Package ‘rzmq’
October 14, 2022

Title R Bindings for 'ZeroMQ'
Version 0.9.8
Description Interface to the 'ZeroMQ' lightweight messaging kernel (see <https://zeromq.org/> for more information).
License GPL-3
Depends R (>= 3.1.0)
SystemRequirements ZeroMQ >= 3.0.0: libzmq3-dev (deb) or zeromq-devel (rpm)
URL https://docs.ropensci.org/rzmq/
BugReports https://github.com/ropensci/rzmq/issues
NeedsCompilation yes
Author Whit Armstrong [aut],

Description

The `zmq_bind()` function shall create an endpoint for accepting connections and bind it to the socket referenced by the socket argument.

The endpoint argument is a string consisting of two parts as follows: `transport://address`. The transport part specifies the underlying transport protocol to use. The meaning of the address part is specific to the underlying transport protocol selected.

The following transports are defined:

- `inproc` local in-process (inter-thread) communication transport, see `zmq_inproc(7)`
- `ipc` local inter-process communication transport, see `zmq_ipc(7)`
- `tcp` unicast transport using TCP, see `zmq_tcp(7)`
- `pgm`, `epgm` reliable multicast transport using PGM, see `zmq_pgm(7)`. With the exception of ZMQ_PAIR sockets, a single socket may be connected to multiple endpoints using `zmq_connect()`, while simultaneously accepting incoming connections from multiple endpoints bound to the socket using `zmq_bind()`. Refer to `zmq_socket(3)` for a description of the exact semantics involved when connecting or binding a socket to multiple endpoints.

Usage

```
bind.socket(socket, address)
```

Arguments

- `socket` a zmq socket object.
- `address` a transport as described above.

Value

TRUE if operation succeeds or FALSE if the operation fails

Author(s)

ZMQ was written by Martin Sustrik <sustrik@250bpm.com> and Martin Lucina <mato@kotelna.sk>.

rzmq was written by Whit Armstrong.

connect.socket

## Not run:

```r
library(rzmq)
context = init.context()
in.socket = init.socket(context,"ZMQ_PULL")
binding.socket(in.socket,"tcp://*:5557")

out.socket = init.socket(context,"ZMQ_PUSH")
binding.socket(out.socket,"tcp://*:5558")
```

## End(Not run)

**connect.socket**

`connect.socket(socket, address)`

**Connect the socket referenced by the socket argument to the endpoint specified by the endpoint argument.**

**Description**

The `zmq_connect()` function shall connect the socket referenced by the socket argument to the endpoint specified by the endpoint argument.

The endpoint argument is a string consisting of two parts as follows: `transport://address`. The transport part specifies the underlying transport protocol to use. The meaning of the address part is specific to the underlying transport protocol selected.

The following transports are defined:

- inproc: local in-process (inter-thread) communication transport, see `zmq_inproc(7)`
- ipc: local inter-process communication transport, see `zmq_ipc(7)`
- tcp: unicast transport using TCP, see `zmq_tcp(7)`
- pgm: epgm reliable multicast transport using PGM, see `zmq_pgm(7)`

With the exception of ZMQ_PAIR sockets, a single socket may be connected to multiple endpoints using `zmq_connect()`, while simultaneously accepting incoming connections from multiple endpoints bound to the socket using `zmq_bind()`. Refer to `zmq_socket(3)` for a description of the exact semantics involved when connecting or binding a socket to multiple endpoints.

**Usage**

```r
connect.socket(socket, address)
disconnect.socket(socket, address)
```

**Arguments**

- `socket`: a `zmq` socket object.
- `address`: a transport as described above.

**Value**

TRUE if operation succeeds or FALSE if the operation fails.
Author(s)

ZMQ was written by Martin Sustrik <sustrik@250bpm.com> and Martin Lucina <mato@kotelna.sk>. rzmq was written by Whit Armstrong.

Examples

```r
## Not run:
library(rzmq)
context = init.context()
in.socket = init.socket(context,"ZMQ_PULL")
bind.socket(in.socket,"tcp://*:5557")

out.socket = init.socket(context,"ZMQ_PUSH")
bind.socket(out.socket,"tcp://*:5558")

## End(Not run)
```

init.context  
initialize zmq context and zmq socket

Description

initialize zmq context and zmq socket for to be used for further zmq operations.

Usage

`init.context(threads=1L)`
`init.socket(context, socket.type)`

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>threads</td>
<td>number of threads for the context to use</td>
</tr>
<tr>
<td>context</td>
<td>a zmq context object.</td>
</tr>
<tr>
<td>socket.type</td>
<td>The ZMQ socket type requested e.g. ZMQ_REQ,ZMQ_REP,ZMQ_PULL,ZMQ_PUSH, etc.</td>
</tr>
</tbody>
</table>

Value

`init.context` returns a zmq context object. `init.socket` returns a zmq socket object.
init.message

Author(s)

ZMQ was written by Martin Sustrik <sustrik@250bpm.com> and Martin Lucina <mato@kotelna.sk>.  
rmq was written by Whit Armstrong.

References

See Also

connect.socket, bind.socket, receive.socket, send.socket, poll.socket

Examples

```r
## Not run:

library(rzmq)
context = init.context()
in.socket = init.socket(context,"ZMQ_PULL")

## End(Not run)
```  

init.message  

create a message object.

Description

Create a ZeroMQ message object that can be sent multiple times

Usage

```r
init.message(data, serialize=TRUE, xdr=.Platform$endian=="big")
```  

Arguments

- **data**: the R object to be sent
- **serialize**: whether to call serialize before sending the data
- **xdr**: passed directly to serialize command if serialize is requested

Value

- a ZeroMQ message object as external pointer

Author(s)

ZMQ was written by Martin Sustrik <sustrik@250bpm.com> and Martin Lucina <mato@kotelna.sk>.  
rzmq was written by Whit Armstrong.
poll.socket

Polls a list of sockets, waiting for the presence of a nonblocking read, write, or error event.

Description

The zmq_poll() function shall poll a list of a sockets for either read, write, or error conditions subject to a millisecond resolution timeout.

Usage

```r
poll.socket(sockets, events, timeout=0L)
```

Arguments

- **sockets**: a list of zmq socket objects.
- **events**: a list of character vectors containing one or more events in \{read, write, error\}. The first element in the list corresponds to the first zmq socket, and so on...
- **timeout**: the numbers of seconds to wait for events. Fractional seconds are supported. ZeroMQ guarantees at most millisecond resolution. A timeout of -1L blocks until an event occurs; a timeout of 0L is non-blocking.

Value

A list of pairlists corresponding to the polled zmq sockets. Each list has one of more tags from \{read, write, error\} with logical values indicating the results of the poll operation.

Author(s)

ZMQ was written by Martin Sustrik <sustrik@250bpm.com> and Martin Lucina <mato@kotelna.sk>. rzmq was written by Whit Armstrong.

## Examples

```r
## Not run:
library(rzmq)

# Create a set of REP-REQ sockets that
# have a Send, Receive, Send, Receive, ...
# pattern.
context = init.context()
in.socket = init.socket(context,"ZMQ_REP")
bind.socket(in.socket,"tcp://*:5557")

out.socket = init.socket(context,"ZMQ_REQ")
connect.socket(out.socket,"tcp://*:5557")

# Poll the REP and REQ sockets for all events.
events <- poll.socket(list(in.socket, out.socket),
  list(c("read", "write", "error"),
       c("read", "write", "error")),
  timeout=0L)

# The REQ socket is writable without blocking.
paste("Is upstream REP socket readable without blocking?", events[1]$read)
paste("Is upstream REP socket writable without blocking?", events[1]$write)
paste("Is downstream REQ socket readable without blocking?", events[2]$read)
paste("Is downstream REQ socket writable without blocking?", events[2]$write)

# Send a message to the REP socket from the REQ socket. The
# REQ socket must respond before the REP socket can send
# another message.
send.socket(out.socket, "Hello World")

events <- poll.socket(list(in.socket, out.socket),
  list(c("read", "write", "error"),
       c("read", "write", "error")),
  timeout=0L)

# The incoming message is readable on the REP socket.
paste("Is upstream REP socket readable without blocking?", events[1]$read)
paste("Is upstream REP socket writable without blocking?", events[1]$write)
paste("Is downstream REQ socket readable without blocking?", events[2]$read)
paste("Is downstream REQ socket writable without blocking?", events[2]$write)

receive.socket(in.socket)
```
receive.multipart

Receive multipart ZMQ message

Description

Returns a list of raw vectors for the parts of a multipart message.

Usage

receive.multipart(socket)

Arguments

socket The ZMQ socket from which to receive data
receive.socket

Receive a message from the socket referenced by the socket argument.

Description

The zmq_recv() function shall receive a message from the socket referenced by the socket argument. If there are no messages available on the specified socket, by default the function shall block until the request can be satisfied. A non-blocking receive can be obtained by setting dont.wait to TRUE. If there are no messages available on the specified socket, the receive.socket() call will return NULL immediately.

Usage

receive.socket(socket, unserialize=TRUE, dont.wait=FALSE)
receive.null.msg(socket)
receive.string(socket)
receive.int(socket)
receive.double(socket)

Arguments

socket a zmq socket object
unserialize whether to call unserialize on the received data
dont.wait defaults to false, for blocking receive. Set to TRUE for non-blocking receive.

Value

the value sent from the remote server or NULL on failure. If dont.wait was TRUE and a message was not immediately available for receipt, NULL is returned and get.zmq.errno() is set to 11 or get.zmq.strerror() is set to EAGAIN.

Author(s)

ZMQ was written by Martin Sustrik <sustrik@250bpm.com> and Martin Lucina <mato@kotelna.sk>. rzmq was written by Whit Armstrong.

Examples

```r
## Not run:
library(rzmq)

remote.exec <- function(out.socket,in.socket,fun,...) {
    send.socket(out.socket,data=list(fun=fun,args=list(...)))
    receive.socket(in.socket)
}

context = init.context()
out.socket = init.socket(context,"ZMQ_PUSH")
bind.socket(out.socket,"tcp://*:5557")

in.socket = init.socket(context,"ZMQ_PULL")
bind.socket(in.socket,"tcp://*:5558")

myfun <- function(x) {
    sum(abs(x))
}

remote.exec(out.socket,in.socket,myfun,rnorm(1e3))

## End(Not run)
```

---

**send.multipart**

Send multipart ZMQ message.

**Description**

Queue a list of raw vectors to be sent as a series of ZMQ message parts. Each part before the last will be sent with the SNDMORE flag.

**Usage**

```
send.multipart(socket, parts)
```

**Arguments**

- **socket**: The ZMQ socket on which to send data
- **parts**: A list of raw vectors; each component will be sent as one part of the message, in the order of the list
Description

Queue the message referenced by the msg argument to be sent to the socket referenced by the socket argument.

A successful invocation of send.socket does not indicate that the message has been transmitted to the network, only that it has been queued on the socket and ZMQ has assumed responsibility for the message.

Usage

send.socket(socket, data, send.more=FALSE, serialize=TRUE, xdr=.Platform$endian=="big")
send.null.msg(socket, send.more=FALSE)
send.raw.string(socket, data, send.more=FALSE)

Arguments

socket a zmq socket object
data the R object to be sent
send.more whether this message has more frames to be sent
serialize whether to call serialize before sending the data
xdr passed directly to serialize command if serialize is requested

Value

a boolean indicating success or failure of the operation.

Author(s)

ZMQ was written by Martin Sustrik <sustrik@250bpm.com> and Martin Lucina <mato@kotelna.sk>. rzmq was written by Whit Armstrong.

Examples

```r
## Not run:

## remote execution server in rzmq
library(rzmq)
context = init.context()
in.socket = init.socket(context,"ZMQ_PULL")
bind.socket(in.socket,"tcp://*:5557")

out.socket = init.socket(context,"ZMQ_PUSH")
bind.socket(out.socket,"tcp://*:5558")

while(1) {
  msg = receive.socket(in.socket)
  fun <- msg$fun
  args <- msg$args
  print(args)
  ans <- do.call(fun,args)
  send.socket(out.socket,ans)
}

## End(Not run)
```

socket.options

**set a socket option.**

Description

The `zmq_setsockopt()` function shall set the option specified by the `option_name` argument to the value pointed to by the `option_value` argument for the ZMQ socket pointed to by the `socket` argument.

Usage

```
set.hwm(socket, option.value)
set.swap(socket, option.value)
set.affinity(socket, option.value)
set.identity(socket, option.value)
subscribe(socket, option.value)
unsubscribe(socket, option.value)
set.rate(socket, option.value)
set.recovery.ivl(socket, option.value)
set.recovery.ivl.msec(socket, option.value)
set.mcast.loop(socket, option.value)
set.sndbuf(socket, option.value)
set.rcvbuf(socket, option.value)
set.linger(socket, option.value)
set.reconnect.ivl(socket, option.value)
```
socket.options

set.zmq.backlog(socket, option.value)
set.reconnect.ivl.max(socket, option.value)
get.rcvmore(socket)
get.last.endpoint(socket)
get.send.timeout(socket)
set.send.timeout(socket, option.value)

Arguments

socket a zmq socket object
option.value the new option value to bet set

Value

a boolean indicating success or failure of the operation or in the case of getsocketoptions, the value of the requested option.

Author(s)

ZMQ was written by Martin Sustrik <sustrik@250bpm.com> and Martin Lucina <mato@kotelna.sk>. rzmq was written by Whit Armstrong.

Examples

## Not run:

library(rzmq)
context = init.context()
socket = init.socket(context, "ZMQ_REQ")

set.hwm(socket, 1L)
set.swap(socket, 100L)
set.identity(socket, "big.ass.socket")

## End(Not run)
**zmq.error**

get *libzmq* error numbers and error strings

**Description**

return the error number or error description after a zmq call

**Usage**

```r
zmq.errno()
zmq.strerror()
```

**Value**

an integer for zmq.errno or a string for zmq.strerror

**Author(s)**

ZMQ was written by Martin Sustrik <sustrik@250bpm.com> and Martin Lucina <mato@kotelna.sk>. rzmq was written by Whit Armstrong.

**References**

**See Also**

```

**Examples**

```r
## Not run:
library(rzmq)
zmq.errno()
zmq.strerror()
```

## End(Not run)
Descripion

return the version string of the system zmq library

Usage

zmq.version()

Value

a string of the following format: major.minor.patch

Author(s)

ZMQ was written by Martin Sustrik <sustrik@250bpm.com> and Martin Lucina <mato@kotelna.sk>. rzmq was written by Whit Armstrong.
