Package ‘scagnostics’

October 14, 2022

Version 0.2-6
Title Compute scagnostics - scatterplot diagnostics
Author Lee Wilkinson <leland.wilkinson@gmail.com> and Anushka Anand
Maintainer Simon Urbanek <simon.urbanek@r-project.org>
Depends rJava
Description Calculates graph theoretic scagnostics. Scagnostics describe various measures of interest for pairs of variables, based on their appearance on a scatterplot. They are useful tool for discovering interesting or unusual scatterplots from a scatterplot matrix, without having to look at every individual plot.

Index

scagnostics Calculate scagnostics for pairs of variables

Description

Scagnostics (scatterplot diagnostics) summarize potentially interesting patterns in 2d scatterplots.
Usage

scagnostics(x, ...)  
scagnosticsOutliers(scagnostics)  
scagnosticsExemplars(scagnostics)  
scagnosticsGrid(scagnostics)

Arguments

x                 object to calculate scagnostics on: a vector, a matrix or a data.frame
...
scagnostics      objects returned from the scagnostics function

Value

scagnostics returns a vector (for a pair) or a matrix consisting of scagnostics (rows) by variable pairs (columns).
scagnostics.outliers and scagnostics.exemplars return a logical vector.
scagnostics.grid returns a data frame with columns x and y which as a pair define the index of variables corresponding to the entries in the scagnostics matrix. Hence it has as many rows as there are columns in the scagnostics matrix and each row defines one pair of variables.

Author(s)

Examples

# testing various forms
scagnostics(1:10, 1:10)
scagnostics(rnorm(100), rnorm(100))
scagnostics(as.matrix(mtcars))

# more real use on a dataset
s <- scagnostics(mtcars)

# look at outliers
o <- scagnosticsOutliers(s)
o[o]
# one outlier, let's plot it

```r
g <- scagnosticsGrid(s)
go <- g[o,]
plot(mtcars[[go$x]], mtcars[[go$y]], pch=19,
     xlab=names(mtcars)[go$x], ylab=names(mtcars)[go$y])
```

# find and plot exemplars

e <- scagnosticsExemplars(s)
e[e]

g[e,]
par(mfrow = c(2,2))
for (i in 1:dim(ge)[1])
    plot(mtcars[[ge$x[i]]], mtcars[[ge$y[i]]], pch=19,
         xlab=names(mtcars)[ge$x[i]], ylab=names(mtcars)[ge$y[i]])
