Package ‘sccore’

March 13, 2023

Title Core Utilities for Single-Cell RNA-Seq
Version 1.0.3
Description Core utilities for single-cell RNA-seq data analysis. Contained within are utility functions for working with differential expression (DE) matrices and count matrices, a collection of functions for manipulating and plotting data via 'ggplot2', and functions to work with cell graphs and cell embeddings. Graph-based methods include embedding kNN cell graphs into a UMAP <doi:10.21105/joss.00861>, collapsing vertices of each cluster in the graph, and propagating graph labels.
License GPL-3
Encoding UTF-8
LazyData true
Imports dplyr, ggplot2, ggrepel, graphics, grDevices, igraph, irlba, magrittr, Matrix, methods, parallel, pbmcapply, pROC, Rcpp, rlang, scales, stats, tibble, utils, uwot, withr
Depends R (>= 3.5.0)
Suggests ggrastr (>= 0.1.7), jsonlite, rmumps, testthat
RoxygenNote 7.2.1
LinkingTo Rcpp, RcppArmadillo, RcppProgress, RcppEigen
NeedsCompilation yes

adjacentVertices

List of adjacent vertices from igraph object

Description
List of adjacent vertices from igraph object

Usage
adjacentVertices(edge_verts)

Arguments
edge_verts edge vertices of igraph graph object

Value
list of adjacent vertices

Examples
## Not run:
edges <- igraph::as_edgelist(conosGraph)
adjacentVertices(edges)
## End(Not run)

adjacent_vertex_weights

List of adjacent vertex weights from igraph object

Description
List of adjacent vertex weights from igraph object

Usage
adjacent_vertex_weights(edge_verts, edge_weights)

Arguments
edge_verts edge vertices of igraph graph object
edge_weights edge weights of igraph graph object

Value
list of adjacent vertices
Examples

```r
## Not run:
edges <- igraph::as_edgelist(conosGraph)
edge.weights <- igraph::edge.attributes(conosGraph)$weight
adjacent_vertex_weights(edges, edge.weights)

## End(Not run)
```

appendSpecificityMetricsToDE

*Append specificity metrics to DE*

Description

Append specificity metrics to DE

Usage

```r
appendSpecificityMetricsToDE(
  de.df,
  clusters,
  cluster.id,
  p2.counts,
  low.expression.threshold = 0,
  append.auc = FALSE
)
```

Arguments

- `de.df`: data.frame of differential expression values
- `clusters`: factor of clusters
- `cluster.id`: names of 'clusters' factor. If a cluster.id doesn’t exist in cluster names, an error is thrown.
- `p2.counts`: counts from Pagoda2, refer to <https://github.com/kharchenkolab/pagoda2>
- `low.expression.threshold`: numeric Threshold to remove expression values (default=0). Values under this threshold are discarded.
- `append.auc`: boolean If TRUE, append AUC values (default=FALSE)

Value

data.frame of differential expression values with metrics attached
as_factor

convert character vector into a factor with names "values" and "levels"

Description
convert character vector into a factor with names "values" and "levels"

Usage
as_factor(vals)

Arguments
vals vector of values to evaluate

Value
factor with names "values" and "levels"

cellAnnotations Conos cell annotations

Description
Conos cell annotations

Usage
cellAnnotations

Format
An object of class character of length 3000.
checkPackageInstalled  
Check whether a package is installed and suggest how to install from CRAN, Bioconductor, or other external source

Description
Check whether a package is installed and suggest how to install from CRAN, Bioconductor, or other external source

Usage
checkPackageInstalled(
  pkgs,
  details = "to run this function",
  install.help = NULL,
  bioc = FALSE,
  cran = FALSE
)

Arguments
pkgs character Package name(s)
details character Helper text (default = "to run this function")
install.help character Additional information on how to install package (default = NULL)
bioc logical Package(s) is/are available from Bioconductor (default = FALSE)
cran logical Package(s) is/are available from CRAN (default = FALSE)

Examples
## Not run:
checkPackageInstalled("sccore", cran = TRUE)

## End(Not run)

collapseCellsByType  
Collapse count matrices by cell type, given min/max number of cells

Description
Collapse count matrices by cell type, given min/max number of cells

Usage
collapseCellsByType(cm, groups, min.cell.count = 10, max.cell.count = Inf)
collapseGraphPaga

Arguments

- **cm**: count matrix
- **groups**: factor specifying cell types
- **min.cell.count**: numeric Minimum number of cells to include (default=10)
- **max.cell.count**: numeric Maximum number of cells to include (default=Inf). If Inf, there is no maximum.

Value

Subsetted factor of collapsed cells by type, with NA cells omitted

Description

Usage

collapseGraphPaga(graph, groups, linearize = TRUE, winsorize = FALSE)

Arguments

- **graph**: igraph graph object Graph to be collapsed
- **groups**: factor on vertices describing cluster assignment (can specify integer vertex ids, or character vertex names which will be matched)
- **linearize**: should normally be always TRUE (default=TRUE)
- **winsorize**: winsorize final connectivity statistics value (default=FALSE) Note: Original PAGA has it as always TRUE, but in this case there is no way to distinguish level of connectivity for highly connected groups.

Value

collapsed graph
collapseGraphSum  

Collapse Graph By Sum

Description
Collapse Graph By Sum

Usage

\[ \text{collapseGraphSum(graph, groups, normalize = TRUE)} \]

Arguments

\begin{itemize}
\item \textbf{graph} \hspace{1cm} \text{igraph graph object Graph to be collapsed}
\item \textbf{groups} \hspace{1cm} \text{factor on vertices describing cluster assignment (can specify integer vertex ids, or character vertex names which will be matched)}
\item \textbf{normalize} \hspace{1cm} \text{boolean Whether to recalculate edge weight as observed/expected (default=TRUE)}
\end{itemize}

Value

\[ \text{collapsed graph} \]

Examples

\[ \text{collapsed }= \text{collapseGraphPaga(conosGraph, igraph::V(conosGraph), linearize=TRUE, winsorize=FALSE)} \]

colSumByFactor  

Calculates factor-stratified sums for each column

Description
Calculates factor-stratified sums for each column

Usage

\[ \text{colSumByFactor(sY, rowSel)} \]

Arguments

\begin{itemize}
\item \textbf{sY} \hspace{1cm} \text{sparse matrix (dgCmatrix)}
\item \textbf{rowSel} \hspace{1cm} \text{integer factor. Note that the 0-th column will return sums for any NA values; 0 or negative values will be omitted}
\end{itemize}
**conosClusterList**

**Value**

Matrix

---

**Description**

Conos clusters list

**Usage**

`conosClusterList`

**Format**

An object of class `list` of length 2.

---

**conosGraph**

*Conos graph*

---

**Description**

Conos graph

**Usage**

`conosGraph`

**Format**

An object of class `igraph` of length 100.
dotPlot

Dot plot adapted from Seurat::DotPlot, see ?Seurat::DotPlot for details

Description

Dot plot adapted from Seurat::DotPlot, see ?Seurat::DotPlot for details

Usage

dotPlot(
  markers,
  count.matrix,
  cell.groups,
  marker.colour = "black",
  cluster.colour = "black",
  xlab = "Marker",
  ylab = "Cluster",
  n.cores = 1,
  text.angle = 45,
  gene.order = NULL,
  cols = c("blue", "red"),
  col.min = -2.5,
  col.max = 2.5,
  dot.min = 0,
  dot.scale = 6,
  scale.by = "radius",
  scale.min = NA,
  scale.max = NA,
  verbose = FALSE,
  ...
)

Arguments

- **markers**: Vector of gene markers to plot
- **count.matrix**: Merged count matrix, cells in rows and genes in columns
- **cell.groups**: Named factor containing cell groups (clusters) and cell names as names
- **marker.colour**: Character or numeric vector (default="black")
- **cluster.colour**: Character or numeric vector (default="black")
- **xlab**: string X-axis title (default="Marker")
- **ylab**: string Y-axis title (default="Cluster")
- **n.cores**: integer Number of cores (default=1)
- **text.angle**: numeric Angle of text displayed (default=45)
gene.order Either factor of genes passed to dplyr::mutate(levels=gene.order), or a boolean. (default=FALSE) If TRUE, gene.order is set to the unique markers. If FALSE, gene.order is set to NULL. If NULL, the argument is ignored.

cols Colors to plot (default=c("blue", "red")). The name of a palette from 'RColorBrewer::brewer.pal.info', a pair of colors defining a gradient, or 3+ colors defining multiple gradients (if 'split.by' is set).

col.min numeric Minimum scaled average expression threshold (default=-2.5). Everything smaller will be set to this.

col.max numeric Maximum scaled average expression threshold (default=2.5). Everything larger will be set to this.

dot.min numeric The fraction of cells at which to draw the smallest dot (default=0). All cell groups with less than this expressing the given gene will have no dot drawn.

dot.scale numeric Scale the size of the points, similar to cex (default=6)

scale.by string Scale the size of the points by 'size' or by 'radius' (default="radius")

scale.min numeric Set lower limit for scaling, use NA for default (default=NA)

scale.max numeric Set upper limit for scaling, use NA for default (default=NA)

verbose boolean Verbose output (default=TRUE)

... Additional inputs passed to sccore::plapply(), see man for description.

Value

ggplot2 object

Examples

library(dplyr)
### Create merged count matrix
### In this example, cms is a list of count matrices from, e.g., Cellranger count,
### where cells are in columns and genes in rows
### cm <- sccore::mergeCountMatrices(cms, transposed = FALSE) %>% Matrix::t()

### If coming from Conos, this can be extracted like so
### cm <- conos.obj$getJointCountMatrix(raw = FALSE) # Either normalized or raw values can be used

### Here, we create a random sparse matrix
cm <- Matrix::rsparsematrix(30,3,0.5) %>% abs(.) %>%
    `dimnames<-`(list(1:30,c("gene1","gene2","gene3")))

### Create marker vector
markers <- c("gene1","gene2","gene3")

### Additionally, color vectors can be included.
### These should have the same length as the input (markers, cell groups)
### Otherwise, they are recycled
col.markers <- c("black","black","red") # or c(1,1,2)
col.clusters <- c("black","red","black") # or c(1,2,1)

### Create annotation vector
annotation <- c(rep("cluster1",10),rep("cluster2",10),rep("cluster3",10)) %>% factor() %>% setNames(1:30)

## Plot. Here, the expression colours range from gray (low expression) to purple (high expression)
sccore:::dotPlot(markers = markers, count.matrix = cm, cell.groups = annotation,
marker.colour = col.markers, cluster.colour = col.clusters, cols=c("gray","purple"))

embeddingColorsPlot  Set colors for embedding plot. Used primarily in embeddingPlot().

Description

Set colors for embedding plot. Used primarily in embeddingPlot().

Usage

embeddingColorsPlot(
  plot.df,
  colors,
  groups = NULL,
  geom_point_w = ggplot2::geom_point,
  gradient.range.quantile = 1,
  color.range = "symmetric",
  legend.title = NULL,
  palette = NULL,
  plot.na = TRUE
)

Arguments

plot.df  data.frame for plotting. In embeddingPlot(), this is a tibble from tibble::rownames_to_column().

colors  vector of numbers, which must be shown with point colors, names contain cell names (default=NULL). This argument is ignored if groups are provided.

groups  vector of cluster labels, names contain cell names (default=NULL)

geom_point_w  function to work with geom_point layer from ggplot2 (default=ggplot2::geom_point)

gradient.range.quantile  Winsorization quantile for the numeric colors and gene gradient (default=1)

color.range  controls range, in which colors are estimated (default="symmetric"). Pass "all" to estimate range based on all values of "colors", pass "data" to estimate it only based on colors, presented in the embedding. Alternatively you can pass vector of length 2 with (min, max) values.

legend.title  legend title (default=NULL)

palette  vector or list or function (default=NULL). Accepts number of colors and return list of colors (i.e. see 'colorRampPalette') (default=NULL)
embeddingGroupPlot

plot.na  boolean/numeric Whether to plot points, for which groups / colors are missed (default=is.null(subgroups), i.e. FALSE). If plot.na passed a numeric value below 0, the NA symbols are plotted below the cells. Otherwise if values >=0, they're plotted above the cells. Note that this argument is FALSE if 'subgroups' is NULL

Value

ggplot2 object

Description

Plotting function for cluster labels, names contain cell names. Used primarily in embeddingPlot().

Usage

embeddingGroupPlot(
    plot.df,  
    groups,  
    geom_point_w,  
    min.cluster.size,  
    mark.groups,  
    font.size,  
    legend.title,  
    shuffle.colors,  
    palette,  
    plot.na,  
    ...
)

Arguments

plot.df  data.frame for plotting. In embeddingPlot(), this is a tibble from tibble::rownames_to_column().
groups  vector of cluster labels, names contain cell names (default=NULL)
geom_point_w  function to work with geom_point layer from ggplot2 (default=ggplot2::geom_point)
min.cluster.size  labels for all groups with number of cells fewer than this parameter are considered as missed (default=0). This argument is ignored if groups aren’t provided
mark.groups  plot cluster labels above points (default=TRUE)
font.size  font size for cluster labels (default=c(3, 7)). It can either be single number for constant font size or pair (min, max) for font size depending on cluster size
legend.title  legend title (default=NULL)
embeddingPlot

shuffle.colors  shuffle colors (default=FALSE)
palette         vector or list or function (default=NULL). Accepts number of colors and return
                list of colors (i.e. see 'colorRampPalette') (default=NULL)
plot.na         boolean/numeric Whether to plot points, for which groups / colors are missed
                (default=is.null(subgroups), i.e. FALSE). If plot.na passed a numeric value be-
                low 0, the NA symbols are plotted below the cells. Otherwise if values >=0,
                they're plotted above the cells. Note that this argument is FALSE if 'subgroups'
                is NULL

Value

ggplot2 object

Description

Plot embedding with provided labels / colors using ggplot2

Usage

embeddingPlot(
  embedding,
  groups = NULL,
  colors = NULL,
  subgroups = NULL,
  plot.na = is.null(subgroups),
  min.cluster.size = 0,
  mark.groups = TRUE,
  show.legend = FALSE,
  alpha = 0.4,
  size = 0.8,
  title = NULL,
  plot.theme = NULL,
  palette = NULL,
  color.range = "symmetric",
  font.size = c(3, 7),
  show.ticks = FALSE,
  show.labels = FALSE,
  legend.position = NULL,
  legend.title = NULL,
  gradient.range.quantile = 1,
  raster = FALSE,
  raster.dpi = 300,
shuffle.colors = FALSE,
keep.limits = !is.null(subgroups),
...
)

Arguments

embedding
two-column matrix with x and y coordinates of the embedding, rownames contain cell names and are used to match coordinates with groups or colors

groups
vector of cluster labels, names contain cell names (default=NULL)

colors
vector of numbers, which must be shown with point colors, names contain cell names (default=NULL). This argument is ignored if groups are provided.

subgroups
subset of 'groups', selecting the cells for plot (default=NULL). Ignored if 'groups' is NULL

plot.na
boolean/numeric Whether to plot points, for which groups / colors are missed (default=is.null(subgroups), i.e. FALSE). If plot.na passed a numeric value below 0, the NA symbols are plotted below the cells. Otherwise if values >=0, they're plotted above the cells. Note that this argument is FALSE if 'subgroups' is NULL

min.cluster.size
labels for all groups with number of cells fewer than this parameter are considered as missed (default=0). This argument is ignored if groups aren't provided

mark.groups
plot cluster labels above points (default=TRUE)

show.legend
show legend (default=FALSE)

alpha
opacity level [0, 1] (default=0.4)

size
point size (default=0.8)

title
plot title (default=NULL)

plot.theme
theme for the plot (default=NULL)

palette
vector or list or function (default=NULL). Accepts number of colors and return list of colors (i.e. see 'colorRampPalette') (default=NULL)

color.range
controls range, in which colors are estimated (default="symmetric"). Pass "all" to estimate range based on all values of "colors". pass "data" to estimate it only based on colors, presented in the embedding. Alternatively you can pass vector of length 2 with (min, max) values.

font.size
font size for cluster labels (default=c(3, 7)). It can either be single number for constant font size or pair (min, max) for font size depending on cluster size

show.ticks
show ticks and tick labels (default=FALSE)

show.labels
show labels (default=FALSE)

legend.position
vector with (x, y) positions of the legend (default=NULL)

legend.title
legend title (default=NULL)

gradient.range.quantile
Winsorization quantile for the numeric colors and gene gradient (default=1)
raster boolean whether layer with the points be rasterized (default=FALSE). Setting of this argument to TRUE is useful when you need to export a plot with large number of points
raster.dpi dpi of the rasterized plot. (default=300). Ignored if raster == FALSE.
shuffle.colors shuffle colors (default=FALSE)
keep.limits Keep axis limits from original plot (default=!is.null(subgroups)). Useful when plotting subgroups, only meaningful if plot.na=FALSE

Arguments passed on to ggrepel::geom_label_repel
mapping Set of aesthetic mappings created by aes or aes_. If specified and inherit.aes = TRUE (the default), is combined with the default mapping at the top level of the plot. You only need to supply mapping if there isn’t a mapping defined for the plot.
data A data frame. If specified, overrides the default data frame defined at the top level of the plot.
stat The statistical transformation to use on the data for this layer, as a string.
position Position adjustment, either as a string, or the result of a call to a position adjustment function.
parse If TRUE, the labels will be parsed into expressions and displayed as described in ?plotmath
box.padding Amount of padding around bounding box, as unit or number. Defaults to 0.25. (Default unit is lines, but other units can be specified by passing unit(x, "units")).
label.padding Amount of padding around label, as unit or number. Defaults to 0.25. (Default unit is lines, but other units can be specified by passing unit(x, "units")).
point.padding Amount of padding around labeled point, as unit or number. Defaults to 0. (Default unit is lines, but other units can be specified by passing unit(x, "units")).
label.r Radius of rounded corners, as unit or number. Defaults to 0.15. (Default unit is lines, but other units can be specified by passing unit(x, "units")).
label.size Size of label border, in mm.
min.segment.length Skip drawing segments shorter than this, as unit or number. Defaults to 0.5. (Default unit is lines, but other units can be specified by passing unit(x, "units")).
arrowspecification for arrow heads, as created by arrow
force Force of repulsion between overlapping text labels. Defaults to 1.
force.pull Force of attraction between a text label and its corresponding data point. Defaults to 1.
max.time Maximum number of seconds to try to resolve overlaps. Defaults to 0.5.
max.iter Maximum number of iterations to try to resolve overlaps. Defaults to 10000.
max.overlaps Exclude text labels that overlap too many things. Defaults to 10.
nudge_x, nudge_y  Horizontal and vertical adjustments to nudge the starting position of each text label. The units for nudge_x and nudge_y are the same as for the data units on the x-axis and y-axis.
xlim, ylim Limits for the x and y axes. Text labels will be constrained to these limits. By default, text labels are constrained to the entire plot area.
na.rm If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
direction "both", "x", or "y" — direction in which to adjust position of labels
seed Random seed passed to set.seed. Defaults to NA, which means that set.seed will not be called.
verbose If TRUE, some diagnostics of the repel algorithm are printed
inherit.aes If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders.

Value
ggplot2 object

Examples

library(sccore)
embeddingPlot(umapEmbedding, show.ticks=TRUE, show.labels=TRUE, title="UMAP embedding")

embedGraphUmap

Description

Usage

embedGraphUmap(
  graph,
  min.prob = 0.001,
  min.visited.verts = 1000,
  n.cores = 1,
  max.hitting.nn.num = 0,
  max.commute.nn.num = 0,
  min.prob.lower = 1e-07,
  n.neighbors = 40,
n.epochs = 1000,
spread = 15,
min.dist = 0.001,
return.all = FALSE,
n.sgd.cores = n.cores,
verbose = TRUE,
...)

Arguments

- **graph**
  - input igraph object

- **min.prob**
  - numeric Minimum probability for proximity when calculating hitting time per neighbors (default=1e-3)

- **min.visited.verts**
  - numeric Minimum number of vertices visited when calculating hitting time per neighbors (default=1000)

- **n.cores**
  - numeric Number of cores to use (default=1)

- **max.hitting.nn.num**
  - numeric Maximum adjacencies for calculating hitting time per neighbor, hitting_time_per_neighbors() (default=0)

- **max.commute.nn.num**
  - numeric Maximum adjacencies for calculating commute time per neighbor, commute_time_per_node() (default=0)

- **min.prob.lower**
  - numeric Probability threshold to continue iteration in depth first search hitting time, dfs_hitting_time() (default=1e-7)

- **n.neighbors**
  - numeric Number of neighbors (default=40)

- **n.epochs**
  - numeric Number of epochs to use during the optimization of the embedded coordinates (default=1000). See 'n_epochs' in uwot::umap()

- **spread**
  - numeric The effective scale of embedded points (numeric default=15). See 'spread' in uwot::umap()

- **min.dist**
  - numeric The effective minimum distance between embedded points (default=0.001). See 'min.dist' in uwot::umap()

- **return.all**
  - boolean If TRUE, return list(adj.info=adj.info, commute.times=commute.times, umap=umap). Otherwise, just return UMAP(default=FALSE)

- **n.sgd.cores**
  - numeric Number of cores to use during stochastic gradient descent. If set to > 1, then results will not be reproducible, even if 'set.seed' is called with a fixed seed before running (default=n_threads) See 'n_sgd_threads' in uwot::umap()

- **verbose**
  - boolean Verbose output (default=TRUE)

- **...**
  - Additional arguments passed to embedKnnGraph()

Value

resulting UMAP embedding
Embed a k-nearest neighbor (kNN) graph within a UMAP. Used within embedGraphUmap(). Please see McInnes et al <doi:10.21105/joss.00861> for the UMAP description and implementation.

Usage

```r
embedKnnGraph(
  commute.times,
  n.neighbors,
  names = NULL,
  n.cores = 1,
  n.epochs = 1000,
  spread = 15,
  min.dist = 0.001,
  n.sgd.cores = n.cores,
  target.dims = 2,
  verbose = TRUE,
  ...
)
```

Arguments

- **commute.times**: graph commute times from get_nearest_neighbors(). The definition of commute_time(u, v) is the expected time starting at u = to reach v and then return to u.
- **n.neighbors**: numeric Number of neighbors
- **names**: vector of names for UMAP rownames (default=NULL)
- **n.cores**: numeric Number of cores to use (except during stochastic gradient descent) (default=1). See ‘n_threads’ in uwot::umap()
- **n.epochs**: numeric Number of epochs to use during the optimization of the embedded coordinates (default=1000). See ‘n_epochs’ in uwot::umap()
- **spread**: numeric The effective scale of embedded points (numeric default=15). See ‘spread’ in uwot::umap()
- **min.dist**: numeric The effective minimum distance between embedded points (default=0.001). See ‘min.dist’ in uwot::umap()
- **n.sgd.cores**: numeric Number of cores to use during stochastic gradient descent. If set to > 1, then results will not be reproducible, even if ’set.seed’ is called with a fixed seed before running (default=n.cores) See ‘n_sgd_threads’ in uwot::umap()
extendMatrix

target.dims numeric Dimensions for ‘n_components’ in uwot::umap(n_components=target.dims) (default=2)
verbose boolean Verbose output (default=TRUE)
...
arguments passed to uwot::umap()

Value

resulting kNN graph embedding within a UMAP

---

**extendMatrix**

*Extend matrix to include new columns in matrix*

**Description**

Extend matrix to include new columns in matrix

**Usage**

`extendMatrix(mtx, col.names)`

**Arguments**

- `mtx` Matrix
- `col.names` Columns that should be included in matrix

**Value**

Matrix with new columns but rows retained

**Examples**

```r
library(dplyr)
gene.union <- lapply(conosClusterList, colnames) %>% Reduce(union, .) extendMatrix(conosClusterList[[1]], col.names=gene.union)
```
fac2col  

Utility function to translate a factor into colors

Description

Utility function to translate a factor into colors

Usage

fac2col(
  x,
  s = 1,
  v = 1,
  shuffle = FALSE,
  min.group.size = 1,
  return.details = FALSE,
  unclassified.cell.color = "gray50",
  level.colors = NULL
)

Arguments

x  
input factor

s  
numeric The "saturation" to be used to complete the HSV color descriptions (default=1) See ?rainbow in Palettes, grDevices

v  
numeric The "value" to be used to complete the HSV color descriptions (default=1) See ?rainbow in Palettes, grDevices

shuffle  
boolean If TRUE, shuffles columns with shuffle(columns) (default=FALSE)

min.group.size  
integer Exclude groups of size less than the min.group.size (default=1)

return.details  
boolean If TRUE, returns a list list(colors=y, palette=col). Otherwise, just returns the factor (default=FALSE)

unclassified.cell.color  
Color for unclassified cells (default='gray50')

level.colors  
(default=NULL)

Value

vector or list of colors

Examples

genes = factor(c("BRAF", "NPC1", "PAX3", "BRCA2", "FMR1"))
fac2col(genes)
**fac2palette**

*Encodes logic of how to handle named-vector and functional palettes. Used primarily within embeddingGroupPlot()*

**Description**

Encodes logic of how to handle named-vector and functional palettes. Used primarily within embeddingGroupPlot().

**Usage**

```
fac2palette(groups, palette, unclassified.cell.color = "gray50")
```

**Arguments**

- `groups` vector of cluster labels, names contain cell names
- `palette` vector or list or function (default=NULL). Accepts number of colors and return list of colors (i.e. see `colorRampPalette()`)
- `unclassified.cell.color` Color for unclassified cells (default='gray50')

**Value**

vector or palette

---

**getClusterGraph**

*Collapse vertices belonging to each cluster in a graph*

**Description**

Collapse vertices belonging to each cluster in a graph

**Usage**

```
getClusterGraph(graph, groups, method = "sum", plot = FALSE, node.scale = 50, edge.scale = 50, edge.alpha = 0.3, seed = 1, ...)
```
Arguments

- **graph**: igraph graph object. Graph to be collapsed.
- **groups**: factor on vertices describing cluster assignment (can specify integer vertex ids, or character vertex names which will be matched).
- **method**: string. Method to be used, either "sum" or "paga" (default="sum").
- **plot**: boolean. Whether to show collapsed graph plot (default=FALSE).
- **node.scale**: numeric. Scaling to control value of 'vertex.size' in plot.igraph() (default=50).
- **edge.scale**: numeric. Scaling to control value of 'edge.width' in plot.igraph() (default=50).
- **edge.alpha**: numeric. Scaling to control value of 'alpha.f' in adjustcolor() within plot.igraph() (default=0.3).
- **seed**: numeric. Set seed via set.seed() for plotting (default=1).
- **...**: arguments passed to collapseGraphSum().

Value

collapsed graph

Examples

```r
cluster.graph = getClusterGraph(conosGraph, igraph::V(conosGraph))
```

Description

Get nearest neighbors method on graph

Usage

```r
get_nearest_neighbors(
  adjacency_list,
  transition_probabilities,
  n_verts = 0L,
  n_cores = 1L,
  min_prob = 0.001,
  min_visited_verts = 1000L,
  min_prob_lower = 1e-05,
  max_hitting_nn_num = 0L,
  max_commute_nn_num = 0L,
  verbose = TRUE
)
```
Arguments

adjacency_list  igraph adjacency list
transition_probabilities  vector of transition probabilities
n_verts  numeric Number of vertices (default=0)
n_cores  numeric Number of cores to use (default=1)
min_prob  numeric Minimum probability for proximity when calculating hitting time per
          neighbors (default=1e-3)
min_visited_verts  numeric Minimum number of vertices visited when calculating hitting time per
                    neighbors (default=1000)
min_prob_lower  numeric Probability threshold to continue iteration in depth first search hitting
time, dfs_hitting_time() (default=1e-5)
max_hitting_nn_num  numeric Maximum adjacencies for calculating hitting time per neighbor, hitting_time_per_neighbors() (default=0)
max_commute_nn_num  numeric Maximum adjacencies for calculating commute time per neighbor, commute_time_per_node() (default=0)
verbose  boolean Whether to have verbose output (default=TRUE)

Value

list of commute times based on adjacencies

graphToAdjList

Convert igraph graph into an adjacency list

Description

Convert igraph graph into an adjacency list

Usage

graphToAdjList(graph)

Arguments

graph  input igraph object

Value

adjacency list, defined by list(idx=adj.list, probabilities=probs, names=edge.list.fact$levels
Examples

library(dplyr)
edge.list.fact <- igraph::as_edgelist(conosGraph) %>% as_factor()
edge.list <- matrix(edge.list.fact$values, ncol=2)
n.nodes <- length(igraph::V(conosGraph))
splitVectorByNodes(edge.list[,1], edge.list[,2], n.nodes)

heatFilter

Graph filter with the heat kernel: $f(x) = \exp\left(-\beta \frac{|x/\lambda_m - a|^b}{\eta}\right)$

Description

Graph filter with the heat kernel: $f(x) = \exp\left(-\beta |x/\lambda_m - a|^b\right)$

Usage

heatFilter(x, l.max, order = 1, offset = 0, beta = 30)

Arguments

x numeric Values to be filtered. Normally, these are graph laplacian eigenvalues.

l.max numeric Maximum eigenvalue on the graph ($\lambda_m$ in the equation)

order numeric Parameter $b$ in the equation. Larger values correspond to the sharper kernel form (default=1). The values should be positive.

offset numeric Mean kernel value ($a$ in the equation), must be in $[0:1]$ (default=0)

beta numeric Parameter $\beta$ in the equation. Larger values provide stronger smoothing. $\beta = 0$ corresponds to no smoothing (default=30).

Value

smoothed values for ‘x’

See Also

Other graph smoothing: computeChebyshevCoeffs(), smoothChebyshev(), smoothSignalOnGraph()
**jsDist**

Jensen–Shannon distance metric (i.e. the square root of the Jensen–Shannon divergence) between the columns of a dense matrix \( m \)

**Description**

Jensen–Shannon distance metric (i.e. the square root of the Jensen–Shannon divergence) between the columns of a dense matrix \( m \)

**Usage**

```r
jsDist(m)
```

**Arguments**

- \( m \)
  - Input matrix

**Value**

Vectorized version of the lower triangle as an R distance object, `stats::dist()`

**Examples**

```r
ex = matrix(1:9, nrow = 3, ncol = 3)
jsDist(ex)
```

---

**mergeCountMatrices**

Merge list of count matrices into a common matrix, entering 0s for the missing entries

**Description**

Merge list of count matrices into a common matrix, entering 0s for the missing entries

**Usage**

```r
mergeCountMatrices(cms, transposed = FALSE, ...)
```

**Arguments**

- \( cms \)
  - List of count matrices
- \( transposed \)
  - boolean Indicate whether ‘cms’ is transposed, e.g. cells in rows and genes in columns (default=FALSE)
- ... Parameters for ‘plapply’ function
**multi2dend**

**Value**

A merged extended matrix, with 0s for missing entries

**Examples**

```r
mergeCountMatrices(conosClusterList, n.cores=1)
## 12 x 67388 sparse Matrix of class "dgCMatrix"
```

---

**multi2dend**

*Translate multilevel segmentation into a dendrogram, with the lowest level of the dendrogram listing the cells*

**Description**

Translate multilevel segmentation into a dendrogram, with the lowest level of the dendrogram listing the cells

**Usage**

```r
multi2dend(cl, counts, deep = FALSE, dist = "cor")
```

**Arguments**

- `cl` igraph communities object, returned from igraph community detection functions
- `counts` dgCmatrix of counts
- `deep` boolean If TRUE, take (cl$memberships[1,]). Otherwise, uses as.integer(membership(cl)) (default=FALSE)
- `dist` Distance metric used (default='cor'). Either 'cor' for the correlation distance in log10 space, or 'JS' for the Jensen–Shannon distance metric (i.e. the square root of the Jensen–Shannon divergence)

**Value**

resulting dendrogram
plapply

Parallel, optionally verbose lapply. See ?parallel::mclapply for more info.

Description

Parallel, optionally verbose lapply. See ?parallel::mclapply for more info.

Usage

plapply(
  ...,
  progress = FALSE,
  n.cores = parallel::detectCores(),
  mc.preschedule = FALSE,
  mc.allow.recursive = TRUE,
  fail.on.error = FALSE
)

Arguments

... Additional arguments passed to mclapply(), lapply(), or pbmcapply::pbmclapply()
progress Show progress bar via pbmcapply::pbmclapply() (default=FALSE).
n.cores Number of cores to use (default=parallel::detectCores()). When n.cores=1, regular lapply() is used. Note: doesn’t work when progress=TRUE
mc.preschedule if set to TRUE then the computation is first divided to (at most) as many jobs as there are cores and then the jobs are started, each job possibly covering more than one value. If set to FALSE then one job is forked for each value of X. The former is better for short computations or large number of values in X, the latter is better for jobs that have high variance of completion time and not too many values of X compared to mc.cores.
mc.allow.recursive boolean Unless true, calling mclapply in a child process will use the child and not fork again (default=TRUE)
fail.on.error boolean Whether to fail and report and error (using stop()) as long as any of the individual tasks has failed (default=FALSE)

Value

list, as returned by lapply

Examples

square = function(x){ x**2 }
plapply(1:10, square, n.cores=1, progress=TRUE)
### `propagateLabels`

Estimate labeling distribution for each vertex, based on provided labels.

**Description**

Estimate labeling distribution for each vertex, based on provided labels.

**Usage**

```
propagateLabels(graph, labels, method = "diffusion", ...)
```

**Arguments**

- **graph**: igraph graph object
- **labels**: vector of factor or character labels, named by cell names, used in `propagateLabelsSolver()` and `propagateLabelsDiffusion()`
- **method**: string Type of propagation. Either 'diffusion' or 'solver'. (default='diffusion') 'solver' gives better result but has bad asymptotics, so it is inappropriate for datasets > 20k cells.
- **...**: additional arguments passed to either `propagateLabelsSolver()` or `propagateLabelsDiffusion()`

**Value**

matrix with distribution of label probabilities for each vertex by rows.

**Examples**

```
propagateLabels(conosGraph, labels=cellAnnotations)
```

### `propagateLabelsDiffusion`

Estimate labeling distribution for each vertex, based on provided labels using a Random Walk on graph

**Description**

Estimate labeling distribution for each vertex, based on provided labels using a Random Walk on graph
propagateLabelsSolver

Usage

propagateLabelsDiffusion(
  graph,
  labels,
  max.iters = 100,
  diffusion.fading = 10,
  diffusion.fading.const = 0.1,
  tol = 0.025,
  fixed.initial.labels = TRUE,
  verbose = TRUE
)

Arguments

graph  igraph graph object Graph input
labels  vector of factor or character labels, named by cell names
max.iters  integer Maximal number of iterations (default=100)
diffusion.fading  numeric Constant used for diffusion on the graph, exp(-diffusion.fading * (edge_length + diffusion.fading.const)) (default=10.0)
diffusion.fading.const  numeric Another constant used for diffusion on the graph, exp(-diffusion.fading * (edge_length + diffusion.fading.const)) (default=0.1)
tol  numeric Absolute tolerance as a stopping criteria (default=0.025)
fixed.initial.labels  boolean Prohibit changes of initial labels during diffusion (default=TRUE)
verbose  boolean Verbose mode (default=TRUE)

Value

matrix from input graph, with labels propagated

Examples

propagateLabelsDiffusion(conosGraph, labels=cellAnnotations)

Description

**propagate_labels**

*propagate_labels*  

**Usage**  

```r  
propagateLabelsSolver(graph, labels, solver = "mumps")  
```

**Arguments**  

- `graph`: igraph graph object Graph input  
- `labels`: vector of factor or character labels, named by cell names  
- `solver`: Method of solver to use (default="mumps"), either "Matrix" or "mumps" (i.e. "rmumps::Rmumps")

**Value**  

result from Matrix::solve() or rmumps::Rmumps

**Examples**  

```r  
propagateLabelsSolver(conosGraph, labels=cellAnnotations)  
```

---

**propagate_labels**  

*Label propagation*

**Description**  

Label propagation

**Usage**  

```r  
propagate_labels(  
  edge_verts,  
  edge_weights,  
  vert_labels,  
  max_n_iters = 10L,  
  verbose = TRUE,  
  diffusion_fading = 10,  
  diffusion_fading_const = 0.5,  
  tol = 0.005,  
  fixed_initial_labels = FALSE  
)  
```
Arguments

edge_verts  edge vertices of igraph graph object
edge_weights edge weights of igraph graph object
vert_labels  vector of factor or character labels, named by cell names
max_n_iters  integer Maximal number of iterations (default=10)
verbose     boolean Verbose mode (default=TRUE)
diffusion_fading numeric Constant used for diffusion on the graph, exp(-diffusion.fading * (edge_length + diffusion.fading.const)) (default=10.0)
diffusion_fading_const numeric Another constant used for diffusion on the graph, exp(-diffusion.fading * (edge_length + diffusion.fading.const)) (default=0.5)
tol          numeric Absolute tolerance as a stopping criteria (default=5e-3)
fixed_initial_labels boolean Prohibit changes of initial labels during diffusion (default=FALSE)

Value

matrix from input graph, with labels propagated

Description

Save DE results as JSON tables for viewing in browser

Usage

saveDeAsJson(
  de.raw,
  sample.groups = NULL,
  saveprefix = NULL,
  dir.name = "JSON",
  gene.metadata = NULL,
  verbose = TRUE
)

Arguments

del.raw    List of DE results from e.g. cocoa, conos
sample.groups Sample groups as named list, each element containing a vector of samples. Can be retrieved from e.g. package cocoa (default=NULL)
saveprefix Prefix for created files (default=NULL)
setMinMax

setMinMax

```
dir.name  Name for directory with results. If it doesn’t exist, it will be created. To disable, set as NULL (default="JSON")
gene.metadata  (default=NULL) # Needs explanation
verbose  Show progress (default=TRUE)
```

Value

JSON files, table of content, and viewer files for viewing DE results in browser

Examples

```
## Not run:
saveDeAsJson(de.raw, sample.groups)
## End(Not run)
## The results can be viewed in a webbrowser by opening toc.html
```

---

**setMinMax**  
*Set range for values in object. Changes values outside of range to min or max. Adapted from Seurat::MinMax*

Description

Set range for values in object. Changes values outside of range to min or max. Adapted from Seurat::MinMax

Usage

```
setMinMax(obj, min, max)
```

Arguments

- **obj**  
  Object to manipulate
- **min**  
  Minimum value
- **max**  
  Maximum value

Value

An object with the same dimensions as input but with altered range in values

Examples

```
example_matrix = matrix(rep(c(1:5), 3), 5)
setMinMax(example_matrix, 2, 4)
```
smoothSignalOnGraph  Smooth Signal on Graph

Description

Smooth Signal on Graph

Usage

smoothSignalOnGraph(
  signal,
  filter,
  graph = NULL,
  lap = NULL,
  l.max = NULL,
  m = 50,
  ...
)

Arguments

signal  signal to be smoothed
filter  function that accepts signal ‘x’ and the maximal Laplacian eigenvalue ‘l.max’. See heatFilter as an example.
graph  igraph object with the graph (default=NULL)
lap  graph laplacian (default=NULL). If NULL, ‘lap’ estimated from graph.
l.max  maximal eigenvalue of ‘lap’ (default=NULL). If NULL, estimated from ‘lap’.
m  numeric Maximum order of Chebyshev coeff to compute (default=50)
...  Arguments passed on to smoothChebyshev

See Also

Other graph smoothing: computeChebyshevCoeffs, heatFilter, smoothChebyshev
smooth_count_matrix

Smooth gene expression, used primarily within conos::correctGenes. Used to smooth gene expression values in order to better represent the graph structure. Use diffusion of expression on graph with the equation $dv = \exp(-a \cdot (v + b))$

Description

Smooth gene expression, used primarily within conos::correctGenes. Used to smooth gene expression values in order to better represent the graph structure. Use diffusion of expression on graph with the equation $dv = \exp(-a \cdot (v + b))$

Usage

smooth_count_matrix(
  edge_verts,
  edge_weights,
  count_matrix,
  is_label_fixed,
  max_n_iters = 10L,
  diffusion_fading = 1,
  diffusion_fading_const = 0.1,
  tol = 0.001,
  verbose = TRUE,
  normalize = FALSE
)

Arguments

edge_verts       edge vertices of igraph graph object
edge_weights     edge weights of igraph graph object
count_matrix     gene count matrix
is_label_fixed   boolean Whether label is fixed
max_n_iters      integer Maximal number of iterations (default=10)
diffusion_fading numeric Constant used for diffusion on the graph, $\exp(-\text{diffusion.fading} \cdot (\text{edge_length} + \text{diffusion.fading.const}))$ (default=1.0)
diffusion_fading_const numeric Another constant used for diffusion on the graph, $\exp(-\text{diffusion.fading} \cdot (\text{edge_length} + \text{diffusion.fading.const}))$ (default=0.1)
tol               numeric Absolute tolerance as a stopping criteria (default=1e-3)
verbose          boolean Verbose mode (default=TRUE)
normalize        boolean Whether to normalize values (default=FALSE)
**Value**

matrix from input graph, with labels propagated

---

**sn**

*Set names equal to values, a stats::setNames wrapper function*

---

**Description**

Set names equal to values, a stats::setNames wrapper function

**Usage**

```
sn(x)
```

**Arguments**

- `x` an object for which names attribute will be meaningful

**Value**

An object with names assigned equal to values

**Examples**

```
vec = c(1, 2, 3, 4)
sn(vec)
```

---

**splitVectorByNodes**

**Description**

splitVectorByNodes

**Usage**

```
splitVectorByNodes(vec, nodes, n.nodes)
```

**Arguments**

- `vec` input vector to be divided
- `nodes` nodes used to divide the vector `vec` via split()
- `n.nodes` numeric The number of nodes for splitting
Value

list from vec with names given by the nodes

Examples

```r
adjList = graphToAdjList(conosGraph)
print(names(adjList))
## [1] "idx" "probabilities" "names"
length(adjList$names)
## [1] 12000
```

```
styleEmbeddingPlot

Set plot.theme, legend, ticks for embedding plot. Used primarily in embeddingPlot().

Description

Set plot.theme, legend, ticks for embedding plot. Used primarily in embeddingPlot().

Usage

```r
styleEmbeddingPlot(
  gg,
  plot.theme = NULL,
  title = NULL,
  legend.position = NULL,
  show.legend = TRUE,
  show.ticks = TRUE,
  show.labels = TRUE,
  relabel.axis = TRUE
)
```

Arguments

- **gg**: ggplot2 object to plot
- **plot.theme**: theme for the plot (default=NULL)
- **title**: plot title (default=NULL)
- **legend.position**: vector with (x, y) positions of the legend (default=NULL)
- **show.legend**: show legend (default=TRUE)
- **show.ticks**: show ticks and tick labels (default=TRUE)
- **show.labels**: show labels (default=TRUE)
- **relabel.axis**: boolean If TRUE, relabel axes with ggplot2::labs(x='Component 1', y='Component 2') (default=TRUE)
Value
  ggplot2 object

| umapEmbedding | UMAP embedding |

Description
  UMAP embedding

Usage
  umapEmbedding

Format
  An object of class matrix (inherits from array) with 12000 rows and 2 columns.

| val2col | Utility function to translate values into colors. |

Description
  Utility function to translate values into colors.

Usage
  val2col(x, gradientPalette = NULL, zlim = NULL, gradient.range.quantile = 0.95)

Arguments
  x  input values
  gradientPalette  gradient palette (default=NULL). If NULL, use colorRampPalette(c('gray90','red'), space = "Lab")(1024) if the values are non-negative; otherwise colorRampPalette(c("blue", "grey90", "red"), space = "Lab")'(1024) is used
  zlim  a two-value vector specifying limits of the values that should correspond to the extremes of the color gradient
  gradient.range.quantile  extreme quantiles of values that should be trimmed prior to color mapping (default=0.95)

Examples
  colors <- val2col( rnorm(10) )
val2ggcol

Helper function to return a ggplot color gradient for a numeric vector

`ggplot(aes(color=x, ...), ...) + val2ggcol(x)`

**Description**

Helper function to return a ggplot color gradient for a numeric vector `ggplot(aes(color=x, ...), ...) + val2ggcol(x)`

**Usage**

```r
def val2ggcol(
    values,
    gradient.range.quantile = 1,
    color.range = "symmetric",
    palette = NULL,
    midpoint = NULL,
    oob = scales::squish,
    return.fill = FALSE,
    ...
)
```

**Arguments**

- **values**: values by which the color gradient is determined
- **gradient.range.quantile**: numeric Trimming quantile (default=1). Either a single number or two numbers - for lower and upper quantile.
- **color.range**: either a vector of two values explicitly specifying the values corresponding to the start/end of the gradient, or string "symmetric" or "all" (default="symmetric"). "symmetric": range will fit data, but will be symmetrized around zeros, "all": gradient will match the span of the range of the data (after gradient.range.quantile)
- **palette**: an optional palette (default=NULL). The default becomes blue-gray90-red; if the values do not straddle 0, then truncated gradients (blue-gray90 or gray90-red) will be used
- **midpoint**: optional midpoint (default=NULL). Set for the center of the resulting range by default
- **oob**: function to determine what to do with the values outside of the range (default =scales::squish). Refer to 'oob' parameter in ggplot
- **return.fill**: boolean Whether to return fill gradients instead of color (default=FALSE)
- **...**: additional arguments are passed to ggplot2::scale_color_gradient* functions, i.e. scale_color_gradient(), scale_color_gradient2(), scale_color_gradientn()

**Value**

`ggplot2::scale_colour_gradient` object
