified to sys.call.

time Time is the time of the dose or the sampling times. This can also be unspecified
and is determined by the object type (list or numeric/integer).

amt Amount of the dose. If specified, this assumes a dosing record, instead of a
sampling record.

evid Event ID; This can be:
et

<table>
<thead>
<tr>
<th>Numeric Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>An observation. This can also be specified as <code>evid=obs</code></td>
</tr>
<tr>
<td>1</td>
<td>A dose observation. This can also be specified as <code>evid=dose</code></td>
</tr>
<tr>
<td>2</td>
<td>A non-dose event. This can also be specified as <code>evid=other</code></td>
</tr>
<tr>
<td>3</td>
<td>A reset event. This can also be specified as <code>evid=reset</code></td>
</tr>
<tr>
<td>4</td>
<td>Dose and reset event. This can also be specified as <code>evid=doseReset</code> or <code>evid=resetDose</code></td>
</tr>
</tbody>
</table>

Note a reset event resets all the compartment values to zero and turns off all infusions.

cmt

Compartment name or number. If a number, this is an integer starting at 1. Negative compartments turn off a compartment. If the compartment is a name, the compartment name is changed to the correct state/compartment number before running the simulation. For a compartment named "-cmt" the compartment is turned off.

Can also specify `cmt` as `dosing.to`, `dose.to`, `doseTo`, `dosingTo`, and `state`.

ii

When specifying a dose, this is the inter-dose interval for ss, addl and until options (described below).

addl

The number of additional doses at a inter-dose interval after one dose.

ss

Steady state flag: It can be one of:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>This dose is not a steady state dose</td>
</tr>
<tr>
<td>1</td>
<td>This dose is a steady state dose with the between/inter-dose interval of ii</td>
</tr>
<tr>
<td>2</td>
<td>Superposition steady state</td>
</tr>
</tbody>
</table>

When `ss=2` the steady state dose that uses the super-position principle to allow more complex steady states, like 10 mg in the morning and 20 mg at night, or dosing at 8 am 12 pm and 8 pm instead of every 12 hours. Since it uses the super positioning principle, it only makes sense when you know the kinetics are linear.

All other values of SS are currently invalid.

rate

When positive, this is the rate of infusion. Otherwise:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No infusion is on this record</td>
</tr>
<tr>
<td>-1</td>
<td>Modeled rate (in rxode2:rate(cmt) =); Can be <code>et(rate=model)</code></td>
</tr>
<tr>
<td>-2</td>
<td>Modeled duration (in rxode2: dur(cmt) =); Can be <code>et(dur=model)</code> or <code>et(rate=dur)</code></td>
</tr>
</tbody>
</table>

When a modeled bioavailability is applied to positive rates (`rate > 0`), the duration of infusion is changed. This is because the data specify the rate and amount,
the only think that modeled bioavailability can affect is duration. If instead you want the modeled bioavailability to increase the rate of infusion instead of the duration of infusion, specify the `dur` instead or model the duration with `rate=2`.

`dur` Duration of infusion. When `amt` and `dur` are specified the rate is calculated from the two data items. When `dur` is specified instead of `rate`, the bioavailability changes will increase rate instead of duration.

`until` This is the time until the dosing should end. It can be an easier way to figure out how many additional doses are needed over your sampling period.

`id` A integer vector of IDs to add or remove from the event table. If the event table is identical for each ID, then you may expand it to include all the IDs in this vector. All the negative IDs in this vector will be removed.

`amountUnits` The units for the dosing records (`amt`)

`timeUnits` The units for the time records (`time`)

`addSampling` This is a boolean indicating if a sampling time should be added at the same time as a dosing time. By default this is `FALSE`.

`by` number: increment of the sequence.

`length.out` desired length of the sequence. A non-negative number, which for `seq` and `seq.int` will be rounded up if fractional.

**Value**

A new event table

**Author(s)**

Matthew L Fidler, Wenping Wang

## bid for 5 days
```
bid <- et(timeUnits="hr") %>%
et(amt=10000, ii=12, until=set_units(5, "days"))

## qd for 5 days
qd <- et(timeUnits="hr") %>%
et(amt=20000, ii=24, until=set_units(5, "days"))

## bid for 5 days followed by qd for 5 days
et <- seq(bid, qd) %>% et(seq(0, 11*24, length.out=100));

## Now Infusion for 5 days followed by oral for 5 days

## note you can dose to a named compartment instead of using the compartment number
infusion <- et(timeUnits = "hr") %>%
et(amt=10000, rate=5000, ii=24, until=set_units(5, "days"), cmt="centr")

qd <- et(timeUnits = "hr") %>% et(amt=10000, ii=24, until=set_units(5, "days"), cmt="depot")
et <- seq(infusion, qd)

## 2wk-on, 1wk-off
qd <- et(timeUnits = "hr") %>% et(amt=10000, ii=24, until=set_units(2, "weeks"), cmt="depot")
et <- seq(qd, set_units(1,"weeks"), qd) %>%
  add.sampling(set_units(seq(0, 5.5,by=0.005),weeks))

## You can also repeat the cycle easily with the rep function
qd <- et(timeUnits = "hr") %>% et(amt=10000, ii=24, until=set_units(2, "weeks"), cmt="depot")
et <- etRep(qd, times=4, wait=set_units(1,"weeks")) %>%
  add.sampling(set_units(seq(0, 12.5,by=0.005),weeks))
etRbind

Usage

etExpand(et)

Arguments

et Event table to expand additional doses for.

Value

New event table with addl doses expanded

Author(s)

Matthew Fidler

Examples

ev <- et(amt = 3, ii = 24, until = 240)
print(ev)
etExpand(ev) # expands event table, but doesn't modify it
print(ev)
ev$expand() ## Expands the current event table and saves it in ev

etRbind

Combining event tables

Description

Combining event tables

Usage

etRbind(
  ...
  samples = c("use", "clear"),
  waitII = c("smart", "+ii"),
  id = c("merge", "unique")
)

## S3 method for class 'rxEt'
rbind(..., deparse.level = 1)
etRbind

Arguments

... The event tables and optionally time between event tables, called waiting times in this help document.

samples How to handle samples when repeating an event table. The options are:

- "clear" Clear sampling records before combining the datasets
- "use" Use the sampling records when combining the datasets

waitII This determines how waiting times between events are handled. The options are:

- "smart" This "smart" handling of waiting times is the default option. In this case, if the waiting time is above the last observed inter-dose interval in the first combined event table, then the actual time between doses is given by the wait time. If it is smaller than the last observed inter-dose interval, the time between event tables is given by the inter-dose interval + the waiting time between event tables.
- "+ii" In this case, the wait time is added to the inter-dose interval no matter the length of the wait time or inter-dose interval

id This is how rbind will handle IDs. There are two different types of options:

- merge with id="merge", the IDs are merged together, overlapping IDs would be merged into a single event table.
- unique with id="unique", the IDs will be renumbered so that the IDs in all the event tables are not overlapping.

deparse.level The deparse.level of a traditional rbind is ignored.

Value

An event table

etRep

Repeat an rxode2 event table

Description

Repeat an rxode2 event table

Usage

etRep(
  x,
  times = 1,
  length.out = NA,
  each = NA,
  n = NULL,
  wait = 0,
  id = integer(0),
  samples = c("clear", "use"),
  waitII = c("smart", "+ii"),
  ii = 24
)

## S3 method for class 'rxEt'
rep(x, ...)

Arguments

x   An rxode2 event table

times   Number of times to repeat the event table

length.out   Invalid with rxode2 event tables, will throw an error if used.

each   Invalid with rxode2 event tables, will throw an error if used.

n   The number of times to repeat the event table. Overrides times.

wait   Waiting time between each repeated event table. By default there is no waiting, or wait=0

id   A integer vector of IDs to add or remove from the event table. If the event table is identical for each ID, then you may expand it to include all the IDs in this vector. All the negative IDs in this vector will be removed.

samples   How to handle samples when repeating an event table. The options are:

  • "clear" Clear sampling records before combining the datasets
  • "use" Use the sampling records when combining the datasets

waitII   This determines how waiting times between events are handled. The options are:
• "smart" This "smart" handling of waiting times is the default option. In this case, if the waiting time is above the last observed inter-dose interval in the first combined event table, then the actual time between doses is given by the wait time. If it is smaller than the last observed inter-dose interval, the time between event tables is given by the inter-dose interval + the waiting time between event tables.

• "+ii" In this case, the wait time is added to the inter-dose interval no matter the length of the wait time or inter-dose interval

ii  When specifying a dose, this is the inter-dose interval for ss, addl and until options (described below).

...  Times or event tables. They can also be one of the named arguments below.

Value

An event table

---

**etSeq**  
**Sequence of event tables**

### Description

This combines a sequence of event tables.

### Usage

```r
etSeq(..., samples = c("clear", "use"), waitII = c("smart", "+ii"), ii = 24)
```

## S3 method for class 'rxEt'

```r
seq(...)
```

### Arguments

- `...` The event tables and optionally time between event tables, called waiting times in this help document.
samples

How to handle samples when repeating an event table. The options are:

- "clear" Clear sampling records before combining the datasets
- "use" Use the sampling records when combining the datasets

waitII

This determines how waiting times between events are handled. The options are:

- "smart" This "smart" handling of waiting times is the default option. In this case, if the waiting time is above the last observed inter-dose interval in the first combined event table, then the actual time between doses is given by the wait time. If it is smaller than the last observed inter-dose interval, the time between event tables is given by the inter-dose interval + the waiting time between event tables.
- "+ii" In this case, the wait time is added to the inter-dose interval no matter the length of the wait time or inter-dose interval

ii

If there was no inter-dose intervals found in the event table, assume that the interdose interval is given by this ii value. By default this is 24.

Details

This sequences all the event tables in added in the argument list . . . . By default when combining the event tables the offset is at least by the last inter-dose interval in the prior event table (or ii). If you separate any of the event tables by a number, the event tables will be separated at least the wait time defined by that number or the last inter-dose interval.

Value

An event table

## You can also repeat the cycle easily with the rep function
qd <- et(timeUnits = "hr") %>% et(amt=10000, ii=24, until=set_units(2, "weeks"), cmt="depot")
et <- etRep(qd, times=4, wait=set_units(1,"weeks")) %>%
add.sampling(set_units(seq(0, 12.5,by=0.005),weeks))

---

**eventTable**  
Create an event table object

**Description**

Initializes an object of class ‘EventTable’ with methods for adding and querying dosing and observation records
Usage

eventTable(amount.units = NA, time.units = NA)

Arguments

amount.units  string denoting the amount dosing units, e.g., “mg”, “ug”. Default to NA to
denote unspecified units. It could also be a solved rxode2 object. In that case,
eventTable(obj) returns the eventTable that was used to solve the rxode2 object.

time.units  string denoting the time units, e.g., “hours”, “days”. Default to “hours”.

An eventTable is an object that consists of a data.frame storing ordered time-
stamped events of an (unspecified) PK/PD dynamic system, units (strings) for
dosing and time records, plus a list of functions to add and extract event records.
Currently, events can be of two types: dosing events that represent inputs to the
system and sampling time events that represent observations of the system with
‘amount.units’ and ‘time.units’, respectively.

Value

A modified data.frame with the following accessible functions:

- get.EventTable() returns the current event table
- add.dosing() adds dosing records to the event table.
- get.dosing() returns a data.frame of dosing records.
- clear.dosing() clears or deletes all dosing from event table
- add.sampling() adds sampling time observation records to the event table.
- get.sampling() returns a data.frame of sampled observation records.
- clear.sampling() removes all sampling from event table.
- get.obs.rec() returns a logical vector indicating whether each event record represents an
  observation or not.
- get.nobs() returns the number of observation (not dosing) records.
- get.units() returns a two-element character vector with the dosing and time units, respec-
tively
- copy() makes a copy of the current event table. To create a copy of an event table object use
  qd2 <- qd$copy()
- expand() Expands the event table for multi-subject solving. This is done by qd$expand(400)
  for a 400 subject data expansion

et()
Examples

# create dosing and observation (sampling) events
# QD 50mg dosing, 5 days followed by 25mg 5 days
#
qd <- eventTable(amount.units = "mg", time.units = "days")
#
qd$add.dosing(dose = 50, nbr.doses = 5, dosing.interval = 1, do.sampling = FALSE)
#
# sample the system's drug amounts hourly the first day, then every 12 hours
# for the next 4 days
qd$add.sampling(seq(from = 0, to = 1, by = 1 / 24))
qd$add.sampling(seq(from = 1, to = 5, by = 12 / 24))
#
# print(qd$get.dosing())  # table of dosing records
print(qd$get.nobs())  # number of observation (not dosing) records
#
# BID dosing, 5 days
bid <- eventTable("mg", "days") # only dosing
bid$add.dosing(
  dose = 10000, nbr.doses = 2 * 5,
  dosing.interval = 12, do.sampling = FALSE
)
#
# Use the copy() method to create a copy (clone) of an existing
# event table (simple assignments just create a new reference to
# the same event table object (closure)).
#
bid.ext <- bid$copy()  # three-day extension for a 2nd cohort
bid.ext$add.dosing(
  dose = 5000, nbr.doses = 2 * 3,
  start.time = 120, dosing.interval = 12, do.sampling = FALSE
)
#
# You can also use the Piping operator to create a table
qd2 <- eventTable(amount.units = "mg", time.units = "days") %>%
  add.dosing(dose = 50, nbr.doses = 5, dosing.interval = 1, do.sampling = FALSE) %>%
  add.sampling(seq(from = 0, to = 1, by = 1 / 24)) %>%
  add.sampling(seq(from = 1, to = 5, by = 12 / 24))
# print(qd2$get.dosing())  # table of dosing records
print(qd2$get.nobs())  # number of observation (not dosing) records
#
# Note that piping with %>% will update the original table.
qd3 <- qd2 %>% add.sampling(seq(from = 5, to = 10, by = 6 / 24))
print(qd2$get.nobs())
print(qd3$get.nobs())
Description

Bind the study parameters and individual parameters

Usage

```
rxBindStudyIndividual(studyParameters, individualParameters)
```

Arguments

- `studyParameters`
  These are the study parameters, often can be generated by sampling from a population. This can be either a matrix or a data frame

- `individualParameters`
  A data frame of individual parameters

Value

Data frame that can be used in rxode2 simulations

Author(s)

Matthew Fidler

Examples

```r
# Function for converting coefficient of covariance into a variance
lognCv <- function(x){log((x/100)^2+1)}

set.seed(32)
nSub <- 100
nStud <- 10

# define theta
theta <- c(lka=log(0.5), # log ka
           lCl=log(5), # log Cl
           lV=log(300) # log V
)

# define theta Matrix
thetaMat <- lotri(lCl ~ lognCv(5),
                 lV ~ lognCv(5),
                 lka ~ lognCv(5))

nev <- nSub*nStud

ev1 <- data.frame(COV1=rnorm(nev,50,30),COV2=rnorm(nev,75,10),
                  COV3=sample(c(1.0,2.0),nev,replace=TRUE))
```
tmat <- rxRmvn(nStud, theta[dimnames(thetaMat)[[1]]], thetaMat)
rxCbindStudyIndividual(tmat, ev1)

```
rxEtDispatchSolve

Dispatch solve to `rxode2` solve

Description
Dispatch solve to `rxode2` solve

Usage
rxEtDispatchSolve(x, ...)

## Default S3 method:
rxEtDispatchSolve(x, ...)

Arguments
x  
rxode2 solve dispatch object
...
other arguments

Value
if `rxode2` is loaded, a solved object, otherwise an error

Author(s)
Matthew L. Fidler
```

```
rxEvid

EVID formatting for tibble and other places.

Description
This is to make an EVID more readable by non pharmacometricians. It displays what each means and allows it to be displayed in a tibble.
```

Usage

rxEvid(x)

as.rxEvid(x)

## S3 method for class 'rxEvid'
c(x, ...)

## S3 method for class 'rxEvid'
x[[...]]

## S3 method for class 'rxEvid'
as.character(x, ...)

## S3 method for class 'rxEvid'
x[[[...]]]

## S3 method for class 'rxRateDur'
c(x, ...)

## S3 method for class 'rxEvid'
format(x, ...)

## S3 method for class 'rxRateDur'
format(x, ...)

## S3 method for class 'rxEvid'
print(x, ...)

Arguments

  x            Item to be converted to a rxode2 EVID specification.
  ...          Other parameters

Value

rxEvid specification

Examples

rxEvid(1:7)
rxRateDur

Creates a rxRateDur object

Description
This is primarily to display information about rate

Usage
rxRateDur(x)

## S3 method for class 'rxRateDur'
x[...]

as.rxRateDur(x)

## S3 method for class 'rxRateDur'
as.character(x, ...)

## S3 method for class 'rxRateDur'
x[[...]]

Arguments

x rxRateDur data
...
Other parameters

Value

rxRateDur object

rxStack

Stack a solved object for things like default ggplot2 plot

Description
Stack a solved object for things like default ggplot2 plot

Usage
rxStack(Data, vars = NULL)

Arguments

Data is a rxode2 object to be stacked.
vars Variables to include in stacked data; By default this is all the variables when vars is NULL.
Value

Stacked data with value and trt, where value is the values and trt is the state and lhs variables.
