**Introduction**

“If I had just five minutes to chop down a tree I would spend the first two and a half minutes sharpening my axe.”

— An anonymous woodsman

This R package provides functions for handling data from the clinical data management system (CDMS) secuTrial. The most important components are related to reading data exports from secuTrial into R. In brief, the package aims to enable swift execution of repetitive tasks in order to allow spending more time on the unique aspects of a dataset. It is developed and maintained by the Swiss Clinical Trial Organisation (SCTO).

If you are still challenged by more basic operations in R we suggest reading Hands-On Programming with R, which serves as an excellent introduction to the basic concepts of R.

This vignette will teach you how to use the `secuTrialR` package and you will likely learn quite a bit about secuTrial exports in general along the way. Throughout the `secuTrialR` package and within this vignette we refer to patients, cases, subjects etc. enrolled in a secuTrial database as participants.

**Install**

Please note that R versions >= 3.5 should be used to run `secuTrialR`.

**Stable release from CRAN**

```r
install.packages("secuTrialR", dependencies = TRUE)
```

**Development release from GitHub with devtools**

For this you will need to have `devtools` installed. If you are working on Windows and would like to install with `devtools` you will likely need to install Rtools. Installing everything, including the dependencies, from scratch may take a while (20-30 minutes).

```r
# install
devtools::install_github("SwissClinicalTrialOrganisation/secuTrialR")

# load silently
suppressMessages(library(secuTrialR))
# show secuTrialR version
packageVersion("secuTrialR")
-> [1] "1.0.3"
```

**The CTU05 dataset**

Before we continue with the functionalities let’s briefly talk about the test data which is delivered as a part of the package. We refer to it as the CTU05 (clinical trial unit project 05) data. This dataset has been fabricated for demonstration purposes only and is not real clinical data. Principally it is made up of eight forms. These are called “surgeries”, “baseline”, “outcome”, “treatment”, “allmedl”, “studyterminat”, “ae” and “sae”. You will see these names again later when the data has been read into R. The project setup includes most data types implementable in secuTrial. It is, however, not exhaustive. Since the data is delivered with the installation of the `secuTrialR` package we can point to it via the `system.file()` function.
If you work on your own datasets you can specify a path as a regular character string without using `system.file()`.

**secuTrial export options**

Prior to reading your data into R you need to export it with the secuTrial ExportSearchTool. We suggest exporting non-rectangular, zipped, English data with reference values stored in a separate table including Add-IDs, centre information, structure information, form status, project setup, without duplicated meta data and without form data of hidden fields. Furthermore, it is important to use “CSV format”/“CSV format for MS Excel” and suggested to select UTF-8 encoding. Most of these options are truly optional and reading your data should work even with differences from the above specifications.

A description of how data can be exported from secuTrial can be found here. This description includes screenshots of the export options configuration interface.

**Reading a secuTrial data export into R**

There is one principle function to read your data (i.e. `read_secuTrial()`). Below you can see it in action with the CTU05 dataset.

```r
ctu05_data <- read_secuTrial(data_dir = ctu05_data_location)
#> Read export successfully.
#> The following export options deviate from the suggested specifications:
#> Data from hidden fields is part of the export.
```

If the “Read export successfully.” message appears your data was correctly read. In this example you are also warned that hidden data fields are in the export which is a deviation from the suggested export option configuration.

**The secuTrialdata object**

If you inspect the `class()` of `ctu05_data` you will find that it is a `secuTrialdata` object.

```r
class(ctu05_data)
#> [1] "secuTrialdata"
```

Really this is only a list containing all the information from your secuTrial export.
The data tables in the secuTrialdata object

We have implemented a custom variation of the `print()` function for `secuTrialdata` objects.

```r
print(ctu05_data)
#> secuTrial data imported from:
#> /home/wrightp/R/x86_64-pc-linux-gnu-library/3.6/secuTrialR/extdata/sT_exports/
#> exp_opt/s_export_CSV-xl5_CTU05_all_info.zip
#>  | table | nrow | ncol | meta | original_name |
#> vp | 4     | 12   | TRUE | vp.xls |
#> vpfs | 8    | 2    | TRUE | vpfs.xls |
#> fs | 8     | 8    | TRUE | fs.xls |
#> qs | 29    | 8    | TRUE | qs.xls |
#> is | 85    | 9    | TRUE | is.xls |
#> ctr | 3    | 3    | TRUE | ctr.xls |
#> cn | 11    | 15   | TRUE | cn.xls |
#> atcn | 0    | 9    | TRUE | atcn.xls |
#> atcups | 0    | 16   | TRUE | atcups.xls |
#> qac | 0     | 12   | TRUE | qac.xls |
#> cts | 0     | 10   | TRUE | cts.xls |
#> miv | 0     | 10   | TRUE | miv.xls |
#> atmiv | 0    | 15   | FALSE | atmiv.xls |
#> baseline | 17  | 107  | FALSE | baseline.xls |
#> atbaseline | 0   | 79   | FALSE | atbaseline.xls |
#> outcome | 13   | 48   | FALSE | outcome.xls |
#> atoutcome | 5    | 47   | FALSE | atoutcome.xls |
#> treatment | 11   | 44   | FALSE | treatment.xls |
#> attreatment | 0   | 45   | FALSE | attreatment.xls |
#> allmedi | 17    | 47   | FALSE | allmedi.xls |
#> atallmedi | 2    | 47   | FALSE | atallmedi.xls |
#> studyterminat | 10 | 41   | FALSE | studyterminat.xls |
#> atstudyterminat | 1 | 39   | FALSE | atstudyterminat.xls |
#> ae | 1     | 66   | FALSE | ae.xls |
#> sae | 2     | 64   | FALSE | sae.xls |
#> atsae | 0    | 57   | FALSE | atsae.xls |
#> esurgeries | 18  | 11   | FALSE | esurgeries.xls |
#> atesurgeries | 0  | 9    | FALSE | atesurgeries.xls |
#> cl | 205   | 3    | TRUE | cl.xls |
#> atcl | 0    | 20   | FALSE | atcl.xls |
```

It shows you where the export archive of your `secuTrialdata` object is located, tells you which data tables (i.e. `table`) it contains, what the source files (i.e. `original_name`) are and specifies each table's dimensions (i.e. `nrow`, `ncol`).

By now you have possibly realized that all the forms specified earlier (i.e. “surgeries”, “baseline”, “outcome”, “treatment”, “allmedi”, “studyterminat”, “ae” and “sae”) are present, but also that there are many tables that do not correspond to the previously introduced forms.

The majority of the unfamiliar tables are tagged as `TRUE` in the `meta` column. This means that they are metadata tables. Their names and data structures are fixed in secuTrial exports. In the following we will briefly explain which information the most relevant meta tables contain.

- `vp` - visitplan definition
- `vpfs` - visitplan form linkage
- `fs` - forms information
Furthermore, there is a set of tables whose names start with “at”. These are audit trail tables. They are only relevant if you need to investigate changes in the data over time. For example certain values may be corrected (i.e. changed) due to findings during monitoring visits at study centres. Last but not least you may have also realized that the “surgeries” table is called esurgeries. This is because it is a so-called repetition form. Repetition forms are labelled with a leading “e” and are implemented as subforms in other forms. In this case, esurgeries is a subform in baseline and the linkage is defined by the mnpdocid column in both tables. If this sounds cryptic to you we suggest you talk so someone who has implemented a database in secuTrial and let them explain it with a specific example. It is pretty straight forward when you look at a concrete implementation.

**Accessing the tables and values**

Since the secuTrialdata object is a list and the data tables within this list are data frames you can simply access the tables using $. Let’s say you would like to have a look at the placebo to verum ratio in your treatment data or what types of other medication were entered in allmedi.

```r
table(ctu05_data$treatment$rando_treatment)
#> Placebo  Verum
#>     8     3

table(ctu05_data$allmedi$med_product)
#> Amoxicillin Doxycycline  Importal
#>     2     1     3
```

**Data transformations**

During the loading process, coded categorical data is transformed. For example the gender variable in the baseline form is categorical. The raw data is accessible via gender and the transformed version of the data is added during the reading process and becomes accessible via gender.factor. Thus, data is not overwritten but added with the .factor extension. If there are issues during factorization a warning() will inform you of this.

```r
# raw gender data
ctu05_data$baseline$gender
#> [1] 1 NA NA 2 1 2 1 NA NA 1 2 NA NA 1 2 2 NA
# attr(,"label")
# [1] "Gender"

# transformed gender data
ctu05_data$baseline$gender.factor
#> [1] male <NA> <NA> female male female male <NA> <NA> male
# attr(,"label")
# [1] Gender
# Levels: male female
```
Note that descriptive labels have also been automatically added to the data.

```r
label(cfu05_data$allmedi$no_more_meds.factor)
#> [1] "No further medication"
label(cfu05_data$baseline$gender.factor)
#> [1] "Gender"
label(cfu05_data$esurgery$esurgery_organ.factor)
#> [1] "Organ"
```

Datetime data is also transformed and similarly to the factorization process the names are concatenated with `.date` or `.datetime`.

```r
cfu05_data$baseline$visit_date
#> [1] 20190401 20190402 20190403 20190402 20190404 20190405
#> [6] 20190406 20190407 20190411 20190412 20190413 20190414 20190413
#> [15] 20190414 20190415 20180501
# attr("label")
#> [1] "Date of visit"
```
Depending on the setup, incomplete dates can be valid entries in a secuTrial database. Thus they will also occasionally appear in your exports. The datetime conversion does not work in these cases and NAs are created. If this happens, secuTrialR will warn you accordingly and you should have a closer look into the affected datetime variables and whether you would like to perform so-called date imputation.

Export options

The secuTrialdata object also contains information on the export options.

```r
cTU5_data$export_options
#> $secuTrial version: 5.5.1.10
#> Time of export on server: 03.10.2019 - 14:43:49 (CEST)
#> Project version: (20.06.2019 - 11:22:04 (CEST))
#> Exported with short names
#> File extension: xls
#> Separator: \'
#> 32 files exported
#> including 13 metadata tables
#> Reference values exported - factorize possible
#> Metadata tables:
#> type exportname available
#> forms fs TRUE
#> casenodes cn TRUE
#> centres ctr TRUE
#> items is TRUE
#> questions qs TRUE
#> queries gac TRUE
#> visitplan vp TRUE
#> visitplanforms vpfs TRUE
#> atcasenodes atcn TRUE
#> atcasevisitplans atcvp TRUE
#> comments cts TRUE
#> miv miv TRUE
#> cl cl TRUE
```

export_options itself is a list. If you are interested in more information than is printed you can also access it. Let’s assume you would like to know the project_name and encoding.

```r
cTU5_data$export_options$project_name
#> [1] "secuTrialR example CDMA"
cTU5_data$export_options$encoding
#> [1] "UTF-8"
```

Much more information is stored in the elements of export_options. The names of the elements should be descriptive enough to infer the contents.
Generic functions for **secuTrialdata** objects

Now that you understand the *secuTrialdata* object we will show you some generic functions you can use on objects of this class.

Show the study participants

First off you may be interested in a table of participants.

```
get_participants(ctu05_data)
```

Please note that the *mnpaid* column in this table corresponds to the *pat_id* column in other tables.
Recruitment over time

You can extract information about participant recruitment per centre and year by applying `annual_recruitment()` on a `secuTrialdata` object.

```r
annual_recruitment(ctu05_data)
#> Center Total 2018 2019
#> 1 All 11 1 10
#> 2 Charité Berlin (RPACK) 5 0 5
#> 3 Inselspital Bern (RPACK) 5 0 5
#> 4 Universitätsspital Basel (RPACK) 1 1 0
```

Since the centre names often have a systematic addition (e.g. (RPACK)) we have enabled the option to remove certain parts of the centre descriptions via regular expressions (i.e. `rm_regex` argument). In this case the regular expression removes trailing parentheses and everything they enclose.

```r
annual_recruitment(ctu05_data, rm_regex = "\\(.*\\)"")
#> Center Total 2018 2019
#> 1 All 11 1 10
#> 2 Charité Berlin 5 0 5
#> 3 Inselspital Bern 5 0 5
#> 4 Universitätsspital Basel 1 1 0
```

It is also possible to plot the recruitment over time.

```r
plot_recruitment(ctu05_data, cex = 1.2, rm_regex = "\\(.*\\)")
```
Visit plan visualization

**secuTrialR** can provide a depiction of the visit structure, although only where the visit plan is fixed. Black rectangles in the grid represent a form to be filled (x) during one of the visits (y).

```r
vs <- visit_structure(ctu05_data)
plot(vs)
```

Completeness of forms

If you are not sure about how complete the data in your export is, it may be useful to get a quick overview of how well the forms have been filled. The below table shows both absolute and relative numbers for a few forms.

```r
fss <- form_status_summary(ctu05_data)
tail(fss, n = 5)
```

<table>
<thead>
<tr>
<th>form_name</th>
<th>partly_filled</th>
<th>completely_filled</th>
<th>empty</th>
<th>with_warnings</th>
<th>with_errors</th>
<th>partly_filled.percent</th>
<th>completely_filled.percent</th>
<th>empty.percent</th>
<th>with_warnings.percent</th>
<th>with_errors.percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>baseline</td>
<td>3</td>
<td>14</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0.17647059</td>
<td>0.8235294</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>outcome</td>
<td>1</td>
<td>12</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0.07692308</td>
<td>0.9230769</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>sae</td>
<td>0</td>
<td>2</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0.00000000</td>
<td>1.0000000</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>studyterminat</td>
<td>0</td>
<td>10</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0.00000000</td>
<td>1.0000000</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>treatment</td>
<td>0</td>
<td>11</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0.00000000</td>
<td>1.0000000</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Please note that a form is only complete if all required fields have been filled. Thus, a whole study may have 99% completeness on variable basis while showing 0% completeness on form basis. It is currently not technically possible to assess completeness on variable basis in a generic way. Hence, high completeness on form basis implies high completeness on variable basis but **NOT** vice versa.

If you would rather retrieve information on form completeness for each participant individually you can perform the following.

```r
fsc <- form_status_counts(ctu05_data)
# show the top
head(fsc)
```

```plaintext
#>   pat_id form_name completely_filled partly_filled empty
#> 1  RPACK-CBE-001   baseline         3           0      0
#> 2  RPACK-CBE-002   baseline         1           0      0
#> 3  RPACK-CBE-003   baseline         1           0      0
#> 4  RPACK-CBE-004   baseline         1           0      0
#> 5  RPACK-CBE-005   baseline         1           2      0
#> 6  RPACK-INS-011   baseline         1           0      0
```

**Form linkage**

Linkages amongst forms can be explored with the `links_secuTrial()` function. This relies on the `igraph` package to create a network. It is possible to interact with the network, e.g. move nodes around in order to read the labels better. The R graphics device ID is returned to the console, but can be ignored. Forms are plotted in deep yellow, variables in light blue.

```r
links_secuTrial(ctu05_data)
```

The output can not be shown within this vignette but you should give it a try. Please note that the linkage plot is likely most useful **without** the audit trail data in the export.
Sampling random participants

During study monitoring it is common practice to check random participants from a study database. These participants should be retrieved in a reproducible fashion, which can be achieved by setting a so-called seed. The below function allows reproducible retrieval for a loaded secuTrial data export.

```r
# randomly retrieve at least 25 percent of participants recorded after March 18th 2019
# from the centres "Inselspital Bern" and "Charité Berlin"
return_random_participants(ctu05_data,
    percent = 0.25,
    seed = 1337,
    date = "2019-03-18",
    centres = c("Inselspital Bern (RPACK)",
               "Charité Berlin (RPACK)"))
```

```
#> $participants
#>   mnpaid centre mnpvisstartdate
#> 2 RPACK-INS-012  Inselspital Bern (RPACK) 2019-04-12
#> 4 RPACK-INS-014  Inselspital Bern (RPACK) 2019-04-14
#> 5 RPACK-CBE-005  Charité Berlin (RPACK) 2019-04-05
#> 3 RPACK-CBE-003  Charité Berlin (RPACK) 2019-04-03
#>
```

Please note that earlier R versions may return different results because there is a different `rng_config` (i.e. `RNGkind()`). For this reason we have added the `rng_config` to the output.

Retrieve score variables

secuTrial allows implementing calculated variables (i.e. scores). Data is not directly entered into these variables but rather calculated automatically. Scores are defined by a set of rules and use the data in other variables as basis. For example the age of a study participant at data entry can be calculated as the difference between the participant’s birthday and the day of data entry.

It is advisable to recalculate or validate score variable data before data analysis. A rule of thumb: The more complex a score is and the more data from different forms is necessary for its calculation the more likely its value should be recalculated. The below function will allow you to detect which variables this concerns.

```r
return_scores(ctu05_data)
```

```
#> name itemtype label
#> 1 age Years y (calculated only) Age
```

Retrieve hidden variables

Sometimes, during a study, certain fields may be hidden because data should no longer be entered into them. If this is the case and the data of these fields is part of your export is likely good to know about it. In this case nothing is hidden.

```r
return_hidden_items(ctu05_data)
```

```
#> [1] name itemtype label
#> <0 rows> (or 0-length row.names)
Finding changes/differences in project setup implementations

In ongoing studies it is possible that changes to the secuTrial data entry interface (i.e. the electronic case report forms) are made. Sometimes these changes may call for adjustments in analysis code. It is considered good practice to run `diff_secuTrial()` on the last export and the current export of a project to at least make yourself aware of potential changes in the setup. If there are differences, the results of this function should be interpreted as a first indicator since they may not cover all alterations. Information is returned on forms and variables. A detailed list of changes can be produced in the secuTrial FormBuilder with “Compare project setup”.

For the below `diff_secuTrial()` showcase we emulated a changed setup of CTU05 by copying the setup and importing it in the FormBuilder as a new secuTrial project (CTU06). From this, we created a data export (v1) and then made a few minor changes and exported again (v2). If this sounds confusing, never mind. CTU06 v1 is simply a copy of CTU05. CTU06 v2 is a slightly altered version of CTU06 v1.

```r
ctu06_v1 <- read_secuTrial(system.file("extdata", "sT_exports", "change_tracking", "s_export_CSV-xls_CTU06_version1.zip", package = "secuTrialR"))
#> Read export successfully.
#> The following export options deviate from the suggested specifications:
#> Data from hidden fields is part of the export.

ctu06_v2 <- read_secuTrial(system.file("extdata", "sT_exports", "change_tracking", "s_export_CSV-xls_CTU06_version2.zip", package = "secuTrialR"))
#> Read export successfully.
#> The following export options deviate from the suggested specifications:
#> Data from hidden fields is part of the export.

diff_secuTrial(ctu06_v1, ctu06_v2)
#> $new_forms
#> [1] "mnpctu06anewform" "mnpctu06anothernewform"
#>
#> $new_variables
#> [1] "new_item_in_fu" "new_item_in_new_form"
#>
#> $removed_forms
#> character(0)
#> #>
#> $removed_variables
#> character(0)
```

As you can see `ctu06_v2` contains the two additional forms `mnpctu06anewform` and `mnpctu06anothernewform` and the two additional variables `new_item_in_fu` and `new_item_in_new_form`.

**Conversion to SPSS, STATA, SAS**

Given that you are working with R it is unlikely that you need such conversions for yourself. However, collaborators may ask for data which is readily importable into SPSS, STATA or SAS. For this you can use `write_secuTrial()`.

Since this has not been heavily tested or used there may be issues and you might prefer doing this manually with the `haven` package. One particular sticking point is the length of variable names - R is not restrictive in this respect, but other software can be. `secuTrialR` does not truncate names, preferring to leave this to the
user, which can cause `write_secuTrial()` to fail with an error.

```r
# retrieve path to a temporary directory
tdir <- tempdir()
# write spss
write_secuTrial(ctu05_data, format = "sav", path = tdir)
```

### Subsetting `secuTrialData`

In some cases it may be useful to subset your `secuTrialData` object. For example if you have cohort data and would like to supply a subset of the data for a retrospective study. We have implemented this option with `subset_secuTrial()`. It will truncate your `secuTrialData` object and return a new `secuTrialData` object which is a subset of the original data. It is possible to subset by including or excluding specific participant ids or centres.

```r
# initialize some subset identifiers
participants <- c("RPACK-INS-011", "RPACK-INS-014", "RPACK-INS-015")
centres <- c("Inselspital Bern (RPACK)", "Universitätsspital Basel (RPACK)")

# exclude Bern and Basel
tcu05_data_berlin <- subset_secuTrial(ctu05_data, centre = centres, exclude = TRUE)
# exclude Berlin
tcu05_data_bern_basel <- subset_secuTrial(ctu05_data, centre = centres)
# keep only subset of participants
tcu05_data_pids <- subset_secuTrial(ctu05_data, participant = participants)
```

If you subset based on centres all traces of deleted centres will be removed. If you remove based on participant ids all traces of deleted participants will be removed.

```r
class(ctu05_data_berlin)
#> [1] "secuTrialData"
class(ctu05_data_bern_basel)
#> [1] "secuTrialData"
class(ctu05_data_pids)
#> [1] "secuTrialData"
```

```r
# only Berlin remains
tcu05_data_berlin$ctr
#> mnpctrid    mnpctrname      mnpcname
#> 1 462 Charité Berlin (RPACK) NA

# all centres remain even though all three participant ids are from Bern
tcu05_data_pids$ctr
#> mnpctrid    mnpctrname      mnpcname
#> 1 462 Charité Berlin (RPACK) NA
#> 2 461 Inselspital Bern (RPACK) NA
#> 3 441 Universitätsspital Basel (RPACK) NA
```
Since the truncated object’s class remains unchanged (i.e. \texttt{secuTrialdata}) you can still use the generic functions on it. Let’s say you would only like to look at the recruitment plot for Bern alone.

```r
# keep only Bern
ctu05_data_bern <- subset_secuTrial(ctu05_data, centre = "Inselspital Bern (RPACK)")
# plot
plot_recruitment(ctu05_data_bern)
```

... or Bern and Berlin.

```r
# keep only Bern and Berlin
ctu05_data_bern_berlin <- subset_secuTrial(ctu05_data, centre = c("Inselspital Bern (RPACK)", "Charité Berlin (RPACK)"))
# plot
plot_recruitment(ctu05_data_bern_berlin)
```
Building URLs to your secuTrial server

If you are creating reports in which you would like to directly link to specific pages of your secuTrial Data-Capture you can use `build_secuTrial_url`. If you are no expert regarding the secuTrial server architecture you would like to build links for, you should talk to the server admin or consult the `build_secuTrial_url` help page. They will be able to guide you regarding the information for the `server`, `instance`, `customer` and `project` parameters. The `docid`, however, is included in your export data in the non-meta data tables of the `secuTrialdata` object and can be found in the `mnpdocid` columns.

```r
define docids for manual treatment
head(ctu05_data$treatment$docid)
#> [1] 181 193 200 205 213 224

define docids for baseline
head(ctu05_data$baseline$docid)
#> [1] 180 184 187 191 199 203
```

To demonstrate `build_secuTrial_url` we will use imaginary data for the `server`, `instance`, `customer` and `project` parameters. The real counterparts on your server will likely look structurally similar.

```r
server <- "server.secutrial.com"
instance <- "ST21-setup-DataCapture"
customer <- "TES"
project <- "7036"

# make three links with the first three baseline docids
bl_docids <- head(ctu05_data$baseline$docid, n = 3)
links <- build_secuTrial_url(server, instance, customer, project, bl_docids)
```

These are the links:

Of course they are dead ends but maybe you can use them to make out the arguments for your server.

The `as.data.frame` function

This vignette has been working with the `secuTrialdata` object, which is of type `list`. For some users, working with a `list` can be tiresome so `secuTrialR` provides an `as.data.frame()` method to save the `data.frames` in the `secuTrialdata` object to an environment of your choice.

As an example, we will create an environment called `env` and check that it’s empty before running `as.data.frame()`...

```r
env <- new.env()
lite(env)
# character(0)

# add files to env
as.data.frame(ctu05_data, envir = env)
```

... and afterwards.
Substituting `env` with `.GlobalEnv` instead would also be an option and would make the data.frames immediately accessible without having to refer to an environment.

**Frequent warning messages**

Certain `warning` messages can occur quite frequently when running `read_secuTrial()`. Some of them may call for deliberate action and thus it is important to understand them. We briefly mentioned some of them earlier in this document but will now more closely explain how they can be interpreted.

Please note that `warning` messages may “pile up” depending on the export you are reading. For example this may happen if there are many date variables with incomplete data. This is no reason for concern. We suggest that you read them and interpret them based on the explanations below. We use `a_form_name` and `a_variable_name` as place holders in the examples. If in doubt you can always work with the raw data because it is never overwritten.

**Dates**

The below warning tells you that some data in a date variable could not be converted during the process of date conversion (i.e. `dates_secuTrial()`). This usually occurs if incomplete date entries are present. Since the raw data is not overwritten but rather a `variable_name.date` or `variable_name.datetime` column are added to the dataset you can specifically see which values could not be converted because the raw data will contain data while the corresponding `.date`/`.datetime` entries will be NA. The `warning` also indicates where to look. The dummy example below indicates to look at the variable `a_variable_name` in form `a_form_name`.

```r
#> Warning: In dates_secuTrial.data.frame(tmp, datevars, timevars, dateformat, :
#> Not all dates were converted for
#> variable: 'a_variable_name'
#> in form: 'a_form_name'
#> This is likely due to incomplete date entries.
```

**Factors**

In some cases secuTrial allows differently coded data to be decoded to the same target value for the same variable. For instance this can happen if hierarchical lookuptables have been implemented in the database. Because this interferes with the factorization (i.e. `factorize_secuTrial()`) we add the code to the duplicate decoded value and return the below message to make you aware.

If you run into this `warning` message we suggest running the `table()` function on the variable in question. This will likely clarify the above explanation.

```r
#> Warning: In factorize_secuTrial.data.frame(curr_form_data, cl = object$cl, :
#> Duplicate values found during factorization of a_variable_name
```
Labels

Sometimes the labels of variables in a secuTrial database implementation may be changed after release of the database. In these cases all labels (current and previous versions) are added to the label attribute during labelling (i.e. `label_secuTrial()`) and the below warning is triggered. It indicates which variables in which forms are affected.

```r
#> Warning: In label_secuTrial.secuTrialdata(d) :
#> The labels attribute may be longer than 1 for the following variables and forms.
#> Likely the label was changed from its original state in the secuTrial project setup.
#> variables: a_variable_name
#> forms: a_form_name
```

A note on `mnp*` variables

There is a plethora of variables in the tables of secuTrial exports whose names start with `mnp`. These are metadata variables which are e.g. important to logically link the different tables. Explaining them all is beyond the scope of this vignette. For detailed explanations, please refer to the secuTrial “Export Formats” user manual.

Disclaimer

The descriptions of the secuTrial exports used in this vignette and other `secuTrialR` documentation correspond to our understanding of them and come with no warranty. For in depth details please refer to the original secuTrial manuals.
